# ANNEX 3

# **Problem definition – facts & figures**

# 1. OVERALL CONTEXT

Table 1a – Evolution of the rail modal share

EU-27 modal split for passenger transport (in %, based on pkm, 1995-2009)

|      | Passenger cars | P2W | Bus&Coach | Railway | Tram&Metro | Air | Sea |
|------|----------------|-----|-----------|---------|------------|-----|-----|
| 1995 | 73,1           | 2,3 | 9,4       | 6,6     | 1,3        | 6,5 | 0,8 |
| 1996 | 73,1           | 2,3 | 9,3       | 6,4     | 1,3        | 6,8 | 0,8 |
| 1997 | 73,1           | 2,3 | 9,1       | 6,3     | 1,3        | 7,1 | 0,8 |
| 1998 | 73,2           | 2,3 | 9,1       | 6,2     | 1,3        | 7,2 | 0,8 |
| 1999 | 73,2           | 2,3 | 8,9       | 6,2     | 1,3        | 7,3 | 0,7 |
| 2000 | 73,0           | 2,3 | 8,8       | 6,3     | 1,3        | 7,7 | 0,7 |
| 2001 | 73,3           | 2,3 | 8,7       | 6,2     | 1,3        | 7,5 | 0,7 |
| 2002 | 73,8           | 2,3 | 8,6       | 6,0     | 1,3        | 7,3 | 0,7 |
| 2003 | 73,7           | 2,3 | 8,5       | 5,9     | 1,3        | 7,6 | 0,7 |
| 2004 | 73,6           | 2,3 | 8,3       | 5,9     | 1,3        | 7,9 | 0,7 |
| 2005 | 73,0           | 2,4 | 8,3       | 6,0     | 1,3        | 8,4 | 0,6 |
| 2006 | 73,0           | 2,4 | 8,0       | 6,1     | 1,3        | 8,6 | 0,6 |
| 2007 | 72,8           | 2,3 | 8,1       | 6,1     | 1,3        | 8,8 | 0,6 |
| 2008 | 72,7           | 2,4 | 8,1       | 6,3     | 1,4        | 8,6 | 0,6 |
| 2009 | 73,5           | 2,4 | 7,8       | 6,2     | 1,4        | 8,0 | 0,6 |
| 2010 | 73,7           | 1,9 | 7,9       | 6,3     | 1,4        | 8,2 | 0,6 |

# 2. QUALITY OF PASSENGER SERVICES

## 2.1. Consumer scoreboard 2011

Every year, the Directorate-General Health and Consumer protection (SANCO) and its executive agency (EAHC) analyses the customer satisfaction of several markets which it then scores on the basis of a Market Performance Index (MPI). The screening hinges on comparability of offers, trust of consumers, complaints, switching and ease of switching and overall satisfaction. The results of the Consumer Scoreboard are available in the website of DG SANCO.

# 2.2. Eurobarometer surveys on passenger satisfaction

The Directorate Generals on Mobility and Transport (MOVE) and Communication (COMM) have taken stock of consumer satisfaction in rail in two Eurobarometer surveys:

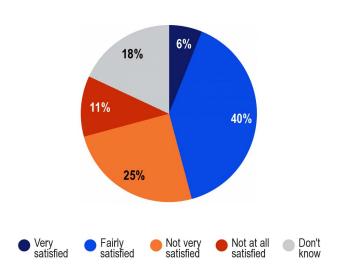

- Flash Eurobarometer 2011 survey devoted to satisfaction with frequency, purpose of journeys by rail, railway stations and with various features of the trains (presented in 2.2.2)
- Eurobarometer 2012 on competition in rail which a question on the overall satisfaction with rail (presented in 2.2.1)

## 2.2.1 – Overall satisfaction with rail

The Eurobarometer 2012 survey is based on face-to-face interviews with approximately 26.000 persons in the 25 Member States of the EU that have railways (Malta and Cyprus don't have any railway network). The survey was carried out from 10-25 March 2012.

Respondents to the Eurobarometer 2012 survey were asked to what extent they are satisfied with their national and regional rail system<sup>1</sup>. Almost half responded that they were satisfied with it: *very satisfied* (6%) or *fairly satisfied* (40%). However, over one-third is not satisfied: *not very satisfied* (25%) or *not at all satisfied* (11%). Almost one-fifth could not form an opinion on this matter (18%).

QC4. Overall, how satisfied are you with the national and regional rail system in (OUR COUNTRY)?

