## COMMISSION STAFF WORKING DOCUMENT

### IMPACT ASSESSMENT

**Initiative to partially revise Regulation (EC) No 883/2004 of the European Parliament and of the Council on the coordination of social security systems and its implementing Regulation (EC) No 987/2009**

#### 1. Introduction and background

##### 1.1. EU rules on social security coordination

The right of EU citizens to freely move to and live in any EU country, along with their family members, is one of the four fundamental freedoms enshrined in EU law and a cornerstone of EU integration.

Free movement would not be possible without the guarantee that citizens do not lose their social security protection when moving to another Member State. A system of social security coordination is essential if freedom of movement is to work in practice. It is for this reason that Article 48 of the Treaty on the Functioning of the European Union (TFEU) has assigned to the legislator the competence to make arrangements to secure the right to benefits and the payment of the benefits to persons resident in another EU Member State. EU rules on social security coordination have existed since the 1950s for this purpose. They may be considered the "oil" that eases the wheels of free movement, facilitating the process of mobility but not compelling or incentivising mobility itself.<sup>1</sup>

The essence of social security coordination is about 'linking' a person to a social security system, determining where he or she needs to pay social security contributions and where to claim for social security benefits, if required. It also ensures that previous periods of insurance, work or residence in other countries are taken into account when a person claims benefits.

The rules coordinate rather than harmonise: they do not address the national conditions for affiliation or entitlement, nor do they envisage introducing a minimum level of protection, or oblige Member States to introduce new benefits in their social security systems. Member States therefore retain the autonomy to design their social security systems to meet national requirements. There remain significant differences in both the range and level of social protection provided in different EU Member States, which can be a source of political tension and public debate. The coordination rules offer no guarantee that transferring one's residence or professional activities to another Member State is neutral as regards social security. Given the disparities in social security legislation, such transfer may work to one's advantage or not, depending on the circumstances.

The rules on the coordination of social security have been adapted several times to ensure that they reflect legal and societal changes in Europe.<sup>2</sup>

The current rules, Regulation (EC) No 883/2004 and the Implementing Regulation (EC) No 987/2009, came into force on 1 May 2010 and now apply to both workers (and their family members) and citizens who are, or have been, covered by the social security legislation of a Member State and who are in a cross border situation.

---

<sup>1</sup> Benton, M., *Reaping the benefits? Social security coordination for mobile EU citizens*, MPI Policy Brief. Series, November 2013, <http://www.migrationpolicy.org/pubs/MPIEurope-SocialSecurity-MobileCitizens.pdf>.

<sup>2</sup> The current rules can be found in Regulation (EC) No 883/2004 of the European Parliament and of the Council of 29 April 2004 on the coordination of social security systems, OJ L 166, 30.4.2004, p. 1; Regulation (EC) No 987/2009 of the European Parliament and of the Council of 16 September 2009 laying down the procedure for implementing Regulation (EC) No 883/2004 on the coordination of social security systems, OJ L 284.

EU law, in particular Regulation (EC) No 883/2004, establishes four key principles which subject to limited exceptions must be observed by all national authorities when applying national social security legislation:

- a) non-discrimination on grounds of nationality;
- b) the aggregation of periods of insurance, employment or residence;
- c) the waiving of residence rules meaning that benefits in cash can be exported to another Member State; and
- d) the application of a single legislation in terms in respect of liability to contribute and entitlement to benefits.

The material scope of the Regulation (EC) No 883/2004 extends to all legislation concerning the following branches of social security: sickness (including long-term care benefits); maternity and equivalent paternity benefits; invalidity pensions; old-age pensions; survivors' benefits; benefits in respect of accidents at work and occupational diseases; death grants; unemployment benefits; pre-retirement benefits; and family benefits. This list is exhaustive. Consequently, a branch of social security which is not mentioned is in principle outside the scope of the regulation. This is the case, for instance, for housing allowances or social assistance.

Over and above these social security benefits, the coordination regulation also applies to special non-contributory cash benefits listed in an annex (Annex X to Regulation (EC) No 883/2004).

It should also be noted that since 1 June 2003, citizens from third countries who are legally residing in an EU Member State and whose situation is not confined within a single Member State also have rights under the EU social security coordination rules.<sup>3</sup>

## 1.2. Social and economic context

With 11 million EU citizens of working age (over 14 million<sup>4</sup> for all ages) resident in another Member State, free movement – or the ability to live, work and study anywhere in the Union – is the EU right most cherished by Europeans.<sup>5</sup> The main motivation for EU citizens to make use of free movement is work-related, followed by family reasons.

Today, 8.3 million EU citizens of working age are economically active<sup>6</sup> and live in another EU country, representing 3.4% of the total EU labour force<sup>7</sup>. Furthermore, 1.6 million frontier workers and other cross-border workers<sup>8,9</sup> work in a Member State other than the one in which they reside, and some 1.45 million workers are posted<sup>10,11</sup>. Third-country nationals who live and work in more than one Member State are also part of the intra-EU mobile labour force and therefore participate to the much needed mobility of workforce across EU countries<sup>12,13</sup>.

---

<sup>3</sup> Regulation (EU) No 1231/10 extends the effect of Regulation (EC) No 883/2004 on the coordination of social security systems to third country nationals in a cross-border situation who would not otherwise be covered by these rules. This instrument replaced Regulation (EC) No 859/2003 which extended the earlier Regulation (EC) No 1408/71 on social security coordination to third country nationals.

<sup>4</sup> 14.3 million, EU LFS data 2014.

<sup>5</sup> On 1 January 2014, 17.9 million citizens were living in a Member State other than their own. In Eurobarometer surveys, more than two thirds of Europeans consider that free movement of people within the EU has economic benefits for their country (67%).

<sup>6</sup> Economically active: working or looking for work.

<sup>7</sup> There are 8.3 million active EU28 nationals living in another EU Member State, while 9.3 million active EU28 nationals live in another EU/EFTA Member State. There are 8.4 million active EU28/EFTA nationals living in another EU Member State, while 9.4 million active EU28/EFTA nationals living in another EU/EFTA Member State (EUROSTAT, EU LFS 2015)

<sup>8</sup> Cross-border workers are those who work in a country different than the one in which they reside; frontier workers are cross-border workers who return to their place of residence at least once a week.

<sup>9</sup> 1.2 million towards EU countries and 0.4 million towards EFTA countries.

<sup>10</sup> Posted workers are those who have their employment contract in the home country, but work temporarily in another country, in the framework of a cross-border service provision.

<sup>11</sup> Data based on Portable Documents A1 (PD A1) issued for posting workers to other Member States in 2014, collected through the Administration Commission for the Coordination of Social Security Systems and analysed in European Commission, *Report on A1 portable documents issued in 2014* (2015).

<sup>12</sup> Though there is a lack of reliable statistical data, as shown in the EMN study (2013), *Intra-EU mobility of third-country nationals*

### 1.2.1 Free movement of workers

#### *Recent trends in free movement of workers<sup>14</sup>*

Of the 8.3 million active EU movers, around 4.3 million have moved to their current country of residence in 2004 or later ('recent movers'): over one third of these recent movers reside in the United Kingdom and around one fifth in Germany, and other important countries of recent active movers are Spain and Italy<sup>15</sup>.

While still significantly below the level of the US, intra-EU labour mobility further increased between 2012 and 2014. Flows from East to West continue to account for the bulk of movements, to a great extent driven by differences in GDP per capita and wages<sup>16</sup>: in 2013, about two-thirds of the intra-EU mobility flows were from Eastern Member States to the West<sup>17</sup>. Labour mobility has attenuated disparities in unemployment, and was reflected in the increasing importance of South to North mobility, from countries more affected by the financial and economic crisis to countries that were less affected: while in 2008 about 8% of the EU mobility flows to the main destination countries originated in the South, by 2013 this doubled to 17%<sup>18</sup>. Spain, Italy, and France, where large numbers of 'older' waves of EU movers still reside, have become less important as destination countries. In terms of total inflows, as it has been the case for the past 10 years, the United Kingdom remains the most important destination country, followed by Germany.

Figures from 2012 and 2014 confirm a slight decrease in mobility of young people compared to older ones, most likely due to high rates of youth unemployment also in important destination countries due to the economic crisis. Between 2008 and 2012, following the onset of the economic crisis, there has been a large increase in the share of highly educated people moving to another country (among all EU-28/EFTA movers). This share has not increased further between 2012 and 2014.

#### *Characteristics of mobile EU citizens*

Mobile EU citizens<sup>19</sup> are more likely to be of working age (15-64) than nationals of host countries (78.0% vs. 65.7%); those of working age are more likely to be in employment (69.2%) than nationals (65.2%) and third country nationals (53.2%); EU mobile citizens have a significantly higher activity rate than nationals (78.3% versus 72.3%), although in some prominent countries of residence, like Germany, France and Spain, employment among recent mobile EU citizens is lower than among nationals, while in some other prominent destinations like the United Kingdom and Italy the employment rate of recent EU mobile is actually considerably higher than that of nationals<sup>20</sup>. Mobile EU citizens also have a slightly higher unemployment rate (11.7% versus 9.9%), and more recent mobile EU workers even higher: this is likely to be linked to the fact that mobile EU workers, and immigrants in general, tend to be more vulnerable to business-cycle fluctuations than natives, and more recently arrived mobile EU workers more than long-established ones.<sup>21</sup>

#### *Cross-border workers*

In addition to the 8.3 mobile EU workers, who work and live in another country, cross-border (or frontier) workers are EU citizens who live in an EU country and work in another one. In 2014, there

---

[http://ec.europa.eu/dgs/home-affairs/what-we-do/networks/european\\_migration\\_network/reports/docs/emn-studies/intra-eu-mobility/emn-synthesis\\_report\\_intra\\_eu\\_mobility\\_final\\_13th\\_august\\_2013.pdf](http://ec.europa.eu/dgs/home-affairs/what-we-do/networks/european_migration_network/reports/docs/emn-studies/intra-eu-mobility/emn-synthesis_report_intra_eu_mobility_final_13th_august_2013.pdf)

<sup>13</sup> Highly mobile workers represent a specific group of workers; they may belong to different categories (e.g. posted workers, workers working in more than one Member State...) and may be particularly present in certain sectors. For instance, around 2 million workers are engaged in international road transport operations and carry out work on the territory of different Member States, often only for brief periods of time (Commission estimate based on the number of Community licences).

<sup>14</sup> For more information, see *2015 Annual Report on Labour Mobility*, European Commission (2015).

<sup>15</sup> See Figure 1 in Annex I.

<sup>16</sup> For the importance of GDP in explaining flows, see European Commission (2015), *Labour Market and Wage Developments in Europe*.

<sup>17</sup> Calculations based on *2015 Annual Report on Labour Mobility*, cit. above.

<sup>18</sup> Calculations based on *2015 Annual Report on Labour Mobility*, cit. above.

<sup>19</sup> A total of 11 million EU/EFTA citizens of working age live in another EU Member State than their country of citizenship (which comprises the 8.4 million living and economically active).

<sup>20</sup> See *2015 Annual Report on Labour Mobility*, cited above.

<sup>21</sup> EUROSTAT/LFS (2013-2014); *2015 Annual Report on Labour Mobility*, cit. above.

were about 1.6 million people who worked in a different EU or EFTA country from the one in which they resided: about 1.2 million worked in another EU country (accounting for 0.6% of the employed EU population), and 382.000 worked in an EFTA country (making up 5.4% of the EFTA employed population).

The analysis above has been prepared with reference to data from 2014. As this report had been approved by the Regulatory Scrutiny Board prior to the publication of the Annual Report on Labour Mobility 2016, the authors have not substantially revised the data described above to include the latest statistics available in relation to the reference year 2015. However, it should be noted that in 2015 there was a slight increase in the numbers of working-age EU-28 citizens who are working or seeking work in one of the 28 EU Member States other than their country of citizenship to 8.5 million. This variation is not anticipated to have a material impact upon the analysis contained in this report.

### 1.3. Policy context

Evidence points strongly to the economic benefits of labour mobility:<sup>22</sup> the single market provides broader economic opportunities than the sum of segmented markets, and labour mobility helps correct imbalances between high and low unemployment regions by matching labour supply with demand. This contributes to job creation, promoting economic growth,<sup>23</sup> competitiveness and innovation.<sup>24</sup> Labour mobility also helps to address skills mismatches across borders (skills gaps). This has been particularly important in the context of the current economic and unemployment crisis where some countries are facing higher unemployment (in particular amongst young highly qualified people), while others face a shortage of skilled workers due to demographic trends within their own population. Within the European Monetary Union, mobility may serve to mitigate cyclical adjustment measures in response to asymmetric shocks<sup>25</sup>. Intra-EU labour mobility may have prevented even stronger spikes in unemployment during the crisis<sup>26</sup>, and empirical analysis also suggests that intra-EU labour mobility has played a significant equilibrating role during the crisis notwithstanding the low levels of labour mobility.<sup>27</sup> Available estimates suggest that up to a quarter of the asymmetric labour market shock could be absorbed by migration within a year<sup>28</sup>.

Between 2004 and 2009, the GDP of EU-15 has increased by around 1%<sup>29</sup> in the long-run as a result of mobility<sup>30</sup> and even more in major destination countries, such as Ireland, the United Kingdom, Spain or Italy. The effect of mobility since 2004 on the unemployment rate and wages in the destination countries has been estimated to be marginal, at least in the long-run<sup>31</sup>. The impact tends to be short-term, moderate and concentrated on specific groups, in particular the low-skilled workers, whilst it could also lead to reductions in the price of services and to consumer surpluses.<sup>32</sup>

<sup>27</sup>Chaloff, Jonathan, *et al.* (2012), "Free labour mobility and economic shocks: the experience of the crisis", in OECD, *Free Movement of Workers and Labour Market Adjustment: Recent Experiences from OECD Countries and the European Union*, OECD Publishing. The impacts of labour mobility on unemployment in the EU27/EFTA area may have been reduced by about 6% at the maximum during the crisis, yet this has to be compared with the low share of mobile workers.

<sup>28</sup>OECD (2014), *Matching Economic Migration with Labour Market Needs*, OECD Publishing, Paris.

<sup>29</sup>"The level of output in the EU-15 may have risen by about 0.7 per cent over the six year period to 2009 as a result of the population movements, adding about 0.1 percentage points to GDP growth per annum on average" NIESR 2011, *Labour mobility within the EU - The impact of enlargement and the functioning of the transitional arrangements*.

<sup>30</sup>On the positive effects of intra-EU labour mobility following recent enlargements, see, for instance, European Commission, *Report from the Commission to the Council on the Functioning of the Transitional Arrangements on Free Movement of Workers from Croatia* (2015)

<sup>31</sup>NIESR 2011

<sup>32</sup>European Commission, ESDE 2011, chapter 6, pp.275-276; Constant A.F., *Do migrants take the jobs of native workers?* IZA (2014); Perini G, *Do immigrant workers depress the wages of native workers?* IZA (2014); M. Foged and G. Peri, *Immigrants' Effect on Native Workers: New Analysis on Longitudinal Data\**, IZA Discussion Paper No. 8961 (March 2015), arguing that immigration had positive effects on native unskilled wages, employment and occupational mobility; and Dustmann, C., Frattini, T. and Preston, I. (2013), "The Effect of Immigration along the Distribution of Wages", *Review of Economic Studies*, 80 (1), 145–173, arguing that although immigration depresses native wages below the 20th percentile of the wage distribution, it leads to slight wage increases in the upper part of the wage distribution,

Finally, to EU citizens, the wider freedom of movement is the right most closely associated with EU citizenship<sup>33</sup>; 56% of European citizens see it as the most positive achievement of the EU<sup>34</sup>; 67% of EU citizens think that free movement brings economic benefits for their country's economy<sup>35</sup>.

Notwithstanding its overall economic benefits, the impact of labour mobility on the ground is subject to debate both in countries of destination and countries of origin. Concerns have been raised, notably in some countries of destination, in relation to potential negative effects of free movement of workers and posting of workers such as the exploitation of mobile EU workers<sup>36</sup> with adverse effects on local jobs and wages, pressure on local services, socio-economic inclusion, and poverty migration (mobility of unskilled workers who are at risk of losing their job and representing a welfare burden). Also, in spite of evidence to the contrary<sup>37</sup>, concerns have sometimes been raised about the risk of *benefit tourism*, i.e. the idea that mobility is driven by differences in welfare benefits, or by fraudulent behaviour.

Specific concerns have also been raised in some countries of origin, in relation to the adverse long-term effects on economic development and consequences for access to essential services such as healthcare, represented by the sudden outflow of workers, and particularly young workers (youth drain), and highly educated workers (brain drain), including health workers<sup>38</sup>. This is only partially compensated by return migration (which made up 20% of migration flows in 2013) or remittances.

A general challenge, as highlighted above, is the fact that these popular concerns are difficult to substantiate with hard facts and data, and often appear to be based on negative perceptions and anecdotal accounts rather than well-founded on evidence. They also do not always acknowledge the distinction between requirements imposed by EU law and the responsibility of Member States to exercise national competencies to enforce the correct application of the rules and invest in detection and prevention of abusive behaviour.

Commission President Juncker, in his Political Guidelines, has underlined that "free movement of workers is one of the pillars of the internal market", a fundamental right enshrined in the Treaty. However, at the same time he also underlined that the internal market must be fair and that there is no place for abuse and fraud in the EU<sup>39</sup>.

One of the Commission's priorities is work towards a deeper and fairer Internal Market. In the 2015 Work Programme, it has been underlined that "It will be important to support labour mobility, especially in cases of persistent vacancies and skills mismatches, including across borders, while supporting the role of national authorities in fighting abuse or fraudulent claims."

A balanced approach to mobility is therefore needed both in order to maximise the benefits, while minimising possible unwanted consequences: measures should be taken to facilitate mobility, but efforts should also focus on supporting national authorities to prevent fraud, abuse and error and renewing efforts to ensure rules are clear, fair and enforceable. The Commission has indicated that it will help public authorities to better implement and enforce existing rules and that it will revise the rules where necessary to adapt them to the economic and social challenges raised by today's mobility.

Achieving a modernised system of social security coordination that responds to the social and economic reality in Member States has been one of the central drivers for the Commission to continue the modernisation process of social security coordination that started more than a decade ago.

<sup>38</sup> Health professionals rank first on the number of decisions taken on recognition of professional qualifications for the purpose of permanent establishment within the EU Member States, EEA countries and Switzerland ([http://ec.europa.eu/internal\\_market/qualifications/regprof/index.cfm?action=stat\\_ranking&b\\_services=false](http://ec.europa.eu/internal_market/qualifications/regprof/index.cfm?action=stat_ranking&b_services=false)).

<sup>39</sup> [http://ec.europa.eu/commission/2014-2019/president\\_en](http://ec.europa.eu/commission/2014-2019/president_en).

Achieving greater clarity over the social security coordination system is an important step to face the challenges and controversies that exist over intra-EU mobility and to address demographic challenges ahead of us.

### *Coherence with other EU policies*

This initiative may be seen to complement a number of existing, recent and planned initiatives in this policy field including:

- Directive 2004/38/EC of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and of their family members to move and reside freely within the territory of the Member States;<sup>40</sup>
- the Communication on Free movement of EU Citizens and their families: five actions to make a difference (COM(2013)837final);
- the 2013 citizenship report (COM(2013)269);
- the Directive 2014/54/EU on measures facilitating the exercise of rights conferred on workers in the context of freedom of movement for workers;
- the proposal (COM/2014/06final) for a regulation on a European network of Employment Services, workers' access to mobility services and the further integration of labour markets, which aims to enhance access of workers to intra-EU labour mobility support services, thus supporting fair mobility and increasing access to employment opportunities throughout the Union;
- the Decision (EU) 2016/344 of the European Parliament and of the Council of 9 March 2016 on establishing a European Platform to enhance cooperation in tackling undeclared work, which will bring together different national enforcement authorities of the EU Member States to exchange best practices, develop expertise and analysis and support cross-border operational actions;
- the proposal for a Directive of the European Parliament and of the Council (COM(2016) 128 final) amending Directive 96/71/EC of the European Parliament and of the Council of 16 December 1996 concerning the posting of workers in the framework of the provision of services
- The EU policy framework for legal migration, including the EU Blue Card Directive<sup>41</sup> and Single Permit Directive,<sup>42</sup> measures for seasonal workers,<sup>43</sup> intra-corporate transferees,<sup>44</sup> for students and researchers<sup>45</sup>, measures for family reunification<sup>46</sup> and long term residents;<sup>47</sup>
- the ongoing work on a comprehensive European Agenda on Migration, which is aimed at building up a coherent and comprehensive approach to reap the benefits and address the challenges deriving from migration, including make Europe an attractive destination for the talent and entrepreneurship of students, researchers and workers;

---

<sup>40</sup> Directive 2004/38/EC of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and of their family members to move and reside freely within the territory of the Member States amending Regulation (EEC) No 1612/68 and repealing Directives 64/221/EEC, 68/360/EEC, 72/194/EEC, 73/148/EEC, 75/34/EEC, 75/35/EEC.

<sup>42</sup> Directive 2011/98/EU of the European Parliament and of the Council of 13 December 2011 on a single application procedure for a single permit for third-country nationals to reside and work in the territory of a Member State and on a common set of rights for third-country workers legally residing in a Member State.

<sup>43</sup> Directive 2014/36/EU of the European Parliament and of the Council of 26 February 2014 on the conditions of entry and stay of third-country nationals for the purpose of employment as seasonal workers.

<sup>44</sup> Directive 2014/66/EU of the European Parliament and of the Council of 15 May 2014 on the conditions of entry and residence of third-country nationals in the framework of an intra-corporate transfer.

<sup>45</sup> Council Directive 2004/114/EC of 13 December 2004 on the conditions of admission of third-country nationals for the purposes of studies, pupil exchange, unremunerated training or voluntary service. In March 2013, the Commission made a proposal to further improve current rules, including by setting clearer time limits for national authorities to decide on applications, providing for increased access to the jobseeking markets, and facilitating intra-EU movement.

<sup>46</sup> Council Directive 2003/86/EC of 22 September 2003 on the right to family reunification.

<sup>47</sup> Council Directive 2003/109/EC of 25 November 2003 concerning the status of third-country nationals who are long-term residents

- ongoing work on the European Network of Employment Services strengthening the European job mobility portal (EURES) and the cooperation between employment services;
- ongoing work on the Investment Plan for Europe;
- The planned Internal Market Strategy for Goods and Services.
- Ongoing work to implement the Electronic Exchange of Social Security Information (EESSI): an IT system that will help social security bodies across the EU exchange information more rapidly and securely – as required by Regulation (EC) No 883/2004 and its Implementing Regulation;
- The planned initiative for a Fresh Start to address the challenges of work-life balance faced by working families;
- The planned review of the disability strategy 2010-2020 assessing progress to ensure the effective implementation of the UN Convention on the Rights of Disabled Persons across the EU.

In addition, work on this initiative may be seen in the context of the deepening of EMU, and policies addressing demographic ageing and structural reform in labour markets while promoting a social agenda to support the economic recovery ensuring a Triple A social rating for Europe.

Furthermore, work has been conducted with regard to the European Parliament resolution of 16 January 2014 calling for the respect for the fundamental right of free movement in the EU.

## **2. OBJECTIVES & SCOPE OF THE INITIATIVE**

### **2.1. Objectives of the review**

The **key policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules. It does not envisage granting new rights to EU citizens but on the contrary clarifying the current methods of coordination.

This initiative serves to facilitate the exercise of the right to free movement by ensuring social security coordination is efficient and effective and does not act as a deterrent to free movement. It is in the interests of all parties to design co-ordination rules that allow full exercise of rights of citizens whilst ensuring coordination requirements for both citizens and Member States are clear and transparent and thereby easy to apply and enforce. It is also important the rules are fair (in particular in relation to the relative balance of responsibility between Member States who receive or have received social security contributions and the obligation to pay benefits) and that perceptions of unfairness are properly investigated and addressed when they arise. Further, the rules should be efficient in terms of cost, administrative burden and risk of fraud or administrative error. Finally the rules should be effective in relation to meeting the overall goals of coordination in particular safeguarding the continuity of social security protection as citizens move from from one Member State to another.

This overarching policy objective underpins and informs all elements of this partial review, however, more specific objectives are included in each distinct area under consideration.

### **2.2. Scope of the review**

To achieve this overall objective, this impact assessment report considers the impact of possible improvements to the rules in four distinct areas:

- Long-term care benefits,
- Unemployment benefits,
- Access to social benefits for economically inactive mobile EU citizens,

- Family benefits.

These areas have been identified following the Commission's services assessment of the extent to which the current legal framework still ensures the effective coordination of social security rights.

Regulation (EC) No 883/2004 and the Implementing Regulation (EC) No 987/2009 came into force on 1 May 2010. They contain formal review obligations which have obliged the Administrative Commission for Social Security Coordination ('Administrative Commission')<sup>48</sup> and the Commission Services to review and assess the implementation and effectiveness of particular provisions contained within the EU Social Security Rules and obligations undertaken by declaration.

In addition to these formal review obligations, the Commission's work has been informed by ongoing dialogue with the Member States within the framework of the Administrative Commission and of course feedback and complaints from citizens, social partners and other stakeholders, which identify on the one hand where the rules are effective and on the other hand where problems arise. In April 2011, one year after the adoption of Regulations (EC) nos 883/2004 and 987/2009, Member States took part in an informal evaluation exercise in Budapest. This discussion concluded that while the rules were functioning well, there were some areas where improvements were necessary, in particular in the field of long-term care benefits, where the lack of a bespoke legislative framework for coordination was causing difficulties in practice.

In the field of unemployment benefits, the Council took the decision in December 2011 to review the effect of adding a new provision on unemployment benefits for self-employed frontier workers within a period of two years after its application. At this meeting and at the request of a majority of Member States, the Commission issued a declaration that the review would be an occasion to open up a broader discussion on the current coordination provisions in the field of unemployment benefits and to assess the need for a review of its principles.

In addition, in relation to the views of stakeholders, the Commission's work has been informed by reports from expert networks, such as TreSS and FreSSco, in particular the 2013 Think Tank Report *Key challenges for the social security regulations in the perspective of 2020*.<sup>49</sup>

In light of the difficulties relating to long-term care benefits and unemployment benefits (the competence for paying unemployment benefits to frontier workers and export of unemployment benefits), a first analysis already took place in 2013/2014 on the coordination of these benefits. The Impact Assessment Board gave a positive opinion on the Impact Assessment Report on 21 January 2014. In view of the finishing mandate of the Barroso II Commission, the adoption of any legislative measures was not pursued in 2014.

Meanwhile, following developments in the Court's case law and in the socio-economic reality the scope of the partial review was expanded to also respond to challenges in the field of family benefits and access of economically inactive EU citizens to social benefits.

A Problem Tree showing the inter-relationship between the problems and drivers across the four strands of this revision exercise is set out below together with a option tree summarising the options that have been considered for each strand and how they relate to the general and specific policy objectives.

For coherency reasons, the assessment of the '2014' and '2015' policy options has been combined in this Impact Assessment report, with the underlying data for the '2014' analysis updated where appropriate.

---

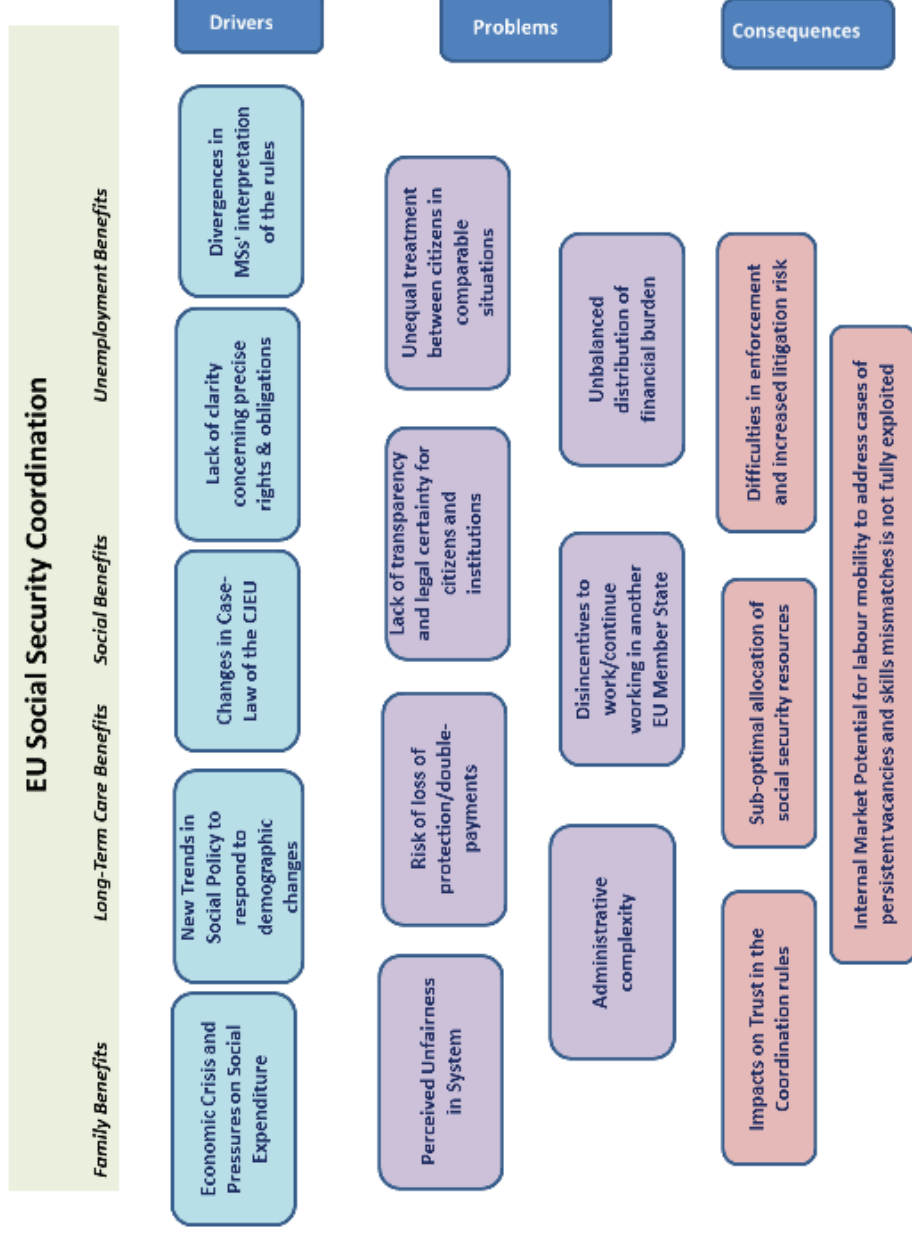

<sup>48</sup> The Administrative Commission is comprised of Member States' representatives. Norway, Iceland, Lichtenstein and Switzerland participate as observers. The committee is responsible for dealing with administrative matters, questions of interpretation arising from the provisions of regulations on social security coordination, and for promoting and developing collaboration between EU countries. The European Commission also participates in the meetings and provides its Secretariat.

<sup>49</sup> The report may be consulted at:

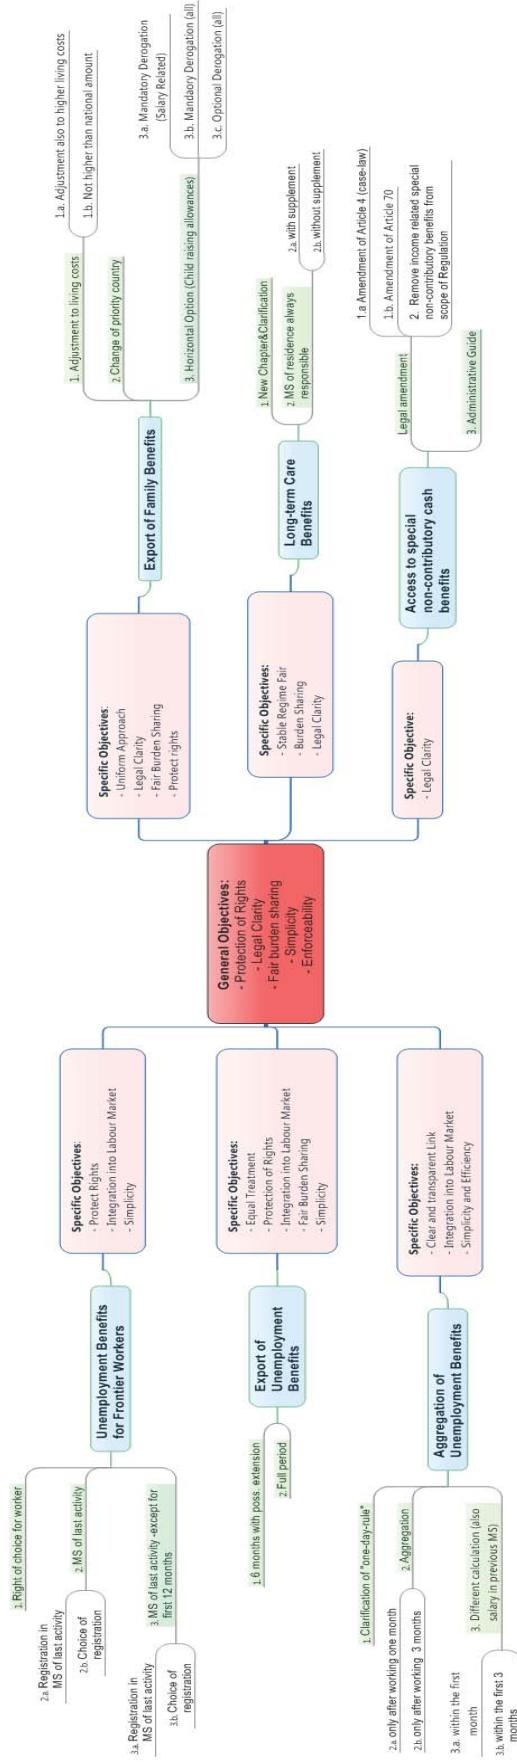

[http://www.tress-network.org/TRESS/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESSIII\\_ThinkTank%20Report%202013.pdf](http://www.tress-network.org/TRESS/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESSIII_ThinkTank%20Report%202013.pdf)

Finally, the revision will also include a number of proposals for technical amendments to the coordination rules. The amendments will clarify the rules, but will not substantially revise them and are not subject to a formal Impact Assessment. For further details of these proposals please see Annex XX of this report.

