VOL B - Part III: DATA AND SUMMARY OF THE COMMENTS SUBMITTED BY THE MEMBER STATES

## TABLE OF CONTENTS

AUSTRIA ..... 5
POLAND ..... 19
PORTUGAL ..... 28
ROMANIA ..... 42

## AUSTRIA

## Statistical data submitted

The statistical data have been submitted by the "Bundesministerien für Gesundheit und FrauenLand und Forstwirtshaft, Umwelt und Wasserwirtschaft - Wirtschaft und Arbeit - Bildung, Wissenschaft und Kultur" (Federal Ministries for Health and Women -Agriculture Forestry, the Environment and Water Mangement - Economic Affairs and Labour - Education, Science and Culture).

## Comments from the Austrian authorities

The number of animals used in procedures in Austria during 2008 has risen by $11,4 \%$ as compared to 2007. However, relative to international figures the Austrian number still remains low. The animal use statistics for 2008 show that in total 220,456 animals were used in procedures in Austria.

Compared to previous years, this total number lies within the range of variation of the last years, yet is still well below the number of the earliest years. Relative to 1990 (the year statistics were recorded for the first time, in which year 482,166 animals were used in procedures) the number of animals is reduced by about $55 \%$. No great apes were used in 2008. No animals have been used for cosmetics testing. The statistics have been presented in the EU-wide standardized format.

## Development of the numbers of animals used since 1990

## Breakdown according to areas of competence

A breakdown of the numbers according to areas of competence for administration of the Animal Experiments Law ranks them as follows:

Health (BMG: Federal Ministry of Health - primarily R\&D for pharmaceuticals, production and quality control of pharmaceuticals and medicinal products, animal health products) is placed first with 155,161 ( $70,3 \%$ ) animals. Second is Science and Research (BMWF: Federal Ministry of Science and Research: universities, Austrian Academy of Sciences, etc. - primarily basic research, in particular health related research) with 58,971 (26,8\%) animals. Environmental Protection and Agriculture (BMLFUW: Federal Ministry of Agriculture, Forestry, Environment and Water Management - primarily safety testing of chemicals and protection of the environment) follows with 3,872 (1,8\%) animals and Industry (BMWFJ: Federal Ministry of Economy, Family and Youth primarily basic research) is last with $2,452(1,1 \%)$ animals used.

## Predominantly mice and rats are used as experimental animals

Of the total number of 220,456 animals used in procedures in Austria during 2008 were:

| 187.472 | $85,0 \%$ | mice and rats |
| ---: | :---: | :--- |
| 18.761 | $8,5 \%$ | rabbits |
| 3.284 | $1,5 \%$ | guinea pigs |
| 5.888 | $2,7 \%$ | agricultural animals |
| 1.381 | $0,6 \%$ | birds |
| 2.579 | $1,2 \%$ | fish |
| 754 | $0,3 \%$ | small animals (hamsters, ferrets, other rodents) |
| 294 | $0,1 \%$ | amphibia and reptiles |
| 41 |  | dogs |
| 2 |  | cats |

$\square$ Guinea pigs
$1 \%$

## Animal Tests for Humans and Animals

The number of animals used in procedures in 2008 - with $85 \%(187,472)$ predominantly mice and rats - is generally due to increased biomedical research in Austria as well as businesses active in biomedical, pharmaceutical and biological research and production. This research and development was directed to production and quality control of human and veterinary pharmaceuticals and medicinal products manufactured for the international market and for combating severe diseases such as cancer or cardiovascular diseases.

A significant part was also devoted to the development, production and quality control of vaccines for the international market, in particular vaccines for which there was a demand from health authorities all over the world.

In scientific and basic research the aims were inter alia improvement of the knowledge in the area of cancer research and development of effective therapies with reduced side effects or stress for the patients. Fundamental and applied research was conducted on cardiovascular diseases (myocardial infarction and its consequences) and neurological disorders (Alzheimer, Parkinson and prion-related diseases).

Increased biomedical research as well as the development of pharmaceuticals and medicinal products requires animal tests - as a first step and precondition for clinical testing on humans - in the interest of health and safety of humans and animals. The same is also true for quality control of pharmaceuticals and medicinal products.

Last but not least, animal tests are also required for animal health, meaning that for the development of veterinary pharmaceuticals it is necessary to conduct clinical studies on animal patients, and animal tests are similarly necessary for the development of diagnostic and therapeutic measures for animals.