Base: Total number of respondents (n=25591)

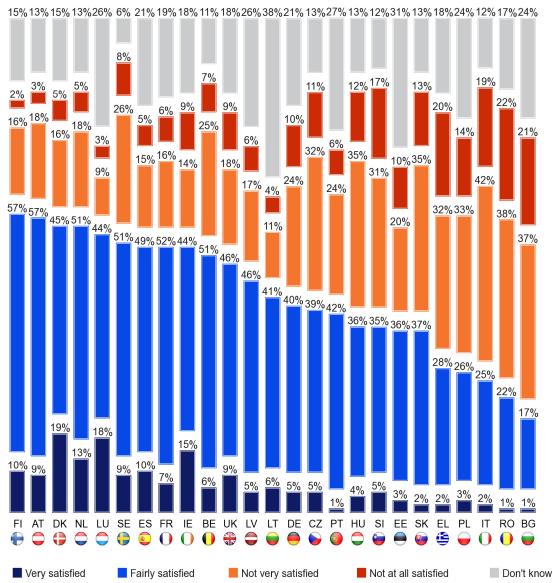

-

<sup>&</sup>lt;sup>1</sup> QC4 Overall, how satisfied are you with the national and regional rail system in (OUR COUNTRY)?

Country-by-country analysis reveals that the majority of respondents in 12 of the 25 Member States surveyed are *satisfied* with their national or regional rail system. These include the northern European countries Finland (67%), Sweden (60%), Denmark (64%) and Latvia (51%) and the western European countries Austria (66%), the Netherlands (64%), Luxembourg (62%), Ireland, France and Spain (all 59%), Belgium (57%), and the UK (55%). In eight Member States, more interviewees were dissatisfied than satisfied. These include Italy (61% dissatisfied), Romania (60%), Bulgaria (58%), and Greece (52%). Finally, interviewees in Lithuania (38%) and Estonia (31%) are most likely to answer they *don't know*.

| Education (End of)        |                   |                          |            |
| 15-                       | 40%               | 33%                      | 27%        |
| 16-19                     | 43%               | 38%                      | 19%        |
| 20+                       | 51%               | 37%                      | 12%        |
| Still studying            | 58%               | 34%                      | 8%         |
| Subjective urbanisa       | tion              |                          |            |
| Rural village             | 45%               | 33%                      | 22%        |
| Small/ Mid-size town      | 44%               | 39%                      | 17%        |
| Large town                | 50%               | 36%                      | 14%        |
| National or regional      | trains            |                          |            |
| At least once a week      | 63%               | 36%                      | 1%         |
| Several times month\ Year | 66%               | 33%                      | 1%         |
| Once a year\ Less\ Never  | 38%               | 37%                      | 25%        |

Base: Total number of respondents (n=25591)

A **socio-demographic** breakdown shows that age, education, subjective urbanisation and user frequency influence the extent of satisfaction with the national or regional rail system.

The younger the interviewees, the more likely they are to be *satisfied* (*fairly satisfied* or *very satisfied*): 55% of the youngest respondents (aged 15-24) compared to 42% of the 40-54 age group and 44% of the oldest category (55+). Respondents educated until the age of twenty or beyond (51%) are more likely to be satisfied than respondents who studied only until age 15 or younger (40%). The same is true of managers (55%) and students (58%) compared to self-employed interviewees (37%). Inhabitants of small or mid-size towns (39%) are slightly more inclined to be *not satisfied* (*not very satisfied or not at all satisfied*) than rural villagers (33%).

Turning to user frequency of national and regional trains, rail passengers are notably more likely to be satisfied than non-rail passengers: 63% of regular passengers (at least once a week) and 66% of occasional passengers (several times monthly or early) compared to 38% of non-rail passengers (who seldom or never travel by train).

#### 2.2.2 - Satisfaction with rail services

## 2.2.2.1 – Satisfaction in 2011

The quality of rail freight services in the European Union remains difficult to measure as a result of a general lack of indicators. Nevertheless, the gradual implementation of performance monitoring of rail freight services on the different freight corridors should provide some information on service punctuality.

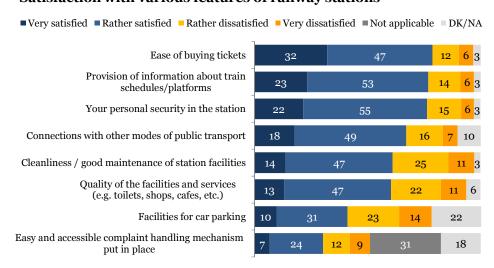

In this context, Directorate Generals on Mobility and Transport (MOVE) and Communication (COMM) commissioned a Eurobarometer survey, where some 10.000 persons per surveyed over the telephone on frequency and purpose of journeys by rail, satisfaction with various features of stations and trains.