Combined problem tree on the partial review of Regulation (EC) No 883/2004 of the European Parliament and of the Council on the Coordination of Social Security Systems and its Implementing Regulation (EC) No 987/2009

Option Tree and Objectives for Revision of Regulations (EC) Nos 883/2004 and 987/2009

### 2.3. Methodology used for the purpose of the impact assessment

For the purpose of this report, each section will summarise the economic,<sup>50</sup> social and regulatory impacts<sup>51</sup>, of each policy option under consideration compared to the baseline scenario. In addition, the analysis assesses other impacts which have been identified as relevant before making an overall assessment of the effectiveness in achieving the specific objectives of the initiative, their efficiency (cost-effectiveness/even burden sharing) and coherence with the general objectives of the EU.

In relation to **social rights**, the impact assessment primarily examines the impact of an option in relation to clarity, simplification and protection of rights.<sup>52</sup> When assessing possible limitations in the access of mobile EU citizens to certain benefits, the assessment refers to the maximum potential impact, since Member States are always allowed to be more generous than what is prescribed in EU law when granting benefits to mobile EU citizens. The impact on rights recognised under the EU Charter of Fundamental Rights has also been assessed.<sup>53</sup>

As regards **economic impacts**, the report focuses upon the direct costs for Member States for providing social security benefits and the relative distribution financial costs between Member States. In line with the legal basis for the EU Social Security Coordination rules the scope of the initiative is to coordinate not harmonise social security legislation between Member States. Therefore, while the impact of EU measures is assessed, this is distinguished from impact that already stems from differences between Member State social security schemes. This means the options do not assess the payment of 'contributions' by insured persons or employers (levies earmarked for social security purposes) into national social security schemes before the contingency occurs.<sup>54</sup> The impact on taxation is also left aside, as under Regulation (EC) No 883/2004 only contributions are coordinated, while general taxation is not. When assessing the economic impact of possible limitations in the access of mobile EU citizens to certain benefits, the methodology assumes the maximum potential impact were Member States to rely upon derogations which are permitted (but not required) by EU law.

In addition, an assessment has been made of the **other impacts** associated with each option specifically regulatory costs, the impact on the risk of fraud and abuse) and fair burden sharing between Member States. In relation to secondary impacts, some cautious estimates of the impact upon mobility flows have been done on the basis of studies in a selected number of States: however, also in

---

<sup>50</sup> Quantified to the extent possible on the basis of the information in Annexes V, IX, X, XIII, XIV.

<sup>51</sup> In line with the new better regulation guidelines it is essential that social aspects are considered on equal footing by the Commission services and the Regulatory Scrutiny Board. In assessing social impacts, simplification and clarification of the coordination rules in Regulation (EC) No 883/2004 and protection of rights of mobile EU workers have been assessed. This also includes possible effects with regard to the risk of fraud and abuse. For the options concerning the competence for paying unemployment benefits to frontier and cross-border workers, the re-integration into the labour market is also assessed.

<sup>52</sup> Relating to policy domain v in the Impact Assessment Guidelines under the social pillar: Social protection, health, coordination of social security and educational systems.

<sup>53</sup> The rights deriving from the Charter of Fundamental Rights of the European Union against which the options are assessed are the following:

- the protection of personal data (Article 8),
- freedom to choose an occupation and the right to engage in work in another Member State (Article 15);
- right to property (Article 17);
- non-discrimination (Article 21);
- best interests of the child (Article 24)
- the rights of the elderly (Article 25),
- integration of persons with disabilities (Article 26),
- the right to family and professional life (Article 33)
- social security and social assistance (Article 34);
- health care (Article 35);
- freedom of movement and residence (Article 45).

<sup>54</sup> For instance, under the current situation as well as under each of the proposed options, a worker will continue to pay contributions in the State in which he/she is insured. It should be noted the level of benefits paid and contributions imposed is a matter of competence for the Member States and outside the scope of the EU social security rules.

light of the very low numbers of people who would be affected, such secondary impacts are estimated to be marginal.<sup>55</sup>

Furthermore the report seeks to examine the **overall impact** of each option with reference to coherence of each option with the general, specific objectives as set out in section 2.1 and depicted in the option tree on page 12 of this report. Where relevant, this assessment also considers overall coherence with the other EU policy initiatives and objectives referred to in section 1.3 of this report.<sup>56</sup>

Each chapter of this report provides a summary and more detailed table of results of the impact of a policy option. The degree to which options are relevant, effective and efficient are indicated on a scale from one to three : ++ for a highly positive assessment, + for a moderate positive assessment, - for a negative assessment. Where a option has both a negative and a positive aspect, a +/- is indicated, highlighting the mixed impact. The sign 0 is used to indicate that the option is considered to be neutral in comparison to the baseline scenario.

The combined effect of this analysis has been used to make an assessment of overall effectiveness and overall efficiency. Effectiveness has been measured by a qualitative assessment of the effectiveness of an option in achieving the the general and specific objectives and its score in respect of the social, economic and other impacts referred to above. By contrast overall efficiency has been assessed by reference to the overall effectiveness of each option compared to its financial impact (economic and regulatory costs). The rationale used to underpin these overall assessments is explained in the conclusions to each section of the report.

No impact on the competitiveness of specific sectors is foreseen by any of the options, as the subject matter does not concern commercial activities of enterprises.<sup>57</sup>

The coordination rules are directly addressed to Member States and their institutions and only concern the services provided under the public social security system. Small and medium size enterprises (SMEs) are not directly affected. They will provide their services under the conditions set by the national legislation. In the public online consultation, private organisations and public and private employers had the opportunity to react.

Whilst it is true that mobility in itself entails movements between Member States and that these movements are accompanied by vehicle emissions, no significant environmental impact<sup>58</sup> is expected from the options under consideration because of the marginal secondary impacts on mobility in comparison to general mobility flows.

Several studies, using different analytical models and methodologies, have been used to prepare the impact assessments.<sup>59</sup> In general, the studies rely on a combination of data sourced through EU-wide surveys such as the Labour Force Survey or data published by Eurostat. This has been complimented by data collected from national competent authorities within the framework of the Administrative Commission, in particular with reference to the payment of social security benefits within the framework of the EU Social Security Rules or the issuance of portable documents attesting to rights acquired under the Regulations on the basis of the sources identified in Annex IV. Since options on the coordination of long-term care benefits, coordination of unemployment benefits for frontier workers and export of unemployment benefits had been assessed in 2013-2014, an update with more recent and newly available data has been conducted in 2015.<sup>60</sup>

---

<sup>55</sup> For more information on who is affected and on the methodology, please refer to Annexes III and IV.

<sup>56</sup> Secondary impacts are not considered in the final comparison in recognition of the limitations of the data available to conduct this assessment

<sup>57</sup> In case C-218/00, *CISAL*, EU:C:2002:36, the Court decided that public social security institutions cannot be regarded as economic undertakings within the meaning of Articles 102 and 102 TFEU.

<sup>58</sup> Impact on the climate, air quality, water quality and resources, biodiversity, soil quality and resources and waste production and recycling.

<sup>59</sup> For a detailed description of the analytical models and the methodologies used in each studies, please refer to Annexes V-XIX, and XXVI.

<sup>60</sup> Annex XXVI.

It should be noted that some statistical analysis is based on citizenship (Labour force survey) and therefore identify EU mobile citizens/workers (those living/working in another country than their country of citizenship) – while other data (administrative data collection) are based on headcounts of case where citizenship is not collected and that therefore constitutes a broader definition of mobility, i.e. includes not only EU mobile citizens/workers but also nationals returning to their country of citizenship as well as third-country nationals moving between EU Member States. In light of this, the Impact assessment adopts a broad definition of mobility which takes into account that in addition to EU mobile citizens other groups also benefit from coordination. In addition, as there is no precise statistical data on the number of frontier workers within the legal meaning of the coordination Regulations, it has been assumed for statistical purposes that all cross-border workers residing in a neighbouring country are frontier workers.

Since quantitative analyses have been mainly based on administrative data provided by Member States, it has to be underlined that not all Member States were able to provide data on the different benefits, nor was all data complete.

When reliable quantitative information on the total impact of the proposed initiative was not available, the analysis has been based on a qualitative assessment and structured interviews conducted with officials in representative Member States. Any limitations to this data are highlighted in the relevant chapter.

An overview of the analytical models used for the impact assessment is provided in Annex IV.

#### **2.4. Stakeholder feedback**

As the preparatory work for the "Revision of Regulation (EC) No 883/2004 and Regulation (EC) No 987/2010" began in 2009, stakeholders were consulted on several occasions on the different elements which were considered in the impact assessment:

1. Member States were consulted on coordination of long-term care benefits, export of unemployment benefits, aggregation of unemployment benefits, coordination of unemployment benefits for frontier workers, export of family benefits and access to special non-contributory cash benefits for economically inactive persons, within the framework of the Administrative Commission.
2. National administrations were also consulted via a specialised online survey on the coordination of long-term care benefits, export of unemployment benefits and coordination of unemployment benefits for frontier workers. Also, a group of national organisation in charge of the payment of family benefits sent a position paper.
3. Social partners were consulted on the coordination of long-term care benefits, coordination of unemployment benefits for frontier workers and export of unemployment benefits in the framework of the Advisory Committee for the Coordination of Social Security Systems, and on the coordination of family benefits, long-term care benefits, and unemployment benefits during a dedicated hearing.
4. NGOs were consulted on the coordination of family benefits, long-term care benefits, and unemployment benefits during an ad-hoc consultation workshop.
5. Two online consultations were also launched, one on the coordination of long-term care benefits, export of unemployment benefits and coordination of unemployment benefits for frontier workers which took place between December 2012 and February 2013; the other one on the coordination of unemployment benefits and the coordination of family benefits which took place between July and October 2015.

It has to be noted that the different consultations presented different degrees of specificity in relation to the options assessed, and due to the high level of complexity of some topics, and the late definition of some options, some consultations have been kept very wide (e.g. the public consultation on aggregation of unemployment benefits; export of family benefits and social security coordination rules on the posting of employed and self-employed persons). The views of different stakeholders are

presented in the assessment of each option, a more detailed description of the consultation process is included in Annex II.

## 2.5. Definitions

Throughout the report, reference is made to the “competent Member State”, “Member State of residence”, “Member State of last activity”, “insured persons”, “frontier workers”, “cross-border workers”, “mobile EU workers” meaning the following within the framework of Regulation (EC) No 883/2004<sup>61</sup>:

- “Member State” – Regulations (EC) Nos 883/2004 and 987/2009 apply to all countries within the EEA and Switzerland. Within this report, the term “Member State” is sometimes used to refer not only apply to EU-28 States but also Iceland, Liechtenstein, Norway and Switzerland.
- “competent Member State”: Member State in which the institution with which the person is insured is located, or the institution paying the social security benefit;
- “Member State of residence”: Member State where the institution which is competent to provide benefits in the place where the person resides is located;
- “Member State of last activity”: Member State where an unemployed person was most recently working before becoming unemployed
- “insured person” any person satisfying the national legal conditions to have the right to benefits, taking into account the provisions of this Regulation;
- “cross-border worker”: a person who resides in another Member State than the State of activity as an employed or self-employed person. This can be divided into two subsets:
  - (i) “frontier worker”: any person pursuing an activity as an employed or self-employed person in a Member State and who resides in another Member State to which he/she returns as a rule on a daily or weekly basis. These States need not be neighbouring countries. A person working in Finland who returns every week on Friday evening to his/her home in Portugal is a frontier worker. Distance is irrelevant;
  - (ii) “other cross-border worker”: a cross-border worker who is not a frontier worker in the legal sense because he/she does not return to the Member State of residence on a daily or weekly basis;
- “Mobile EU worker”: a worker who has moved his work or place of residence to another Member State.”

## 3. Why should the EU act?

Social security coordination concerns cross-border situations where no Member State can act alone. Coordination measures at EU level in the field of social security are required by Article 48 TFEU and necessary to guarantee that the right to free movement can be exercised. Without such coordination, free movement may be hindered, since people would be less likely to move if it meant losing social security rights acquired in another Member State.

The EU coordinating legislation replaces the numerous pre-existing bilateral agreements. The creation of an EU framework in this field ensures a uniform interpretation and protection of rights of mobile EU citizens and their family members that could not be achieved by the Member States alone at national level since this could potentially conflict with the Regulations.

---

<sup>61</sup> See Annex XIII for the full glossary of terms.

This not only simplifies social security coordination for Member States, but also ensures equal treatment of EU citizens who are insured in accordance with national social security legislation. An effective and efficient coordination system at EU level requires that it takes account of changes in Member States' national social security legislation and keeps track with changes in social reality that affect the coordination of social security systems to achieve a fair and just distribution of financial burden between Member States. Taking action at EU level aims to ensure a uniform interpretation and creates a common basis that applies to all Member States. Conversely, without such an update of the Regulations the financial and administrative burdens would be likely to be greater, as the provisions would not meet changing needs of the Member States.

#### **4. Long-term care benefits**

##### **4.1. Current Coordination Rules for Long-term Care Benefits**

According to the OECD definition, long-term care benefits are a holistic type of benefits that bring together a range of services for persons who are dependent on help with basic activities of daily living over an extended period of time. Such benefits can be provided in kind or in cash. Examples include allowances (of a fixed or differential amount) to compensate for the additional expenditure resulting from the recipients' condition of reliance on care (cash benefits) or the provision, direct payment or reimbursement of the costs of home care services, specialised home adaptations or equipment (benefits in kind).

Under the EU coordination rules, long-term care benefits are mentioned by Regulation (EC) No 883/2004 at several occasions. However, these benefits have so far not been expressly defined, nor coordinated within the scope of Regulation (EC) No 883/2004 (leaving aside the clarification in Art. 1 (va) that also long-term care benefits in kind have to be regarded as benefits in kind for the application of the sickness chapter).

The Court of Justice considered that long-term care benefits for the purposes of Regulation (EC) No 883/2004 are benefits intended to improve the state of health and quality of life of persons reliant on care and as such, are intended to supplement sickness insurance benefits (irrespective of classification under national law). If these benefits are granted on the basis of an objective and legally defined position (i.e. in a non-discretionary way), they are covered by the Regulation. As a rule, long-term care benefits are designed to promote the independence of persons reliant on care, in particular from the financial point of view. Typically, they promote home care in preference to care provided in hospital but also consist of grants, aids or subsidies for people staying in residential care facilities.

The conditions for the grant of the benefit or the underlying method of financing do not affect the classification of a benefit. The fact that a benefit is non-contributory or that its grant is not linked to payment of a sickness insurance benefit, is according to the Court, of irrelevant to its classification as a long-term care benefit.

In the absence of a comprehensive and coherent coordination regime well suited to the particularities of long-term care benefits, the Court has consequently decided that long-term care benefits should be coordinated in line with the coordination rules applicable to sickness benefits.<sup>62</sup> According to these rules, long-term care benefits in kind are to be provided by the Member State of residence and reimbursed by the competent Member State. Long-term care benefits in cash are to be provided and paid by the competent Member State, including export to entitled persons residing in another Member State. Residence for social security purposes, according coordination Regulations, means the place where the person habitually resides. Competence of a Member State is established according to the conflict rules laid down in these Regulations. In line with these rules, the Member State where a person works is responsible for sickness benefits even if the person resides in another Member State.

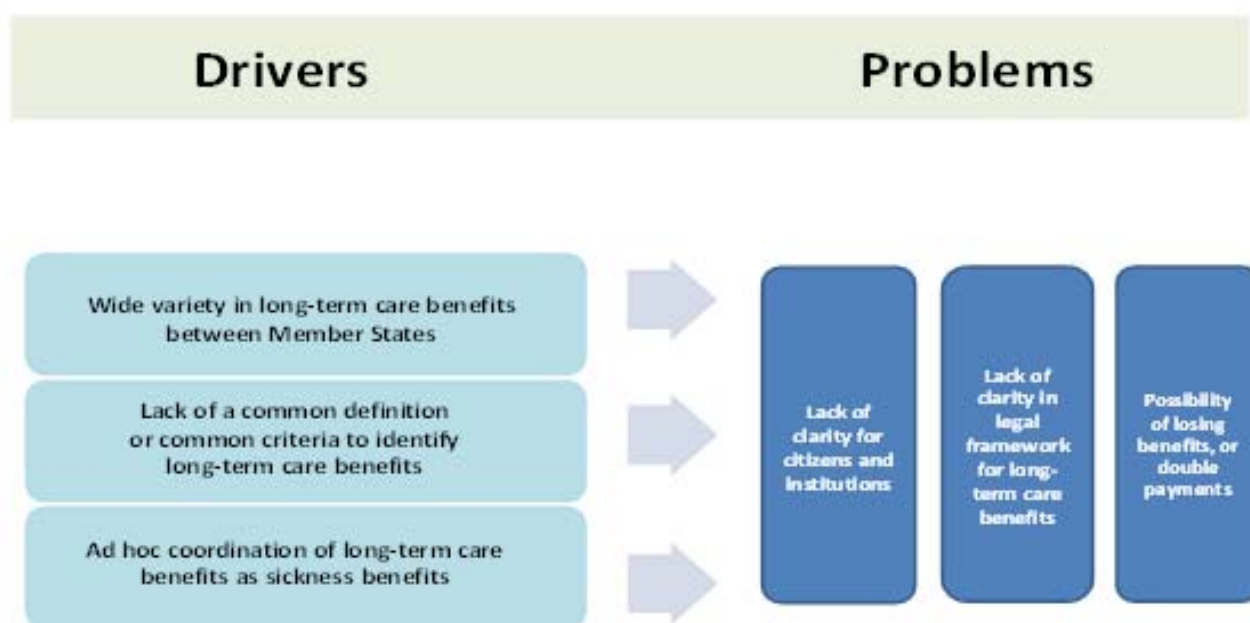

---

<sup>62</sup> Such clarifications are made by the Court on a case-by-case basis. At least 11 such cases were dealt with by the Court since the first time in 1998, most of them concerning Germany, Austria and the United Kingdom, whose legislation provided for benefits having features of long-term care benefits.

For pensioners, it is the State primarily responsible for their pension that is competent for sickness benefits, even if they reside in another Member State. Family members of these categories of persons are also covered by the said rules.

Regulation (EC) No 883/2004 also contains an anti-overlapping provision<sup>63</sup> which applies in situations where a person receives long-term care benefits in kind from the State of residence and long-term care benefits in cash from competent Member State and both benefits are intended for the same purpose. The benefits in cash have priority over the benefits in kind and the competent Member State will deduct from the benefits in cash the amount for which it reimburses the State of residence for the long-term care benefits in kind.

#### 4.2. Problems with the coordination of long-term care benefits

##### *Lack of clarity for citizens and institutions*

There is a low level of understanding of the coordination rules for the recipients of long term care benefits leading to confusion for both citizens and competent institutions.

Slightly more than 80% of the individual respondents to the EU Public Consultation claimed either not to know (44%) or to have only a vague idea (38%) about the current rules on care benefits for elderly and/or disabled persons when moving within the EU. These figures contrast with the 18% of individuals who claimed to know the current rules. In addition, almost 57% of the participants declared that they did not know in which country they could apply for long-term care benefits if they or their family members would be in need of them. 16% of the individuals were not even aware of the possibility to apply for long-term care benefits while living outside the Member State in which one is insured. Moreover, 24% of the respondents replying on behalf of organisations (national administrations, social partners and trade unions, civil society and NGOs and private companies) were of the view that intra-EU migrants are not sufficiently aware of their rights.

A driver behind this problem is a lack of common definition or criteria to identify long-term care benefits as a relatively new strand of social security rights. During the final years of the twentieth century Member States have invested in the design of special schemes for persons in need of care.

<sup>63</sup> Article 34 of Regulation (EC) No 883/2004.

The main purpose of these new schemes was to help the ageing population for which traditional assistance from other family members was no longer readily available.

An additional driver is that at the national level, long-term care benefits are very diverse, either based on insurance legislation (Belgium, France, Austria, Germany, the Netherlands, Luxembourg, Spain, Portugal, Italy, Greece) or on residence legislation (Sweden, Denmark, Finland, United Kingdom, Ireland), some being universal (Nordic countries, the United Kingdom), while others are not (Estonia, Latvia, Lithuania, Poland, Czech Republic, Hungary, Slovakia, Romania, Bulgaria, Croatia)<sup>64</sup>. Benefits having characteristics of the long-term care benefits can be divided over several branches of social security in some Member States, whereas in others separate legislation specific to long-term care exists. This may lead to difficulties when more than one country is involved<sup>65</sup>.

This lack of clarity has direct consequences for EU citizens who have or wish to exercise their right to free movement, especially those who are vulnerable in light of their need for long-term care.

#### *Lack of clarity in legal framework for long-term care benefits*

While it is clear that sickness benefits are traditionally intended to improve the state of health and invalidity schemes are traditionally intended to compensate for the loss of income due to invalidity, there is not one and the same principle that applies to long-term care benefits. Although coordinated as sickness benefits, long-term care benefits still have a number of distinctive features which differentiate them from traditional sickness benefits. In particular, they are typically awarded for a longer period of time than sickness benefits and may also have the purpose of compensating for loss of income or other social risks faced by the claimant. This leads to lack of a common understanding at EU level of what long-term care benefits are and how they should be coordinated, which can lead to different outcomes for citizens and competent institutions. In the past three years (mid-2012 – mid-2015), the Commission services received around 450 complaints or queries related to problems linked to coordination of sickness and long-term care benefits. This shows that the current ad-hoc system of coordination is an ongoing source of uncertainty.

Drivers behind this problem may be identified as the lack of a common definition or common criteria to identify long-term care benefits, which, when recognizing the wide variety of different models of long-term care provision between the Member States, results in a disparate approach. Not all the benefits that correspond to the identified common characteristics at EU level are recognised as long-term care benefits by the Member States. For instance, Greece, Italy, Portugal, Romania and Slovakia have indicated that they do not have any long-term care benefits which fall in the scope of Regulation (EC) No 883/2004, while information available shows that such benefits exist in these countries. Also, Member States apply differing definitions in their national legislation, if they have a definition at all. Bulgaria, Greece, Malta, Norway, Romania, Slovakia and the United Kingdom do not have in their national law a definition of long-term care benefits. This does not mean that no long-term care benefits exist, but that the benefits might be related to other social insurance risks, such as invalidity or old age.<sup>66</sup>

A further driver may be regarded as the "ad-hoc" system of coordination of long-term care benefits, which is not always applied consistently either by national authorities or the Court. In its recent case-law<sup>67</sup>, the Court acknowledged that long-term care benefits may have characteristics of invalidity benefits and old-age pensions. The Court may continue connecting long-term care benefits to other social security risks than sickness, depending on the individual characteristics of the benefits. Such an

---

<sup>64</sup> For an overview of the welfare systems, see page 18 of Annex V.

<sup>65</sup> For example, some Member States, like Spain, consider a specific financial guarantee for persons in need of nursing care as independent long-term care benefit, whereas in France it is paid as a supplement to the pension.

<sup>66</sup> Austria, France, Finland, Hungary, Italy, Latvia, Lithuania, Poland, Slovenia, Slovakia, Sweden referred to the relationship with other branches of social security in the questionnaire on long-term care benefits carried out by the trESS Network for the purpose of Analytical Study 2012.

<sup>67</sup> Case 388/09, *Da Silva Martins*, EU:C:2011:439, p. 48, Case C-503/09, *Lucy Stewart*, EU:C:2011:500.

ad-hoc coordination system contributes to legal uncertainty, inconsistent approaches by national institutions and unpredictable outcomes for citizens.

In a survey of stakeholders, the lack of a uniform application and understanding of EU law by Member States and the lack of awareness among mobile citizens were identified as significant problems<sup>68</sup>. The authorities<sup>69</sup> confirmed that poor coordination and disputes follow from the lack of consensus concerning the treatment of long-term care benefits across the Member States. The general view shared by these authorities is that the system is unclear, administratively burdensome and unstable.

The lack of legal clarity over classification of these benefits and their coordination increases the likelihood of infringement proceedings and leaves it up to the Court to decide on a case-by-case, and fragmented, basis which national benefits are to be considered a long-term care benefit. Moreover, the Court only has the option of applying the existing coordination principles when categorising new benefits and thus categorising them with the benefits which they seem to resemble most closely. In these circumstances, the Court has determined in its case law a distinction between long-term care benefits in cash and sickness benefits within the strict sense<sup>70</sup>. It is likely that the Court will continue its reasoning on that basis, and by connecting the long-term care benefits to other social security risks on a case-by-case basis, which will not be helpful to come to a common understanding of long-term care benefits.

This can have a number of adverse consequences for the potential users of these benefits. For example, there may be difficulties in applying some of the traditional coordination mechanisms, such as the aggregation of periods<sup>71</sup>, the prevention of overlapping<sup>72</sup>, the priority rules in case there is a concurrent right from two Member States<sup>73</sup> or the rules to provide supplements if a person would have been entitled to a higher benefit from the State of insurance.<sup>74</sup>

While successful infringement procedures may lead to a change in the legislation or national general practices, such successes are on a case by case basis and the advantages for individual citizens are limited, as the specific effects for them have to be established by national courts. Furthermore, infringement procedures may take a long time. In case of non-compliance, the case will be referred to the Court and the rights of EU citizens will still be on hold.

#### *Possibility of losing benefits, or double payments*

There is a risk that a person may lose out on long-term care benefits if they are not properly classified and coordinated. Another, more far-reaching situation is the one in which a person receives neither benefits in cash or kind, as he or she moved from a State that only has benefits in kind (= non exportable), to a State which only has benefits in cash to the detriment of the fundamental rights of the person concerned.

---

<sup>68</sup> Online consultation carried out among public authorities by Deloitte Consulting in 2012.

<sup>69</sup> Twenty-two replies were received from public authorities in Belgium, Bulgaria, Cyprus, Denmark, Finland, France, Greece, Hungary, Iceland, Ireland, Liechtenstein, Norway, Portugal, Romania, Switzerland and United Kingdom. See Annex II.

<sup>70</sup> Case C-388/09 *da Silva Martins*, EU:C:2011:439.

<sup>71</sup> If the entitlement to long-term care benefits is dependent on the completion of periods, equivalent periods fulfilled in another Member State should be taken into account if necessary for the opening of the right to long-term care benefits.

<sup>72</sup> Long-term care benefits differ from country to country. They could be paid in the form of a monthly allowance to persons, or take the form of benefits in kind. In cross-border situations, there is a risk of accumulating benefits in cash and in kind from different Member States. If a person is entitled to benefits in cash from the competent Member State and at the same time can claim benefits in kind intended for the same purpose from the Member State of residence or stay that will have to be reimbursed by the competent Member State, the amount of the benefits in cash shall be reduced by the amount of the benefit in kind which could be claimed from the competent Member State.

<sup>73</sup> Family members of insured persons can have a derived right to sickness benefits from the family member, or an independent right in the Member State of residence, e.g. on the basis of their residence there. It is laid down in Article 32 of Regulation (EC) No 883/2004 that an independent right shall take priority over a derivative rights, except where the independent right in the Member State of residence exists directly and solely on the basis of the residence in that State.

<sup>74</sup> In cases where the reimbursement of costs incurred on the benefits in kind provided in the State of stay, calculated under the rules in force in that State, is less than the amount which application of the legislation in force in the State of affiliation would afford, the competent institution, upon the request of the person concerned, will reimburse him/her the difference, within the limits of the costs actually incurred.

As with the problem above, the drivers behind this problem are the lack of a common definition or common criteria to identify long-term care benefits, which when recognizing the wide variety of different models of long-term care provision between the Member States results in a disparate approach. To distinguish between the benefits in kind and in cash, the Administrative Commission prepared a simple 'yes/no' list without any further description of these benefits<sup>75</sup>. In such a list for long-term care benefits, 11 Member States have declared that they do not have cash benefits. Another 10 Member States have said that they do not have benefits in kind. These declarations appear inconsistent with the Commission's own research.

The current "yes/no" list for long-term care benefits has proved to be inadequate. The user percentage of long-term care benefits in cash is only equal to zero in Belgium, Bulgaria, Ireland, Hungary and the Netherlands<sup>76</sup>. Also, all Member States have benefits in kind and in cash that can qualify as 'long-term care benefits'<sup>77</sup>.

Solely listing benefits by means of a yes/no list may have the consequence that a mobile citizen may either lose rights or alternatively lead to a duplication of rights leading to inefficient allocation of welfare budgets between Member States. The current anti-overlapping provision in Regulation (EC) No 883/2004 deals with the situation where a person receives long-term care benefits in kind from the State of residence and long-term care benefits in cash from competent Member State and both benefits are 'intended for the same purpose'. However, the current system makes it difficult for Member States to be clear over whether two benefits are 'provided for the same purpose'. In particular, a competent Member State providing long-term care benefits in cash is unable to verify whether or not the person in receipt of sickness benefits in kind from the State of residence for the same purpose and the same time period; this would only reveal itself when the competent Member States receives a claim for reimbursement from the Member State of residence which normally happens only annually. In cases of overlap, the competent Member State is effectively taking on extra information obligations to process claims for something that a person is already receiving.

**Example illustrating the risk of double payments:** an Austrian pensioner with long-term care needs moves to Germany after his retirement. He receives a full Austrian pension (and has no pension entitlement from Germany or any other Member State). In accordance with the rules of Regulation (EC) No 883/2004, Austria is the 'competent Member State' for providing long-term care benefits in cash. Consequently, Austria has to export care allowances in cash, for example, a cash benefit intended to cover the costs of a home carer. The German system also provides care benefits in kind which can be claimed by the pensioner, such as trained carers who visit elderly persons to provide assistance their home.

Austria will reimburse the costs for the benefits in kind provided by Germany. The Austrian care allowance might no longer be necessary as the person already receives home care in Germany. It is therefore necessary for the Member State to compare, in line with the anti-overlapping rule, the two benefits to determine if they are intended for the same purpose and are paid for the same period of time in order to prevent double-payments.

For instance, in 2012, 2570 persons exported *Pflegegeld* from Austria to another Member State (Table 75 in Annex V), of which 70% of this long-term care benefit in cash was exported to Germany. This is an important share, which makes the comparison with the benefits in kind in Germany even more relevant.

It is noticed that the existing anti-accumulation rules at Article 34 are not working effectively in this regard.

<sup>75</sup> See 'list of cash benefits and benefits in kind as referred to in Article 34 of Regulation (EC) No. 883/2004.'

(<http://ec.europa.eu/social/main.jsp?catId=868&langId=en>), state of play for EU-27 in May 2010, and the MISSOC tables.

<sup>76</sup> See the 2015 Ageing Report. Table 25 in Annex XXVI. Moreover, based on the 2012 Ageing Report none of the countries showed a user percentage equal to zero.

<sup>77</sup> See the mapping of systems of long-term care benefits in Annex XXI.

### 4.3. Baseline scenario

In total, there are 1.8 million persons covered by the Regulation who live in another Member State than the one in which they are insured against sickness. Out of them, 45.000 mobile citizens use long-term care benefits in kind and 35.000 mobile citizens use cash long-term care benefits<sup>78</sup>.

The demographic changes in the EU (ageing population) and national legislative developments (new types of benefits) are drivers for Member States to continue developing special schemes for persons in need of care. On the basis of the demographic projections<sup>79</sup>, the effect of ageing itself is expected to result in an increase of need for long-term care and of public spending on long-term care benefits from 1.6% of GDP in 2013 to 1.8 % of GDP in 2020 and 2.0% of GDP in 2030. The budgetary impact of the baseline scenario in 2013 is of 792.796.846 EUR<sup>80</sup>.

The differences in the concept of long-term care benefits and their treatment across Member States can undermine the effective functioning of the reimbursement and mechanism of deduction for the avoidance of double payments. In order to avoid the competent Member State reimbursing costs for benefits in kind that overlap with the benefits in cash that it provides directly to the person concerned, it is necessary to have a clear overview of benefits that are provided for the same purpose. The number of cross-border users of long-term care benefits, who are today 80.000 (45.000 receiving long-term care benefits in kind and 35.000 long-term care in cash ) might increase by 11% in 2020 in comparison to 2013 and by 28% in 2030<sup>81</sup>.

A lack of clear classification also limits the efficiency gains that might otherwise be foreseen by the launch of the Electronic Exchange for Social Security Information (EESSI) scheduled for launch by the end of 2016 with a deadline for full implementation in all Member State by the end of 2018 which will introduce common structured electronic documents and a uniform procedure for all national authorities to follow when processing claims social security benefits.<sup>82</sup> In the absence of clear classification, EESSI will have limited potential to support national institutions to process long-term care benefits in a consistent and efficient manner.

Furthermore, non-action increases the risk of loss of confidence in the EU rules for citizens and institutions. Keeping the current framework can also have knock-on effects on the administrative costs for the Member States. Finally, it might also imply costs for citizens seeking to enforce their rights in a legally uncertain environment.

### 4.4. Objectives for coordination of long-term care benefits coordination rules

As with all elements of this review exercise, the **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.

In relation to long-term care in particular, this is reflected in the need to ensure coherence and clarity in the rules applied to long-term care benefits and lay down a stable coordination system, while recognising that the current inconsistent approach by Member States creates legal uncertainty for citizens and national institutions and consequent difficulties in uniform application of these rules.

---

<sup>78</sup> See the synoptic overview in Annex III and table 2.18 in Annex XXVI.

<sup>79</sup> The total fertility rate (TFR) is projected to rise from 1.59 in 2013 to 1.68 by 2030 and further to 1.76 by 2060 for the EU as a whole. However, during the same period, the proportion of young people (aged 0-19) is projected to remain fairly constant by 2060, while the total age-dependency ratio (people aged below 20 and aged 65 and above over the population aged 20-64) is projected to rise from 64.9% to 94.5%. European Commission: The 2015 Ageing Report: Economic and Budgetary Projections for the 28 EU Member States (2013-2060): Graph I.1.2.

<sup>80</sup> Estimate based on data LFS and 2015 Ageing Report.

<sup>81</sup> As follows from Table 27 in Annex XXVI.

<sup>82</sup> Annex VI, p17.