## Animal Test with Minimal Pain on Healthy Cattle for the Health of Agricultural Animals

An example of the fact that animal tests with minimal pain are sometimes necessary to improve the health of animals is provided by the number of cattle which appear in the 2008 Statistics due to a research project of the Federal Ministry of Agriculture, Forestry, Environment and Water Management dealing with "Full pastoral farming of dairy cattle under alpine production conditions". In this research project merely blood samples were taken from healthy cows in agricultural productions units in order to investigate how the conversion to low-input pastoral farming affects fertility and animal health, milk production and quality and to find out which consequences for the output of the farm and for the environment might arise from the conversion.

## No animal experiments for cosmetics

In accordance with the legal prohibition of animal experiments for cosmetics (§ 3 Abs. 5 Tierversuchsgesetz) in force since 1999 there were naturally no animal experiments carried out for cosmetics.

## No great apes used

It is particularly gratifying that in 2008 in Austria no animal experiments on great apes were carried out, in accordance with the legal prohibition of animal experiments on great apes which has been in force since January 1, 2006 (BGBl. I, Nr. 162/2005). This also reflects a general trend in Europe to
restrict such experiments as far as possible and to avoid them altogether according to the best available science.

## Statistics in EU-wide standardized format

In accordance with the amended Animal Experiments Law (BGBl. I, Nr. 169/1999) and the Ordinance on Animal Use Statistics (BGBl. II Nr. 199/2000) the Animal Use Statistics 2008 requires the use of eight statistical tables which should contain data in a standardized format and give details on, inter alia, the origin of the animals, the purposes for which they were used (basic research, $\mathrm{R} \& \mathrm{D}$ for medicines and medicinal products, for quality control, etc.).

## Internationally Compared Low Animal Numbers in Austria

The number of animals used in procedures in Austria contributed less than 1,5\% to the total number of 12.1 million vertebrate animals used in Europe, as can be seen from the EU-wide animal use statistics for 2005 (the last year for which the European Commission compiled such a statistical report). When comparing at an international level, the figures of animal numbers in Austrian still remain low. These comparatively low numbers of animals are due to at least three interconnected developments in relation to animals experiments:

## 1. Application of „3R"

Firstly, scientists, researchers and users themselves apply the principles of the „3R"(Replacement, Reduction, Refinement) - which also guide the Austrian Animal Experiments Law - to the widest possible extent, as well as using alternatives.

## 2. Restrictive authorization practice for projects

Second, all authorities issue permits for projects very restrictively in accordance with the strict provisions of the Animal Experiments Law and the Ordinance on Animal Experiments, which allow animal experiments only under very restrictive conditions and stipulate that projects may only be permitted, if no other satisfactory methods are available to achieve the aim without using live animals.

## 3. Support for research on Alternative Methods to Animal Testing

Finally, public financial support for developing and promoting alternative methods contributes to motivation of users and researches:
3.1. Financial support for research projects aimed at developing alternative methods, totalling more than $2,562 \mathrm{~m}$ EUR for 29 projects, as well as promoting the use of alternative methods nationally and internationally,
3.2. National Award for Alternative Methods, i.e. a specific award publicly recognizing scientific achievements in the area of alternative methods.

TABLE 1: NUMBER OF ANIMALS USED IN RELATION TO THEIR PLACE OF ORIGIN

## PORTUGAL

## Statistical data submitted

The statistical data have been submitted by the "Ministério da Agricultura, Desenvolvimento Rural e das Pescas - Direcção Geral de Veterinária - Direç̧ão de Serviços de Saúde e Protecção Animal" (Ministry of Agriculture, Rural Development and Fisheries - General Direction of Veterinary - Directorate for Animal Health and Protection)

## Comments of the Portuguese authorities

## 1. Total number of animals used by species

In 2008, the total number of animals used for experimental and other scientific purposes in Portugal was 50,888.

Compared to the data of 2005, where the total number of used animals was 41,621 , it means that with regard to 2008 there was an increase in the use of animals of $22,26 \%$.

Mice are the most commonly used species representing 78,23\% of the total number of animals.

The second most used group of animals was Rats (12,91\%).
The third most used group is represented by the Cold-blooded animals (7,47\%) and the fourth by the group of Artio and Perissodactyla with $0,52 \%$.