The flash Eurobarometer 2011 found that the main concerns of passengers are cleanliness and the quality of the facilities and services, where satisfaction is below 60%. Passengers also consider that particular attention should be paid in stations to car parks, the quality of facilities and cleanliness and maintenance. On the other hand, passengers are generally satisfied with security on board trains, journey times forecast, comfort levels in passenger coaches, ticket distribution, information and security. The level of satisfaction with regard to stations varies considerably from one country to the next; it is very high in Spain and Luxembourg, but remains low in Poland and Hungary.

Punctuality appears satisfactory in a significant number of Member States (66% of overall satisfaction in the EU), but is considered insufficient by more than 40% of those surveyed in Poland, Germany, Sweden, Romania and France.

# 2.2.2.Benchmarking satisfaction

On the one hand, it is difficult to identify a definitive benchmark for customer satisfaction. On the other hand, it is obvious that if satisfaction levels are below 50%, it will be difficult to lure travellers to rail from other transport modes.

The table below provides an analysis of the number of Member States whose level of satisfaction is above 75% and 70%.

Table 4a - Analysis of satisfaction in the Flash Eurobarometer 2011

The railway systems which have scored best in the Eurobarometer 2011 are Spain, Luxembourg, Portugal, UK, Ireland and Austria. Citizens in Finland, Lithuania, Latvia and Slovenia rate also well their railway systems. With the notable exception of Portugal and Slovenia, all these Member States score well in terms of overall satisfaction in the Eurobarometre 2012.

Similarly, while overall satisfaction appears to be relatively high in Sweden, France, Belgium and Netherlands in the Eurobarometer 2012, these countries do not appear well ranked in the Eurobarometer 2011. A series of delays resulting from snow in 2010-2011 and leading to important service disruption probably reflect dissatisfaction in the Flash Eurobarometer 2011 which is not found in the Eurobarometer 2012.

#### 2.2.2.3- Evolution of satisfaction: 1997-2011

The Graph 11 shows the level of, and changes in, overall satisfaction with rail services in different Member States between 1997 and 2012 (a Eurobarometre survey on railway services was conducted in 1997²). Satisfaction for these Member States as a whole increased from 41% to 46% over this period but the responses for individual Member States vary considerably. In 10 of the 15 Member States shown there was an increase in satisfaction and this exceeded 10 percentage points in Belgium, France, Spain, Sweden and the UK. However, a number of Member States with developed rail systems, including Denmark, Germany and Finland, experienced a reduction in satisfaction and the satisfaction score remains below 65% in all but two.

## 2.2.3 – Analysis of the quality of rail services

# 2.2.3.1- AVAILABILITY AND FREQUENCY

TABLE 5A PROVIDES THE EVOLUTION OF TRAIN-KILOMETRES BETWEEN 1993, 2000 AND 2008. IT ALSO PROVIDES THE GROWTH RATES AND THE VARIANCE OF TRAIN-KILOMETRES, BASED ON THE DATA PROVIDED IN TABLE 1E.

Train-kilometres have grown some 11% in the EU since 1993 and some 2% since 2000. The variance of train-kilometres between the Member States has increased by 31% between 1993 and 2008.

Train-kilometres have increased the most in Spain, Ireland, Finland, France and the UK since 1993. They have decreased most in Sweden and the Baltic States.

Table 5b provides the evolution of train-kilometres per rolling stock to approach train frequency (i.e. utilisation rates of trains) – see also 3.2.4

Train-km per rolling stock has increased by 7% since 2000 in the EU25 (no data for 1990). The variance has increased since 1990.

Table 5a – Evolution of train-kilometres 1993-2000-2008

|     | 1993       | 2000      | 2008      | 2008/1993 | 2008/2000 |

Table 5f presents the number of victims (killed or injured) per train-kilometre between 2004 and 2010, their overall decrease in the EU and the yearly variance of this indicator (which also decreases over time). Where series were incomplete (e.g. Bulgaria, Belgium, Greece), indicators refer to the period in question.

## 2.2.3.4 -PRICES

Table 5g presents the harmonized consumer price index for railway transport between 2000 and 2010, and presents the nominal and real price increases during that period. The real price is increase in comparison with the harmonized consumer price index for all items.