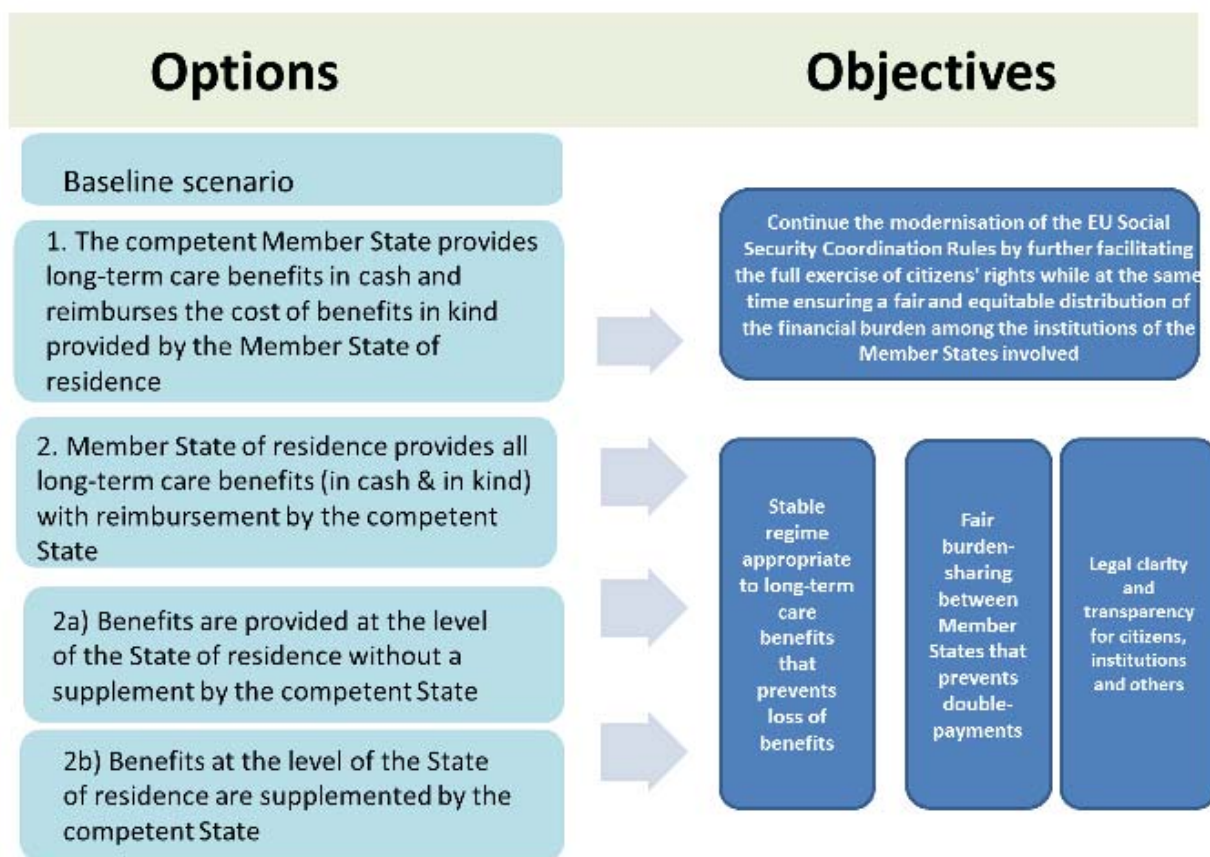

In addition to the general objective, the **specific objectives** in the field of long-term care benefits are:

- To establish a **stable regime appropriate to long-term care benefits** which prevents loss of benefits and lays a basis for effective and efficient coordination;
- To ensure a **fair and equitable sharing of the financial burden between Member States**: to prevent double payment of sickness benefits in cash and ensure that the financial burden for paying long-term care benefits to persons who are insured in the competent Member State are shared proportionally between that Member State and the State of residence.
- To bring **legal clarity and transparency for citizens, institutions and other stakeholders** on coordination rules applicable to them so that they are ensured what the citizens' rights to long-term care are when exercising their right to freedom of movement.

#### 4.5. What are the various options to achieve the objectives concerning long-term care benefits?

A number of policy options have been identified to meet the objectives set out in Section 1.4.

##### 4.5.1 Option 0: Baseline scenario

No explicit legal framework is laid down in the coordination Regulations for long-term care. Following the interpretation given by the Court, the existing rules on sickness benefits apply to long-term care benefits.

The Member States in their national legislations, or in case of disagreements, the Court, decide on a case-by-case basis which national benefits are to be considered as long-term care benefits.

#### *4.5.2 Option 1: The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence*

This option applies the existing rules on sickness benefits to long-term care benefits and complements them with some specific rules that take account of the characteristics of long-term care benefits.

Similarly to sickness benefits, long-term care benefits in kind are to be provided by the Member State of residence in accordance with its legislation and reimbursed in full by the competent Member State. This can be done at the actual or at fixed level of expenses, depending on the national system, as shown in the accounts of the Member State of residence<sup>83</sup>.

Long-term care benefits in cash are to be provided and paid by the competent Member State in accordance with its legislation, including to the entitled persons residing in another Member State. By agreement between the Member States, benefits in cash may, however, be provided by the Member State of residence at the expense of the competent State and in accordance with the legislation of the latter<sup>84</sup>.

The following clarifications distinguishing the long-term care area from the sickness rules on coordination are also proposed:

1) Inserting a new definition of long-term care benefits in Article 1 of Regulation (EC) No 883/2004 that takes into account the characteristics of long-term care benefits and facilitates their distinction from sickness benefits in a strict sense. Specifically, this could be accomplished by introducing a new chapter in the Regulation for long-term care benefits, based on the same principles as the sickness chapter but allowing for the key distinctions between these two types of benefits.

2) Defining the risk of 'long-term care' in Article 3(1) of Regulation (EC) No 883/2004 so it clearly falls as a distinct field of social security falling within the material scope of the EU rules;

3) Drawing up a list of long-term care benefits per Member State that covers all benefits that are included or excluded for the purposes preventing double payment of long-term care benefits by the institutions. This should be possible on the basis of the common elements in the definition and the existing analysis of national systems.<sup>85</sup>

#### *4.5.3 Option 2: The Member State of residence provides all long-term care benefits with reimbursement by the competent Member State*

Under this option the State of residence grants long-term care benefits in cash and in kind as they exist under its national system. This is different from the baseline scenario, under which the competent Member State pays the long-term care cash benefits directly to the insured person. By making only one Member State responsible for providing long-term care benefits in cash and in kind, the risk of overlapping or a total loss of benefits in kind is reduced.

Similarly to sickness benefits, the competent Member State shall reimburse expenses for long-term care benefits in kind. This can be done at the actual or at fixed level of expenses, depending on the national system, as shown in the accounts of the Member State of residence. An additional reimbursement procedure for long-term care benefits in cash would however need to be introduced between the Member States.

The situation can occur where the level of the long-term care benefits in the State of residence is lower than in the competent Member State. The two sub-options described below explore the possibilities for offering more favourable treatment of the persons concerned, in particular by giving the best benefits from two countries. The sub-options are partly inspired by the coordination system

<sup>83</sup> See Articles 17 and 35 of Regulation (EC) No 883/2004.

<sup>84</sup> See Article 21(1) of Regulation (EC) No 883/2004.

<sup>85</sup> Annex XXI.

that applies to family benefits in Regulation (EC) No 883/2004. In the field of family benefits, if two rights coincide, the person is entitled to the highest amount that he/she is entitled to under either of the two systems (for more information see Chapter 7.1).

*4.5.3.1. Sub-option 2a) The benefits are provided at the level of the Member State of residence without a supplement by the competent Member State*

Under this sub-option, all long-term care benefits are provided by the Member State of residence at the level as determined by its legislation, irrespective of where the person is insured. The person concerned will not receive a 'top-up' from the competent Member State; even its benefits are higher than those in the Member State of residence.

*4.5.3.2. Sub-option 2b) The benefits at the level of the Member State of residence are supplemented by the competent Member State*

Under sub-option 2b, the person receives a supplement from the competent Member State in the event that the benefits in the Member State of residence, or the amount of reimbursement, are at a lower level than in the competent Member State. The 'top up' will be paid to the amount to which the person would have been entitled in the competent Member State and will be paid directly to the person concerned.

A person is insured in Member State A and resides in Member State B, where he applies for home care. The home care services costs EUR 5.100 including a service user charge of EUR 1.100 paid for by the insured person. The amount corresponding to the level of cover provided by the insurance system of Member State B is EUR 4.000. This amount is paid by the institution of Member State B and is to be refunded by the institution of Member State A.

But if the level of cover under the system of Member State A is higher, e.g. EUR 6.000, the person will also be able to receive the actual costs incurred in terms of the service user charge of EUR 1.100 from Member State A.

*4.5.4 Discarded options*

Three options were considered but discarded from assessment:

*a) The introduction of a safeguarding provision*

The competent Member State would award the long-term care benefits in cash for persons who reside outside that Member State. In a situation where the legislation of the competent Member States does not provide for long-term care benefits in cash and at the same time benefits in kind are non-existent in the Member State of residence, the Member State of residence should grant the long-term care benefits in cash existing under its legislation to avoid that a person is left with nothing. The competent Member State would then reimburse the benefits in cash provided by the Member State of residence.

This option would be less clear than the baseline scenario and would give rise to a lot of uncertainties for the Member State of residence about when benefits are or are not available in the competent Member State<sup>86</sup>. Although the right to a benefit for the person concerned would be guaranteed, this option does not provide legal certainty about when the Member State of residence would provide benefits, what benefits would be concerned and what amount.

*b) Make the Member State of residence responsible for providing all long-term care benefits without reimbursement by the competent Member State*

<sup>86</sup> The following sources supported the analysis: trESS Analytical Study 2012, *Legal impact assessment for the revision of Regulation (EC) No 883/2004 with regard to the coordination of long-term care benefits*, to be consulted at: [http://www.tress-network.org/tress2012/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS\\_Analytical%20Study%202012.pdf](http://www.tress-network.org/tress2012/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS_Analytical%20Study%202012.pdf), p. 37-40 and Deloitte, *Consulting Study for the impact assessment for revision of Regulations (EC) Nos 883/2004 and 987/2009*, 6 December 2013, pages. 130-13, Tables 53 and 54. The study can be found in Annex V to this report.

The Member State of residence would be competent for providing all the long-term care benefits, in cash and in kind, on the basis of its own legislation, thereby applying its own conditions for entitlement and granting benefits at the level set in that Member State. The long-term care benefits would remain fully at the expense of the Member State of residence.

Only one Member State is involved in providing long-term care benefits and this will make the system administratively easier to handle. However, the Member State of residence will be faced with an increase in applications for long-term care benefits, both from persons who are not insured against sickness benefits in that Member State and who have not contributed to financing the system of long-term care benefits (e.g. pensioners who are covered for health care in the country from which they receive a pension) without recourse to any reimbursement. Moreover, the system could provide an incentive to move to a country with more 'generous' long-term care benefits. This option would therefore put too great a burden on the administrative and financial organisation of the system of long-term care benefits in the Member State of residence.

*c) Make the competent Member State responsible for providing all long-term care benefits to insured persons residing abroad (export).*

Under this option the competent Member State would become responsible for providing all long-term care benefits to insured persons who are residing abroad. Where benefits are only available in the form of services, the competent Member State would reimburse the relevant services provided for in the Member State of residence according to the rates applicable in the Member State of residence.

This option would introduce a slight improvement in the protection of rights of the person concerned, as all persons in need of long-term care will be treated equally in the competent Member State (=Member State of insurance) and will not have their benefits reduced when they move to another Member State. However, this option would have significant practical challenges, including the necessity of increased information exchange between Member States. The benefits in kind available in both countries would need to be compared to assess if the benefits in kind in the Member State of residence could be provided under the same conditions as the competent Member State. If no benefits in kind are available in the Member State of residence the competent Member State would have to 'value' these benefits in cash. In all, this option would not contribute to an even financial burden sharing between Member States, and would make the system harder to administer for the competent Member State.

#### **4.6. Stakeholder Support**

##### *4.6.1 Baseline Scenario*

In discussions in the Administrative Commission<sup>87</sup>, the baseline scenario received support from 10 delegations<sup>88</sup>; two delegations explicitly opposed the option<sup>89</sup>. In the stakeholders' EU public consultation<sup>90</sup> this option received support corresponding to replies from 18% of individuals<sup>91</sup>, 17% of social partners<sup>92</sup> and 12% of NGOs<sup>93</sup>.

---

<sup>87</sup> Discussions took place in meetings of the Administrative Commission in the period 2009 to 2013. A Working Party dedicated to the revision of the provisions on the coordination of long-term care benefits was held on 10 October 2013. The consultation within the Administrative Commission concerns a consultation at expert level. The views expressed at the level of the Administrative Commission do not necessarily represent the Government's view.

<sup>88</sup> Belgium, Greece, Spain, Hungary, Malta, Poland, Sweden, Estonia as well as the United Kingdom and France without declaring their definite position.

<sup>89</sup> Italy, Luxembourg.

<sup>90</sup> A public consultation between December 2012 and February 2013 invited citizens and organisations to provide their views on the main problems linked to the coordination of long-term care benefits.

<sup>91</sup> Out of 127 requested records relating to 6 different options considered.

<sup>92</sup> Out of 12 social partners providing responses relating to 6 options considered.

<sup>93</sup> Out of 8 NGOs providing responses relating to 6 options considered.

#### 4.6.2 *Option 1: The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence*

Option 1 gained the most support from the delegations in the Administrative Commission, whereby 12 delegations explicitly supported this option, seven other Member States did not object its elements without taking definite position and none of the Member States declared to be against<sup>94</sup>. Although the opinions differed as regards their exact design, all delegations recognised the importance and the need to have a definition and a list of long-term care benefits. The outcome of the public consultation provided for the same result as the baseline scenario as the consultation did not make distinction between it and option 1.

#### 4.6.3 *Option 2: The Member State of residence provides all long-term care benefits with reimbursement by the competent Member State*

Option 2 did not receive explicit support from any delegation in the Administrative Commission, four Member States being against<sup>95</sup>. The complexity and the administrative burden of supplement system is generally the main reason for the low support for this option among national public authorities. One of the comments was that when the system of providing long-term care benefits is decentralised and local municipalities are responsible for providing long-term care benefits, this option will be difficult to implement<sup>96</sup>. In the stakeholders' consultation option 2a) received support corresponding to replies from 19% of individuals, 17% of social partners and 50% of NGOs, while option 2b) was supported by 6% of individuals, 25% of social partners and none of the NGOs.

#### 4.6.4 *Discarded options*

Although delegations in the Administrative Commission were not explicitly consulted on the discarded options, the discussion was not limited to the selected options and possibility was given to present any additional ideas. None of the delegations supported any of the discarded options.

In the public consultation<sup>97</sup>, option a) received support from 14% of individuals, 8% of social partners and 12% of NGOs, option b) was supported by 19% of individuals, 17% of social partners and 50% of NGOs<sup>98</sup> and option c) received support from 38% of individuals, 33% of social partners and 25% of NGOs.

### 4.7. **What are the Impacts of the Different Options?**

For all of the options assessed, the potentially affected groups are the same. The options are specifically targeted at cross-border workers, retired former cross-border workers, other mobile pensioners and the family members of the said categories of entitled persons.

The fact there is no specific coordination regime and a common definition, made it difficult to collect data on long-term care benefits as limited data exists at national level. Administrative data on long-term care benefits are only available in specific forms dealing with the coordination rules of the sickness chapter.

For the purposes of assessing the impact, two types of data sources were used: secondary data (available literature and reports at EU and Member States' level, particularly the trESS network reports; replies to the online public EU Consultation on the need to revise of the current rules; available statistical data with regard to mobility patterns and the use of long-term care benefits in cross-border cases) and primary data, collected through interviews and a consultation of the

---

<sup>94</sup> Luxembourg, Spain, Italy, Portugal, Lithuania, Poland, Belgium, Malta, Sweden, Czech Republic, Hungary and Latvia explicitly supported the option, whilst Austria, Germany, France, Ireland, Slovenia, Slovakia and Greece, without taking definite position, supported some elements of this option or did not object it.

<sup>95</sup> Belgium, Germany, France and Sweden.

<sup>96</sup> In Sweden for example, 290 municipalities in the future would also need to provide long-term care benefits in cash and set up a reimbursement mechanism.

<sup>97</sup> A public consultation between December 2012 and February 2013 invited citizens and organisations to provide their views on the main problems linked to the coordination of long-term care benefits.

<sup>98</sup> The results are identical to those for option 2a, as no distinction was made in the public consultation as to responsibility for reimbursement of the cost of the benefits provided by the Member State of residence.

stakeholders (findings from strategic interviews with Commission officials; findings from interviews with stakeholders at EU level, e.g. European umbrella organisations; findings from interviews with key stakeholders at national level (health insurers, healthcare providers); replies to the EU-wide web-based survey among responsible public authorities; new, generated statistical data with regard to mobility patterns and the use of long-term care benefits in cross-border cases; findings from the 13 workshops/group interviews and 8 phone interviews on the administrative costs and administrative burden related to the policy options).

For further information about the methodology see section 2.3 and Annex IV.

The Table below illustrates a summary of impacts of the different options:

Type of impact	Clarification	Simplification	Protection of rights	Fundamental rights	Economic impacts	Regulatory costs	Risk of fraud and abuse	Equitable burden sharing Member State	Coherence with EU objectives	Overall Effectiveness	Overall Efficiency (cost vs effectiveness)
<b>Baseline Scenario</b>	0	0	0	0	0 <sup>99</sup>	0	0	0	0	0	0
<b>Option 1</b>	++	+	+	+	0	0	+	0	+	++	+
<b>Option 2a</b>	++	+	+/-	+/-	+	-	-	+/-	+	+	+
<b>Option 2b</b>	+	--	++	+	--	--	-	+/-	+	-	-

<sup>99</sup> The budgetary impact of the baseline scenario in 2013 has been estimated at 792.79 million euros. This is an estimate based on LFS data and the 2015 Ageing Report.

The following Tables demonstrate specific impacts for each of the considered policy options:

<b>Policy Option 1: The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence</b>		
<b>Social impacts</b>		
Clarification	++	This option will coordinate long-term care benefits under a separate umbrella, taking into account their specific characteristics. The creation of a common EU definition of long-term care benefits and a concrete list of the benefits is an important step towards more clarity and a uniform approach will lead to greater clarity and a uniform approach, while preserving the method currently applied to sickness benefits.
Simplification	+	This option will not fundamentally change the principles of the baseline as regards the differences between benefits in kind and in cash. However, the proposed option will make it easier for Member States and citizens to understand and apply the coordination provisions on national long-term care benefits. The option also offers a greater stability as it maintains the main principles currently applied under the baseline scenario.
Protection of rights	+	This option will contribute to expediting the process by which persons that require care receive the benefits by removing much of the uncertainty over the status of the various long-term care benefits. There will be no doubt about which benefits can be claimed in a cross-border situation. Nevertheless, the actual receipt of the benefits remains dependent on the distinction between benefits in cash and in kind and the limitation that benefits in kind cannot be exported. Theoretically, an insured person could still be excluded from their benefits, for example, when the competent Member State only grants long-term care benefits in kind and the State of residence only has benefits in cash.
<b>Financial impact</b>	0	This option would involve no economic impact in comparison to the baseline scenario, as Member States will continue to pay the long-term care benefits under the same coordination rules as before. The impact would only manifest itself if benefits that are currently outside the scope of the existing rules would be included in the list. For detailed budgetary impact for individual Member States see Tables 2.19-2.23 in Annex XXVI.
<b>Impacts on fundamental rights</b>	+	This option will contribute to a smoother application of the coordination provisions for long-term care benefits and hence to freedom of movement and residence (Article 45), and facilitate the access to social security and social assistance (Article 34). It would ensure that citizens, despite any vulnerability or care-need they might have, are not disadvantaged in exercising their right to free movement within the EU in accordance with the rights of the elderly (Article 25) and the integration of persons with disabilities (Article 26). There is no impact on the right of property, as rights acquired under the national legislation of the competent Member State and the State of residence are maintained on the same footing.
<b>Other impacts</b>		
Regulatory Costs	0	The information obligations for institutions and citizens under this option will remain the same as under the baseline scenario as no

		new obligations will be introduced. The option facilitates the comparison of benefits in kind and in cash and could lead to fewer disputes between institutions. In an initial phase the new legal definition may increase the administrative burden for Member States and impact the exchange of information between Member States. In the long term the clarification would save time and money for Member States, especially in light of increasing demand for long-term care benefits.
Risk of fraud and abuse	+	In general, additional clarifications will always make the legal situation clearer for the persons concerned and the institutions. Specifying the national benefits concerned will reduce the risk of overlapping payments.
Fair burden sharing between Member States	0	There are no fundamental changes in comparison to the current situation. Depending on the definition of long-term care benefits and the benefits to be included in the list, some benefits which would currently not be coordinated under the Sickness Chapter could be more or less beneficial for a Member State.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Establish a stable regime appropriate to long-term care benefits;</li> <li>• Ensure a fair and equitable sharing of the financial burden between Member States;</li> <li>• Bring legal clarity and transparency for citizens, institutions and other stakeholders on coordination rules applicable to them.</li> </ul>	+	This option, by introducing a legal basis for the already applicable rules, leads to stability of the already applied regime appropriate to long-term care benefits, while remaining compatible with the system currently applied under the baseline scenario. In parallel, it achieves legal clarity and transparency on the rules applicable both for citizens and institutions as well as other stakeholders. Although benefits in kind are provided by the residence State, costs of all cash and in kind benefits provided are at the expense of the competent Member State which ensures a fair distribution of the financial burden. This option however will not solve existing mismatches in case the competent Member State has no benefits in cash and the State of residence has no benefits in kind.

**Policy Option 2a: The benefits are provided by the Member State of residence without a supplement by the competent Member State even if the benefits in the Member State of residence, or the amount of reimbursement, are at a lower level than in the competent Member State**

**Social impacts**

Clarification	++	Under this option, the same clarifying measures will be provided as under option 1 so that the person will always know that he or she needs to claim the benefits under the legislation of the Member State of residence. There will be no doubts even if it is not clear under the relevant legislation whether a certain benefit is a benefit
---------------	----	---

		in cash or in kind.
Simplification	+	Only one Member State is exclusively competent to provide long-term care benefits to the person concerned. Priority rules against overlapping will be superfluous, which will simplify the procedure for mixed-type systems but there will need to be an additional reimbursement procedure for cash benefits.
Protection of rights	+/-	This option would ensure that the persons concerned are always protected at the same level as all other persons in the Member State of residence. Affiliation to the system of the State of residence needs to be assimilated in cases where a person is not covered by the legislation of the State of residence. This in itself can be seen as positive in comparison to the baseline scenario. However, depending on the system or level of long-term care benefits in the Member State of residence, a person might be better or worse off in comparison to the level of benefits in the competent Member State as the level of protection will depend solely on the level of benefits in the residence State.
<b>Financial impact</b>	+	<p>Long-term care benefits in cash shall be provided by the State of residence and no longer by the competent Member State. This implies a considerable decrease of the budget which is needed to finance the cross-border use of long-term care benefits in cash (from € 203 Million to € 111 Million or a decrease of 45% (Annex XXVI– Tables 2.19 and 2.20)). The details of the estimates reveal that whereas more persons are using long-term care benefits in cash, the average amount is much lower. The total budgetary impact is estimated at € 701 million, which corresponds to a decrease of 12% in comparison to the baseline scenario (Annex XXVI – Tables 2.19 and 2.20).</p> <p>On the level of Member States an especially positive impact (less spending) is observed for Austria (decrease of 61% of expenditure on long-term care benefits in comparison to now), Italy (-53%) and Czech Republic (-41%) (Annex XXVI – Table 2.20).</p> <p>Primarily, a negative impact (more spending) in comparison to the other options is observed for the Slovak Republic (increase of 75% of expenditure on long-term care benefits in comparison to the baseline scenario), Croatia (+66%) and Hungary (+50%). These countries have a rather low level of sickness benefits in cash. They also have a rather low user rate of long-term care benefits in their country. Under this option, Member States will have to reimburse benefits in kind and in cash provided to persons who are insured under their social security systems, but who reside in another Member State where the level of long-term care benefits is higher. This could entail paying more than permitted under national legislation.</p> <p>Member States in which no crucial negative or positive financial impact is observed are: Estonia, Luxembourg, Sweden, Denmark, Cyprus and France.</p> <p>For detailed budgetary impact for individual Member States see Tables 2.19-2.23 in Annex XXVI.</p>
<b>Impacts on fundamental rights</b>	+/-	The impact is the same as for option 1 however; the impact on the right of property will vary as depending on the system or level of long-term care benefits in the Member State of residence, a person

		might be better or worse of in comparison to the level of benefits in the competent Member State.
<b>Other impacts</b>		
Regulatory Costs	-	As only one Member State is competent for providing long-term care benefits, this option does not require further implementing arrangements or priority rules to avoid overlapping. The competent Member State and the State of residence will however need to set up a new reimbursement mechanism for benefits in cash. This option may be difficult to implement in Member States where the system providing long-term care benefits is decentralised. The State of residence will have to assume entitlement for benefits in cash for a person who is insured in another Member State and will be confronted with an increase in cases (from 45.000 to 80.000 per year, based on current estimations of recipients of cross-border long-term care - table 2.18 - Annex XXVI). The administrative costs for long-term care are expected to diminish in comparison to the baseline scenario, but the relative share of the regulatory costs in the total budget for long-term care could increase slightly (combined impact for both benefits in cash and in kind - table 55 - Annex V).
Risk of fraud and abuse	-	The risk of fraud and abuse is slightly higher than in the baseline scenario. Member States with more generous long-term care benefits warned that this option could lead persons to move to a Member with a higher level of benefits and claim long-term care benefits there. This in itself is not fraud or abuse, but it can contribute to the perception of so-called 'opportunistic behaviour'.
Fair burden sharing between Member States	+/-	Both the competent Member State and the Member State of residence contribute to the costs of granting the benefit to the person concerned. The competent Member State will have to reimburse the costs made in the Member State of residence, according to the level of the State of residence – even if this is higher or the Member State of residence would anyhow provide the benefits on the basis of its national legislation. This may entail a higher or lower share of burden depending on the respective level of benefits in the Member States concerned.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Establish a stable regime appropriate to long-term care benefits;</li> <li>• Ensure a fair and equitable sharing of the financial burden between Member States;</li> <li>• Bring legal clarity and transparency for citizens, institutions and other stakeholders on coordination</li> </ul>	+	This option introduces a stable regime appropriate to long-term care benefits. The regime however differs from the currently applied rules and thus will require adaptation before full stability is achieved. In parallel, the option brings legal clarity and transparency on the rules applicable both for citizens and institutions as well as other stakeholders. Although the overall costs for the spending on long-term care benefits in cash is decreased, this option might be less effective at achieving the objective of a fair and equitable distribution of financial burden between Member States as the costs are always reimbursed at the level of the residence State. Also, introducing a separate reimbursement procedure for long-term care benefits in cash which will require setting up of a new system for the exchange of information between Member States will entail additional regulatory costs compared to the baseline scenario.

rules applicable to them.		
---------------------------	--	--

**Policy Option 2b: The competent Member State provides a supplement to the beneficiary in the event that the benefits in the Member State of residence, or the amount of reimbursement, are at a lower level than in the competent Member State**

<b>Social impacts</b>		
Clarification	+	Under this option, the person will always know that he/she needs to claim the benefits under the legislation of the Member State of residence. However, the person may also need to introduce a claim for paying the supplement in the competent Member State, which can only be done after the initial claim has been paid by the Member State of residence.
Simplification	--	This option is more complex than the baseline scenario as it opens simultaneous entitlements under the legislation of several Member States. Priority rules will have to be drawn up and a procedure will need to be developed for the calculation of the supplement and how the supplements shall be settled. <sup>100</sup> Moreover, the option deviates from currently applied sickness logic which is consistent with the Court's case-law.
Protection of rights	++	The social impact is the same as for option 1 and in addition the insured person will always receive the highest benefit to which he/she would have been entitled to in the competent Member State.
<b>Financial impact</b>	--	<p>It is estimated that the total expenditure for long-term care benefits would increase to € 1.4 billion, of which € 1.15 billion is for benefits in kind (an increase of 95% in comparison to the baseline scenario) and € 253 million for benefits in cash (an increase of 25%) (Annex XXVI – Table 2.24). The differences are caused by the supplement, which is estimated at € 560 million for long-term care benefits in kind and € 142 million for long-term care benefits in cash which come from the account of the competent Member State.</p> <p>This option has no positive budgetary impact on any of the Member States. The highest increase in comparison to the current scenario is estimated to take place in Sweden (+318%), the Netherlands (+297%) and Finland (+ 248%).</p> <p>For detailed budgetary impact for individual Member States see Tables 2.19-2.23 in Annex XXVI.</p>
<b>Impacts on fundamental rights</b>	+	The impact is the same as for option 1 and in addition the insured person will always receive the highest benefit to which he/she would have been entitled to in the competent Member State.

<sup>100</sup> It may not be possible to directly replicate the existing system for calculation of a differential supplement in the field of family benefits and still respond to the specifics of long-term care..

<b>Other impacts</b>		
Regulatory Costs	--	This option is more complex than the baseline scenario as it opens simultaneous entitlements under the legislation of two Member States: one to be provided with the actual benefit and the other for receiving the supplement. A procedure to compare the level of benefits between the competent Member State and the State of residence needs to be set up, as well as a procedure to settle the payment of the supplement. It will necessitate an additional exchange of information between the Member State of residence and the Member State competent for paying the supplement.
Risk of fraud and abuse	-	The risk of fraud and abuse is slightly higher than in the baseline scenario. Member States with more generous long-term care benefits warned that this option could lead persons to move to a Member with a higher level of benefits and claim long-term care benefits there. This in itself is not fraud or abuse, but it can contribute to a perception of so-called 'opportunistic behaviour'.
Fair burden sharing between Member States	+/-	As the supplement is paid directly to the person concerned, it will not contribute to even burden sharing between Member States, but will only increase the total costs of the benefits provided by these Member States.  Both the competent Member State and the Member State of residence have their share in granting the benefit to the person concerned. The competent Member State will have to reimburse the costs made in the Member State of residence, according to the level of the State of residence –even in this is higher or the Member State of residence would anyhow provide the benefits on the basis of its national legislation. If the level of benefits in the State of residence is lower, the competent Member State will also have to 'top up' the benefits to the level applicable under its own legislation.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Establish a stable regime appropriate to long-term care benefits;</li> <li>• Ensure a fair and equitable sharing of the financial burden between Member States;</li> <li>• Bring legal clarity and transparency for citizens, institutions and other stakeholders on coordination rules applicable to them.</li> </ul>	+	This option introduces a stable regime appropriate to long-term care benefits and offers the maximum level of protection to the person. The regime however differs from the currently applied rules and thus will require adaptation before full stability is achieved. In parallel, the option brings legal clarity and transparency on the rules applicable both for citizens and institutions as well as other stakeholders. The payment of the supplement for benefits provided in residence State increases the costs for the competent Member State. This option is thus less effective at achieving the objective of a fair and equitable distribution of financial burden between Member States. Furthermore, the priority rules and calculation rules for the reimbursement of the benefits and provision of the supplement need to be introduced as well as an administrative procedure for settling supplements.

Based on the above tables, some preliminary conclusions can be drawn on the strengths and weaknesses of the different options and their overall effectiveness, efficiency and relevance in achieving the various objectives while avoiding excessive costs.

Option 1 which introduces the legal basis for the already applicable rules, contributes positively to bringing legal certainty, transparency and stability of the already applied regime appropriate to long-term care benefits, while remaining compatible with similar system applicable to sickness benefits. These effects are maximised by the inclusion of clarifications under a separate Chapter categorising the rules for long-term care benefits separately and offering a clear distinction with the provisions on sickness benefits and social assistance. Citizens and institutions will benefit from the clarification of these rules. This option however will not solve existing mismatches in case the competent Member State has no benefits in cash and the State of residence has no benefits in kind. This option will have low implementation costs as it brings clarification without drastically changing the system of coordination and the information obligations following from that system. In light of the effectiveness at achieving the objectives this option is considered the most cost efficient<sup>101</sup>. It is also coherent with wider EU Policy objectives, in particular, the planned review of the disability strategy 2010-2020 assessing progress to ensure the effective implementation of the UN Convention on the Rights of Disabled Persons across the EU and the ongoing work to promote a social agenda to support the economic recovery ensuring a Triple A social rating for Europe, which advocates greater efficiency in allocation of social protection to challenge examples of multiple benefits overlapping, poorly targeted cash or in-kind benefits (services). The option was supported by a significant majority of experts from Member States.

Sub-option 2a ensures a common understanding and increased transparency for citizens and institutions and introduces a stable regime appropriate to long-term care benefits. The regime however differs from the currently applied rules which are consistent with the logic applied to sickness benefits and the Court's case-law and thus, will require adaptation before full stability is achieved. The overall costs for the spending on long-term care benefits in cash will decrease, caused by a lower level of benefits in the State of residence, however this cost saving needs to be counter-balanced against the fact this option is less effective at achieving the objective of a fair and equitable distribution of financial burden between Member States. It should be also noted that while the costs will indeed decrease in some Member States, a negative impact (more spending) may also be observed for other Member States in comparison to the baseline scenario and some Member States of residence may be required to pay more than permitted under their national legislation to reimburse costs spent by the Member State of residence. In the alternative, the option may result in less beneficial result for persons insured under the competent State's system compared to those insured persons who remained resident in that State. Introducing a separate reimbursement procedure for long-term care benefits in cash will require setting up a new system for the exchange of information between Member States and information obligations for the person concerned who has no 'insurance link' with the State of residence. This will entail additional regulatory costs compared to the baseline scenario. The option may be difficult to implement in decentralised systems providing long-term care benefits. The option is, however, coherent with wider EU Policy objectives for the same reasons as set out in relation to option 1. Option 2 did not receive explicit support from any delegation in the Administrative Commission mainly on grounds of the perceived administrative burden.