Rodents with Rabbits represent $91,69 \%$ of the total number of animals used.
The Carnivors were not used in 2008 and, as in other previous reports, in Portugal, Non-human primates continued to not being used.

## Comparison with the data of the previous report (data of 2005)

The percentages of classes of animals used in 2005 (41,621 animals) and in 2008 ( 50,888 animals) are represented in the following table:

| Class of <br> animals (\%) | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 8}$ |
| :--- | :---: | :---: |
| Mice | 68,04 | 78,23 |
| Rats | 16,32 | 12,91 |
| Guinea-pigs | 0,91 | 0,30 |
| Hamsters and <br> other rodents | 0,31 | 0,06 |

| Rabbits | 1,43 | 0,19 |
| :--- | :---: | :---: |
| Cold-blooded <br> animals | 11,53 | 7,47 |
| Quail and other <br> birds | 0,27 | 0,31 |
| Artio <br> Perissodactyla | 1,11 | 0,52 |
| Carnivors | 0,09 | 0,00 |

In 2008, looking at the data by groups of animals, the percentage of all of them decreased. However the largest increase occurred, again, in mice and a slight increase in the Birds group (quail and other birds). The biggest decrease occurred in the use of cold-blooded animals (4,06\%) followed in descending order, by the use of rats (3.41\%) and in rabbits ( $1,24 \%$ ).

Within the group of cold-blooded animals, fish were the only animals used.
Within the Artiodactyla, Pigs were the most used animals (61,67\%).

## 2. Number of animals used by purposes of experiments

In 2008, the percentage of animals (total 50,888 ) used by purposes of experiments was the following:

- $83,82 \%$ of animals were used in "Fundamental biology";
- 9,74\% in "Research and development for human medicine, veterinary medicine, dentistry";
- $0 \%$ in "Production and quality control of products and devices in human medicine and dentistry and veterinary medicine";
- 0,61\% in "Toxicological and other safety evaluation";
- $1,44 \%$ in "Diagnosis of disease";
- $1,83 \%$ in "Education and training";
- 2,55\% in "Other purposes";

Referring to the use of species versus experimental purposes, the highest amount of use of mice and of rats is in "fundamental biology" and in "research and development for human medicine, veterinary medicine, dentistry".

Comparison with the data of the previous report (data of 2005)

The most significant increase in 2008 is the number of animals that were used for "Fundamental biology", which increased from 78,78\%, in 2005, to 83,82\%, in 2008.

The other increases that occurred were in the percentage of animals used in "Research and development for human medicine, veterinary medicine, dentistry" which increased from $6,78 \%$, in 2005 , to $9,74 \%$, in 2008, and in "Other purposes" which increased from $1,39 \%$ in 2005, to $2,55 \%$ in 2008.

The use of animals in the rest of the other categories decreased, for example:
The percentage of animals used for "Production and quality control of products and devices in human medicine and dentistry and veterinary medicine" was the biggest decrease in 2008 as no animal was used for this purpose, compared to 2005 in which $5,09 \%$ of all animals were used to this same purpose.

The percentage of animals used for "Toxicological and other safety evaluation" decreased from $2,26 \%$ to $0,61 \%$.

The percentage of animals used for "Education and training" decreased from 3,02\% to 0,61\%.

## 3. Number of animals used for "Toxicological and safety evaluation" by type of products

In 2008, the use of animals in "Toxicological and other safety evaluation" represents only $0,61 \%$, which only refers to 310 animals (mice), of a total of 50,888 animals that were used for experimental purposes in Portugal.
"Potential or actual contaminants in the general environment which do not appear in other columns" represents $61,30 \%$ of the animals used for "Toxicological and other safety evaluation" and "Other toxicological or safety evaluations" represent 38,70\%.

## Comparison with the data of the previous report (data of 2005)

Compared to the data of 2005, in 2008 there was a decrease in the use of animals in "Toxicological and other safety evaluation".

The percentage of animals used for "Toxicological and other safety evaluation" decreased from 2,26\% to 0,61\% (from 939 to 310 animals).