Railway transport prices have increased by 23% in real terms since 2000. The average increase of each railway system is 28% (no weighting attached to the price increases). The lowest increases were recorded in Sweden (9%), Austria (9%), and Luxembourg (6%), with Belgium recording a decrease of 7% in real terms.

It is important to underline that the prices relate to railway purchased by households (i.e. passenger transport) and, as explained in Annex 4, mostly <u>regulated</u>. Given that open access commercial services only existed marginally in the UK and were not so much (yet) established in 2011 in Austria, Czech Republic, Sweden and Italy, their influence is most likely marginal.

## 2.2.3.5 – Air-rail price competition in some high speed lines

Pour comparer les différence de prix entre l'avion, des simulations ont été conduites pour 2 types de trajet :

- Le trajet « business »
- Le trajet « loisir »

Chacune de ces deux typologies de voyage, a fait l'objet d'une comparaison de données homogènes, élaborée dans certaines conditions spécifiques.

Pour le trajet « business » on a considéré un trajet aller-retour sur la même journée. Celui est modélisé par un voyage d'affaire le mardi, et par un billet acheté 6 jours à l'avance. Le billet est choisi comme le billet le plus flexible possible (et donc souvent le plus cher). La plage horaire de départ est 7h-9h et celle de retour est 17h-19h. Nous traitons dans ce cas deux choix : la première classe ou la classe business.

Pour le trajet « Loisir » on a considéré un trajet où l'individu part le vendredi soir et revient le dimanche soir. Le départ du vendredi soir est situé entre 17h-19h, et le retour du dimanche soir entre 17h et 19h. Ce trajet est acheté environ 2 semaines à l'avance. Nous décidons de ne tenir compte que du tarif de la 2<sup>nde</sup> classe. Dans cette catégorie, nous ne prenons pas les billets moins chers qui augmentent fortement le trajet (par exemple si un billet à 89€ est pour un trajet Paris-Lyon en 2h et qu'un billet à 59€ fait Paris-Lyon en 5h, nous choisirons tout de même le billet à 89€). Quand il n'y avait pas de vol disponible pour ces horaires là, ce qui n'est très peu arrivé, on aura pris le vol après 19h considérant que les voyages loisirs sont tributaires des horaires de travail du vendredi. Pour avoir une offre comparable avec l'aérien, on choisit les billets les moins chers (et qui sont la plupart du temps, non échangeables et/ou non remboursable)

Les trajets aériens ont été choisis avec les mêmes conditions (dates et heures) de voyage à 5 reprises (5 mercredis à 15:00: le 23 mai 2012, le 30 mai 2012, le 13 juin 2012, le 20 juin 2012 et le 28 juin 2012). Les trajets "business" ont été choisis en prenant les tarifs des billets les plus flexibles, alors que les trajets "loisir" ont été choisis sur la base de la minimisation du coût du trajet, générant souvent une flexibilité moindre ou nulle du voyage.

A partir de cette méthodologie, nous avons cherché les différents tarifs sur les sites internet. Le résultat est présenté sur la page suivante. Les couleurs permettent de repérer aisément les prix qui sont comparables entre eux.

Finalement, sur base d'une série d'hypothèses présentées dans le tableau 11 sur le temps de trajet ville-aéroport, il a été possible de comparer l'attractivité de l'avion par rapport au train. Cela s'est avéré possible dans un seul cas sur la ligne Madrid-Barcelone où le prix proposé par Vueling en trajet "business" s'est avéré plus compétitif.

Table 5h - Train fares in major domestic lines in Europe

|                     |            |                |                 |                        | Service ferrov | iaire                      |                              |             |                   |

## 3. GAPS IN EFFICIENCY

## 3.1 – Evolution of efficiency ratios

## 3.1.1 - ANALYSIS OF EFFICIENCY RATIOS

TO MEASURE THE EFFICIENCY OF RAILWAY UNDERTAKINGS, THE MAIN INPUTS ARE MEASURED IN COMPARISON WITH THE MAIN OUTPUT, I.E. PASSENGER-KILOMETRES.