Sub-option 2b ensures a common understanding and increased transparency for citizens and institutions and introduces a stable regime appropriate to long-term care benefits. It offers the maximum level of protection to the person, albeit this not being the aim of the Regulations. The person concerned will open simultaneous entitlements under the legislations of more than one Member State. Similarly to sub-option 2a, the regime differs from the currently applied rules and thus, will require adaptation before full stability is achieved. Priority rules and calculation rules for the reimbursement of the benefits and provision of the supplement need to be introduced as well as an administrative procedure for settling supplements. This option is therefore less efficient than the

---

<sup>101</sup> Table 2.21 in Annex XXVI.

current situation. The payment of the supplement will increase the costs especially for the competent Member State, which has to reimburse the costs of all long-term care benefits provided by the State of residence and pay the supplement up to the level in its national legislation directly to the person concerned meaning it is less efficient than the other options. The coherence of the option with the wider EU Policy Agenda is the same as for option 1. Option 2 did not receive explicit support from any delegation in the Administrative Commission.

## 5. Unemployment Benefits

### 5.1. Current Coordination Rules for Unemployment Benefits

‘Unemployment benefits’ are benefits granted if the risk of loss of employment materialises.<sup>102</sup> Typically an unemployed person is required to register as a person seeking for employment with the employment service which is providing the benefit. Unemployed persons are usually required to be fit for work, available for work and actively seeking work.

The coordination rules for unemployment benefits deal with three different areas and concern three different scenarios, namely:

- a) the aggregation of periods of insurance completed by mobile workers in different member States,
- b) the export of unemployment benefits for unemployed persons who want to move to another Member State for the purpose of seeking employment there,
- c) the determination of the Member State which is competent for providing unemployment benefits for frontier and other cross-border workers.

The rules of coordination in respect of these three areas are briefly summarised below:

#### 5.1.1 *Rules as regards the principle of aggregation*

The principle of aggregation of periods of social security protection is a basic principle of the coordination rules, which ensures previous periods completed in another Member State are recognized for the purposes of establishing entitlement. In respect of unemployment, the rules require that only periods of insurance, employment and self-employment completed in different Member States have to be aggregated. This can be explained by the fact that national unemployment schemes are not based on periods of residence but rather periods of insured employment. The qualifying period varies from at least 4 months in France to 24 months in the Slovak Republic. Most Member States apply a qualifying period of some 12 months<sup>103</sup>.

The Court has determined that the recognition of those periods depends on the rules applicable in the competent Member State.<sup>104</sup> This means that even periods of employment which did not qualify as an insurance period in the country where they have been completed must be taken into account for the purpose of aggregation, if such periods would be covered by the unemployment insurance in the State providing the benefit.

**Example: Denmark** provides coverage in case of unemployment on a voluntary basis. According to the interpretation of the Court, it is therefore possible that a mobile worker who elected not to be covered by the unemployment insurance during a period of employment in Denmark would nevertheless receive unemployment benefits from another Member State where they subsequently become insured on the basis of the Danish periods of employment if those periods would qualify as insured periods against the risk of unemployment in that Member State.

<sup>102</sup> Case C-228/07, *Petersen*, paragraph 28; Case C-404/04, *De Cuyper*, paragraph 27.

<sup>103</sup> Figure 2 in PACOLET, J. and DE WISPELAERE, F., *Aggregation of periods for unemployment, Network Statistics FMSSFE, European Commission*, June 2015, Annex XXI.

<sup>104</sup> Case 388/87, *Warmerdam-Steggerda*, EU:C:1989:196.

Moreover, the current rules require an aggregation of periods only subject to the condition that the person concerned has most recently completed periods of insurance, employment or self-employment in the Member State concerned. This particular condition applies only to mobile workers who move to another country, i.e. who change their residence and claim unemployment benefits under the legislation of their new country of residence. It does not apply to cross-border workers, who by definition, already have their residence in another State.

This provision is based on the general principle that the Member State which has received the contributions shall also bear the burden of the unemployment benefits. This requirement of ‘most recent’ insurance also encourages the search for work in that Member State. As a result, it is not possible for an unemployed person to simply move to another Member State or to return to his or her State of origin and claim unemployment benefits in that State based on the principle of aggregation of periods completed in another Member State without having first been employed and insured in that Member State.

**Example:** Michael loses his job in Member State A and moves or returns to Member State B without having registered as unemployed person in Member State A. In this case, Michael will only be entitled to receive unemployment benefits from Member State B when he has most recently been insured there, i.e. if he obtains employment in Member State B after his return but once again becomes involuntarily unemployed.

The calculation of unemployment benefits in the event that a person had completed periods of employment in more than one Member State are based on the principle that unemployed persons should receive their unemployment benefit from the Member State of last activity in accordance with the legislation applicable in that State.<sup>105</sup> Consequently, the competent institution needs to take into account exclusively the salary or professional income received in respect of the last activity as an employed or self-employed person<sup>106</sup>.

This rule does not affect Member States where unemployment benefits are paid on a flat-rate basis<sup>107</sup>, or those Member States which base the calculation of their benefits on the salary earned at the moment when the person became unemployed<sup>108</sup>. Most Member States, however, base their calculation on average salaries earned during a reference period of 3,<sup>109</sup> 6,<sup>110</sup> 12<sup>111</sup> or even 24 months<sup>112</sup>.

### 5.1.2 *The principle of export of unemployment benefits*

One of the basic principles of social security coordination is the requirement that cash benefits shall be paid irrespective of the place of residence of the beneficiary. In the area of unemployment benefits, however, export is only possible subject to the specific conditions set out below and only for a limited period of time.

An unemployed person who goes to another Member State in order to seek work must

---

<sup>105</sup> This principle does to cross-border workers who resided during their economic activity in another Member State than the Member State where the activity was performed.

<sup>106</sup> Article 62(1) of Regulation (EC) No 883/2004.

<sup>107</sup> Ireland, Malta, Poland, United Kingdom.

<sup>108</sup> Table 9 in Annex VII: The Netherlands take the daily wage into account. Belgium refers to the average salary earned in the last position.

<sup>109</sup> Croatia, Czech Republic, Denmark, Luxembourg.

<sup>110</sup> Iceland, Spain, Switzerland.

<sup>111</sup> Austria, Cyprus, France, Germany, Hungary, Latvia, Norway, Portugal, Romania, Sweden.

<sup>112</sup> Bulgaria, Italy, Slovak Republic.

- have been registered with the employment service of the competent Member State for a period of at least four weeks,<sup>113</sup>
- register with the unemployment service of the Member State where he/she is looking for work within seven days after departing,
- comply with the control procedures organized by the unemployment service of that Member State.

Jobseekers who intend to look for work in another country shall request a certificate, namely the Portable Document U2 (PD U2 – *Retention of unemployment benefits*) before departure which certifies their right to continue to draw unemployment benefit. They should take care to return before expiry of the maximum period, because if they return later, without the explicit permission of the employment service of the state which is paying the benefits, they risk losing all remaining entitlement to benefits.<sup>114</sup>

In the new country of stay, the jobseeker will be treated by the employment service exactly the same way as any other jobseeker in this country. If the institution of this country becomes aware of any circumstance which might affect entitlement to benefits, it will immediately inform the competent institution and the jobseeker by issuing the document U3. This document informs the unemployed person of the situation and advises him of his right of appeal to the competent institution if he/she does not agree in order to ensure the continuation of the benefit payment.

The periods for which an unemployment benefit can be exported are limited. The original maximum period of three months under Regulation 1408/71 was extended by Regulation No 883/2004 to a minimum period of three months and a maximum period of six months.

### 5.1.3 *Coordination of unemployment benefits as regards frontier and other cross-border workers*

Cross-border workers are workers who reside in another Member State than the State of activity. The current rules differentiate between which Member State is competent for providing unemployment benefits as regards to frontier works and other cross-border workers and between the situations, that a cross-border worker is wholly, partially or intermittently unemployed. They provide that:

- Frontier workers shall receive their unemployment benefits from the competent institution in their Member State of residence if they are wholly unemployed, and
- from the institution of the Member State of activity if they are only partially or intermittently unemployed.
- The same applies to other cross-border workers if they are only partially or intermittently unemployed.
- If they are wholly unemployed, they have a right of choice, i.e. they can return to their country of residence and claim unemployment benefits from the institution of that State or remain in the country of previous activity and claim benefits there.

To compensate the institution of the Member State for the fact that they are obliged to provide benefits without having received contributions, the rules provide for a reimbursement of benefits paid for the first three months or five months. The five-month reimbursement applies when the beneficiary had been insured in the Member State of previous activity for at least 12 months within the last 24 months.

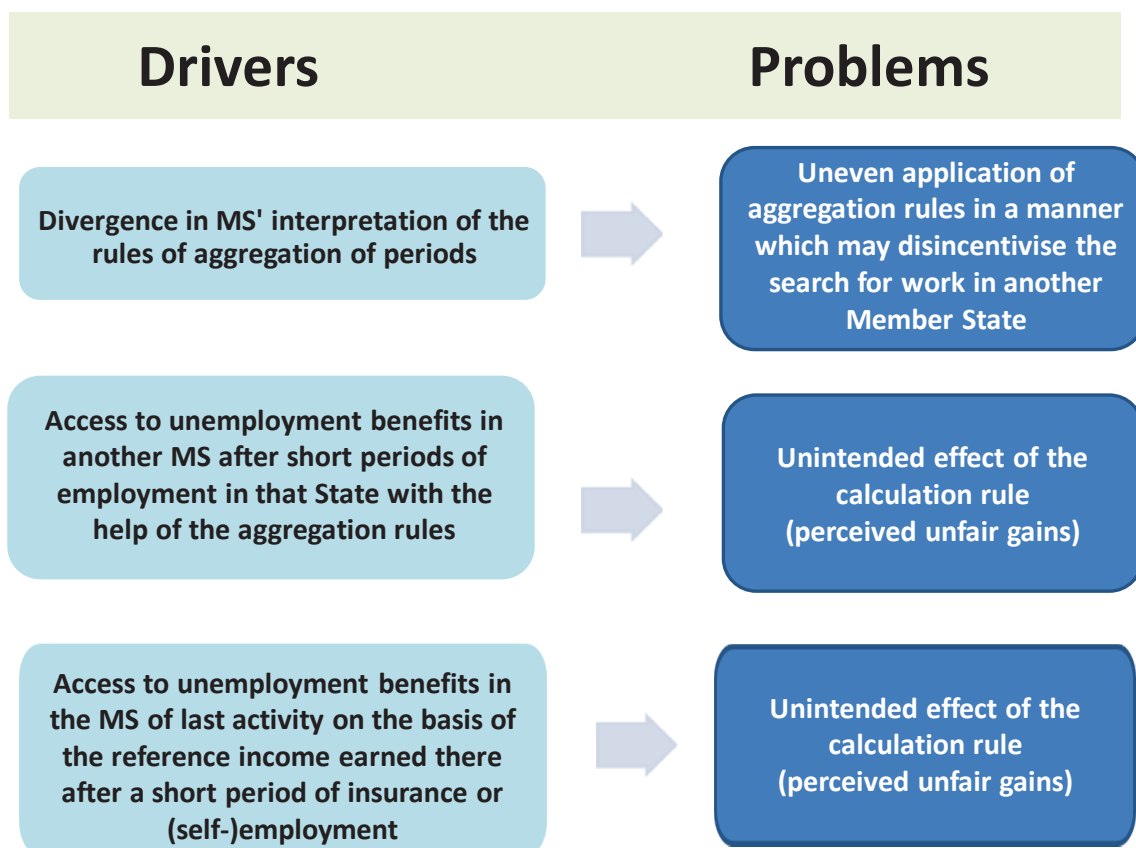

There are specific rules for frontier workers who were formerly self-employed. If they reside in a country where there is no unemployment insurance for self-employed persons, they shall be entitled to receive unemployment benefit from the institution in the country of last activity to which they had been affiliated.

<sup>113</sup> The underlying idea of this precondition is that an unemployed person should at first exhaust all possibilities of finding a new job in his former country of employment before extending the search for employment to other countries. This period can be shortened, however, by the institution concerned.

<sup>114</sup> Unless otherwise provided for under the legislation of the competent Member State.

## 5.2. Aggregation of periods for unemployment benefits

### 5.2.1 Problems with the aggregation of periods for unemployment benefits and the drivers behind them

#### 5.2.1.1 Uneven application of the rules on aggregation of periods in a manner which leave workers without protection and may disincentivise the search for work in another Member State

Although the Court considered that a uniform interpretation of the principle of aggregation is a prerequisite for its application<sup>115</sup>, the condition<sup>116</sup> that periods have to be aggregated by the institution as soon as the unemployed person has 'most recently' completed periods of insurance, employment or

<sup>115</sup> Case C-12/93 *Drake* EU :C:1994:336, paragraph 26; case 69/79, *Jordens-Vosters*, EU:C:1980:7, paragraphs 6 and 11.

<sup>116</sup> This specific conditions has been justified by the Court in the case C-12/93 *Drake* EU :C:1994:336, paragraph 26: "Article 51 of the Treaty and Regulation 1408/71 provide only for the aggregation of insurance periods completed in different Member States and do not regulate the conditions under which those insurance periods are constituted." In the case 69/79, *Jordens-Vosters*, EU:C:1980:7, paragraphs 6 and 11, the Court stated: 'It is well established that the requirement that Community law be applied uniformly within the Community implies that the concepts to which that law refers should not vary according to the particular features of each system of national law but rest upon objective criteria defined in a Community context.' 'The essential object of Regulation No 1408/71 adopted under Article 51 of the Treaty is to ensure that social security schemes governing workers in each Member State moving within the Community are applied in accordance with uniform Community criteria. To this end it lays down a whole set of rules founded in particular upon the prohibition of discrimination on grounds of nationality or residence and upon the maintenance by a worker of his rights acquired by virtue of one or more social security schemes which are or have been applicable to him.'

self-employment is not uniformly applied. This is due to the fact that the length of the required period of 'most recent insurance' or (self-) employment is not specified in EU law. Most Member States take the view that 'any' period of insurance or (self-)employment (even one day) will suffice in order to trigger the application of the principle of aggregation. Some Member States<sup>117</sup>, however, have specifically defined periods for the application of the aggregation principle in their national law, for example because periods of insurance or (self-) employment are expressed in weeks and not in days, or as they understand a 'period' to comprise a longer period of time and that mere insurance or (self-) employment is not sufficient.

In **Finland**, section 9 of Chapter 5 of the Unemployment Security Act (1290/2002) requires that periods of insurance or employment completed in another State shall only be taken into account if the person concerned has pursued an activity as an employed person in Finland for at least four weeks or as a self-employed person for at least four months immediately before becoming unemployed.

In **Denmark**, section 2 of the Danish Ordinance No 490 stipulates that a person who has not been a member of a Danish unemployment insurance fund within the last five years but has been insured in another Member State will have his or her periods of insurance completed in another Member State taken into account subject to, among other conditions, that the person must have worked continuously in Denmark for at least 296 working hours in the past 12 weeks or three months, or for partially employed persons 148 working hours in the past 12 weeks or three months. In case of self-employment, the equivalent condition is eight full weeks within a period of 12 weeks or three months prior to the unemployment.

A further difficulty is that there is no uniform application of the jurisprudence regarding the recognition of periods completed in another Member State for the purpose of aggregation. The case-law of the Court<sup>118</sup> in this respect is not consistently applied. This leads to the situation that some Member States also aggregate periods of employment or self-employment for which no contributions have been paid, while others do not. According to an internal survey carried out by Poland as a follow-up to the debate in the Administrative Commission, 18 Member States do not aggregate periods of non-insured (self-) employment completed in another Member State whose legislation does not provide for unemployment insurance coverage. This number is even higher (24) if the person voluntarily decides not to insure him/herself in the State of activity and afterwards claims that he/she has fulfilled periods of employment there.

Moreover, a debate was launched on this issue in 2011 in the Administrative Commission showed that many Member States take the view that the wide interpretation of the Court leads to unjustified results. There was support from seven delegations to change the rules on aggregation<sup>119</sup>.

The driver behind these related problems is that Member States do not have the same understanding as regards the recognition of periods to be aggregated or the condition of most-recent insurance. This applies in particular with respect to the practice described above whereby some Member States require under national law a specific period of insurance before applying the aggregation rules.

The consequence of this uneven application of the rules is legal uncertainty which may result in the situation that an unemployed person who has not been insured for long enough in the competent Member State is neither entitled to unemployment benefits in the State of last activity nor in the former State where they previously worked.

---

<sup>117</sup> For example Finland and Denmark.

<sup>118</sup> Case 388/87, *Warmerdam-Steggerda*, EU:C:1989:196

<sup>119</sup> Czech Republic, Germany, Austria, the Netherlands, Spain, Denmark.

**Example:** Dorothea has worked for five years in Sweden and then decides to move to Denmark to take up a new position there. Unfortunately, she is dismissed after a probation period of two months. As she does not fulfil the conditions set out in the Danish law (three months of insurance), she cannot aggregate her insurance periods to claim unemployment benefits in Denmark. At the same time, she will be refused unemployment benefits in Sweden, as she is no longer insured there.

Had Dorothea spent her working life in Denmark (including the five years in Sweden), then she would have been entitled to unemployment benefits in Denmark.

It may also have the unwanted effect of dis-incentivising the search for work in another Member State. The fear that taking up a position in another Member State could lead to a loss of social protection, might discourage mobile EU workers from exercising their right to freedom of movement thereby constituting an obstacle to that freedom. This would run counter to the objectives of the Treaty. The Court has repeatedly held that the aim of Articles 45 TFEU and 48 TFEU would not be achieved if, as a consequence of the exercise of their right to freedom of movement, mobile workers were to lose the social security advantages afforded them by the legislation of one Member State, especially where those advantages correspond to contributions which they have paid.<sup>120</sup>

#### 5.2.1.2 Access to unemployment benefits in another Member State after short periods of employment in that State with the help of the aggregation rules may lead to unintended gains

The most-recent-insurance requirement is intended to prevent unemployed persons from moving to a new Member State and immediately claiming unemployment benefits without first having contributed to that scheme.

In light of this aim it is doubtful whether it was the legislator's intent that unemployment benefits should be paid by a new Member State in situations where a worker had been employed only for an extremely short period, e.g. for only one day. A number of Member States<sup>121</sup> argue that it is not appropriate that simply taking up insurance in a Member State already suffices for making this Member State responsible for providing unemployment benefits, when the entitlement to those benefits is to a large extent based on periods of insurance completed in another Member State. They argue that their respective schemes should be protected from claims of mobile workers who have not in any substantial way contributed to the financing of their scheme<sup>122</sup>.

This reasoning also plays a role in the case law concerning the rights of jobseekers to 'social advantages'<sup>123</sup> under Regulation (EU) No 492/2011. For instance, in joined cases C-22/08 and C-23/08, *Vatsouras and Koupatanze*<sup>124</sup>, the Court has concluded that jobseekers enjoy the right to equal treatment under Article 45 TFEU and hence are entitled to receive jobseekers allowance on the same footing as nationals of the Member State in which they are looking for work. However, a Member State may decide to grant such an allowance only after it has been possible to establish a 'real link' between the jobseeker and the labour market of that State<sup>125</sup>.

<sup>120</sup> See case C-548/11, *Mulders*, EU:C:2013:249, paragraph 47 and the case law cited therein

<sup>121</sup> For instance: Denmark, Finland, Austria, France, Greece, Ireland and Romania.

<sup>122</sup> See for example Barslund, M, Busse, M. and Schwarzwalder, J., *Labour Mobility in Europe: An untapped resource?*, CEPS Policy Brief No. 327, March 2015, Brussels, p. 4.

<sup>123</sup> The Court has held that social advantages means all the advantages which, whether or not linked to a contract, are generally granted to national workers primarily because of their objective status as workers or by virtue of the mere fact of their residence on the national territory and whose extension to workers who are nationals of other Member States therefore seems likely to facilitate the mobility of such workers within the Community. This has been held to cover, for example, public transport fare reductions for large families, child raising allowances, funeral payments, minimum subsistence payments, study grants. See, for instance Case C-85/96, *Martinez Sala*, EU:C:1998:217.

<sup>124</sup> Joined cases C-22/08 and C-23/08, *Vatsouras and Koupatanze* ECLI:EU:C:2009:344, paragraphs 36-38.

<sup>125</sup> See also Cases C-224/98, *D'Hoop*, EU:C:2002:432, paragraph 28 and C-258/04, *Ioannidis*, EU:C:2005:559, paragraph 31.

The available statistics for 23 Member States who were in a position to provide quantitative data in this respect for 2013<sup>126</sup> show that in 42% of the approximately 25.000 cases, aggregation was applied before 3 months of periods of insurance or (self-)employment had been completed<sup>127</sup>. When looking at the Member States of 'destination' (United Kingdom, Belgium, Spain, France) relatively more requests for aggregation were received within a period of 30 days, whereas in the Member States of 'origin' (Hungary, Romania, Bulgaria, Poland, Slovakia), the majority of requests for aggregation of periods were received after a period of three months. This could indicate that mobile EU workers are more likely to stay in or return to the 'higher wage' Member States directly after they have become unemployed. It is likely that this trend will continue due to a greater availability and use of temporary or precarious working arrangements and the willingness of people to adjust their quantity of work (part-time, on call, informal work, etc.) before returning home<sup>128</sup>.

### 5.2.1.3 Calculation of unemployment benefits in the Member State of last activity only on the basis of the reference income earned therein may lead to unintended results after a short period of insurance or (self-)employment

Under the current rules, Member States cannot take into account salaries or professional income earned during the reference period in different Member States, as they are only allowed to base the calculation on salaries or professional income earned in their own territory. Although being administratively easier to apply, this can also lead to situations where the calculation of the unemployment benefit is based on salaries or professional income earned during a period which is much shorter than the reference period fixed under national law. It cannot always be assumed that the salary or professional income received during such a short period in one Member State is equal or at least comparable to the salary or professional income received during the reference period in another Member State. As a consequence, the current rules concerning the calculation of unemployment benefits may lead to unintended results.

**Example:** Under **Austrian** law, the basic amount of earnings-related unemployment benefit amounts to 55% of the average insured net earnings of the last calendar year. If a person has previously worked in Germany and has worked in Austria for only four weeks before becoming unemployed again, he/she would receive unemployment benefit in Austria only on the basis of the average salary earned within the four weeks when he or she was employed there. The lower or higher average salary earned in Germany during the reference period of one year would have no bearing on the amount of his or her unemployment benefit in Austria.

In the situation above, it can be questioned to what extent the salary earned during four weeks in Austria properly reflects the 'reference earnings' of the worker concerned<sup>129</sup>.

Some Member States also fear that this may provide a 'pull factor' for opportunistic behaviour and undermine the sense of the unemployment benefits coordination provisions. Such a concern has been articulated by six delegations of the Administrative Commission<sup>130</sup> and also by the legal experts FreSsco.<sup>131</sup>

<sup>126</sup> Table 6 in Annex VII. (Annex XII)

<sup>127</sup> Table 2 in Annex XII.

<sup>128</sup> European Commission, *Economic and Social Developments in Europe*, December 2014, p.48 and OECD Employment Outlook 2015, table 1.7, p.30.

<sup>129</sup> This aspect is also highlighted by FUCHS, B. (ed.), GARCIA DE CORTAZAR, C., BETTINA, K. and PÖLTL, M., *Assessment of the Impact of amendments to the EU social security coordination rules on aggregation of periods or salaries for unemployment benefits*, Analytical report 2015, FreSsco, European Commission, June 2015 (Annex VII).

<sup>130</sup> Austria, the Netherlands, Finland, Germany, Ireland, Norway, Denmark.

<sup>131</sup> The same view has been taken by the authors of the FreSsco report FUCHS, B. (ed.), GARCIA DE CORTAZAR, C., BETTINA, K. and PÖLTL, M., *Assessment of the impact of amendments to the EU social security coordination rules on aggregation of periods or salaries for unemployment benefits*, Analytical report 2015, FreSsco, European Commission, June 2015. On the other hand, whereas sometimes mobility can be at the advantage of a worker, in other situations this could not be the case. The coordination rules do not always offer more 'advantageous' benefits to mobile workers. For instance, the current rules also have as an effect those in cases of 'return migration' a person could be faced with a lower level of benefits. For instance, a

The problem is exacerbated by the large differences between remuneration levels and the calculation method of unemployment benefits. On the other hand, it is mitigated by the fact that 11 Member States<sup>132</sup> apply a maximum ceiling to earnings that can be taken into account. For example, in the case of Belgium the lowest amount of benefits to be paid per day amounts to €36.66 and the highest amount to € 61.66 regardless of actual earnings.

### 5.2.2 *Baseline scenario*

In the 23 Member States for which data are available for the year in 2013, 24.821 cases of aggregation of periods for unemployment were reported. In relation to the total annual inflow of migrants of working age in those States, this represents 2.1%. Given, however, that some large EU-15 Member States (e.g. Germany and Italy) did not provide data and thus are not included in the above figures, the total number of aggregation cases is likely to be higher.

On average, 0.11% of total unemployment spending by the reporting Member States could be related to aggregation of periods.<sup>133</sup> The total expenditure for unemployed benefits reported by 23 Member States for the 24.821 cases of mobile EU workers who had to rely on periods of aggregation was around € 100 million, of which € 36 (36%) million for workers who had worked for less than 30 days, € 15 million (15%) for workers who had worked between 1 and 3 months, and € 46 million (46%) for workers who had worked 3 months or more.<sup>134</sup> In absolute terms, France (€ 53 million) and Belgium (€ 20.5 million) are the main spending Member States, which can be explained by the higher number of aggregation cases and the higher average spending per unemployed persons in comparison to other Member States. Romania (€ 2157), Cyprus (€ 3890) and Latvia (€ 4908) can be found on the lower end, influenced by the low number of cases for aggregation and the lower annual average expenditure per unemployed person.

As the Member State of last activity has to assume the costs for providing unemployment benefits, it is also this State which is affected by the provisions on the calculation of those benefits. The current rules stipulate that the calculation of unemployment benefits shall only be based on the earnings received in the Member State of last activity. This leads to higher expenditure in all cases where the reference earnings in the Member State of last activity are higher than in the Member State of previous activity. In the reverse situation, this provision results in savings.<sup>135</sup>

The evolution of those numbers in the future will depend to a large extent on the evolution of the number of new intra-EU movers, their risk of becoming unemployed and the qualifying period. Moreover, the budgetary impact will also be influenced by the evolution of the unemployment benefit and the average duration of unemployment.

If we assume that working age mobility flows will grow between 2015 and 2020 at the same rate as they have grown for the overall flows year on year between 2010 and 2013 (5.6%),<sup>136</sup> and if we assume that 2.1% of the total annual inflow of migrants of working age will continue to rely on aggregation, then we could estimate that in 2020 there would be some 33.000 cases of aggregation in the 28 Member States.

If, alternatively, we assume that working age mobility flows will grow between 2015 and 2020 by the same absolute amount per year as the overall flows year on year have grown between 2010 and 2013 (66.000),<sup>137</sup> and if we still assume that 2.1% of the total annual inflow of migrants of working age will continue to rely on aggregation, then we could estimate that in 2020 there would be some 32.000 cases of aggregation in the 28 Member States.

---

Portuguese worker who has worked in the Netherlands for one year and decides to return to Portugal, where he falls unemployed after two months, will receive unemployment benefits based on the salary received in Portugal, without taking account of the potentially higher earnings in the Netherlands.

<sup>132</sup> Belgium, Bulgaria, Germany, Spain, Croatia, France, Italy, Cyprus, Netherlands, Austria and Sweden.

<sup>133</sup> Annex XIV, Table 10.

<sup>134</sup> Annex XIV, Table 10.

<sup>135</sup> Annex XIV, Table 2.

<sup>136</sup> Rate is based on average of year on year absolute growth of population all ages based on Eurostat Migration flows data migr\_imm1ctz.

<sup>137</sup> Average of year on year absolute growth of population all ages based on Eurostat Migration flows data migr\_imm1ctz.

Not undertaking action in the field of aggregation could lead to increased public disenchantment and exacerbate criticism of, and anxiety about the consequences of free movement. It could lead to the situation that (more) Member States apply their own interpretation of the current rules in a restrictive way thus reducing legal certainty and risking that mobile EU workers will lose out on rights. If Member States were free to apply the EU legal provisions on the coordination of unemployment benefits at their discretion, the intended uniform application of these provisions could no longer be guaranteed.

### *5.2.3 Objectives for review of the coordination rules on aggregation of periods*

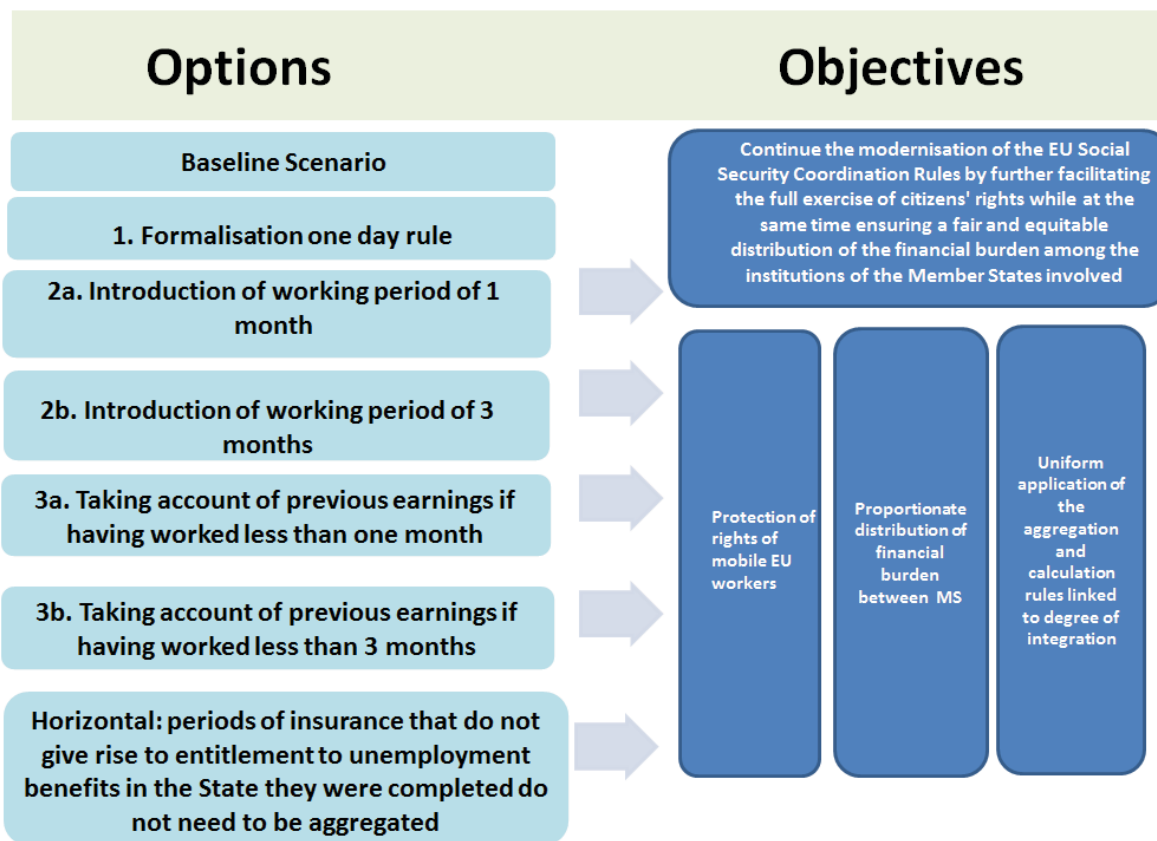

The **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further enabling the citizens to exercise their rights while at the same time ensuring legal clarity and a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.

In relation to the rules on aggregation of periods for the purpose of fulfilling qualifying periods set up under national law for entitlement to unemployment benefits, this means in particular to provide clarity in order to avoid divergent interpretations and to ensure a uniform application of the rules by all Member States. At the same time, there is also a need to consider the underlying reasons for the current discrepancies and to see how they can be taken into account without depriving mobile citizens of the rights in case of unemployment which they may have acquired in different Member States.

In view of this general objective, the **specific objective** in this field can be defined as follows:

- Ensure a **uniform and consistent** application of the **aggregation and calculation rules** in a way that also reflects the degree of integration of a worker in the insurance system of a Member State.
- Ensure mobile EU workers benefit from **protection of rights** when they move to another Member State to take up employment there.
- Ensure a proportionate distribution of financial burden between Member States.

### *5.2.4 What are the various options to achieve the objectives concerning the aggregation of periods of unemployment benefits?*

#### 5.2.4.1 Option 0 : baseline scenario

If the status quo were to be maintained, aggregation can only be applied from the moment when an unemployed mobile person, has ‘most recently’ completed a period of insurance or (self-)employment under the national unemployment insurance scheme, regardless of the duration of that employment. Where the amount of the unemployment benefit is determined as a proportion of previous salary of professional earnings, only the wages or incomes earned in the competent Member State are taken into account.

#### 5.2.4.2 Option 1: Formalization of the "one day rule"

A uniform interpretation of the requirement of ‘most-recent insurance can be achieved by introducing a minimum period of prior employment in the text of Regulation (EC) No 883/2004. Option 1 entails that the principle of aggregation can be invoked after one day of insurance or (self-)employment under their system. This is shortest minimum insurance or employment requirement that can be applied. The unemployment benefit shall be calculated on the basis of the salary earned or professional income in the State of last activity.

**Example: David moves from Member State A to Member State B and works there for two weeks before becoming unemployed.** Under this option, he could claim unemployment benefit immediately in A based on his (aggregated) periods of insurance completed in B. The amount of the benefit will be calculated on the basis of the wage earned during the two weeks of work in A.

#### 5.2.4.3 Option 2: Introduction of a minimum period of insurance or (self-)employment of one or three months

Instead of interpreting a period of insurance or (self-) employment as one day, reference to a longer period of time can be considered as well. About half of the EU Member States use qualifying periods of 50 or 52 weeks. Lithuania and Slovakia have qualifying periods of 64 weeks or longer. If the

employment history of the mobile worker in the Member State which has to aggregate should sufficiently represent the link to the labour market in that State, introducing a minimum period of insurance or work of:

a) at least one month (**option 2a**), or

b) at least three months (**option 2b**)

has been completed in the Member State of last activity.<sup>138</sup>

The periods are chosen with a view to enable the persons concerned to establish a ‘sufficient link’ to the social security system of the competent Member State without depriving them of their rights. This would also allow continuing applying the rule that unemployment benefits are only calculated on the basis of the salary or professional income earned in the territory of the competent Member State as the previously competent Member State would calculate the level of unemployment benefits on the basis of the calculation rules applicable there.