The data of 2008 refers to the same category of products that had been tested in 2005, except for the category of "Products/substances or devices for human medicine and dentistry and for veterinary medicine" where no animals were used in 2008.
"Potential or actual contaminants in the general environment which do not appear in other columns" represented, in 2005, 21,29\% of the animals used for "Toxicological and other safety evaluation" and, in 2008, 61,30\%; "Other toxicological or safety evaluations" represented $26,62 \%$ in 2005 while, in $2008,38,70 \%$, which means that there was an increase in 2008.

As in 2005, in 2008 the other groups of products/substances were not tested which means that, for example, there were no animals used for the purpose of evaluating the safety of cosmetics or additives in food for animal consumption.

## 4. Number of animals used for the study of diseases

In 2008, the number of animals used for the "Studies on human and animal diseases" was 14,753 , which represents $29 \%$ of the total number of animals ( 50,888 animals) that were used.

The percentages of animals per type of diseases were:

- $2,70 \%$ in "Human cardiovascular diseases";
- $15,66 \%$ in "Human nervous and mental disorders";
- 2,22\% in "Human cancer (excl. evaluation of carcino hazards)";
- 75,57\% in "Other human diseases";
- 3,85\% in "Specific animal diseases".

The percentage of the number of animals used for studies of human diseases represents $96,15 \%$ ( 14,185 animals) of the total number of animals used for all studies of diseases ( 14,753 animals).

In 2008, the number of animals used to study animal diseases was only 568 (3.85\%) while in 2005, that number had been 271 (1.40\%), which means that in 2008, there was an increase on the use of animals for the study of animal diseases.

## 5. Number of animals used for "Toxicological and other safety evaluations" by the types of tests

As referred previously, in 2008, the use of animals in "Toxicological and other safety evaluation" represents only $0,61 \%$, which only refers to 310 animals, of a total of 50,888 animals that were used for experimental purposes in Portugal.

## Comparison with the data of the previous report (data of 2005)

The percentages of animals used in toxicity tests for "Toxicological and other safety evaluation" in 2005 (939 animals) and in 2008 (310 animals) are represented in the following table:

| Type of tests <br> (\%) | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 8}$ |
| :--- | :--- | :--- |
| Acute and sub-acute <br> toxicity testing methods <br> (including limit test) | 37,6 | 0 |

| Irritation/sensitization <br> tests | 27,8 | 0 |
| :--- | :---: | :---: |
| Sub-chronic and chronic <br> toxicity | 0 | 0 |
| Mutagenicity and <br> Carcinogenicity | 32 | 38,71 |
| Reproductive and <br> developmental toxicity | 0 | 0 |
| Toxicity of aquatic <br> vertebrates not included <br> in other columns | 0 | 0 |
| Other tests | 2,7 | 61,29 |

In 2008, the uses of animals in toxicity tests only fell into the categories of "Carcinogenicity" and "Other tests" which means that there was a decrease in the other uses of tests compared to data of 2005, i.e., "Acute and sub-acute toxicity testing methods (including the 'limit test')" and "Irritation/sensitization tests" the percentage of which decreased to $0 \%$.

## 6. Type of toxicity tests carried out for "Toxicological and other safety evaluations" of products

As pointed out previously, in 2008, the use of animals in "Toxicological and other safety evaluation" represents only $0,61 \%$, which only refers to 310 animals, of a total of 50,888 animals that were used for experimental purposes in Portugal.

## Comparison with the data of the previous report (data of 2005)

The numbers of animals used for "Toxicological and other safety evaluation" per types of products in 2005 (939 animals) and in 2008 (310 animals) are represented in the following tables:

| Types of products (\%) | 2005 | 2008 |
| :---: | :---: | :---: |
| Products/substances or devices for human medicine and dentistry and for veterinary medicine | 689 | 120 |
| Potential or actual contaminants in the general environment which do not appear in othe columns | 0 | 190 |
| Other toxicological or safety evaluations | 250 | 0 |

In 2008, the number of animals used to test "Products/substances or devices for human medicine and dentistry and for veterinary medicine" were 120 animals in "Carcinogenicity" (in 2005, they were 200 animals);

In 2008, in comparision to 2005, there was an increase of the number of animals used to test "Potential or actual contaminants in the general environment which do not appear in other columns" from zero animals, in 2005, to 190, in 2008.

In 2008, there were no animals used to fill the category "Other toxicological or safety evaluations" which represent a decrease compared to 2005.

TABLE 1: NUMBER OF ANIMALS USED IN RELATION TO THEIR PLACE OF ORIGIN