THE MAIN INPUTS TO PRODUCE PASSENGER-KILOMETRES ARE:

- Infrastructure
- Rolling-stock
- Labour
- Capital (PSO Subsidies)
- Energy

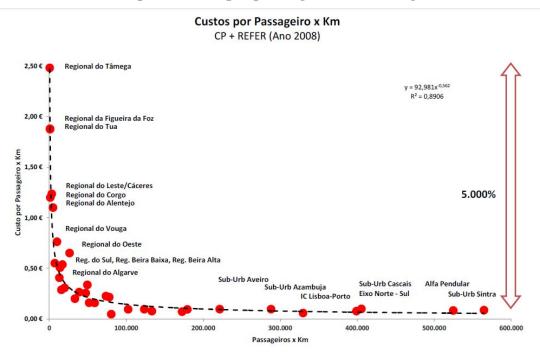

These inputs are transformed into train-kilometres.

In this context, we propose to measure:

- 1. The overall ratio passenger-kilometres to train-kilometres
- 2. Usage of infrastructure: passenger-kilometres to the km of infrastructure
- 3. Productivity of labour (i.e. train-kilometres to staff)
- 4. Productivity of capital (i.e. train-kilometres to rolling stock)

The cost structure of each national railway system is determined by Geographical conditions like population density and Geographic concentration. For instance, in the case of Portugal (the second most urbanely concentrated Member State of the EU, the difference of costs between regional services – with little traffic but necessary for territorial cohesion policy – and long-distance (Alfa Pendular/Lisbon-Porto rail services) or commuter services (Sintra, Cascais) – which have much more traffic can reach as much as 5000% (cf. graph 12). It is also interesting to note that long-distance services tend to be successful and without PSO in these countries (e.g. Sweden, Portugal, Spain, Italy, Austria, France and to some extent Finland), precisely because two or three cities concentrate make most of the activity. In geographically sparse Member States, this difference should not be as big as traffic is more evenly spread.

Source: OECD

The variety of geographical realities within the EU complicates to a large extent the comparisons between the railway systems of the Member States.

This also implies that the impact of efficiency measures will never equalise efficiency between railway systems within the EU. In fact, the efficiency frontier of each railway system is different (i.e. with the same input, the railway systems will achieve different levels of efficiency) and the maximal efficiency points of each railway system will vary, no matter which legislative actions are undertaken.

However, if the efficiency of <u>all</u> railway systems increases, then the difference between the least performing and the best performing railway system should stay the same or, more probably, decrease (as least performing operator will increase relatively more their efficiency than the best performing).

We propose therefore to analyse the aforementioned key efficiency ratios for all EU railway systems since the early nineties (to take stock of the effects of liberalisation processes), and determine whether any potential increase has been accompanied by convergence (like in safety, where the variance of victims per train-kilometres has decreased) or divergence.

#### 3.1.2 - Analysis of the ratio passenger-km to train-km

In this part, the passenger-km to train-km ratio is presented, including its evolution since 1993 and 2000 till 2008. Data on passenger-kilometres comes from Eurostat, whereas data on train-kilometres comes from UIC (Union Internationale des Chemins de Fer).

The ratio Thousand passenger-km/train-km scores best in Sweden and France (20%), whereas it is very low in Luxembourg, Lithuania, Slovakia and Slovenia.

Table 7a- Ratio Thousand passenger-km/train-km, EU-27 and by Member State

|    | 2008 | 2009 | 2010 |  |

Source: Eurostat, own calculations

It is interesting to measure the evolution of this ratio since 1993 and 2000 till 2008 and compare the evolution between Member States. The ratio has substantially increased in Sweden and Belgium, but also in Latvia and Estonia. But in these countries, its variation is erratic, increasing one year and decreasing the other (cf. variance of growth rate).

It is also important to underline that the growth of this efficiency ratio could be hindered by the lack of investments in additional infrastructure. In this sense it will be useful to also take stock of the evolution of the **growth** of passenger-kilometres to the **growth** of kilometres of infrastructure (cf. infra)

Table 7b- Annual growth of the Ratio Thousand passenger-km/train-km, EU-27 and by Member State – average and variance  $\frac{1}{2}$

Source: Eurostat, own calculations

The ratio passenger-kilometres to lines has increased from 1.5 million pkm/km of line to 1.7 million pkm/km of line between 1995 and 2008. The ratio has grown most significantly in the UK (84%) and in Sweden (65%), but has also grown importantly in Belgium (48%), Slovenia (48%) and to a lesser extent in Spain (33%), France (24%) and Finland (24%). It has decreased in Poland because the closure of lines has been smaller than the decrease of passengers.

Overall, the variance of the ratio passenger-kilometres to lines has increased by 58% between 1995 and 2008.