**Example: David moves from Member State A to Member State B and works there for four months before becoming unemployed.** David becomes entitled to unemployment benefits in B based on his insurance periods in A because by working for four months he has completed in excess of one month (option 2a) or three months (option 2b) of insurance or (self-)employment in Member State B. The amount of the benefit would be calculated on the basis of the wage earned during the four month period of work in B.

When discussing this option in the Administrative Commission, a number of Member States clearly pointed out that a person should not lose out on rights when he/she is not able to make a claim for aggregation and that a solution should be found for these situations<sup>139</sup>. In general, other stakeholders emphasized the need to respect the right of equal treatment.

It is obvious that the condition of one month of previous employment (option 2a) is easier to fulfil than the condition of three months of employment (option 2b)<sup>140</sup>. However, the urgency to satisfy this condition is greatly reduced if the mobile worker can benefit from unemployment benefits paid by the Member State of previous activity in such a case.

A gap in protection could indeed occur if a mobile worker like David would become unemployed after a period of employment of for instance two weeks. In this case, he may not be able to claim unemployment benefits in the Member State of previous activity due to the fact that he was not ‘most recently’ insured in that State.

To overcome this situation, i.e. to allow the unemployed person to stay in the State of last activity to search for new work there, both options should be combined with a provision that the previous Member State of activity should export the unemployment benefit in accordance with its national legislation.<sup>141</sup> This means that the previously competent Member State will have to apply its rules as if the unemployed person were still insured there, irrespective of the fact that the unemployment occurred in the Member State of last activity and that the unemployed person resides in that State<sup>142</sup>. To this end, it shall suffice that the unemployed person registers and makes him/herself available to the employment services in the Member State of last activity and that he/she adheres to the obligations applied to jobseekers in that Member State.

<sup>138</sup> The length of these periods coincides with the current practice in some Member States (Denmark and Finland).

<sup>139</sup> Portugal, Poland, Germany, Hungary, Austria, France, Greece, Ireland and Romania.

<sup>140</sup> The three months also correspond to the current right to claim an export of unemployment benefits for at least such a period and to the rule contained in Articles 6 and 24(2) of the Free Movement Directive 2004/38, according to which an inactive person may move to another Member State without any further requirement regarding his income, but at the same time also without a right to social assistance benefits in the host Member State.

<sup>141</sup> The options with regard to the export of unemployment benefits are discussed in paragraph 5.3.4.

<sup>142</sup> According to the case-law of the Court (Case C-308/84, *Naruschawicus*, EU:C:1996:28, paragraph 26), the requirement of ‘availability’ cannot have as a direct or indirect effect that a person should be required to change his or her residence.

This means that an unemployed person shall not be forced to return to the previously competent Member State to register with the employment services there.

**Example:** If David had been in employment for only two weeks in Member State B in the example above, he cannot claim unemployment benefits in Member State B as he does not satisfy the condition of at least one or three months of employment there.

However, by using the export provision, he will nevertheless be able to receive unemployment benefits from Member State A on the basis of his earnings and his periods of insurance there. He will have to register with the employment services in Member State B, which will follow-up on his job searching activities on behalf of the employment service in Member State A and which will report back to Member State A.

Option 2a and 2b only apply to the specific situation where a person has moved his or her residence to another State and then becomes unemployed after having completed less than one or three months of insurance or (self-)employment. These options hence do not affect frontier and other cross-border workers, that is to say those workers whose place of residence already was, and remains, in another Member State than the Member State of last activity during their unemployment.

#### *5.2.4.4 Option 3: Taking into account previous earnings received in another Member State if a person has worked less than one or three months in the competent Member State*

This option aims to establish a stronger link with the level of the previously earned salary or professional income ('reference earnings').

Option 3 reflects this idea, but only in case where the person concerned has worked for a period shorter than:

- one month (**option 3a**), or
- three months (**option 3b**) in the competent Member State.

These two sub-options allow Member States that calculate their unemployment benefit by reference to previous average earnings to take into account also reference earnings that have been received in the territory of another Member State.

**Example: David moves from Member State A to Member State B and works there for two weeks before becoming unemployed.** Under this option, he could claim unemployment benefit immediately in Member State B based on his (aggregated) periods of insurance completed in Member State A. However, his unemployment benefit will be calculated on the basis of an average of the salaries in Member States A and B.

Imagine that the reference period for calculating unemployment benefits in Member State B is 12 months. Imagine David has worked for 12 months in Member State A and 2 weeks in Member State B. David has earned a monthly salary of € 1000 in Member State A and € 500 in Member State B. The unemployment benefit in Member State B will be calculated on the basis of the following salary:  $(2/52 * € 500) + (50/52 * 1000) = € 19.23 + € 961.53 = € 980.76$ .

Option 3 is an alternative to option 2. Both options lead to the result that in case of short employment in the new Member State of less than one or three months, the calculation of the unemployment benefit is (also) based on earnings received in the Member State of previous activity. However, under option 2, the benefit is paid by and at the expense of the institution of the Member State of previous activity, whereas under option 3, benefits are paid by the Member State of last activity.

#### *5.2.4.5 Horizontal option: clarification of the conditions for the recognition of periods to be aggregated*

This option can be combined with each of the previous options, as its aim is to clarify the conditions under which a person has a right to base his or her claim or unemployment benefits on periods completed in another Member State.

The current Article 61 is the source of much controversy between Member States, as is shown by the results of the survey carried out within the Administrative Commission under the Polish Presidency in 2011. This holds especially true when it comes to the question of whether periods of employment always provide for coverage in the Member State in which they were fulfilled. In order to ensure a uniform interpretation of Article 61 (1) of Regulation (EC) No 883/2004, it is important the legal text be as clear and unequivocal as possible. This could either be done by introducing this clarification in Article 61, or by applying the general rule on the aggregation of periods in Article 6 of Regulation (EC) No 883/2004.

A uniform aggregation rule can accommodate Member States' desires that periods that do not give entitlement to unemployment benefits in the Member State where they were completed are not taken into account for the purposes of aggregation.

#### *5.2.4.6 Discarded Option*

The idea to introduce a reimbursement mechanism between the Member State of most recent Employment and Member State of previous employment as an alternative to Option 2a and b was considered but has been discarded, as the current problems with the reimbursement mechanism for unemployed frontier workers show that such a mechanism is likely to create disputes and delays between the institutions involved.

#### *5.2.5 Stakeholders' views on the different options*

##### *5.2.5.1 Option 0 : baseline scenario*

In consultations with stakeholders, maintaining the status quo was supported by ten delegations in the Administrative Commission<sup>143</sup> Further in the public consultation only 40% of organisations and 33% of individuals indicated support that the current rules should be changed.<sup>144</sup> However, some of the social partners and NGO representatives<sup>145</sup> took the view that they could accept a change of the rules if the rights of mobile citizens continue to be safeguarded.

##### *5.2.5.2 Option 1: Formalization of the "one day rule"*

Ten delegations supported this option<sup>146</sup>. In addition, in the public consultation only 40% of organisations and 33% of individuals indicated support for moving from the prevailing practice that one day of insurance suffices, however, amongst the comments from respondents there was support for consistent practices among Member States.

Eight delegations<sup>147</sup> indicated that they could accept option 1 if in return the calculation rule would be amended, or vice versa, as either one of the rules is needed to establish a 'genuine link' with the unemployment insurance system.

##### *5.2.5.3 Option 2: Introduction of a minimum period of insurance or (self-)employment of at least one month (option 2a) or three months (Option 2b)*

Option 2a was supported by three delegations in the Administrative Commission<sup>148</sup>. Option 2b gained support from 10 delegations<sup>149</sup> of which 5<sup>150</sup> made an explicit written request to introduce a minimum period of insurance or (self-) employment in Article 61. There is also support from an employer

---

<sup>143</sup> The Bulgarian, Czech, Estonian, German, Croatian, Italian, Polish, Portuguese, Slovakian, and Slovenian delegations supported this option.

<sup>144</sup> A public consultation between July and October 2015 invited citizens and organisations to provide their views on the main problems linked to the coordination of unemployment benefits, family benefits and posting of workers.

<sup>145</sup> A global consultation with social partners and NGOs took place.

<sup>146</sup> The Bulgarian, Czech, Estonian, German, Croatian, Italian, Polish, Portuguese, Slovakian, and Slovenian delegations supported this option.

<sup>147</sup> The Bulgarian, Italian, Portuguese, Belgian, Estonian, Irish, Polish and Swedish delegations

<sup>148</sup> The Finnish, Luxembourgish and Hungarian delegations.

<sup>149</sup> The Austrian, Danish, Greek, French, Irish, Latvian, Lithuanian, Maltese, Romanian and United Kingdom delegations.

<sup>150</sup> Austria, France, Greece, Ireland and Romania.

association<sup>151</sup>. Less than half of the respondents to the public consultation commented on the principle of aggregation, but amongst that group there was general support for the idea of consistent practices between Member States. In addition there was general support of introducing a minimum employment/ contribution period at EU level. At the same time, many argued that the Member State where the contributions are paid – namely the Member State of (the last) employment – should provide the unemployment benefits. Among organisations responding to the consultation, the proposed period was at least one month, while among individuals there was greater support for a minimum qualifying period of insurance of at least three months (or longer).

#### *5.2.5.4 Option 3: Taking into account previous earnings received in another Member State if a person has worked less than one month (option 3a) or three months (option 3b) in the competent Member State*

This issue has been raised by six delegations<sup>152</sup> in the Administrative Commission, where they have proposed to introduce a stronger link between the salary or professional income earned and the amount of the unemployment benefit awarded. Although only a minority of respondents to the public consultation commented on the issue of "reference earnings", among those that did there was general support for the principle that unemployment benefits should be calculated by reference to earnings for the entire reference period including those earned in another Member State.

### *5.2.6 What are the Impacts of the Different Options on aggregation of periods of insurance or (self-)employment*

#### *5.2.6.1 Introduction*

For all of the options assessed, the potentially affected groups are the same. The options are specifically targeted at mobile EU workers, that is to say: workers who have moved their residence to the new State of activity. Hence, they do not concern frontier workers or other cross-border workers. National governments will have to administer the rules in the framework of their national legal systems and allocate resources to the national, regional or local institutions to apply the principle of aggregation. At the executive level, national, regional or even local institutions providing unemployment benefits to workers will have to deal with claims for aggregation of periods of insurance or (self-)employment.

In relation to fundamental rights all options aim to facilitate the exercise of the right to engage in work in another Member State (Article 15) by clarifying the provisions on aggregation of unemployment benefits. They also respect the right to social security benefits (Article 34). In terms of respecting equal treatment and the right to free movement under Article 45 of the Charter as well as Article 45 TFEU, the Court has held that the legislator can attach conditions to the rights granted by Article 45 TFEU<sup>153</sup>, as long as mobile workers are not put at an unjustified disadvantage in comparison to national workers, for example where they will have to pay social security contributions in which there is no return<sup>154</sup>. Although the options are directly targeted at mobile EU workers, a difference in treatment can be justified only if it is based on objective considerations distinct from the nationality of the persons concerned and is proportionate to the legitimate aim pursued under national law.

In relation to the economic impact, it has to be pointed out that the aggregation of periods is a mechanism to open, retain or recover a right to unemployment benefits. The principle as such does not have a direct budgetary impact, whereas the direct consequence of applying that principle, namely the payment of unemployment benefits, has. A detailed overview is provided in Annex XXII. It has to be

---

<sup>151</sup> UEAPME.

<sup>152</sup> Austria, the Netherlands, Finland, Germany, Ireland and Norway.

<sup>153</sup> Case C-62/91, *Gray*, EU: C:1992:177, paragraph 11.

<sup>154</sup> See, to that effect, Cases C-393/99 and C-394/99, EU:C:2002:182, paragraph 51, C-493/04, *Piatkowski*, EU:C:2006:167, paragraph 34, C-345/09, *Van Delft*, EU:C:2011:57, paragraphs 100 and 101; C-388/09, *da Silva Martins*, EU:C:2011:439, paragraph 72 and 73.

noted that a total of 23 Member States<sup>155</sup> (Belgium, Bulgaria, Denmark, Estonia, Spain, France, Croatia, Cyprus, Latvia, Lithuania, Luxembourg, Hungary, Malta, the Netherlands, Poland, Romania, Slovakia, Finland, Sweden, United Kingdom, Liechtenstein, Norway, Switzerland) provided quantitative data, of which three Member States (France, Spain and Estonia) were not able to provide a breakdown by Member State of origin. The missing data for a number of large Member States, in particular EU-15 Member States, have entailed some limitations in the assessment of some of the options<sup>156</sup>. The full study is attached in Annex XIV.<sup>157</sup>

Based on the data from the administrative questionnaire on the aggregation of periods for unemployment the budgetary impact of the current rules and the different alternative options could be calculated. Member States had to provide a breakdown by Member State of origin and a breakdown by length of insurance. The reported cases have been multiplied by the annual average expenditure per unemployed person (also by taking into account the annual average duration of the payment of the unemployment benefit) in order to estimate the public unemployment spending. Option 3 (change of the calculation method) required more detailed information about the unemployed recent migrant worker's salary. No information on the salary earned in the competent Member State as well as in the Member State of origin was collected via the administrative questionnaire. Therefore, wage data published by Eurostat has been used.

The analysis solely focuses upon the cost to the competent Member State for the provision of unemployment benefits. It is recognised that in relation to option 1 and 2 there could be a shift in the competence for other social security benefits (in particular for family and sickness benefits) for the cases where a person has worked for an insufficient period in the Member State of last employment to qualify for aggregation of unemployment benefits meaning that competence shifts to the Member State of previous employment. However, insufficient data is available to quantify the economic impact resulting therefrom.

When looking in particular at economic impact, regulatory costs and secondary impact for option 2, as already explained above<sup>158</sup>, this option has evolved during the impact assessment, notably by making the Member State of previous employment responsible for exporting unemployment benefits for those workers who have not completed a period of insurance of one or three months in the Member State of last employment. For this reason, a quantitative assessment has only been made for the first version of the option, whereas a qualitative assessment could be made for the final version of the option.

There are large differences between the salaries across the 23 Member States surveyed<sup>159</sup>, and it should be borne in mind that data limitations are even more significant than for the other options as the economic impact for this option could only be estimated for some 14 Member States. The estimated budgetary impacts do not take into account the 'flattening' of the level of unemployment benefits due to a ceiling of earnings applicable in some Member States or minimum or maximum amount of benefits. The negative impact thus can be mitigated by such a ceiling.

The regulatory costs for both public administrations and citizens were assessed through a number of interviews with public officials working for administrations dealing with the aggregation of unemployment benefits (both as Member States of last employment and of previous employment) in six Member States (Germany, Denmark, the Netherlands, Poland, Romania, the United Kingdom). The full study is attached to this report in Annex XVII.<sup>160</sup>

---

<sup>155</sup> For the purpose of Social security coordination rules, the term Member State refers to the EU-28 + Switzerland, Norway, Liechtenstein and Iceland.

<sup>156</sup> For a detailed reporting on the questionnaire on the aggregation of periods for unemployment, see Annex XII.

<sup>158</sup> See above, chapter 4.3 (Option 2 – Introduction of a minimum period of insurance or (self-)employment of one or three months).

<sup>159</sup> Table 17, Annex XIV.

<sup>160</sup> Katrine Julie Abrahamsen, Monica Lind, Peter G. Madsen, *Administrative costs of handling aggregation of periods or salaries for unemployment benefits*, 2015 (Annex XVII).

The proposed policy options can also have an incidence on mobility decision and mobility patterns of mobile EU workers. The secondary impacts of the options in terms of inflows and outflows of EU citizens were estimated on the basis of case studies in eight Member States (Germany, Denmark, France, the Netherlands, Italy, Poland, Romania, and the United Kingdom). They provide an indication on the direction and the general magnitude of the variation generated by the implementation of the policy options. The full study is attached to this report in Annex XIX.<sup>161</sup>

Finally, the options have been compared to the baseline scenario and with regard to their effectiveness in achieving the general and specific objectives of the initiative, their efficiency (cost-effectiveness/even burden sharing), coherence with the general objectives of the EU and their impacts as assessed below.<sup>162</sup>

<sup>161</sup> Michele Raitano, Matteo Luppi, Riccardo Conti, Diego Teloni, *Secondary effects following a change of regulations on the aggregation of periods or salaries for unemployment benefits*, 2015 (Annex XIX).

<sup>162</sup> Secondary impacts are not considered in the final comparison in recognition of the limitations of the data available to conduct this assessment.

### 5.2.6.2 Summary of the impact of different options concerning the aggregation of periods for entitlement to unemployment benefits

Type of impact	Clarification of	Simplification	Protection of rights	Fundamental rights	Economic impacts	Regulatory costs	Risk of fraud and abuse	Equitable burden sharing Member State	Coherence with General, Specific and EU objectives	Overall Effectiveness	Overall Efficiency (cost effectiveness vs)
<b>Baseline Scenario</b>	0	0	0	0	0 <sup>163</sup>	0 <sup>164</sup>	0	0	0	0	0
<b>Option 1</b>	+	+	+	+	0	+/-	-	-	-	++	++
<b>Option 2a</b>	+	+	+	+	+/- <sup>165</sup>	+/-	+	+	+	0	+
<b>Option 2b</b>	+	+/-	+	+	+/-	+/-	+	++	0	0	++
<b>Option 3a</b>	+/-	+/-	+/-	+	- <sup>166</sup>	- <sup>167</sup>	+	-	0	+	-
<b>Option 3b</b>	+/-	-	+	+	- <sup>168</sup>	+/- <sup>169</sup>	+	-	+	+	-
<b>Horizontal Option</b>	+	+	+/-	0	0	+	+	+	+	+	+

<sup>163</sup> € 100 m is the budget devoted to aggregation of UB in 23 reporting Member States, equating to on average, 0.11% of total unemployment spending by the reporting Member States - Annex XIV, Table 10.

<sup>164</sup> Costs for handling aggregation of UB varies between € 100 – 40,000 in selected Member States.

<sup>165</sup> Decrease of €21 million (-22%) for Member State of last employment (= Member State of residence), but corresponding increase for Member State of previous employment.

<sup>166</sup> Small decrease (-3.2%).

<sup>167</sup> Increase by 28%.

<sup>168</sup> Small decrease (-4.1%).

<sup>169</sup> Increase by 29%.

### 5.2.6.3 Impacts of Policy Option 1: Formalisation of the "one day rule"

Policy Option 1: Formalisation of the "one-day-rule"		
<b>Social impacts</b>		
Clarification	+	Clarity of the legal rule on aggregation will be improved by eliminating the divergent interpretations on the application of the aggregation rule, thereby increasing legal certainty.
Simplification	+	A uniform interpretation of the rules on aggregation will contribute to simplifying the aggregation procedure for the institutions concerned as they will all apply it as from the same moment. A limited number of Member States (Denmark, Finland) would have to change their national legislation.
Protection of rights	+	Uniform application of the principle, that aggregation takes place after one day of insurance, employment or self-employment in the competent Member State will facilitate access for mobile EU citizens to their rights to unemployment benefits, as Member States will apply a consistent approach to aggregation of periods completed in another Member State.
<b>Economic impacts</b>		
Financial impact	0	On average, 0.11% of the total unemployment spending (around € 100m) by the reporting Member States is related to aggregation of periods. This option is likely to entail a slight increase of expenditure for those Member States <sup>170</sup> which currently require in a longer period of insurance or (self-)employment before aggregation is applied in accordance with their national legislation. However, as 26 Member States currently apply the one day rule as the 'standard' period for triggering aggregation the overall impact is expected to be negligible. <sup>171</sup>
Impact on fundamental rights	+	This option aims to facilitate the exercise of to the right to engage in work in another Member State (Article 15 of the Charter), as well as to a better protection of rights for workers who have made use of their right to free movement (Article 45 of the Charter). The right to property (Article 17 of the Charter) will be respected as well, as periods acquired in a previous Member State can be added to periods of insurance or (self-)employment as of the first day of insurance or (self-) employment in the host Member State and no 'gap' in the protection of the worker can occur. The principle of equal treatment (Article 21 of the Charter) is also respected as nationals and non-nationals are subject to the same conditions as regards their rights to unemployment benefits.

<sup>170</sup> Denmark and Finland.

<sup>171</sup> There may be an increase could be expected in the number of workers being able to claim unemployment benefits in those Member States that today require a longer period of work than one day before aggregation can take place, for instance Denmark (now applying a three-month period for those who have not yet been a member of an unemployment insurance fund for at least five years) and Finland (now applying a one-month period).

<b>Other impacts</b>		
Regulatory Costs	+/-	This option will not have a significant effect on the administrative burden of institutions as it will reflect existing practice in 26 of the 28 Member States. A marginal increase of aggregation cases and the corresponding regulatory costs may occur in those Member States that today require a longer period of work than one day before aggregation of previous periods of employment can take place (Denmark and Finland).
Risk of fraud and abuse	-	In principle, the requirement of one day of employment may be used by some mobile workers or employers to engage in bogus employment, although there is no evidence in this respect.
Fair burden sharing between Member States	-	This option does not contribute to a fairer sharing of burden between Member States as a Member State may become responsible for providing unemployment benefits even in cases where they have received a relatively (very) small part of the social security contributions.
Mobility	0	In terms of mobility flows, it is estimated that a formalisation of the "one day rule" could result in a negligible increase in workers and jobseekers movements towards those countries that today require a longer period of work than one day before aggregation of previous periods of unemployment can take place. Considering the low number of aggregation cases even in countries that apply the one day rule, the increase in flows is expected to be very limited. <sup>172</sup>
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the <b>aggregation and calculation rules</b> reflecting the degree of integration in the Member State.</li> <li>• Ensure mobile EU workers benefit from <b>protection of rights</b></li> <li>• Ensure a proportionate distribution of financial burden between Member States</li> </ul>	-	This option introduces legal clarity and simplicity for unemployed persons and is easy to implement from an administrative point of view for the majority of Member States. It also has negligible budgetary impact. On the other hand; it fails to require a genuine link with the unemployment insurance system in the State of last activity. This option in itself is therefore not the most effective option to strike a balance between the aims of protecting mobile workers and requiring a certain degree of integration in the labour market and insurance system of the State of last activity, before it becomes responsible for the payment of benefits. It is neutral in relation to coherence with wider EU policy objectives.

<sup>172</sup> See table 3.1.1, Annex XIX.

5.2.6.4 Impacts of Policy Option 2: Introduction of a minimum period of insurance or (self)-employment of one month (sub option 2a) or three months (sub option 2b)

Policy Option 2: Introduction of a minimum period of insurance or (self)-employment of one month (sub option 2a) or three months (sub option 2b)		
<b>Social impacts</b>		
Clarification	+	Clarity of the legal rule on aggregation will be improved by eliminating the divergent interpretations.
Simplification	+	A uniform interpretation of the rules on aggregation will contribute to simplifying the aggregation procedure for the institutions concerned as they will all apply it as from the same moment. A limited number of Member States (Denmark, Finland) would have to change their national legislation. A small number of citizens, who do not have the requisite minimum period of insurance may experience a change in the competent Member State responsible for their unemployment benefits as competence would revert to the Member State of previous activity. However, such administrative arrangements would be largely dealt with by the competent institutions.
Protection of rights	+	Uniform application of the principle, that aggregation takes place after one month (option 2a) or three months (option 2b) of insurance, employment or self-employment in the competent Member State can affect those mobile EU citizens who claim their right to unemployment benefits within a period of one (option 2a) or three (option 2b) months. As a consequence, a group of 6.742 (1month) or 10.082 (3 months) mobile EU workers concerned would not be entitled to unemployment benefits in the last State of activity as long as they have not fulfilled this minimum period meaning they would have no right to unemployment benefits from the competent State. This would negatively affect their right to free movement.  However, this disadvantage will to a large extent be compensated by an export of unemployment benefits from the Member State of previous activity.
<b>Economic impacts</b>		
Financial impact	+/-	This option is likely to entail a slight increase of expenditure for the Member States of previous employment (to a larger extent under sub option 2b than under sub option 2a), but a corresponding decrease of expenditure for the Member States of last activity (37% for option 2a vs 51% for option 2b). Overall, there will be a positive impact with a decrease of the expenditure of €21 million (22%) for 2a) and of approximately € 29 million (42%) for 2b) <sup>173</sup>  The most significant reductions will occur in Belgium (€ 6.8 million

<sup>173</sup> This is based on a calculation of €51 million (€36 million for workers with less than 30 days of insured work + €15 million workers with less than 3 months who will not fulfil the minimum period for aggregation minus €22 million (amount to be paid by the previous Member State responsible for unemployment benefits considering a 3 month entitlement (see Annex XIV Table 16).

		<p>for 2a and €12.8million for 2b ), Spain (€ 3.1 million for 2a and €4.5million for 2b) and France (€ 25 million for 2a and €33 million for 2b)<sup>174</sup>, being the Member States with currently the highest number of aggregation cases.</p> <p>While increases in public employment expenditure in the Member States of previous employment: of € 3.4 million in respect of option 2a and €6.5 million in respect of option 2b (both calculations assuming an entitlement for 3 months), with the Netherlands (€ 1 million in respect of option 2a and €2million in respect of 2b ) and France (€ 0.4 million in respect of 2a and €0.6 million in respect of 2b) being the most affected countries<sup>175</sup>.</p> <p>Furthermore, there could be a shift in the competence for other social security benefits (in particular for family and sickness benefits) for the 6,471 (one month) or 10,082 (3 months) cases from the Member State of last employment to the Member State of previous employment. However, insufficient data is available to quantify the economic impact resulting therefrom.</p>
Impact on fundamental rights	+	<p>Under option 2, the rights of mobile EU workers will be protected through securing export from the previously competent Member State. Limiting the time for the export of unemployment benefits is one of the conditions which are permitted<sup>176</sup>. In terms of respecting the principle of proportionality, the introduction of a minimum period of work and (self-) employment the objective of establishing a sufficient link to the social security system of the host Member State<sup>177</sup> is balanced with safeguards to ensure continuity of protection for the worker.<sup>178</sup> The right to property (Article 17) is respected by ensuring that the person can receive unemployment benefits from the previously competent Member State, at least during the period of export.</p>
<b>Other impacts</b>		
Regulatory Costs	+/-	<p>This sub option does not impose new information obligations on unemployed persons or require new implementing arrangements for the institutions. It does however result in shifting the responsibility between Member States. Where previously an unemployed mobile EU worker could apply for aggregation in the State of last activity to claim unemployment benefits there, he/she now needs to apply for an export of unemployment benefits from the previously competent Member State. To that end there may be additional administrative tasks for the respective Member States of most recent employment and previous employment.</p> <p>On the basis of the interviews conducted with national administrations, it is estimated that the administrative tasks for the institutions of the Member State of last employment would remain almost unchanged. Interviewees from Germany, Denmark, Netherlands and United Kingdom expect a reduction in the number of cases – see also <i>mobility</i> below – which would translate into a</p>

<sup>174</sup> Tables 10, 11 and 14 Annex XIV.

<sup>175</sup> Tables 12 and 15 Annex XIV.

<sup>176</sup> Joined cases 41/79, 121/79 and 796/79, *Testa*, EU:C:1980:163, paragraph 14.

<sup>177</sup> Case C-62/91, *Gray*, EU: C:1992:177, paragraph 12.

<sup>178</sup> In terms of respecting equal treatment and the right to free movement under Article 45 of the Charter as well as Article 45 TFEU, the Court of Justice has held that the legislator can attach conditions to the rights granted by Article 45, as long as mobile workers are not put at an unjustified disadvantage in comparison to national workers, for example where they will have to pay social security contributions in which there is no return..

		<p>marginal reduction of the total regulatory costs in Germany (€300 for option 2a and €400 for 2b), Denmark (€200 for 2a and 2b) and Poland (€350 for 2a and €2700 for 2b)<sup>179</sup>.</p> <p>In the Member States of previous employment, a corresponding increase is to be expected, though it was not possible to quantify it<sup>180</sup>.</p>
Risk of fraud and abuse	+	In particular option 2b ensures a clearer link between the State responsible for awarding benefits and where contributions have been paid, but could also provide for an incentive to accept part-time or low-paid employment in the Member State of last activity just for the purpose of being able to claim unemployment benefits.
Fair burden sharing between Member States	++	This option – in particular sub option 2b - contributes to a fairer sharing of burden between Member States as their institutions become responsible for providing unemployment benefits only to those mobile workers who had been a member of the scheme and who had therefore contributed to the financing of the scheme for a substantial period. In comparison to the baseline scenario, a reduction of approximately € 3.6 million (37%) in the expenditure for unemployed benefits for people needing aggregation for 23 reporting Member States can be estimated.
Mobility	0	An estimation (on the basis of the case studies aimed at measuring the effects generated by this option in terms of intra-EU mobility) <sup>181</sup> , which did not take into account the fact of making the Member State of previous employment competent, concluded that a reduction in the mobility flows could occur, notably towards Denmark (up to 6%), Italy (up to 4.5% for 2a and 6% for 2b), France (up to 2.5% for 2a and 3.4% for 2b) and Germany (up to 2.5% for 2a and 3.3% for 2b). In the United Kingdom, the impact of option 2a could be rather moderate (a decrease of 0.6%) <sup>182</sup> . These results are driven by the country-specific figures on migration flows, average levels of unemployment benefits and income differentials <sup>183</sup> . However, these reductions are likely to disappear if, as proposed now under this option, the Member State of previous employment would become responsible for paying unemployment benefits. <sup>184</sup>
Coherence with General, Specific and wider EU Objectives:	+	<p>This option (whether applied for one or three months) more effectively strikes a balance between the protection of workers and the protection of unemployment insurance schemes in the Member State of last activity as they require a certain degree of integration in the labour market and the insurance system of the State of last activity before benefits become due. This applies in particular for option 2b. The rights of the workers remain safeguarded if they become entitled to unemployment benefits from the Member State of previous activity although such export shall be limited to a period of six months.</p> <p>Both options are coherent with the wider EU objective of supporting</p>
<p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative</p>		

<sup>179</sup> Tables 3-1, 3-2, 3-3 and 3-4, Annex XVII.

<sup>180</sup> Page 23, Annex XVII. However, it was possible to quantify (minimal) changes for the Member State of previous employment, but only for the previous version of the option, which did not foresee the Member State of previous employment becoming competent for unemployment benefits: see Tables 3-5, 3-6, 3-7, 3-8, Annex XVII.

<sup>181</sup> Annexe IV, XIX. This analysis was based upon Behavioural (dis)incentives to move to another Member State to take up employment there can be linked to the costs of moving, the (long-term) perspective of staying in employment in the new Member State set off against the risk of falling unemployed and the level of benefits in the previously competent Member State.

<sup>182</sup> Figure 4.1, Annex XIX.

<sup>183</sup> Page 22, Annex XIX.

<sup>184</sup> Pages 29-30, Annex XIX.

<p>simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the <b>aggregation and calculation rules</b> reflecting the degree of integration in the Member State.</li> <li>• Ensure mobile EU workers benefit from <b>protection of rights</b></li> </ul> <p>Ensure a proportionate distribution of financial burden between Member States</p>		<p>fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union.</p>
---	--	--

*5.2.6.5 Impacts of Policy Option 3: Taking into account previous earnings if a person has worked less than one month (sub-option 3a) or three months (sub-option 3b) in the competent Member State*

<b>Policy Option 3: Taking into account of previous earnings if a person has worked less than one (sub option 3a) or three months (sub option 3b) in the competent Member State</b>		
<b>Social impacts</b>		
Clarification	+/-	Clarity of the legal rule on aggregation will be improved in combination with the baseline scenario.
Simplification	+/-	In combination with the baseline scenario, a uniform interpretation of the rules on aggregation will be achieved. On the other hand, the options would also result in an increase in the administrative burden for workers applying for unemployment benefits, as they would have to wait longer before receiving benefits, and they would face increased requirements to provide the relevant information themselves.
Protection of rights	+/-	This can be to the advantage of the unemployed person concerned, for example when he or she moves from a Member State with a higher wage to a Member State with a lower wage. But it could also cause a disadvantage in the reverse situation, where the worker could be faced with a lower level of unemployment benefits but is residing in a Member State with a comparatively higher cost of living. However, there is a risk that the additional information exchanges between Member States required to determine the correct salary may lead to delays for the determination of the average level of reference earnings and payment of benefits to the disadvantage of the unemployed person.
<b>Economic impacts</b>		
Financial impact	-	<p>Option 3a would result in a reduction of 3.2% of the budget devoted to the aggregation of unemployment benefits in comparison to the baseline scenario for the 14 reporting Member States; option 3b would result in a reduction by 4.1% in the budget devoted to the aggregation of unemployment benefits.</p> <p>It would have a positive budgetary impact on Belgium (€ 1.4 million</p>

		<p>for 3a or € 2.3 million for 3b), Denmark (€ 80.000 for 3a or €78.000 for 3b), the Netherlands (€26.000 for 3a or €40.000 for 3b) and Finland (€34.000 for 3a or €90.000 for 3b), being Member States with a higher level of wages, compared to the Member States where the mobile EU workers were previously working. There could be a negative financial impact for Bulgaria (€ 36.000 for 3a or €230.000 for 3b), Latvia (€ 5.000 for 3a and 3b), Hungary (€ 5.000 for 3a or €6.000 for 3b), Slovakia (€ 200.000 for 3a or €370.000 for 3b) and Sweden (€25.000 for 3a and €50.000 for 3b), as relatively low wage Member States, compared to the Member State of previous employment.</p> <p>There would be no impact for those Member States which do not use previous earnings as reference for the calculation of unemployment benefits.<sup>185</sup></p>
Impact on fundamental rights	+	<p>These options aim to facilitate the exercise of to the right to engage in work in another Member State (Article 15 of the Charter), as well as to take a balanced approach to free movement and the right to social security (Articles 34 and 45 of the Charter). Taking into account a previously earned salary or professional income does not compromise the right to equal treatment (Article 21 of the Charter), as the unemployment benefit paid to national workers is generally calculated over their average income during a certain reference period. The right to property (Article 17 of the Charter) is also respected as this sub option does not affect the entitlement to unemployment benefits as such.</p>
<b>Other impacts</b>		
Regulatory Costs	-	<p>These option will have a significant effect on the administrative burden of institutions, as they may become obliged to deal with a variety of different salary statements of other Member States and to interpret the content thereof. The options would also lead to an increase in man hours devoted to collect information on the income earned in the previous Member State and to calculate the amount of unemployment benefits. It is estimated that there will be an increase by 28-9% in the administrative tasks of Member States of last employment, mainly due to an increase in man hours devoted to collect information and calculate unemployment benefit.</p> <p>This may translate into an increase in the total annual cost of handling aggregation of unemployment benefits for Germany (€ 8,700 for 3a or €43,000 for 3b), Denmark (€ 700 for 3a or €900 for 3b) and the Netherlands (€ 1,300 for 3a or €1000).<sup>186</sup></p> <p>Also, a further increase could be expected for Germany (€ 4,800 for 3a and b) and Denmark (€ 900 for 3a and b) which as Member State of previous employment have to provide the Member State responsible for aggregating periods and calculating the unemployment benefits with additional information.<sup>187</sup></p> <p>This option would also result in an increase in the administrative burden for workers as they would face increased requirements to provide the relevant information themselves<sup>188</sup>.</p>

<sup>185</sup> Ireland, Malta, Poland and the United Kingdom.

<sup>186</sup> Tables 3-1, 3-2, 3-3 and 3-4, Annexe XVII.

<sup>187</sup> Tables 3-5, 3-6, 3-7, 3-8, Annexe XVII.

<sup>188</sup> Page 25, Annexe XVII.

Risk of fraud and abuse	+	From the point of view of the Member States, changing to the calculation mechanism in such a way could contribute to reducing 'possible' artificial conduct to obtain an unfair advantage <sup>189</sup> . On the other hand, this sub option could also provide a disincentive for a person to accept employment in a lower wage Member State if this person receives an unemployment benefits which are based on a much higher salary or professional income. <sup>190</sup>
Fair burden sharing between Member States	-	This option does not contribute to a fairer sharing of burden between Member States. Although it could for higher wage Member States mean that the amount of the unemployment benefits would be lower, lower-wage Member State may be required to pay a higher amount than under national law. This may also happen in cases where the beneficiaries have paid a relatively small part of the contributions.
Mobility	-	A moderate reduction in the mobility flows could occur as a result of this option, notably in Denmark (up to 1.9% for 3a and b) and in Italy (up to 1.7% for 3a and 2.2% for 3b) <sup>191</sup> . These results mainly concern flows of mobile EU citizens coming from Poland and Romania towards Germany, Denmark, Italy, the Netherlands and the United Kingdom and coming from the United Kingdom, Germany and Italy towards France. <sup>192</sup>
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the <b>aggregation and calculation rules</b> reflecting the degree of integration in the Member State.</li> <li>• Ensure mobile EU workers benefit from <b>protection of rights</b></li> <li>• Ensure a proportionate distribution of financial burden between Member States</li> </ul>	0	Options 3a and b aim at establishing a better reflection of the previously earned reference salary or professional income in calculating the level of the unemployed benefits. Thereby would avoiding 'random' results in levels of unemployment benefits based on extreme short periods of insurance which disrupt the balance of financial burden. However, they would also entail an increase of regulatory costs, as it would require more exchange of information between the institutions of the Member States to receive information on the last earned salary or professional income, and would thus lead to potential delays in providing the unemployment benefits to the detriment of workers' rights. In addition, these options would possibly provide a financial advantage only for Member States with a high level of earnings, not for those with a comparatively lower wage level. The uncertain outcomes means this option therefore may be considered less coherent with the wider EU objective of supporting fair mobility and increasing access to employment opportunities throughout the Union.

<sup>189</sup> See Annex VII, p. 47.

<sup>190</sup> It is true that the same could occur under option 2, if benefits calculated on the earnings received in the previous Member State are paid. However, such a payment would only be made for the limited export period of three or six months, whereas option 3 would entail a payment based on those earnings for the whole period of entitlement.

<sup>191</sup> Figure 4.1, Annex XIX. These can be explained by the differences in average earnings in the Member State of origin compared to the Member State of destination and average levels of unemployment benefits p26-29 Annex XIX.

<sup>192</sup> Pp. 26-29, Annex XIX.

5.2.6.6 Impacts of Horizontal Policy Option: Clarification regarding the recognition of periods for the purpose of aggregation

<b>Horizontal Policy Option: clarification regarding the recognition of periods for the purpose of aggregation of periods of insurance, employment or self-employment</b>		
<b>Social impacts</b>		
Clarification	+	Clarity of the legal rule on aggregation will be improved by eliminating the complications introduced by divergent interpretation of the rules.
Simplification	+	Whilst differences between the nature of the periods continue to exist, a uniform interpretation of the rules on aggregation will contribute to simplifying the aggregation procedure for the institutions concerned.
Protection of rights	+/-	A uniform application of the rules on aggregation would partially improve the protection of rights. It would ensure equal treatment in all cases where the rules will have to be applied and there is no risk that a person might lose out on rights due to existing different interpretations. On the other hand, if it were to be decided that periods of (self-) employment are only those periods that provide for cover under the legislation of the Member State in which they were fulfilled, this means a restriction in comparison to the baseline scenario (although this restriction is already applied by a majority of Member States). Nevertheless, the person that pursues an activity which does not afford any cover under an unemployment scheme in the competent State does not (and cannot) have any legal expectation that such period should give rise to an entitlement to unemployment benefit from an unemployment scheme of a different State. On the contrary, the result that such uninsured period will not be taken into account by any other State preserves the principle of equal treatment and puts national and mobile workers on exactly same footing.
<b>Economic impacts</b>		
Financial impact	0	This option will not have a substantial budgetary impact for Member States. If there is any marginal impact to be noticed, this would be positive. The social security coordination provisions will take into account insured periods only reflecting contributions or levies paid to the social scheme or public finance.
Impacts on fundamental rights	0	As regards option 3, taking into account a previously earned salary or professional income does not compromise the right to equal treatment (Article 21), as the unemployment benefit paid to national workers is generally calculated over their average income during a certain reference period. The right to property (Article 17) is also respected as this sub option does not affect the entitlement to unemployment benefits as such.

<b>Other impacts</b>		
Regulatory Costs	+	The impact is expected to be positive, as Member States will not be required to investigate periods of insurance not normally recognised or recorded under their national legislation. Thereby the clarification could lead to fewer disputes between Member States.
Risk of fraud and abuse	+	The clarification reduces the risk of abuses claims made with reference to periods of employment in respect of which no record exists.
Fair burden sharing between Member States	+	This option could contribute to a fairer sharing of burden between Member States if it were clear that all periods under all circumstances need to confer an entitlement to unemployment benefits in the country in which they are fulfilled.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the <b>aggregation and calculation rules</b> reflecting the degree of integration in the Member State.</li> <li>• Ensure mobile EU workers benefit from <b>protection of rights</b></li> <li>• Ensure a proportionate distribution of financial burden between Member States</li> </ul>	+	The horizontal option responds to the general objective as it provides for a clear and uniform rule for the recognition of periods completed in another Member State for aggregation purposes. the purpose of aggregation providing ention the acquisition of unemployment benefits. This option is also considered efficient and coherent with the wider EU objective of supporting fair mobility and increasing access to employment opportunities throughout the Union.

### 5.2.7 Conclusions

The baseline scenario, from a merely administrative point of view, is the easiest option to implement and it has the support of a large number of stakeholders. It can however lead to uneven results when it comes to the protection of the mobile EU worker due to the unilateral introduction of minimum periods of insurance or (self-)employment by some Member States. The fact that the requirement of a 'genuine' link with the unemployment insurance system and labour market of a Member State is not explicitly expressed in the current rules may lead to unintended gains.

Option 1 introduces legal clarity and simplicity for unemployed persons and is relatively easy to implement from an administrative point of view for the majority of Member States. It also has a minor budgetary impact only for those Member States which currently apply a minimum period of insurance

or (self-)employment. On the other hand, it fails like the baseline scenario to require a genuine link with the unemployment insurance system in the State of last activity. Eight delegations<sup>193</sup> have expressed in the Administrative Commission the view that they could accept option 1 if in return the calculation rule would be amended, or vice versa, as either one of the rules is needed to establish a 'genuine link' with the unemployment insurance system. This option in itself is therefore not the most effective option to strike a balance between the aims of protecting mobile workers and requiring a certain degree of integration in the labour market and insurance system of the State of last activity, before it becomes responsible for the payment of benefits. It is neutral in relation to coherence with wider EU policy objectives.

Options 2a and 2b more effectively strike a balance between the protection of workers and the protection of unemployment insurance schemes in the Member State of last activity as they require a certain degree of integration in the labour market and the insurance system of the State of last activity before benefits become due. This applies in particular for option 2b. The rights of the workers remain safeguarded if they become entitled to unemployment benefits from the Member State of previous activity although such export shall be limited to a period of six months. Taking into account the relative costs compared to the effectiveness of achieving objectives option 2b offers superior efficiency to option 2a (both are more efficient than the baseline). The idea to introduce a reimbursement mechanism instead has been discarded, as the current problems with the reimbursement mechanism for unemployed frontier workers show that such a mechanism is likely to create disputes and delays between the institutions involved. Both options are coherent with the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union.

Options 3a and 3b aim at establishing a better reflection of the previously earned reference salary or professional income in calculating the level of the unemployed benefits. They would avoid 'random' results in levels of unemployment benefits based on extreme short periods of insurance. However, this aim would be achieved in a less effective and efficient way than under option 2<sup>194</sup>. They would also entail an increase of regulatory costs, as it would require more exchanges of information between the institutions of the Member States to receive information on the last earned salary or professional income, and would thus lead to potential delays in providing the unemployment benefits. In addition, these options would possibly provide a financial advantage only for Member States with a high level of earnings, not for those with a comparatively lower wage level. The uncertain outcomes means this option therefore may be considered less coherent with the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union.

The horizontal option responds to the general objective as it provides for a clear and uniform rule for the recognition of periods completed in another Member State for aggregation purposes. Taking into account the negligible anticipated costs of this option compared to the potential success in realising objectives this option is also considered efficient and coherent with the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union.

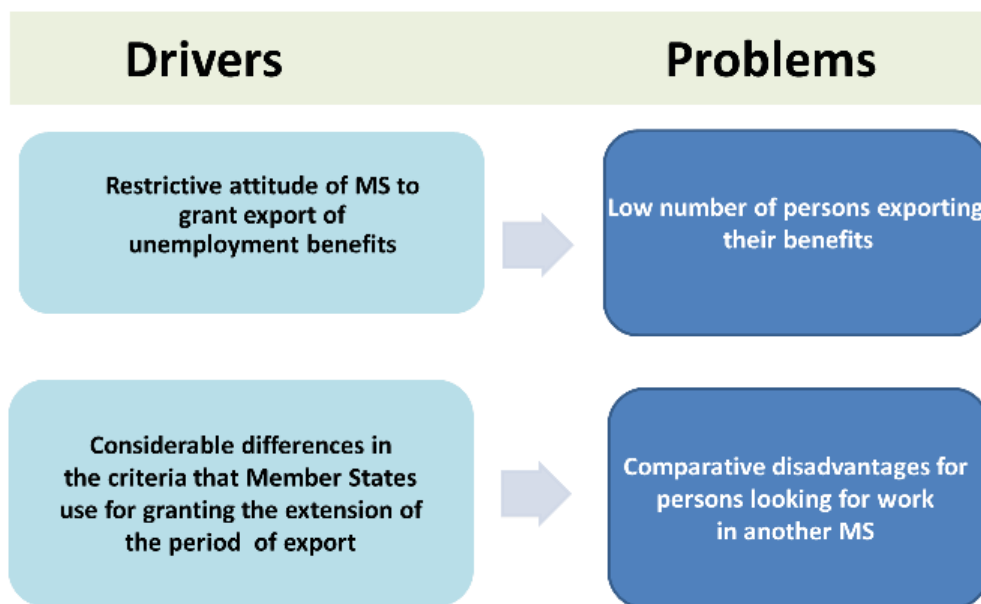

### 5.3. Export of Unemployment Benefits

#### 5.3.1 *Problems with the limited export of unemployment benefits and drivers behind them*

---

<sup>193</sup> The Bulgarian, Italian, Portuguese, Belgian, Estonian, Irish, Polish and Swedish delegations.

<sup>194</sup> It should be borne in mind, that unemployment benefits paid by the Member State of previous activity in accordance with options 2 are also calculated on the basis of reference earnings received in those States, and not on the earnings received for only a short period in the Member State of last activity.

*5.3.1.1 There are currently low numbers of persons exporting their unemployment benefits and the period of export does not give a realistic chance for a jobseeker to find work in another Member State*

A worker who has acquired an entitlement to unemployment benefits has a right to look for a job in another Member State while retaining the unemployment benefit for a limited period of time. Under the current rules the period of export is limited to a minimum of three months and a maximum of six months.

The right to export unemployment benefits is either certified by the Portable Document U2 (PD U2 – *Retention of unemployment benefits*) or at request of the institution in the host State by the Structured Electronic Document U008 (SED U008). Statistical data about the number of PD U2/SED U008 issued<sup>195</sup> shows that the mobility of jobseekers is rather limited, because only approximately 27.000 unemployed persons have exported their unemployment benefits in 2013 and in 2014<sup>196</sup> representing on average only 1 out of 1.000 unemployed persons received this document in 2013 and in 2014. Spain (3,128), Portugal (1.751), Germany (± 1.600) and France (1.510) issued the highest number of PD U2 during the second semester of 2013, whereas Malta (6) and Romania (3) issued the fewest.

There is anecdotal evidence that the period of three months generally considered too short to respond to the aspiration of unemployed persons that they will find abroad. Nine individual respondents to the public consultation had requested the export of unemployment benefits at some point in their lives.<sup>197</sup> Out of these nine, five reported problems when asking to receive their benefits abroad. In the public consultation, a mobile worker living in Sweden and with a full-time job pointed out that “With the current high unemployment and fierce competition it is almost impossible to find a job in 3 months, considering you have to create a new network, learn a new language, get into a new culture and the society as a whole. I would really like to see the rules changed to be the same for every Member State concerning exporting / receiving unemployment benefit for at least 6 months.”

<sup>195</sup> Pacolet, J. and De Wispelaere, F., Export of unemployment benefits – PD U2 Questionnaire, Network Statistics FMSSFE, European Commission, June 2014, p25.

<sup>196</sup> Pacolet, J. and De Wispelaere, F., Export of unemployment benefits – PD U2 Questionnaire, Network Statistics FMSSFE, European Commission, June 2014, 25 p.

<sup>197</sup> A public consultation between December 2012 and February 2013 invited citizens and organisations to provide their views on the main problems linked to the export of unemployment benefit.

There is also statistical evidence that a prolongation of the export period is likely to enhance the chances of the unemployed person to find a job. The available statistical data show an average success rate between 11% (average percentage of the reporting sending Member States) and 8% (average percentage of reporting receiving Member States). The figures also show an increase of the total success rate by 3 percentage points in case a prolongation was granted.<sup>198</sup>

Drivers behind these problems are that Member States do not consistently promote the right to export unemployment benefits. Under the current rules, the competent institution can decide if, depending on the circumstances of the case, an extension of the export period of another three months will be granted. Currently nine Member States structurally do not grant an extension of the export period,<sup>199</sup> even if this would increase the person's chances of finding employment in one of these Member States.

Furthermore, the negotiations in Council on the Chapter on Unemployment Benefits in the coordination Regulations showed that Member States are reluctant to grant a prolonged export of their unemployment benefits. This is not only due to considerations of financial interests, but also by concerns regarding the possibilities to supervise the jobseeking activities of the unemployed person. One of the drivers for the more stringent attitude of some countries seems to be inspired by (potential) difficulties in the mutual cooperation between Member States for monitoring the person's jobseeking activities, as well as the fear that the person is not genuinely looking for work. These factors seem to be mutually reinforcing and give a clear signal that the mutual cooperation mechanism needs to be strengthened. This is also confirmed by the online consultation by Deloitte Consulting<sup>200</sup> which shows that the current cooperation mechanism is not regarded as a sufficient safeguard that all necessary checks are performed due to the fact that employment services in the host State have no financial incentive to verify jobseeking efforts undertaken by those unemployed persons. Member States find it much more difficult to trust information confirming active jobsearch from foreign employment services institutions than from their own institutions. Public authorities in Austria, Czech Republic, Hungary, Italy, Lithuania, the Netherlands, Poland and Portugal who believe that the export of unemployment benefits could lead to increased risk of misuse of rights, proposed, among other measures, that the host Member State should assume more responsibility for jobseekers who have exported their unemployment benefit from another Member State.<sup>201</sup>

However, there is no evidence<sup>202</sup> that points to a wide-scale abuse of the system. The Final Report of the Ad-hoc Group on Combatting Fraud and Error through the exchange of personal data within the framework of the Administrative Commission<sup>203</sup> shows that difficulties and obstacles in exchanging data do not derive from the Regulations, but are rather due to a lack of cooperation, prioritisations, long delays in answering and fragmented replies, as well as to limitations in domestic law in certain Member States to exchange personal data with institutions across the border. It is anticipated that these issues will be greatly reduced by the introduction of the Electronic Exchange for Social Security Information (EESSI) scheduled for launch by the end of 2016 with a deadline for full implementation in all Member State by the end of 2018 which will introduce common structured electronic documents and a uniform procedure for all national authorities to follow when processing claims for social security benefits has the potential to address the concerns raised by competent Member States concerning the need to monitor a jobseeker's compliance with active labour market requirements when seeking work in another Member State.<sup>204</sup>

Increased mobility can play a key role in tackling EU-wide unemployment. Whilst some areas of the EU are experiencing an acute unemployment crisis, there exist about 2 million positions that have

<sup>204</sup> Annex VI, p17.

remained unfilled for a significant period of time, according to information by the EURES network. Export of unemployment benefit allows a citizen to search for work in another Member State without becoming a burden to the social security system of that State. Instead, they continue to receive benefits to which they contributed in their 'home' Member State. The consequences of the comparatively small percentage of persons using the possibility to look for employment in another Member State points very clearly that the current rules are not achieving their full potential. EU rules on export and coordination should take this into account, whilst at the same time recognising the concerns of Member States in this respect.

### *5.3.1.2 Member States apply inconsistent criteria in determining whether to grant the extension of the export period leading to comparative disadvantages for persons looking for work in another Member State*

Under the current rules Member States have a discretion to determine whether they export unemployment benefits only for the minimum period of three months or the maximum period of six months. However, the restrictive attitude from Member States towards granting export in general is also reflected in granting an extension of the export period beyond three months. The results of a survey carried out by the trESS network<sup>205</sup> and a questionnaire launched within the framework of the Administrative Commission<sup>206</sup> show that still a considerable number of Member States do not let their institutions make use of this discretion at all, or only exceptionally:

- 3 months, no extension: Cyprus, Denmark, Finland, France, Croatia, Greece, Sweden, Hungary, Italy, Ireland, the Netherlands and the United Kingdom;
- 3 months, possibility to extend: Austria, Belgium, Bulgaria, Spain, Germany, Luxembourg, Malta, Romania, Estonia, Latvia, Lithuania, Slovenia, Slovakia, Poland, Portugal;
- 6 months by default<sup>207</sup>: Czech Republic and Malta.

The main reasons for not granting an extension of the export period vary as well. Sometimes, the national legislation does not allow for an extension or does not contain any criteria for granting an extension (e.g. the United Kingdom). Other Member States have developed their own criteria. In Germany for example, the expected national demand for labour in the coming months, the individual reasons for a preferred work abroad and better integration opportunities are taken into account in the decision of whether to extend the export period.

Luxembourg and Romania grant the extension every time upon an individual request. In some Member States, such as Belgium, the extension of export is exceptional and can only be granted if there is proof that the intensive search for employment and a further stay are indispensable in the light of ongoing applications. Similarly, the Austrian institutions request proof of whether there is a job offer available in the home country before granting an extension and the Spanish authorities ask the unemployed person to prove that he or she is likely to find work during the extended period. Also, Latvia, Lithuania, Estonia, Slovenia, Bulgaria and Slovakia examine every case individually after the expiry of the the three months of export.

Unemployed persons in countries which never grant an extension of the period of export are put at a disadvantage compared to those who get their benefit from more 'generous' institutions. They therefore have more limited support in their search for work in another Member State.

The consequence of this problem is that there is inconsistent treatment of applications to extend the period of export of unemployment benefits across the EU and mobile jobseekers face inconsistent treatment when they seek work in another Member State depending on which Member State is

<sup>206</sup> Pacolet, J. and De Wispelaere, F., Export of unemployment benefits – PD U2 Questionnaire, Network Statistics FMSSFE, European Commission, June 2014, 25 p.

<sup>207</sup> i.e. PDs U2 had immediately been granted for the maximum period from the outset.

competent for payment of the unemployment benefits. Once again this suggests the EU social security rules are not achieving their full potential to support the internal market by facilitating intra-EU mobility in particular to target asymmetrical spikes in unemployment or to address skills mismatches or shortages in skilled workers.

### 5.3.2 Baseline scenario

There are about 24.000 persons exporting unemployment benefits to another Member State, representing only 0.1% of all unemployed persons in the EU<sup>208</sup>. Only limited data is available on the countries to which unemployed persons export their benefits in table 65 in Annex V.<sup>209</sup> From that table it follows that persons mainly apply to export their benefits to a neighbouring country. For example, Belgium issued the highest number of PD U2 forms for persons moving to France. Unemployed persons in Poland, Denmark and the Netherlands tend to look for work in Germany. The United Kingdom is also a preferred destination of jobseekers, most probably for linguistic reasons. On the basis of the current spread over the destination countries, a large influx of unemployed persons in either of these countries not to be expected.

Based on the projections of the 2015 Ageing report, assuming that the unemployment rate in the EU will diminish between 2015 and 2020, and assuming that the rate of unemployed persons exporting unemployment benefits will remain stable at 0.1%, then we could expect that the number of people exporting unemployment benefits when moving abroad under the current scenario would decrease to around 23,000 in 2020 and 19,000 in 2030. However, as this report only describes the effect of the demographic development and as other factors such as the general evolution of the economy in the different Member States has a more decisive impact on the rate of unemployment and on movements of unemployed persons between Member States, these projections alone do not necessarily present the likely future trends in this area.

Providing the right to export unemployment benefits is, in itself, not sufficient to encourage people to work where they are most needed, or where the chances of finding a job are higher. A person's motivation to move is always a combination of 'push factors' in the home country and 'pull factors' in the receiving country. The decision to move is inspired by better prospects for the future and the potential costs are carefully weighed against the knowledge of the potential costs associated with the migration<sup>210</sup>. If we look at the reasons to move for unemployed persons, 24% declared that they wish to move to a particular country due to the employment opportunities there, while 43% wish to earn more money.<sup>211</sup>

Not undertaking action in the field of export of unemployment benefits would maintain the current divergences as regards the application of the existing rules. It would also stifle the mobility of jobseekers between national labor markets and not only deprive them of a chance of finding more suitable employment, but also the Member States of a chance to fill in persistent vacancies and to even out skill mismatches.

The Electronic Exchange for Social Security Information (EESSI) scheduled for launch by the end of 2016 with a deadline for full implementation in all Member State by the end of 2018 which will introduce common structured electronic documents and a uniform procedure for all national authorities to follow when processing claims for social security benefits has the potential to address the concerns raised by competent Member States concerning the need to monitor a jobseeker's

<sup>209</sup> See also Pacolet, J. and De Wispelaere, F., Export of unemployment benefits – PD U2 Questionnaire, Network Statistics FMSSFE, European Commission, June 2014, 25 p. However, no data with regard to the bilateral flows between Member States are available. Different reasons to export the unemployment benefit might appear (a lower unemployment rate compared to the competent Member State, familiarity with the Member State where looking for employment, 'return' of the mobile worker to his/her country of birth etc.).

compliance with active labour market requirements when seeking work in another Member State. Electronic exchange will provide a more consistent and efficient means for Member States to cooperate and exchange information in cases of export of unemployment benefits.<sup>212</sup>

### 5.3.3 Objectives for review on the export of unemployment benefits

The **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further enabling the citizens to exercise their rights while at the same time ensuring legal clarity and a fair and equitable distribution of the financial burden among the institutions of the Member States involved.

In relation to the rules on export of unemployment benefits, this means in particular to ensure that jobseekers can benefit from the opportunities of the European labour market and exert their right to free movement without having to fear a loss of their benefit entitlements. As long as they can enjoy their acquired rights to unemployment cash benefits, they are less likely to become a burden on the welfare system of the host Member State to which they went in order to seek employment there. It also generally supports financial equilibrium within the internal market by serving to mitigate cyclical adjustment measures in response to asymmetric shocks<sup>213</sup> spikes in unemployment and skill mismatches between Member States.<sup>214</sup>

In view of this general objective, the **specific objective** in this field can be defined as follows:

- **Protection of rights** of unemployed persons when they move to another Member State to take up employment there.
- **Promotion of integration** of unemployed persons **into the labour market across the EU.**
- Provision of a **systematic and easy to administer cooperation and control mechanism** in order to monitor the fulfilment of their rights and obligations.

<sup>214</sup>ESDE 2015.

### 5.3.4 What are the various options to achieve the objectives concerning the export of unemployment benefits?

#### 5.3.4.1 Option 0: baseline scenario

Under the status quo, export of unemployment benefits can be granted for a period of three months with a possibility for extension of up to six months.

#### 5.3.4.2 Option 1: Extend the period for export of unemployment benefits to a minimum period of 6 months (or end of entitlement period if shorter)

This option can be combined with the previous options as all unemployed persons have the opportunity to look for a job in another Member State while maintaining their right to unemployment benefits. Clear guidance, provided by the Commission, on the correct application of the export period of unemployment benefits could be helpful to attain more uniformity in the interpretation of this particular export rule.

The time limit of 6 months is chosen for several reasons and aims at increasing the number of persons exporting their benefit. The first one is the increased chances of finding a job after a period of 6 months. Based on figures provided by 9 Member States, the average success rate increases by 3 percentage points if an extension from 3 to 6 months is granted.<sup>215</sup>

<sup>215</sup> Pacolet, J. and De Wispelaere, F., Export of unemployment benefits – PD U2 Questionnaire, Network Statistics FMSSFE, European Commission, October 2015. Based on figures provided for 2014 on PDs U2 or SEDs U008 issued in the year 2014, they calculated an average total success rate, i.e. the percentage of unemployed persons exporting their unemployment benefit who have found work abroad of between 11% (average percentage of the reporting sending Member States) and 8% (average percentage of the reporting receiving Member States). This rate increases by 3 percentage points in case of prolongation of the export period up to 6 months.

The period of six months also coincides with the period that was seen as appropriate for a person to find a job independently of active labour market assistance<sup>216</sup>. It is also the time limit awarded to jobseekers under EU law<sup>217</sup> for having a right-to-reside as a jobseeker. An extension of the period will also be beneficial for the unemployed cross border workers who wish to return to their State of residence and look for work there.<sup>218</sup> It is also beneficial to mobile EU workers who have not completed a sufficient periods of insurance or (self-)employment to apply for aggregation of periods.<sup>219</sup> In addition, the competent institution paying the unemployment benefits can decide to extend export of unemployment benefits beyond the period of six months on the basis of an individual assessment of the chances and efforts made to find employment in another Member State.

#### *5.3.4.3 Option 2: Provide for export of unemployment benefits until the end of the entitlement period.*

This option stipulates that an unemployed person has the right to search for a job in another Member State and to receive unemployment benefits for as long as the entitlement to such benefits under national legislation of the competent Member State lasts. The availability for the labour market in another Member State should be considered parallel to the availability to the labour market in the competent Member State.

In relation to both options, ensuring improved support for Member States to address their concerns over the administrative burden caused by benefit coordination is important. Therefore in relation to both options extension of the export period will be coupled with a reinforced cooperation mechanism to facilitate the information exchange between Member States and to increase mutual trust over performing effective checks on the person's jobseeking activities. The verification procedure will consist of:

- a) The possibility to ask for 'ad hoc' checks by the employment services in the receiving State.
- b) Introducing a system of automatic reporting by the employment services in the 'receiving State' to the employment services of the competent Member State. An automatic process, expedited by EU law, could help to remove much of the problems quoted by administrations involving delays in receiving the information they need to verify jobseeking activities.
- c) Introducing a legal basis in Regulation (EC) No 883/2004 for "data matching" (i.e. the comparison of bulk data of insured persons). Such data transmission can take place in a case where there is no actual doubt about the accuracy of the information provided to enable Member States to identify any fraud or error in the proper implementation of the Regulations. For example, it allows Member State A to provide Member State B with personal data which Member State B will check against its own data in order to identify any inconsistencies which would affect the proper application of the Regulations. This "data-matching" may be used by Member States to identify whether there is fraud and error in the payment of unemployment benefits to persons living outside the paying State, by comparing lists of persons in receipt of such exported benefits living in State B against data held on persons in employment by that State.

Under this option, the delivery of support services to assist any person interested in matching, placement and recruitment through the EURES network can be an important complement to the person's jobseeking activities<sup>220</sup>.

<sup>219</sup> For more information about the rules that apply to aggregation of unemployment benefits see paragraph 5.2.

<sup>220</sup> Receiving assistance with matching, recruitment and placement for, including in gaining access to both active labour market measures and information and advice on social security as proposed in the Communication on the reformed EURES network.

### 5.3.5 Stakeholder Support on amending the rules on the export of unemployment benefits

#### 5.3.5.1 Option 1: Extend the period for export of unemployment benefits to a minimum period of 6 months

Based on the first consultation in the Administrative Commission of Member States' opinions as regards the extension of the export period, 8 delegations<sup>221</sup> have indicated to support his option. 16% of the individual respondents to the public consultation supported this option and no clear preference was identified among the respondents from social partners.

#### 5.3.5.2 Option 2: Provide for export of unemployment benefits until the end of the entitlement period

None of the experts within the Administrative Commission seemed to support this option explicitly. Three delegations<sup>222</sup> seemed flexible to introduce this option. The results of the online consultation by Deloitte Consulting show that 79% of the public authorities think that the risk of misuse or abuse of rights is particularly high if the unemployment benefits would be provided until the end of a persons' entitlement, according to the rule of the Member State which provides them.

On the other hand, it seems that almost 60% of the individual respondents to the public consultation support this option and 18% of the representatives of social partners.

All delegations recognised the importance of reinforcing the cooperation mechanism while keeping the administrative burden on an acceptable level.

#### 5.3.5.3 What are the impacts of the Different Options on the export of unemployment benefit

The options have been compared to the baseline scenario and with regard to their effectiveness in achieving the specific objectives of the initiative, their efficiency (cost-effectiveness/even burden sharing), coherence with the general objectives of the EU and their impacts as assessed above.<sup>223</sup>

Figures for all EU-Member States on the export of unemployment benefits have become available via the administrative PD U2 Questionnaire launched in 2015 within the framework of the Administrative Commission (for 2013). Additional data available for Belgium has been used to describe the impact of the prolongation period on finding a job abroad. Finally, figures of Eurostat (based on the LFS) were used to calculate the average duration of the unemployment period.

---

<sup>221</sup> Czech Republic, Luxembourg, Portugal, Italy, Malta, Slovakia, Slovenia and Romania.

<sup>222</sup> Czech Republic, Italy and Portugal.

<sup>223</sup> Secondary impacts are not considered in the final comparison in recognition of the limitations of the data available to conduct this assessment.

### 5.3.5.4 Summary of the impact of different options concerning the export of unemployment benefits

Type of impact	Clarification	Simplification	Protection of rights	Fundamental rights	Economic impacts	Regulatory costs	Risk of fraud and abuse	Equitable burden sharing Member State	Coherence with General, Specific and EU objectives	Overall Effectiveness	Overall Efficiency (cost effectiveness vs)
<b>Baseline Scenario</b>	0	0	0	0	0	0	0	0	0	0	0
<b>Option 1</b>	+ <sup>224</sup>	+	+	+	+/- <sup>225</sup>	-	+	+	++	++	++
<b>Option 2</b>	+ <sup>226</sup>	+	+	+	+/-	-	+	+/-	+	+	+

<sup>224</sup> Duration of export up to 6 months is no longer at the discretion of Member State.

<sup>225</sup> The economic impact is expected to be neutral, because the duration of export does not affect the overall period of entitlement.

<sup>226</sup> No discretion as regards duration of export.

### 5.3.5.5 Impact of Policy Option 1: extension of the export period up to a minimum of 6 months

Policy Option 1: extension of the export period up to a minimum of 6 months		
<b>Social impacts</b>		
Clarification	+	This option eliminates the uncertainty derived from the degree of flexibility applied by the national institutions. There would be a clear and uniform standard for all persons wishing to take their unemployment benefits with them when looking for a job in another Member State.
Simplification	+	This option would make an end to the widely varying practices that currently exist across Member States. The period of six months also coincides with the periods that was seen as appropriate for jobsearch within the framework of freedom of movement and in which persons can find a job independently of active labour market assistance <sup>227</sup> .
Protection of rights	+	This option would ensure that the persons concerned can retain their entitlement to unemployment benefit for a longer period than under the existing rules. It would also allow them to make better use of the possibilities offered by the host Member State to find suitable employment.
<b>Economic impacts</b>		
Financial impact	+/-	This option does not affect substantially the duration, nor the amount of unemployment benefits paid by the competent Member State. It does not have any significant financial impact on the Member States, either at an individual or aggregate level, as it does not create a right for unemployment benefits, but only maintains an existing right to benefit in case of search of employment in another Member State.
Impacts on fundamental rights	+	This option contributes to the freedom to choose an occupation and the right to engage in work in another Member State (Article 15), as well as to a better protection of rights for workers who have made use of their right to free movement (Article 45). There is no impact on the right to property (Article 17) as acquired rights to unemployment benefits are maintained.
<b>Other impacts</b>		
Regulatory Costs	-	Improving and standardising unemployment benefit export between Member State, including introducing a new co-operation and control mechanism, will contribute to reducing the administrative burden that is often cited by Member States as being experienced by their competent institutions. Currently the length of time for which Member States will export unemployment benefit

<sup>227</sup> Grubb, David, Key features of successful activation strategies, PES to PES dialogue conference “Activation and integration: working with individual action plans”, OECD Employment Analysis and Policies Division, Brussels 8-9 March 2012.

		varies between Member States, necessitating separate processes for granting an extension of the period of export. Setting up the reinforced cooperation mechanism requires an increased effort in comparison to the baseline scenario, for the person concerned to inform the employment services and for the employment services to communicate the follow-up on the unemployed person's job searching activities. It is not expected that this will have a substantial impact on the administrative burden of the individual Member States. The total number of PD U2 forms issued is still rather moderate and varies between 0,001% and 1,26% of the total population of unemployed persons in 2013.
Risk of fraud and abuse	+	Combined with the intended introduction of a reinforced cooperation mechanism, it is expected that this option will entail a lower risk of fraud and abuse than the current rules.
Fair burden sharing between Member States	+	During the export period, the person concerned remains covered by the legislation of the Member State which provides the benefit. This reduces the risk that the person concerned has to rely on welfare benefits from the host Member State if he stays there beyond the current minimum export period of three months. Moreover, the investment that an employment service in the host state may make in cooperation activities may pay itself back when the person actually succeeds in finding a job in that country, starts working and paying social security contributions.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the export rules.</li> <li>• Offer jobseekers the best chance of (re)integrating into the labour market</li> <li>• Provide for a systematic and easy to administer cooperation and control mechanism to monitor the fulfilment of obligations by the jobseeker in exchanges between Member States</li> </ul>	++	By setting a minimum period for the export of unemployment benefits that is longer than the current three months, <u>option 1</u> is effective in providing opportunities for job searching activities in another Member State supporting better allocation of labour force (and human capital) within the internal market and indirectly resulting in savings in terms of public funds devoted to payments of unemployment benefits and social assistance. <sup>228</sup> A new cooperation mechanism that would be more effective and efficient than the current one would reduce the fear of fraud and error. This option may therefore be considered coherent with the wider EU objective of supporting fair mobility and increasing access to employment opportunities throughout the Union while limiting the time in which a jobseeker does not have direct access to activation measures and support from the competent Member State. It is also aligned with 2013 citizenship report (COM(2013)269) which as its key action 1 refers to the proposal to extend the export of unemployment benefits to six months.