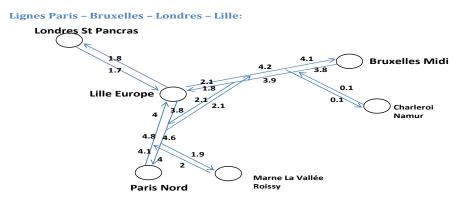

#### 3.1.3.2 - Usage of infrastructure in important high speed lines

WE HAVE ESTIMATED THE TRAFFIC IN HIGH-SPEED LINES IN SEVERAL MEMBER STATES BY CALCULATING THE NUMBER OF TRAINS PER HOUR BETWEEN 6H AND 22H. THIS WAS DONE FOR MAIN IMPORTANT DOMESTIC LINES LIKE MADRID-BARCELONA, ROME-MILAN AND FRANKFURT-MUNICH (THE LATTER HAS NO FULLY DEDICATED HIGH-SPEED LINE). DATA FOR PARIS-LYON<sup>3</sup> WAS TAKEN FROM A STUDY COMMISSIONED BY RFF, THE FRENCH INFRASTRUCTURE MANAGER. INFORMATION ON THE TRIANGLE BRUSSELS-LONDON-LILLE-PARIS WAS ALSO ADDED ON THE BASIS OF SIMILAR RESEARCH.

Table 7d – Usage of main domestic high-speed lines

| Ligne              | Sens               | Nombre de trajets<br>par jour           | Nombre de trains<br>par heures | Espacement<br>possible<br>entre<br>chaque train | Nombre maximal<br>théorique de train<br>par heure | Utilisation de la<br>ligne |

Source: Eurostat, UIC, EIRO CAR2, own calculations

Employment has decreased by 43% between 1993 and 2008 and by an estimated 13% between 2000 and 2008 (for the UK we used the 2001 estimations of the EIRO study as UIC does not provide data on UK rail employment in 2000). Most of the employment losses appear to have been recorded in Central Eastern and South-Eastern Europe: in Hungary and Romania, more than 70% and 60% respectively. UK and Sweden appear to have created jobs since 2001. Data for Germany is special as it contains data in 1993 for both DB and DR (the former East German rail undertaking), whereas we did take into account the 65.000 persons working in the road operations of DB Schenker in the 2008 data.

Source: Eurostat, UIC, EIRO CAR2, own calculations

The ratio domestic pkm per staff appears to be biased towards Member States that have a large area (there could be economies of scale in terms of area for this ratio), with the notable exceptions of Denmark and The Netherlands (whose productivity appears to be twice the one of Belgium), or those that have major freight operations (Latvia, Lithuania).

It is important to underline that this indicator is an **approximation of productivity**, as data sources are not clear-cut in terms of railway jobs as they include in some cases freight and infrastructure management, but also maintenance (which is outsourced by some operators). It has been preferable to measure productivity in terms of FTEs (as UIC to prevent double counting temporary work).

It is interesting to note however that the variance of the ratio has tripled since 1993, indicating increasing disparities within the best performers and the worst performers.

Most important growth was recorded in Hungary, Ireland, Germany, Spain, Finland and UK. For all these systems - and also in Belgium – the improvement of pkm per staff is not only due to the reduction of staff (the "non-labour variation" is the difference between the pkm-staff variation and the reduction of staff with the view to estimate the increase of pkm-staff productivity that is not related to labour reductions.

The analysis of train-kilometres (whose available data includes international traffic) provides similar results, except that the reductions in train-kilometres in Sweden paired with the increase of rail jobs in that country actually interestingly

**Table 8d – Train-kilometres per staff (as FTEs)**

# 3.1.5-Productivity of rolling stock

Data is provided in table 5b, where Hungary, Portugal, Sweden, Slovenia, Germany and UK have witnesses the largest increases.

The variance has tripled, showing that there are increasing disparities in the productivity of rolling stock.

# 3.1.6-Efficiency of subsidies

The railway sector absorbed some 46 billion EUR of subsidies in 2009, compared to some 3 billion EUR for all other transport sector. It is important to underline that state support infrastructure goes through public gross capital formation and is not necessarily accounted in road transport.

Table 9a - State aid to the transport sector (excluding railways), EU-27 and by Member State, in million EUR; 2005-2010

| Transport sector            | 2005 | 2006  | 2007 | 2008 | 2009 | 2010 | Average 2005-2007 | Average 2008-2010 |

As shown in Table 9c, some 18-19 billion EUR are provided annually for public service obligations in the EU. In 2008, totals show some 18 billion EUR, but miss data from Italy. In this context, it is better to consider a figure of 18-20 billion EUR (at 2008 prices).