<sup>228</sup> European Policy Centre, Making progress towards the completion of the Single European Labour Market, available at: [http://www.epc.eu/documents/uploads/pub\\_3529\\_single\\_european\\_labour\\_market.pdf](http://www.epc.eu/documents/uploads/pub_3529_single_european_labour_market.pdf).

5.3.5.6 Impact of Policy Option 2: extension of the period of export of unemployment benefits until the end of the entitlement period

Policy Option 2: extension of the period of export of unemployment benefits until the end of the entitlement period.		
<b>Social impacts</b>		
Clarification	+	The adoption of this option could have positive effects in comparison to the baseline scenario, as the period of export will be subject to a uniform rule with no room for differing interpretation or practices.
Simplification	+	A direct link between the export and the entitlement period will be aligned with national rights in a way mobile workers may find easier to understand.
Protection of rights	+	This option would ensure that the persons concerned retain their entitlement to unemployment benefit for the whole period in case of search for work in another Member State. It would also allow them to make full use of the possibilities offered by the host Member State to find suitable employment. Figure 2.1 in Annex IX shows that 55.5% jobseekers exit unemployment after 12 months and 75% after 24 months. The increases are proportionally not as substantial as between 3 and 6 months.
<b>Economic impacts</b>		
Financial impact	+/-	The impact is the same as for option 1.
Impacts on fundamental rights	+	The impact is the same as for option 1.
<b>Other impacts</b>		
Regulatory Costs	-	The impact of this option on the administrative burden is the same as for option 1.
Risk of fraud and abuse	+	Combined with the intended introduction of a reinforced cooperation mechanism, it is expected that this option will entail a lower risk of fraud and abuse than the current rules.
Fair burden sharing between Member States	+/-	The effect is the same as for option 1, although potentially for an even longer period.
Coherence with General, Specific and wider EU Objectives: Continue the modernisation of the EU Social Security Coordination	+	Extension until the end of the entitlement period under <u>option 2</u> will allow a person to perform jobseeking activities in another Member State throughout the full entitlement period and it complies with the 2013 citizenship report (COM(2013)269) proposal to extend the export of unemployment benefits to six

<p>Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a <b>uniform and consistent</b> application of the export rules.</li> <li>• Offer jobseekers the best chance of (re)integrating into the labour market</li> <li>• Provide for a systematic and easy to administer cooperation and control mechanism to monitor the fulfilment of obligations by the jobseeker in exchanges between Member States</li> </ul>		<p>months. However, the effects on length of time spent unemployed are in the long-term unclear and it is uncertain longer entitlement to unemployment benefits actually increases likelihood of reintegration into the labour market. It could increase the administrative burden for the State of destination, through needing to actively monitor the person's employment situation over a longer period. Moreover, there will be little incentive for the country to which the person has gone to provide active labour market assistance throughout the full period of the payment of the unemployment benefit, if that institution has no power to control the payment of unemployment benefits or is not compensated financially by the competent Member State. This measure may therefore be considered less effective in achieving the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union and promoting access to labour market activation measures.</p>
--	--	--

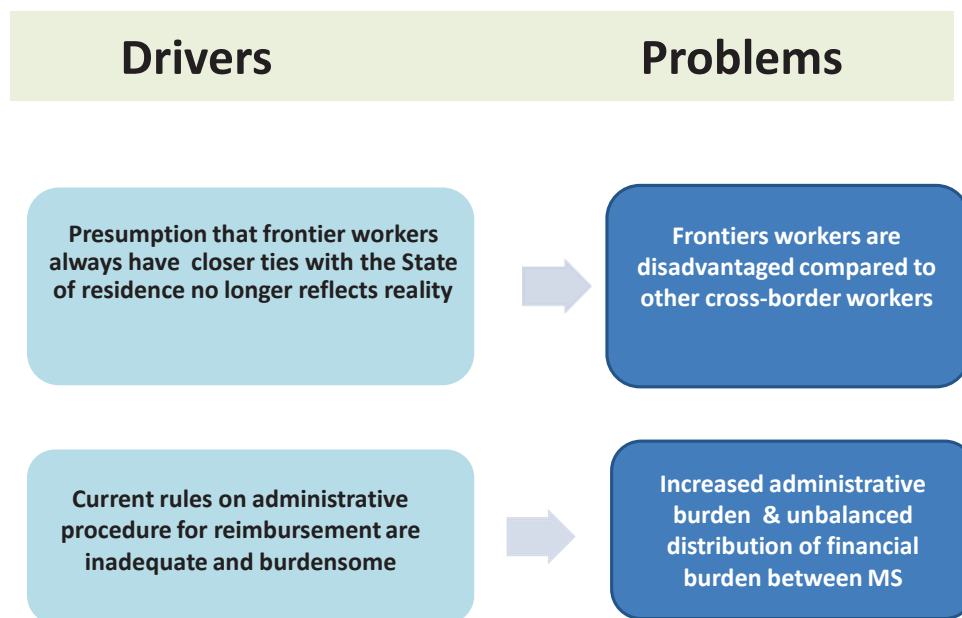

### 5.3.6 Conclusions

By setting a minimum period for the export of unemployment benefits that is longer than the current three months, option 1 is more effective in providing opportunities for job searching activities in another Member State. It will involve communication between Member States for an extended period of time and an effective cooperation mechanism to take away the fear of fraud and error in Member States. This option may therefore be considered coherent with the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers in the competent Member State) and increasing access to employment opportunities throughout the Union while limiting the time in which a jobseeker does not have direct access to activation measures and support from the competent Member State. It is also aligned with 2013 citizenship report (COM(2013)269) which as its key action 1 refers to the proposal to extend the export of unemployment benefits to six months.

Although extension until the end of the entitlement period under option 2 will allow a person to perform jobseeking activities in another Member State throughout the full entitlement period, it will not be effective if not accompanied by an established control mechanism that will allow competent Member States to follow up on the jobseeking activities of the person. The effects on length of time spent unemployed are in the long-term unclear. It could increase the administrative burden for the State to which the person has gone, through needing to actively monitor the person's employment situation. Moreover, there will be little incentive for the country to which the person has gone to provide active labour market assistance throughout the full period of the payment of the unemployment benefit, if that institution has no power to control the payment of unemployment benefits or is not compensated financially by the competent Member State. This measure may therefore be considered less effective in achieving the wider EU objective of supporting fair mobility (fair for both jobseekers and tax-payers) and increasing access to employment opportunities throughout the Union and promoting access to labour market activation measures even if it complies with the 2013 citizenship report (COM(2013)269) proposal to extend the export of unemployment benefits to six months. This option is therefore not the most effective, or efficient option. The results of the online consultation by Deloitte Consulting show that 79% of the public authorities think that the risk of misuse or abuse of rights is particularly high if the unemployment benefits would be provided until the end of a persons' entitlement, according to the rule of the Member State which provides them.

#### 5.4. The rules on the provision of unemployment benefits for frontier and other cross-border workers

##### 5.4.1 Problems with the coordination rules on the provision of unemployment benefits for frontier and other cross-border workers

##### 5.4.1.1 Frontier workers are disadvantaged compared to other cross-border workers

The legislator has made an explicit choice in Regulation (EC) No 883/2004 that a frontier worker should receive unemployment benefits in the State of residence. This is a derogation from the general principle that a person pursuing a gainful activity should be affiliated to the social security scheme of the State in the territory of which he/she is employed or self-employed (*lex loci laboris principle*).

However, this derogation is not applied consistently:

- 1) It applies only to frontier workers, but not to other cross-border workers. Cross-border workers who do not return on a regular basis to their country of residence have a right of choice, i.e. they can remain in their country of activity and claim unemployment benefits there or they can claim unemployment benefits from the country of residence, provided they return to that country.
- 2) Moreover, the derogation only applies to frontier workers who are wholly unemployed, whereas frontier workers, who are only partially or intermittently unemployed continue to receive their unemployment benefit from the country of last activity.
- 3) In addition, it does not necessarily apply to those frontier workers who were formerly self-employed. If they reside in a country where there is no unemployment insurance for self-employed persons, they shall be entitled to receive unemployment benefit from the institution in the country of last activity to which they had been affiliated.

The derogation for unemployed frontier workers is based on the assumption that, as a rule, they have closer ties to the Member State of residence than to the Member State of previous employment and therefore better prospects of finding a job there. Moreover, unemployed persons have to register with the employment service which is competent for them in order to receive their benefits and they are required to be available for work. It has been assumed that this condition can more easily be fulfilled in

the country of residence than in the State of previous employment and that, for this reason, frontier workers can get their benefits in the State of residence under more favourable conditions.<sup>229</sup>

However, this assumption appears to be flawed when looking at the latest statistics<sup>230</sup>. An estimated average of 927.000 cross-border workers<sup>231</sup> (76% of the total number of cross-border workers) were employed for longer than 12 months in the State of activity before becoming unemployed which indicates that they have established a strong link to the labour market of the State of activity. Compared to that, only 287.000 cross-border workers (or 24% of the total number of cross-border workers) had been employed less than 12 months in their State of activity.

Moreover, distances can nowadays more easily be bridged by modern means of transport and also by electronic means of communication which are more and more frequently used by employment services of Member States also for the purpose of registration and supervision of the jobseeking activities of an unemployed person.

Another problem derives from the fact that it is not always easy to distinguish between frontier workers and other cross-border workers. A number of Member States have pointed out in the discussions within the Administrative Commission<sup>232</sup> that it has become more and more difficult to assess in practice if a person is a frontier worker or another cross-border worker. Large distances can be more easily overcome nowadays, so that it cannot be excluded that for example, a person who works in Brussels returns every weekend to London and is therefore a frontier worker. The Member States concerned have therefore questioned if it is still justified to make a distinction between frontier workers and other cross-border workers on the basis of their commuting patterns.

It has also to be acknowledged that a consequence of the current different treatment of unemployed frontier workers and other cross-border workers may disadvantage the first group in comparison to the latter, especially when the legislation of the State of last employment would have resulted in a more favourable level of unemployment benefits for the unemployed frontier worker. This became apparent in the Case C-443/11 *Jeltes*<sup>233</sup> and there are also numerous complaints (28 from August-December 2012 and 35 in the period of January-September 2013) showing that the current rules are not always in the interest of the workers' concerned. Being bound to claim unemployment benefit in their country of residence, they are at a significant disadvantage compared to cross-border workers, who have right of choice. As cross-border workers tend to work in countries where comparatively higher wages and benefits are paid, there is some evidence that, as a general rule, they will be entitled to higher unemployment benefits when they are allowed to claim them in their country of last activity. There is a difference of 68% between the amount of the unemployment benefits paid by the State of last activity and the State of residence.<sup>234</sup>

**Example:** The Austrian authorities in the framework of the Impact Assessment Study presented the case of a Hungarian frontier worker, who resided in Hungary and worked for a period of 30 years in Austria, after which he became unemployed. An average monthly salary of € 2000 gives entitlement to three months of unemployment benefits in Hungary of around € 340 per month. Had the frontier worker applied for unemployment benefits in Austria, he would have been entitled to € 1100 for a period of at least nine months.

<sup>229</sup> For these reasons and in spite of the inherent flaws, the compatibility of this provision with the principle of free movement of persons had been confirmed by the Court in the Case C-443/11, *Jeltes*, EU:C:2013:224, paragraph 51.

#### 5.4.1.2 *The reimbursement procedure for unemployment benefits between Member States is inadequate and burdensome*

Regulation (EC) No 883/2004 introduces a reimbursement mechanism between the State of last activity and the State of residence to compensate for the fact that the institution in the Member State of residence has to provide unemployment benefits to unemployed cross-border workers without having collected any contributions or taxes for the period of last activity carried out in another Member State. From a financial and administrative point of view, the reimbursement mechanism is not satisfactory.

The current mechanism only partially covers the additional expenses incurred in the Member State of residence. This is due to a number of limitations:

1) The amount of reimbursement to be paid by the State of last activity is capped at the amount that the State of last activity would pay under its national legislation. As a result the actual reimbursement by the State of last activity to the State of residence, on average, is 23% lower than the amount of the claims representing the amount of unemployment benefit paid by the State of residence<sup>235</sup>. For Luxembourg and the Netherlands, the discrepancy is 0%; i.e. they pay out the entirety of the benefit reimbursement that is claimed from them. At the other end of the scale are Romania, Bulgaria and Poland which reimburse, on the average, only 5% or less of the amount claimed.

2) Reimbursement is limited in time. The competent Member State is only obliged to reimburse the first three months of the unemployment benefit payment. This period is extended to 5 months if the person has been insured in the competent Member State for at least 12 months in the preceding 24 months. Any unemployment benefit payments beyond that period are not reimbursed creating a disproportionate burden for the Member State of residence.

3) The reimbursement only covers the 'gross amount' of the unemployment benefit, i.e. the full amount of those benefits before any deductions (e.g. taxes or contributions levied on the benefit). It does not cover other benefits which may become payable due to the fact that the State of residence also becomes responsible for other social security benefits (e.g. health care or family benefits).

Table 2.7 in Annex XXVI gives a complete overview of the division of costs between the competent Member State and the State of residence. Based on the average amount of unemployment benefits, the yearly expenditure by the State of residence on unemployment benefits to cross-border workers is estimated at € 277 million, of which € 238 million is related to frontier workers and € 39 million to other cross-border workers (Annex XXVI, table 2.7<sup>236</sup>). Of the yearly expenditure on unemployment benefits, 67% is paid by the State of residence and 33% is paid by the State of last activity on average<sup>237</sup>. However, these figures mask very large discrepancies in the share of the burden shared by the Member States of last activity and of residence. For example, in the cases of countries with a very low number of incoming cross-border workers, the cost is mainly borne by the State of residence.

This demonstrates quite clearly that the current system is particularly disadvantageous for States of residence with a high number of 'outgoing' frontier workers or with a higher level of unemployment benefits compared to the States of last activity<sup>238</sup>. Member States that are net 'exporters' of frontier workers can, in a time of economic downturn, find themselves confronted with a much larger number of former frontier workers claiming an unemployment benefit for which the State of residence never received social security contributions.

Another problem is that the reimbursement procedure is administratively burdensome. It requires that for each single case, that information is exchanged on the working period of the person concerned, the

---

<sup>235</sup> Annex XXVI - Table 2.3.

<sup>236</sup> In order to estimate the budgetary impact of the baseline scenario, the estimated number of unemployed cross-border workers (based on the LFS and the unemployment rates of the 2015 Ageing Report) is multiplied by the annual unemployment benefit per unemployed person taking into account the annual average duration of the payment of the unemployment benefit.

<sup>237</sup> After reimbursement, these percentages are 55% and 45%.

<sup>238</sup> Table 2.2 in Annex XXVI.

reimbursement period and payment dates<sup>239</sup>. The debtor Member State then has to check if reimbursement has not already been applied for the same periods, or if the ceiling under national legislation has been reached. If a request for reimbursement is refused, or only partially accepted, further exchange on the reasons for refusing the requests is needed. Delays of reimbursement are mentioned as a common problem by 22% of the respondents on behalf of organisations<sup>240</sup> to the EU public consultation. This leads to uncertainty in the Member State of residence if and when it will receive the reimbursement requested from the Member State of last activity.

It follows from the online consultation by Deloitte Consulting<sup>241</sup> that the long processing time of a case is seen as very problematic for claimants of unemployment benefits, because as long as a Member State does not have the required information about a claimant, it is not able to make a decision about the unemployment benefit. Communication between institutions of Member States is perceived as an area with margin for improvement. Problems of delays are reported by public authorities in the online survey by Deloitte Consulting and the public consultation. Only 10% of the respondents to the Deloitte survey think that the communication with other Member States in dealing with individual claims for unemployment benefits is effective and smooth. About 25% of the respondents describe the communication as ineffective and slow.

Member States have therefore agreed on an administrative procedure for the reimbursement of unemployment benefits in Decision U4 of the Administrative Commission<sup>242</sup>. Although this Decision constitutes a good step towards a joint interpretation of the reimbursement mechanism, it is not applied consistently across the EU. Member States even have started questioning its value, despite it being applicable as of 2012 only. The Decision states that reimbursement can be claimed ‘regardless of the eligibility conditions for unemployment benefits laid down by the legislation of the creditor State.’ This is not complied with by a State which makes the reimbursement conditional upon the fulfilment of sufficient periods of contributions, because it argues that otherwise, the maximum amount payable under its own legislation is zero. In December 2013, the Commission received a letter from the Chair of the Administrative Commission raising the collective concern that one particular Member State is not applying Decision U4 in a correct way.

Another problem concerns disputes about the determination of the place of residence. In these situations, it is frequently extremely difficult to verify retroactively where the place of residence of the person concerned had actually been during his or her past period of employment.<sup>243</sup>

In the online consultation carried out by Deloitte consulting, 72% of the respondents from public authorities indicated that the current rules are not uniformly understood and applied by the Member States. A recurrent concern is the reimbursement procedure between Member States which are not sufficiently detailed and clear. 40% of the participating public administrations in the online consultation by Deloitte consulting reported that the EU rules create significant administrative costs for national administrations. The reimbursement was repeatedly mentioned as a source of burden mainly due to slow and ineffective communication between Member States.

<sup>239</sup> Institutions at national, regional and local level to that end exchange information via 'Structured Electronic Documents' (SEDs). SEDs U 20 to U 27 are developed to communicate in cases when reimbursement is requested: U 20 (Reimbursement Request), U 21 (Reimbursement Full Acceptance), U 22 (Reimbursement Non Acceptance), U 23 (Partial Acceptance of Request for Reimbursement), U 24 (Reimbursement Payment Notification), U 25 (Reimbursement Receipt/Closing Notification), U 26 (Charging Interest (in case of delay)), and U 27 (Reply on Charging Interest). A number of Member States (Belgium, Czech Republic, Germany, Austria, Slovakia and Finland) apply reimbursement on the basis of fixed amounts.

<sup>240</sup> The group 'organisations' consists of national administrations, social partners and trade unions, civil society and non-governmental organisations and a private company.

<sup>241</sup> Annex II.

<sup>242</sup> Administrative Commission for the Coordination of Social Security Systems, Decision No U4 of 13 December 2011 concerning the reimbursement procedures under Article 65(6) and (7) of Regulation (EC) No 883/2004 and Article 70 of Regulation No 987/2009, OJ C. 5, 25.2.2012.

<sup>243</sup> This issue had been raised by Poland, the Czech Republic and Malta in the 342nd and 343rd meeting of the Administrative Commission in 2015.

### 5.4.2 *Baseline Scenario*

There are some 1.2 million cross-border workers employed in the EU28 who are potentially affected by the provisions on unemployment benefits<sup>244</sup>. It can be assumed that some 793,000 of them are frontier workers, because they reside in a neighbouring country.<sup>245</sup> Applying the national unemployment rates on those figures, results in an estimate of 91,700 unemployed cross-border workers 53,500 of whom are frontier workers.

The evolution of those numbers in the future will depend to a large extent on the evolution of the number of frontier workers and other cross-border workers and the unemployment rates. Cross-border work has increased over the last 10 years in absolute figures largely due to the accessions of the new Member States. However, in relative terms (% of employed population) it remained at a low level (from 0.5% in 2006 to 0.7% in 2014). If we assume that the number of cross-border workers remain stable in relative terms as a % of the employed population between 2015 and 2020, then we could expect some 1.3 million cross-border workers in 2020, but the numbers of unemployed cross-border workers may indeed go down as a lower unemployment rate is projected for 2020<sup>246</sup>.

Not undertaking action in the field of coordination of unemployment benefits would mean maintaining rules which no longer reflect the real interests of the persons concerned and it would mean to maintain the current reimbursement procedure with all its inherent flaws.

### 5.4.3 *Objectives for review of the existing rules on the provision of unemployment benefits for frontier and other cross-border workers*

The **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further enabling the citizens to exercise their rights while at the same time ensuring legal clarity and a fair and equitable distribution of the financial burden among the institutions of the Member States involved.

In relation to the rules on the provision of unemployment benefits for frontier and other cross-border workers, this means in particular to remove unjustified differentiations and to strengthen the link between the acquisition and the provision of unemployment benefits, i.e. between the payment of contributions by the insured person and the payment of benefits for the insured persons.

In view of this general objective, the **specific objective** in this field can be defined as follows:

- Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same **protection of rights** in case of unemployment.
- Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the **best available opportunities of reintegration** in the labour market.
- **The financial burden** for paying unemployment benefits **shall be distributed** between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is **easy to administer** and achieves **fair results**.

---

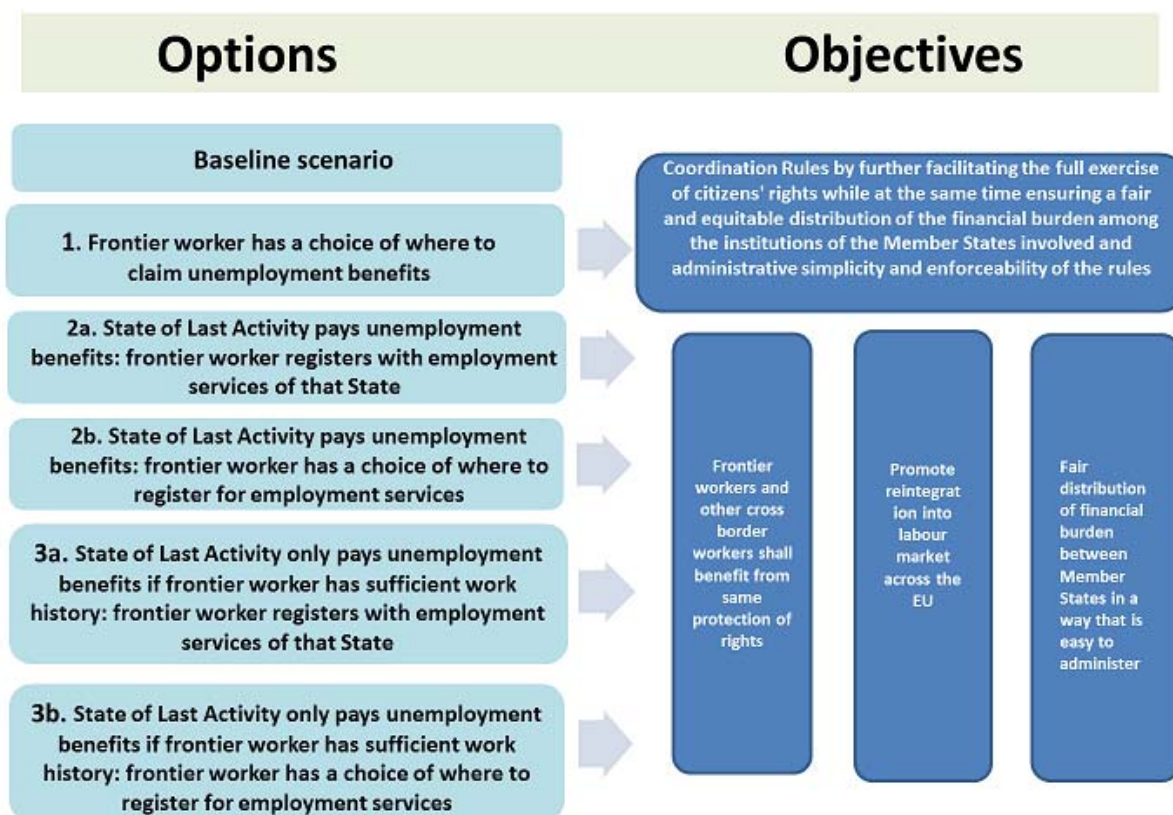

<sup>244</sup> 2015 Annual Report on Labour Mobility.

<sup>245</sup> This is a gross estimation, because there are no figures available on the number of frontier workers in the sense of the legal definition contained in Regulation (EC) No 883/2004.

<sup>246</sup> 2015 Annual Report on Labour Mobility, European Commission (2015).

#### 5.4.4 What are the various options to achieve the objectives concerning the provision of unemployment benefits for frontier and other cross-border workers

A number of policy options have been identified to meet the objectives set out above.

##### 5.4.4.1 Option 0: baseline scenario

Under the status quo, unemployed cross-border workers who are not frontier workers can choose either to remain available to the employment services in the territory of the competent Member State or to make themselves available to the employment services in the territory of the Member State where he/she resides. In the first case, they receive their unemployment benefits from the Member State where they were last employed, in the second case from the Member State where they reside.

Frontier workers, i.e. those cross-border workers who return to their State of residence on a regular daily or at least weekly basis do not have this right of choice, as they can claim their unemployment benefits only from the employment service at their place of residence.

A reimbursement system has been established in order to compensate for situations in which the Member State of residence is obliged to pay unemployment benefits to former cross-border workers without having benefited from their contributions or taxes during their previous economic activity.

##### 5.4.4.2 Option 1: Introduce a right of choice for frontier workers to receive unemployment benefits from the Member State of last activity, or the Member State of residence

This option ‘copies’ the baseline scenario by offering frontier workers the same right of choice as other cross-border workers currently enjoy under the status quo. This option thus abolishes the distinction between frontier workers and other cross-border workers as regards the State in which they can claim the benefits, while offering the best chance of reintegrating into the labour market across the EU.

The choice would imply making oneself available to the employment services in the Member State where the benefits are claimed. This requires that the competent Member State creates a legal fiction

of residence and pays the unemployment benefits *as if* the person resided on its territory. If the person decides to be available for the labour market of the State of former activity and is claiming benefits there, this State should pay the unemployment benefits *as if* he/she resided on its territory.

The choice for one Member State does not exclude that the unemployed frontier worker may also go and look for work in the other Member State. To increase the opportunities to find work the unemployed frontier worker may also register with the employment services in the Member State *not* paying the benefit as a supplementary step which does not affect the obligations that the unemployed person needs to fulfil in the State paying the benefits. Therefore, the obligations and/or jobseeking activities in the Member State which pays the benefit take priority over any obligations in the second Member State.

#### *5.4.4.3 Option 2: Provide for the payment of unemployment benefits by the Member State of last activity*

This option aims to ensure that the country which has received the contributions or income tax is the one that should pay the benefit. It will also abolish the distinction between frontier and other cross-border workers. The sub-options differ as regards the country in which the person registers with the employment services and is available for the labour market.

##### *5.4.4.3.1 Option 2a: The unemployed cross-border worker shall register with the employment services in the State of last activity*

Under this option, the unemployed cross-border worker registers with the employment services of the State of last activity and will claim benefits there.

This option assumes that the worker is to a certain degree integrated into the labour market of the State of last activity and is orienting towards finding a job in this Member State. If the person rather wishes to return to the State of residence to look for work there, he/she can make use of the right to export the unemployment benefits from the competent Member State to the Member State of residence. Whilst the unemployed worker still needs to comply with the obligations in the State of last activity, the employment services in the Member State of residence will carry out verification procedures and provide assistance with jobseeking activities on behalf of the competent institution.

##### *5.4.4.3.2 Option 2b: The unemployed cross-border worker is awarded the choice to register with the unemployment services in the State of last activity, or the State of residence*

This option is the same as option 2a when it comes to the payment of the benefit, but offers the unemployed cross-border worker the opportunity to either register with the employment services in the State of last activity, or in the Member State of residence.

The aim of this option is to offer cross-border workers whose habitual place of residence is far away from their place of last activity the opportunity to fulfil the jobseeking activities in their Member State of residence. If the legislation of the competent Member State requires participation in activation measures, training and physical presence, a person will satisfy these criteria by performing the obligations in the State of residence.

Secondly, this option also aims to facilitate the check on jobseeking obligations by the employment services in the State of residence on behalf of the State of last activity<sup>247</sup>.

As the Member State of residence will be made responsible for following up on the jobseeking activities of the person concerned, but will not reap the financial benefits from these activities, incentives will require introduction for the Member State of residence to check this. In this respect, the employment services in the State of residence should be given discretionary power to mandate extra activity that meets the needs of the regional labour market. Enhanced mobility support services and improved exchanges of information within the EURES network could contribute to providing

---

<sup>247</sup> The CJEU has concluded in the *Caves Krier* case (Case C-379/11) that a Member State may not make the registration of a jobseeker subject to the condition of residence on its territory.

assistance to persons on behalf of the employment services in another Member State. In addition, the public employment services (PES) are encouraged to develop partnerships to promote a coherent service package to employers as regards intra-EU labour mobility<sup>248</sup>.

*5.4.4 Option 3: Provide for the payment of unemployment benefits by the Member State of last activity only in situations where the cross-border worker has worked there for a sufficiently representative period (at least 12 months)*

When discussing this option in the Administrative Commission, it was noticeable to what extent the delegations were divided between keeping the system as it is now<sup>249</sup>, and moving to a coordination system under which the State of last activity is paying the unemployment benefits. The delegations in favour of the status quo feared that a change of the coordination system would not provide adequate protection for the person and would put a heavy financial burden on the State of last activity in case of short periods of employment there. Moreover, this option would require more stringent monitoring and control measures from the labour market authorities in the Member State paying the benefits.

The divide between Member States was the reason to develop a third option that could meet the concerns raised<sup>250</sup>. This option only makes the State of last activity competent if the cross-border worker is deemed to have a 'sufficient link' with the labour market of the State of last activity. This 'sufficient link' is reflected in the duration of insurance for unemployment benefits in the State of last activity. The rationale for this option is that Member States will not be confronted with claims for unemployment benefits after only a very short period of insurance in that Member State. Moreover, the option aims at a better correlation between the level of the benefit and the earning level of the person concerned.

The link with the labour market of the State of last activity arises from the insurance under an unemployment scheme of that State for at least the last 12 months before becoming unemployed. This length of the period is based on the average length of the reference periods in Member States<sup>251</sup>, the distribution of the average duration of current unemployment spells among cross-border workers, plus the fact that nearly all conflict rules in Regulation (EC) No 883/2004 refer to the period of 12 months as a reference period for establishing either a connection to the social security system of a Member State<sup>252</sup>, or for acquiring rights<sup>253</sup>.

It is also based on the assumption that having been insured in another Member State for at least 12 months<sup>254</sup> creates a close link with the labour market of the State of last activity, which gives the unemployed cross-border worker a good chance of finding suitable employment in that State. If the person wishes to register with the employment services in the State of residence, he/she can opt to export the unemployment benefits from the State of last activity.

In the situation where a person has not fulfilled the reference period in the State of last activity, the Member State of residence is competent for paying the unemployment benefits,<sup>255</sup> therefore rendering the current reimbursement mechanism redundant. Also under this option, two sub-options can be

---

<sup>248</sup> The Commission Staff Working Document on Reforming EURES to meet the goals of Europe 2020 (SWD(2012) 100 final) sets out the goals and lines along which the EURES reform will take place.

<sup>249</sup> Germany, Ireland, Denmark, the Netherlands, Austria, Greece, Slovakia.

<sup>250</sup> This option is a compromise solution and no explicit consultation has taken place.

<sup>251</sup> Source: [www.missoc.org](http://www.missoc.org). The reference period should be sufficiently long enough to avoid parallel entitlements in two Member States at the same time.

<sup>252</sup> Title II of Regulation (EC) No 883/2004.

<sup>253</sup> For example pension rights: only periods of insurance or residence of at least a year will be taken into account for calculating pension rights.

<sup>254</sup> How the 'insurance' is established, is a matter of national law. Regulation (EC) No 883/2004 defines as a period of insurance "periods of contribution, employment or self-employment as defined or recognized as periods of insurance by the legislation under which they were completed or considered as completed, and all periods treated as such, where they are regarded by the said legislation as equivalent to periods of insurance" (Article 1 (t)). It must be stressed that Regulation (EC) No 883/2004 cannot take away rights that have been acquired independently on the basis of national legislation. If the national reference period in the State of last activity is shorter than 12 months, the person can choose if he would like to receive the unemployment benefits from that Member State.

<sup>255</sup> If the Member State of residence has no unemployment benefit system for self-employed frontier workers, the Member State of last Portugal, without taking account of the potentially higher earnings in the Netherlands activity will have to export the unemployment benefits as is currently the case.

explored that differ as regards the possibilities to register with the employment services in the State (not) paying the benefits:

*5.4.4.4.1 Option 3a: The unemployed person shall register with the employment services in the State of last activity*

In the situation where the State of last activity is competent to pay the unemployment benefits, the unemployed cross-border worker is required to register with the employment services in the State of last activity.