Source: data provided by Member States to the services of the European Commission, data was calculated at 2008 constant prices based on the Harmonised Consumer Index of Eurostat

Subsidies for railways appear to have decreased in several Member States in real terms (UK, Germany Austria, and Belgium) over the period 2000-2008. The same situation can be witnessed in Sweden for the period 2003-2008. Subsidies to public service obligations appear to have increased substantially in Latvia, Luxembourg, Portugal (in this case during the period 2000-2003) but also France (where part but not all increase is due to pensions). It is important to underline that data for Italy, Ireland and Latvia used 2007 as last year. In the case of Italy and Latvia, this was due to lack of data. In the Ireland, it was used to isolate the sudden drop in 2008, probably most related to budgetary cuts further to the Irish crisis. The exchange rate effect was isolated for the currencies that are not part of the ERM III (GBP, SEK, PLZ, CZK, HFL and also LVL).

Table 9d provides for the difference between the variation in passenger-kilometres and subsidies for public service obligations. For those countries outside the ERM III or Latvia the correct percentages depend from the evolution of subsidies in national currency (not in euros).

Source: Cf. infra

The best performing ratios over the period 2000-2008 are found in UK (61%), Belgium (42%), Austria (41%), Germany (29%), Denmark (21%) and Sweden (17%). Portugal, France and Luxembourg perform badly with subsidies growing much more than pkm.

The best performing ratios over the period 2003-2008 are found in Sweden, UK, Estonia, Germany, Austria, and Belgium. Similarly, Portugal, France and Luxembourg perform badly with subsidies growing much more than pkm.

# Subsidies to infrastructure

According to CER (2011), investments in road infrastructure in Europe amounted annually to some 54 billion EUR in 2008 – based on data from the International Transport Forum (OECD). As rail still also gets some 20 billion EUR of subsidies for PSC, whereas road and other transport modes only get some 3 billion EUR, it can be assumed that rail still absorbs some 40% of all public subsidies.

It is difficult to use this data to make ratios of efficiency on public service obligations and series are sometimes incomplete, as the data is partially complete

#### 4. CONCLUSIONS

As indicated previously, rather than comparing the efficiency of all the domestic networks, which is heavily influenced by geography, it is more important to measure the evolution of these systems since the nineties. At the same time, some indicators of major importance, like safety and punctuality, do not depend on geography and deserve therefore to be compared throughout the Member States.

Table 10a lists for each indicator the 6 best performing Member States based on the analysis of efficiency and satisfaction performed in this Annex. For the efficiency of public spending, it is proposed to take the classification for the period 2003-2008 rather than 2000-2008 as it covers all Member States (however ranking will be analysed slightly differently – cf. infra).

**Table 10a – Best performing Member States** 

| Evolution                              | Ranking MS "6++"       | #         |

| Punctuality                            | LV, LT, RO, FI, SK, BE | Р         |
| Safety                                 | UK, NL, FR, DK, ES, DE | S         |
| Satisfaction 2012                      | FI, AT, NL, DK, LU, SE | <b>S1</b> |
| Satisfaction EB2011                    | ES, LU, PT, UK, IE, AT | S2        |

The ranking of the Member States for each indicator of evolution (a-j) and overall quality (P, S, S1 and S2) is analysed in Table 10b. The first ranked Member States receives a grade "6" till the sixth which received a grade "1" All other Member States have no mark (i.e. "0"). For the efficiency of public spending, we propose to take the mean of the rankings in the 2000-2008 and 2000-2003 classification (for Estonia and Denmark which are listed only once we take the only existing ranking). For punctuality, we propose to remain with the data of 2008 as the ERA data for 2010 and 2011 is incomplete. Finally, where member States had values putting them ex aequo, then the median ranking was used.

**Table 10b – Analysis of rankings** 

|    |   |   |   |   |   |   |   |   |   |   | Total  |   |   |           |    | Total |        |        |

The UK and Sweden are the networks that have improved in most a-j indicators since the nineties, followed by Belgium, Spain and Germany. It is important to underline that these indicators only refer to the evolution and progress since the nineties, NOT to the current quality of the system.

As soon as indicators of overall quality are added, then France, Austria, Finland, Denmark and the Netherlands also rank well.

The UK and Sweden are the Member States that are listed most times (cf. indicators "Count" that counts the number of times each Member State is among the 6 best ones of a particular indicator).

Table 10c – Evolution and variance of the evolution indicators

|   |               | Divergence/  |                 |
|---|---------------|--------------|-----------------|
|   | Evolution (%) | Convergence  | Period          |
| pkm   | 11%           | not relevant | 1993-2008       |
| Modal split   | 1%(a)(z)      | -19%         | 2000-2010       |
| Satisfaction 1997-2012                              | 12%(b)(c)     | -40%         | 1997-2012       |

| (z) EU15: 9% increase/0.6 percentage points         |               |              |                 |
| (*) exchange rate problems complicate comparability |               |              |                 |

Table 10c highlights the evolution of the various indicators through different periods, which depend on the availability and comparability of data (several data series going back to 1993 do not contain information for all the Member States that have acceded to the EU since 2004 or 2007). Also, for employment, the period 2000-2008 was preferred as there was creation of jobs during that period (the objective is to measure creation of jobs).

Table 10c also highlights whether the data sets have converged (there are less difference between Member States) or actually diverged (the difference between member States has increased). To measure convergence or divergence we can use the growth or the decrease of variance between two years (i.e. if data sets converge then the variance decreases and if data sets diverge then variance increases over time).

**Table 10d – Evolution of efficiency indicators** 

| Evolution                              | Ranking MS "6++"       |   |
|--|------------------------|---|
| Growth of productivity of RS/Frequency | HU, SI, DK, EE, SE, CZ | d |
| Growth of pkm/train-km                 | SE, BE, NL, UK, DE, FR | f |
| Growth of pkm/line                     | UK, SE, BE, SI, ES, FI | g |
| Growth of employment                   | SE, UK, NL, LU, IE-DE  | h |
| Growth of productivity of labour       | IE, HU, DE, UK, FI, ES | i |
| Improvement of subsidy efficiency      | SE, UK, EE, DE, AT, BE | j |

If we isolate the efficiency growth ratios, rankings vary slightly, with Germany becoming the 4<sup>th</sup> system that has grown the most in terms of efficiency.

It is also possible to check the benchmarks in terms of clusters of Member States. As explained in the main report, Member States can be accordingly grouped in 5 clusters (cf. Map 1):

- **fully liberalised markets** like UK and Sweden, where all passenger-kilometres are in open access or where all public service contracts are competitively tendered.
- **largely liberalised markets** like Austria, Italy and Germany where more than 33% of the passenger-kilometres are in open access or correspond to competitively tendered PSCs; new entrants have been able to successfully compete *in* and *for* the market.
- **partially liberalised markets** like the Czech Republic, the Netherlands and Portugal, where less than 33% of the passenger-kilometres are in open access or correspond to competitively tendered PSCs, but where new entrants have taken an important share of the liberalised traffic.
- **quasi-liberalised markets** like Bulgaria, Denmark, Estonia, Latvia, Lithuania, Poland, Romania and Slovakia, where the whole market is contestable through open access but there is no effective competition *in* the market and PSCs are directly awarded. New entrants, if any (Denmark, Slovakia, Estonia), are operating the directly awarded PSCs.
- **Non-liberalised markets** like Belgium, Finland, France, Greece, Hungary, Ireland, Luxembourg, Slovenia and Spain, where the incumbent operates all commercial services and PSOs

Some Member States can be difficult to classify and it is necessary to distinguish between prospective analysis (future) and retrospective analysis (past). As Sweden only has abolished exclusive rights in long distance in 2011 and as Germany will introduce competitive tendering as from 2012, it makes sense to use a cluster "fully

and largely liberalised" for retrospective analysis. Also, successful tendering of international PSCs suggests that Denmark could easily join the group of "partially liberalised" countries for prospective analysis. Finally, lack of *de facto* competition for years in quasi-liberalised markets, make them in reality quite similar to non-liberalised markets.

In that context, the following results are obtained:

Table 11a – Annex 3 benchmarking points per type of cluster (satisfaction/quality indicators)

| Fully Liberalised:           | 17.7 |
|------------------------------|------|
| Largely liberalised:         | 5.2  |
| Fully or largely liberalised | 10.2 |
| Partially liberalised:       | 5    |
| Quasi-liberalised:           | 3.4  |
| Non- liberalised:            | 6.6  |

Table 11b – Annex 3 benchmarking points per type of cluster (efficiency indicators):

| Fully Liberalised:           | 20.5 |
|------------------------------|------|
| Largely liberalised:         | 5.5  |
| Fully or largely liberalised | 11.5 |
| Partially liberalised:       | 3    |
| Quasi-liberalised:           | 1.5  |
| Not liberalised:             | 6    |