*5.4.4.4.2 Option 3b: The unemployed person is awarded the choice to register with the unemployment services in the State of last activity, or the State of residence*

Under this option, the competent Member State will remain responsible for paying the unemployment benefits, whereas the unemployed cross-border worker can register with the employment services in the State of residence. The employment services of the State of residence will follow up on performing the checks on the jobseeking activities on behalf of the competent Member State. Enhanced mobility support services and improved exchanges of information for the EURES network could be used to provide assistance to persons on behalf of the employment services in another Member State.

*5.4.5 Stakeholder support for the different options concerning the provision of unemployment benefits for frontier and other cross-border workers*

*5.4.5.1 Option 1: Introduce a right of choice for frontier workers to receive unemployment benefits from the Member State of last activity, or the Member State of residence*

Only one delegation of the Administrative Commission seemed to support this option. Concerns were expressed that rather than the employment opportunities, the level of the benefits could be a decisive factor for making the choice. The option was supported by almost half of the individual respondents to the public consultation and 29% of the respondents who are representatives of the social partners.<sup>256</sup>

*5.4.5.2 Option 2: Provide for the payment of unemployment benefits by the Member State of last activity either with registration with the employment services in the State of last activity (2a) or giving the worker a choice of registering with the employment services in the State of last activity or the State of residence (2b)*

When presenting this option to the Administrative Commission, it was favoured by nine delegations for reasons of simplification<sup>257</sup>. Looking at the results of the public consultation, 40% of the individual respondents and 47% of the social partners supported this option.

*5.4.5.3 Option 3: Provide for the payment of unemployment benefits by the Member State of last activity only in situations where the cross-border worker has worked there for a sufficiently representative period either with registration with the employment services in the State of last activity (3a) or giving the worker a choice of registering with the employment services in the State of last activity or the State of residence (3b)*

These options were developed in direct response to feedback from Member States in the Administrative Commission to address concerns about the potential financial burden on the State of

---

<sup>256</sup> A public consultation between December 2012 and February 2013 invited citizens and organisations to provide their views on the main problems linked to the coordination of unemployment benefits for cross-border workers.

<sup>257</sup> Czech Republic, Spain, Portugal, Poland, Italy, Romania, Slovenia, France and Malta.

last activity in case of short periods of employment there and the need for robust monitoring and control measures from the labour market authorities in the Member State paying the benefits. Option 3 (and its sub-options) was developed as a compromise in response to this feedback but no formal consultation on this option has taken place.

#### *5.4.6 Impact assessment of the different options concerning the provision of unemployment benefits for frontier and other cross-border workers frontier workers*

These options are assessed for the specific group of frontier workers and cross-border workers. It has not been possible to give quantitative estimations for the possible secondary effects on their mobility.

As the number of outgoing and incoming cross-border workers differs between Member States, an assessment of the economic impact has to combine both situations. Moreover, the reimbursement mechanism has to be taken into account. Calculations are based on the assumption that frontier workers claim benefits in their country of residence and other cross-border workers will choose the highest amount and based on the assumption that they will receive the country-specific average amount for an average duration of unemployment.<sup>258</sup>

Based on Labour force Survey (LFS) data for 2013 and 2014, an estimation of the number of cross-border workers has been made. In the further analysis we considered all workers who worked in another country than the country of residence as cross-border workers. Workers who worked in a neighbouring country are considered as frontier workers. This is different from the legal definition provided in Regulation (EC) No 883/2004. National unemployment rates from Eurostat were applied to the number of cross-border workers in order to estimate the number of unemployed cross-border workers. The unemployment rates of the country of last activity and not of the country of residence have been applied on the number of cross-border workers. In order to estimate the budgetary impact of the baseline scenario, the estimated number of unemployed cross-border workers are multiplied by the annual unemployment benefit per unemployed by taking into account the annual average duration of the payment of the unemployment benefit (on the basis of ESSPROS, Eurostat figures and the LFS).

There are no reliable figures on the administrative cost for handling claims for unemployment benefits for cross-border workers. A stylised and cautious estimate on the regulatory costs on the basis of a limited number of Member States comes to the conclusion<sup>259</sup>, that in all cases, in which the State of residence pays the unemployment benefit, this results in an additional administrative cost of around € 43 for the handling of a PD U1 in the State of residence and some € 20 in the State of last activity. For the processing of a reimbursement claim, the regulatory costs are estimated at € 20 in both countries. Multiplying this estimated standard cost with the total number of cases results in a total administrative cost for the payment of the unemployment benefit has been used to estimate the regulatory costs.

<b>Option 2b</b>	+	+/-	+	+	- <sup>266</sup>	- <sup>267</sup>	+/-	+/-	+	+	-
<b>Option 3a</b>	+	+	+	+	- <sup>268</sup>	+ <sup>269</sup>	+	+	++	++	++
<b>Option 3b</b>	+	+/-	+	+	- <sup>270</sup>	- <sup>271</sup>	+	+	+	++	+

<sup>260</sup> € 416 m is budget devoted to the payment of unemployment benefits to frontier and other cross-border workers. This figure also takes the effect of the reimbursement mechanism into account. Table 2.4 in Annex XXVI.

<sup>261</sup> € 9.9 m is the cost of handling unemployment benefits for frontier and other cross-border workers.

<sup>262</sup> Budget devoted to the payment of unemployment benefits increases to € 556 m.

<sup>263</sup> The regulatory costs decrease to € 4.9 m. See Table 2.9 of Annex XXVI.

<sup>264</sup> Budget devoted to the payment of unemployment benefits increases to € 499 m.

<sup>265</sup> The regulatory costs decrease to € 3.7 m.

<sup>266</sup> Budget devoted to the payment of unemployment benefits increases to € 499 m.

<sup>267</sup> Regulatory costs will increase due to additional cooperation and control mechanisms.

<sup>268</sup> Budget devoted to the payment of unemployment benefits increases to € 442 m.

<sup>269</sup> The regulatory costs decrease to € 5.1 m.

<sup>270</sup> Budget devoted to the payment of unemployment benefits increases to € 442 m.

<sup>271</sup> Regulatory costs will increase due to additional cooperation and control mechanisms.

5.4.6.2 Impacts of Policy Option 1: Introduce a rights of choice for frontier workers to receive unemployment benefits either in the State of last activity or State of residence.

Policy Option 1: Introduce a right of choice for frontier workers to receive unemployment benefits either in the State of last activity or the State of residence		
<b>Social impacts</b>		
Clarification	-	For the workers and public institutions, this option will cause a significant increase in uncertainty as the choice is only made at the moment when a person falls unemployed.
Simplification	-	In comparison to the baseline, this option does not lead to a simplification, as the right of choice is only made at the moment when the person claims unemployment benefit. It also requires effective follow-up of the jobseeking activities of the unemployed person who does not reside in the Member State paying the benefit.
Protection of rights	++	This option contributes to optimise a frontier worker's chances of resuming employment under the most favourable conditions by providing the worker with the maximum amount of freedom to decide where they have the best chances of finding work
Financial impact	-	This option will lead to an overall increase of the annual unemployment benefit expenditure for cross-border workers of 34% (€ 556 million instead of € 416 million under the baseline scenario <sup>272</sup> ) due to the fact that the persons concerned are likely to choose the scheme providing the highest benefit (Annex IX – Table 2.10 and Annex XXVI – Table 2.4). The estimated effect differs for the individual Member States depending on the average amount of benefits paid by the Member States concerned. For 8 Member States <sup>273</sup> this is the most expensive option and the least expensive option for 9 Member States <sup>274</sup> .
Impacts on fundamental rights	+	This option contributes to the freedom to choose an occupation and the right to engage in work in another Member State (Article 15), as well as to a better protection of rights for workers who have made use of their right to free movement (Article 45). There is no incidence on the right to property (Article 17) as acquired rights to unemployment benefits are maintained.
<b>Other impacts</b>		
Regulatory Costs	+	This option will reduce the number of reimbursement cases between Member States, as they will be distributed between the State of last activity and the State of residence. The unemployed person makes his/her choice explicit by applying for unemployment benefits, thereby providing all the

<sup>272</sup> Calculations are based on the average amount of unemployment benefits paid in 2013/2014 and an assumed average duration of payment of 3 months.

<sup>273</sup> Czech Republic, Denmark, Germany, Ireland, Spain, Luxembourg, Netherlands and Finland, see Table 2.6 in Annex .

<sup>274</sup> Bulgaria, Estonia, Latvia, Hungary, Poland, Portugal, Slovak Republic, Sweden and the United Kingdom.

		information required under the national legislation. If the unemployed person wishes to receive the unemployment benefit from the State of residence, they can request a PD U1 from the State of last activity and submit it to the institution where they claim unemployment benefit. If the unemployed person opts to receive unemployment benefits from the State of last activity, this will result in a 'permanent export' of the unemployment benefits by that State, necessitating information exchange between the institution in the State of residence and in the competent Member State on the follow-up of the jobseeking activities of the person concerned. The administrative cost for the State of residence is estimated at € 4.9 million (Annex XV - Table 15 and Annex XXVI – Table 2.9). This is a decrease of 50% in comparison to the baseline scenario (of € 9.9 million euro). The costs for issuing PD U1s by the State of last activity drops from € 51.400 to € 18.500; a decrease in the administrative burden of 64% (Annex XV - Table 14 <sup>275</sup> ).
Risk of fraud and abuse	-	This option itself does not lead to an increased risk of fraud and abuse, as the person concerned is subject to the same obligations as any other unemployed person in the Member State of which he or she chooses to receive the unemployment benefits. The risk of 'opportunistic behaviour' rather relates to the choice from which country to receive unemployment benefits. As was indicated by many public authorities in the stakeholder consultation, the labour market chances may frequently not outweigh the choice for the most generous unemployment benefits.
Fair burden sharing between Member States	-	This option is likely to put an additional burden in particular on the Member States with comparatively high unemployment benefits and will therefore not lead to a more equitable distribution of the financial burden for Member States.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same <b>protection of rights</b> in case of unemployment.</li> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the <b>best available opportunities of reintegration</b></li> </ul>	+	The unemployed frontier worker is offered the greatest flexibility to re-integrate into the labour market of their choice. It will eventually reduce the administrative burden of processing reimbursement and will shift a part of the financial burden from the State of residence to the State of last activity. However, this is fully dependent on the choice that the person makes and this option entails great uncertainty for the Member States. This option also entails an overall increase in budgetary costs. It could also encourage the unemployed person to choose the State with the most generous unemployment benefits, rather than the one with the best prospects for re-integration. However, this may still be considered coherent with the wider EU policy objective to promote greater support and labour activation measures to promote reintegration into the labour market.

<sup>275</sup> This calculation is based on stylized estimates.

<p>in the labour market.</p> <ul style="list-style-type: none"> <li>• <b>The financial burden</b> for paying unemployment benefits <b>shall be distributed</b> between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is <b>easy to administer</b> and achieves <b>fair results</b>.</li> </ul>		
---	--	--

*5.4.6.3 Impacts of Policy Option 2a: Member State of last activity provides the unemployment benefits to frontier workers and other cross-border workers – registration for employment services in Member State of last activity*

<b>Policy Option 2a: Introduce the rule in Regulation (EC) No 883/2004 according to which the Member State of last activity provides the unemployment benefits to frontier workers and other cross-border workers – requirement to register with the employment services in the Member State of last activity</b>		
<b>Social impacts</b>		
Clarification	+	This option will bring more clarity for the unemployed cross-border workers and the institutions, as it will always be the institution in the Member State of last activity that pays out the benefit. The person will receive all benefits from the same source, which will provide welcome clarification in relation to cases where a person receives another benefit from the of last State (i.e. a partial invalidity benefit).
Simplification	+	One system will apply to all unemployed persons and there will no longer be a distinction between frontier and other cross-border workers. A direct link will be established between benefits and contributions and there is no need for a reimbursement mechanism. Persons residing at a large distance from the Member State of last activity may face more difficulties in meeting the eligibility conditions, as they will have to travel a longer way for this purpose to their competent employment service, but these could be mitigated by an option to claim an export of their unemployment benefits to their Member State of residence. This means that persons who prefer to orientate to the labour market of the State of residence can return to that State by using the right to export their unemployment benefits. This means that the unemployed person can be more responsive to the relative likelihood of finding a job in the different Member States, and can direct his or her efforts to the Member State with the best job opportunities in their particular field.
Protection of rights	+	This option ensures that cross-border workers are not treated differently from other workers in the same situation, who work and reside in the same Member State. It also ensures that unemployment benefits are paid under the conditions and at the amount acquired by the payment of contributions.

Financial impact	-	The total expenditure on unemployment benefits will increase from € 415 million to € 499 million; an increase of 20% in comparison to the current scenario. This is due to the fact that cross-border workers use to work in countries with comparatively higher wages and correspondingly higher benefits (see (Annex XV - Table 2.2 and Annex XXVI – Table 2.4). The estimated effect differs for the individual Member States depending on the average amount of benefits paid and depending on the relation of frontier workers to other cross-border workers residing in the Member State concerned. <sup>276</sup> From a Member States' perspective, very short period of employment can have a negative financial impact, when no contributions were received in proportion to the cost for paying the unemployment benefit.
Impacts on fundamental rights	+	This option eliminates differences in treatment between frontier workers and other cross-border workers and contributes to the freedom to choose an occupation and the right to engage in work in another Member State (Article 15) as well as to a better protection of rights for workers who have made use of their right to free movement (Article 45). The right of property (Article 17) is protected, as the person directly receives the benefits from the State to which he/she lastly paid contributions.
<b>Other impacts</b>		
Regulatory Costs	+	Only one Member State will be competent for paying unemployment benefits and monitoring the availability of the person to the labour market. The unemployed person can apply directly to the institution in the Member State in which he/she was insured during the last employed activity. Reimbursement arrangements are no longer necessary. Member States will have to waive residence conditions for persons registering with their employment services and may have to make changes to their administrative procedures to check upon persons residing outside their territory. It is also the cheapest option, as the total regulatory costs are reduced from around € 9.9 million to € 3.7 million, i.e. to 37% of the costs under the baseline scenario (Annex XXVI – Table 2.9).
Risk of fraud and abuse	+/-	This option itself does not lead to an increased risk of fraud and abuse, as all unemployed persons are subject to the same obligations as any other unemployed person in the Member State of last activity. However, in the case of export of unemployment benefits there may be a perceived risk that jobseeking obligations are not fully complied with (see section 5.3.1).
Fair burden sharing between Member States	+/-	This option will lead to a more equitable distribution of the costs related to the payment of benefits for Member States who have a relatively large number of unemployed frontier workers residing in that Member State. It will also remove the obligation to reimburse the Member State of residence. However, it may also lead to the situation that benefits have to be provided by a

<sup>276</sup> It is the most expensive option for Greece, Cyprus, Malta, Austria and the United Kingdom

		Member State after a relatively short period of insurance.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same <b>protection of rights</b> in case of unemployment.</li> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the <b>best available opportunities of reintegration</b> in the labour market.</li> <li>• <b>The financial burden</b> for paying unemployment benefits <b>shall be distributed</b> between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is <b>easy to administer</b> and achieves <b>fair results</b>.</li> </ul>	++	<p>This option restores the direct link between receiving unemployment benefits and availability for the labour market. The financial and administrative burden shifts to the State of last activity, leading to an absolute increase in terms of financial and administrative burden in States that have a high number of incoming cross-border and frontier workers, although overall in fewer Member States this option has the lowest budgetary impact. Moreover, this option does not prevent the Member State of last activity becoming competent even after a very short period of activity there, which would in reality not contribute to an even burden sharing. This option provides for some flexibility for the person concerned, who can continue looking for work in the State of last activity or, by making use of the export of benefits, can return to the Member State of residence to look for employment there. However, where the person is residing far away from the place where he/she is registered with the employment services, he/she can experience difficulties in following up on the jobseeking activities. This therefore may not be considered entirely coherent with the wider EU policy objective to promote greater support and labour activation measures to promote reintegration into the labour market.</p>

*5.4.6.4 Impacts of Policy Option 2b: Member State of last activity provides the unemployment benefits to frontier workers and other cross-border workers – choice of registration for employment services in either Member State of last activity or State of residence*

<b>Policy Option 2b: Introduce the rule in Regulation (EC) No 883/2004 according to which the Member State of last activity provides the unemployment benefits to frontier workers – choice to register with the employment services in the Member State of last activity, or the Member State of residence</b>		
<b>Social impacts</b>		
Clarification	+	This option will bring more clarity for the unemployed person and the institution, as it will always be the institution in the Member State of last activity that pays out the benefit for all unemployed persons. On the other hand, it contributes to optimise a frontier worker's chances of resuming employment under the most favourable conditions, either in the Member State of last activity, or in the State of residence
Simplification	+/-	One system will apply to all unemployed persons and there will no longer be a distinction between frontier and other cross-border workers. A direct link will be established between benefits and contributions and there is no need for a reimbursement mechanism. However, the split of competences

		between the payment of the benefits and the responsibility to follow-up on the jobseeking activities of the person concerned calls for new arrangements between the competent Member State and the State of residence.
Protection of rights	+	<p>This option ensures that all cross-border workers are treated equally. They would also get the same benefits under the same conditions as workers who work and reside in the Member State in which they pursued their activity.</p> <p>From the point of view of the Member States this is also positive; as it is in their interest to allow their unemployed persons to look for work in the Member State where they are most likely to find it. Therefore, the impact in comparison to the baseline scenario is considered as being positive.</p>
Financial impact	-	The economic impact is the same as for option 2a. The costs for the introduction of the cooperation mechanism will depend on the specifics of the mechanism and could therefore not be quantified.
Impacts on fundamental rights	+	The impact on fundamental rights is the same as for option 2a.
<b>Other impacts</b>		
Regulatory Costs	-	The impact on regulatory costs is the same as for option 2a. However, additional cooperation and control mechanisms need to be established, as the responsibility for paying unemployment benefits and checking availability for work can lie with different institutions. The cooperation mechanism should not only include regular reporting on the situation of the unemployed person, but also provide for incentives for the employment services in the State of residence to actively follow-up on the jobseeking activities, and possible financial compensation for providing active labour market measures on behalf of another Member State. This could have a negative impact on the administrative burden in comparison to the baseline scenario, depending, in each case, on the actual measures taken.
Risk of fraud and abuse	+/-	This option itself does not lead to an increased risk of fraud and abuse, as all unemployed persons are subject to the same obligations as any other unemployed person in the Member State of last activity. There may be a need to incentivise the employment services in the State of residence to actively follow-up on the jobseeking activities.
Fair burden sharing between Member States	+/-	From the perspective of providing the unemployment benefits, this option establishes a direct link between receiving contributions and providing unemployment benefits. It will also

		remove the obligation to reimburse the Member State of residence. Active labour market assistance measures will, in the first place, be at the expense of the employment services in the State of residence. However, it may also lead to the situation that benefits have to be provided by a Member State after a relatively short period of insurance.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same <b>protection of rights</b> in case of unemployment.</li> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the <b>best available opportunities of reintegration</b> in the labour market.</li> <li>• <b>The financial burden</b> for paying unemployment benefits <b>shall be distributed</b> between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is <b>easy to administer</b> and achieves <b>fair results</b>.</li> </ul>	+	<p>This option offers the person concerned the opportunity to register with employment services in the State of residence. This option provides the unemployed persons a right of choice as regards their registration which may be convenient for them in particular in those situations where their place of residence is far away from the place where the competent institution in the Member State of last activity is located. They may also prefer to deal with their local institution for linguistic reasons. There is however also a drawback to this option as the current rules only provide for an export of cash benefits, but not necessarily also for the provision of training and reactivation measures in a country different from the one where the competent institution is located. This therefore may not be considered coherent with the wider EU policy objective to promote greater support and labour activation measures to promote reintegration into the labour market. The institution in the State of residence may want to be compensated for these type of activities provided to the person concerned.</p>

*5.4.6.5 Impacts of Policy Option 3a: Member State of last activity provides the unemployment benefits to frontier workers and other cross-border workers only if person has worked there for 12 months– registration for employment services in Member State of last activity*

<b>Policy Option 3a: Introduce a rule in Regulation (EC) No 883/2004 that the State of last activity only pays unemployment benefit if the person has worked there for a sufficiently representative period , i.e. for 12 months – registration with the State of last activity</b>		
<b>Social impacts</b>		
Clarification	+	<p>This option establishes a direct causal link between the level of integration in the labour market of a Member State and compensation for lost employment periods. The link with the labour market arises from the length of the contributions paid in the State of activity and will provide a balanced reflection of the relationship between the contribution period and acquiring the right to unemployment benefits.</p>

Simplification	+	There will be a 'switch' between the competent Member State and the State of residence dependent on the employment duration of the former cross-border workers. The impact for persons residing at a large distance from the Member State of last activity will be the same as 2a.
Protection of rights	+	The unemployed person will always receive unemployment benefits from the State with which he/she has the closest link with the labour market, either from the State of last activity or the State of residence.
<b>Financial impact</b>	-	<p>This option will lead to an increase of 6% in budgetary costs for Member States from € 416 million to € 442 million (Annex IX – Table 2.10 and Annex XXVI – Table 2.4<sup>277</sup>). For 6 Member States, this option has the lowest budgetary impact, whereas for 5 Member States, it is the most costly option (Annex X – Table 2.6 and Annex XXVI – Table 2.4). Many 'outgoing' (seasonal) workers have their place of residence in these countries. They are mostly employed less than 12 months, which means that they will have to claim unemployment benefits in their State of residence.</p> <p>When looking at the distribution of unemployment benefits for incoming cross-border workers, under this option 12% of the total unemployment benefit will be paid by the State of residence and 88% by the State of last activity (Annex XXVI – Table 2.7). The Member State of last activity thus has a higher share in the payment of unemployment benefits than under the current scenario (68%), but it is guaranteed that it has received contributions corresponding to at least 12 months of insurance. Based on 2.2c of Annex XXVI, 53.800 unemployed frontier workers would receive unemployment benefits in the State of last activity on the basis of their insurance for at least 12 months there. In the baseline scenario, only the 28.500 cross-border workers can claim unemployment benefits from the State of last activity (73.700 – 45.200 frontier workers). This explains why the 70-30% division between the State of last activity and the State of residence moves to 88%-12% under this option, as more frontier workers will receive unemployment benefits from the State of last activity.</p>
<b>Impacts on fundamental rights</b>	+	The impact on fundamental rights is the same as for option 2. The right to property (Article 17) is protected, as the person will always have an entitlement to unemployment benefits corresponding to the period of contributions paid into a system.
<b>Other impacts</b>		
Regulatory Costs	+	Depending on the employment history of the person during the

<sup>277</sup> The same calculation method has been used as for option 1. Calculations are based on the assumption that the 'sufficiently representative period' is set at 12 months.

		<p>last 12 months, the competence for paying unemployment benefits will switch between the State of last activity and the State of residence. Member States do not have to apply the aggregation rules for determining the period of 12 months (it concerns a minimum period that the person must have worked in the State of last activity) and hence there is additional information exchange needed between the competent Member State and the State of residence as regards the reference period of 12 months. For the opening of the right to unemployment benefits the information obligations for the person and the information exchanges between Member States or the purposes of aggregation will be the same as under the baseline scenario. In combination with the annulment of the reimbursement procedure, this option has a positive impact on administrative burden for the institutions in comparison to the baseline scenario. The total amount of the regulatory costs for this option are estimated at around € 5.1 million, a reduction of approximately 4.8 million or 51% of the baseline scenario. As verification of jobseeking activities and benefit payment will both be dealt with by the same institution in the State of last activity, this option can help reduce administrative burden caused by 'cross-border' monitoring of the beneficiary.</p>
Risk of fraud and abuse	+	<p>This option itself does not lead to an increased risk of fraud and abuse. There is no incentive for 'opportunistic behaviour' due to the binding effect of the conflict rule. Moreover, this option excludes the possibility that a person can claim unemployment benefit in a Member State after having worked there for only one day, or too short a period to have a genuine link with the labour market of the State of last activity. Periods of insurance in other Member States cannot be aggregated for the calculation of the 12 month period to avoid 'forum shopping'. Verification of jobseeking activity and benefit payment are linked and carried out by the same institution. This makes ensuring applicable jobseeking activities are being carried out easier for the institutions of the State of last activity.</p>
Fair burden sharing between Member States	+	<p>This option ensures that the cost of the unemployment benefits are divided between the relevant Member State in a way that is proportional to level of contributions or income tax received by the competent Member State. A reimbursement mechanism is no longer needed.</p>
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same <b>protection of rights</b> in case of unemployment.</li> </ul>	++	<p>This is a 'compromise' solution. It not only restores the direct link between receiving contributions and paying unemployment benefits, but also guarantees a 'sufficiently close link' in terms of received contributions and labour market integration. It may therefore be considered to promote greater efforts by the worker to reintegrate into the labour market by requiring the worker to register with the employment services in this location in a manner aligned to wider EU policy objectives on active labour market policy. This can meet the objective of proportionate sharing of the burden between Member States.</p>

<ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the <b>best available opportunities of reintegration</b> in the labour market.</li> <li>• <b>The financial burden</b> for paying unemployment benefits <b>shall be distributed</b> between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is <b>easy to administer</b> and achieves <b>fair results</b>.</li> </ul>		
--	--	--

*5.4.6.6 Impacts of Policy Option 3b: Member State of last activity provides the unemployment benefits to frontier workers and other cross-border workers only if worker has worked there for 12 months– choice of registration for employment services in either Member State of last activity or State of residence.*

<b>Policy Option 3b: Introduce the rule in Regulation (EC) No 883/2004 that the State of last activity only pays unemployment benefit if the person has worked there for a sufficiently representative period – choice of registration</b>		
<b>Social impacts</b>		
Clarification	+	This option establishes a direct causal link between the level of integration in the labour market of a Member State and compensation for lost employment periods. The link with the labour market arises from the contributions paid in the State of activity and will provide a balanced reflection of the relationship between the contribution period and acquiring the right to unemployment benefits.
Simplification	+/-	Member States' institutions may have to apply a greater amount of flexibility when it comes to recognising the availability for the labour market in another Member State with availability in the competent Member State and procedures need to be set up for that purpose for both the citizen and the national authority.
Protection of rights	+	This option will be beneficial for persons receiving unemployment benefits from the State of last activity and residing far away from the State of last activity. It will contribute to optimising the unemployed person's chances of resuming employment under the most favourable conditions, either in the State of residence or in the State of last activity.

<b>Financial impact</b>	-	The impact is the same as for option 3a.  The costs for the introduction of the cooperation mechanism will be dependent on the specifics of the mechanism and could therefore not be quantified.
<b>Impacts on fundamental rights</b>	+	The impact on fundamental rights is the same as for option 2a.
<b>Other impacts</b>		
Regulatory Costs	-	Depending on the employment history of the person during the last 12 months, responsibility for paying unemployment benefits will switch between the State of last activity and the State of residence. Member States do not have to apply the aggregation rules for determining the period of 12 months and the Member State of last activity only needs to take into account the periods effectively fulfilled within its territory. A reimbursement procedure is no longer necessary, but additional cooperation and control mechanisms need to be established, as responsibility for paying the unemployment benefits and checking the availability for work lie with different institutions. The cooperation mechanism should not only include regular reporting on the situation of the unemployed person, but also provide for incentives for the employment services in the State of residence to actively follow-up on the jobseeking activities of the person, and possible financial compensation for providing active labour market measures to the person on behalf of another Member State. This will have a negative impact in comparison to the baseline scenario.
Risk of fraud and abuse	+	This option itself does not lead to an increased risk of fraud and abuse. There is no opportunity for the unemployed person to go 'forum shopping' due to the binding effect of the conflict rule. Moreover, this option excludes the possibility that a person can claim an unemployment benefit in a Member State after having worked there for only one day, or too short a period to have a genuine link with the labour market of the State of last activity. The employment services in the State of residence may need to be incentivised to actively follow-up on the jobseeking activities without the responsibility for the payment.
Fair burden sharing between Member States	+	From the perspective of providing the unemployment benefits, this option establishes a direct link between receiving contributions and providing unemployment benefits. There is no need for reimbursement of the unemployment benefits. Active labour market assistance measures will, in the first place, be at the expense of the employment services in the State of residence.
Coherence with General, Specific	+	This option offers the person concerned the opportunity to register with the employment services in the State of residence.

<p>and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the same <b>protection of rights</b> in case of unemployment.</li> <li>• Frontier and other cross-border workers, who reside in another Member State than the State of last activity, shall benefit from the <b>best available opportunities of reintegration</b> in the labour market.</li> <li>• <b>The financial burden</b> for paying unemployment benefits <b>shall be distributed</b> between the competent Member State of last activity and the Member State of residence in a manner that corresponds to contributions or taxes received in a way which is <b>easy to administer</b> and achieves <b>fair results</b>.</li> </ul>		<p>From the point of view of the need for a sufficiently close link with the labour market, it seems more difficult to justify why payment of benefits should be separated from availability for the labour market. Without a cooperation and reimbursement mechanism, the incentive for the institution in the State of residence to actively support the unemployed person could be low. This therefore may not be considered coherent with the wider EU policy objective to promote greater support and labour activation measures to promote reintegration into the labour market. This option is more effective for the unemployed person concerned, but has as an important drawback in that it necessitates setting up a new cooperation mechanism, which may increase regulatory burden contrary to the objective of establishing an easy to administer system.</p>
--	--	---

#### 5.4.7 Conclusions – Combination of Preferred Options

Except for the horizontal option on the recognition of periods for the purpose of their aggregation, all the other options cannot be seen in isolation. A compromise is required between the objective to ensure a proportionate distribution of the financial burden, the objective of providing a uniform and consistent application of the aggregation and calculation rules that reflect the degree of integration of the worker with the insurance system and the objective to ensure the best conditions for the unemployed person for reintegration in the labour market and to protect him/her against the loss of rights.

Such a compromise should aim at ensuring that a Member State becomes responsible for paying the unemployment benefit only after a sufficient link had been established by the mobile worker to the scheme in question, it should aim at ensuring administrative simplicity which means that – where possible – the full administrative procedure of registration, determination and payment of benefits, and assistance in offering job opportunities should be in the hand of one institution and that this competent institution should be, where possible, the institution which is in close distance to the place of residence of the beneficiary. Should the latter not be the case, then an extended period for exporting unemployment benefits will allow the unemployed person to stay in or return to the Member State with which he/she has the closest ties and the highest probability of finding a job.

From the comparison of the options under Section 7, it follows that:

For the coordination of unemployment benefits, the best compromise would be a combination of option 2b for the aggregation of periods in combination with the horizontal option regarding the

recognition of periods for the purpose of aggregation, option 1 for the export of unemployment benefits, and option 3a for competence and registration, of.

This combination of options would ensure that:

- a) Periods completed in another Member State are only taken into account by way of aggregation, where those periods would also have been considered as periods of insurance in that Member State where they have been completed;
- b) The Member State of last activity becomes competent for the aggregation of periods in all cases in which the insured person had been most recently insured that State for at least three months;
- c) The Member State of previous activity becomes competent and has to export the benefit whenever this condition has not been satisfied;
- d) Cash benefits are exported, i.e. are paid to unemployed persons looking for a job in another Member State than the competent one for an extended period of at least six months in order to provide sufficient time for an effective job search;
- e) The Member State of last activity would remain competent for providing unemployment benefits to frontier and other cross-border workers in all cases where those persons have been insured there for at least 12 months, because it can be assumed that this suffices to create a strong link to the labour market of this State;
- f) The Member State of residence becomes competent for those who have not satisfied this requirement and thus have not established such a strong link.

## 6. Access by economically inactive mobile citizens to certain social benefits

### 6.1. Introduction

For a number of years social security institutions have had to deal with two distinct sets of EU rules regarding access to welfare benefits by economically inactive citizens from other EU Member States. On the one hand, Regulation (EC) No 883/2004 which provides for equal treatment in relation to social security benefits. On the other hand, Directive 2004/38/EC on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States (“the Free Movement Directive”)<sup>278</sup> which applies limitations and conditions to the residence of EU citizens and their families in other Member States and contains a number of exceptions from equal treatment as regards access to Member States' social assistance systems. Although Regulation (EC) No 883/2004 and Directive 2004/38/EC were negotiated partly at the same time and adopted by the EU legislators on the same day (30 April 2004), Regulation (EC) No 883/2004 makes no reference to the Directive; nor does the Directive make any reference to the coordination Regulation. The relationship between the two sets of rules has therefore not been entirely clear.

Social assistance encompasses all assistance schemes established by the public authorities to which recourse may be made by an individual who does not have resources sufficient to meet his own basic needs and those of his family. By reason of that fact, such an individual may, during his period of residence, become a burden on the public finances of the host Member State which could have consequences for the overall level of assistance which may be granted by that State.

Regulation (EC) No 883/2004 extends to all legislation concerning defined categories of social security. The material scope is exhaustive. Consequently, a branch of social security which is not mentioned, is in principle, outside the scope of the regulation. This is the case, for instance, for social assistance.

However, some benefits, falling within the Regulation, the so-called special non-contributory cash benefits (SNCBs), have characteristics both of social security legislation and of social assistance. SNCBs are defined as benefits which are provided under legislation which, because of its personal scope, objectives and/or conditions for entitlement, has characteristics both of the social security legislation and of social assistance (Article 70(1) Regulation (EC) No 883/2004).

SNCBs can either provide supplementary, substitute or ancillary cover against the risks covered by the branches of social security, and which guarantee the persons concerned "a minimum subsistence income having regard to the economic and social situation in the Member State concerned" or “solely specific protection for the disabled, closely linked to the said person's social environment in the Member State concerned” (Article 70(2)(a) Regulation (EC) No 883/2004).

If all conditions for belonging to the SNCB category are satisfied and if the claimant falls within the personal scope of Regulation (EC) No 883/2004, SNCBs are provided exclusively in the Member State where the persons concerned reside, in accordance with its legislation and are not exportable.

As explained below, the access of economically inactive EU citizens and jobseekers to social benefits constituting social assistance in the Member State where they are not nationals has been the subject of rulings from the Court of Justice in recent years, which have clarified the relationship between the Regulation and the Free Movement Directive. At the time of preparing this Impact Assessment Report the jurisprudence of the Court of Justice was limited to finding that SNCBs could be subject to the conditions of the Free Movement Directive.

On 14 June 2016 the Court gave its ruling in the case of C-308/14 European Commission v United Kingdom holding that access of economically inactive EU citizens to classic social security benefits (not constituting social assistance within the meaning of the Free Movement Directive) could also be subject to such conditions.<sup>279</sup> This ruling has impacted on the base line scenario and hence also on the

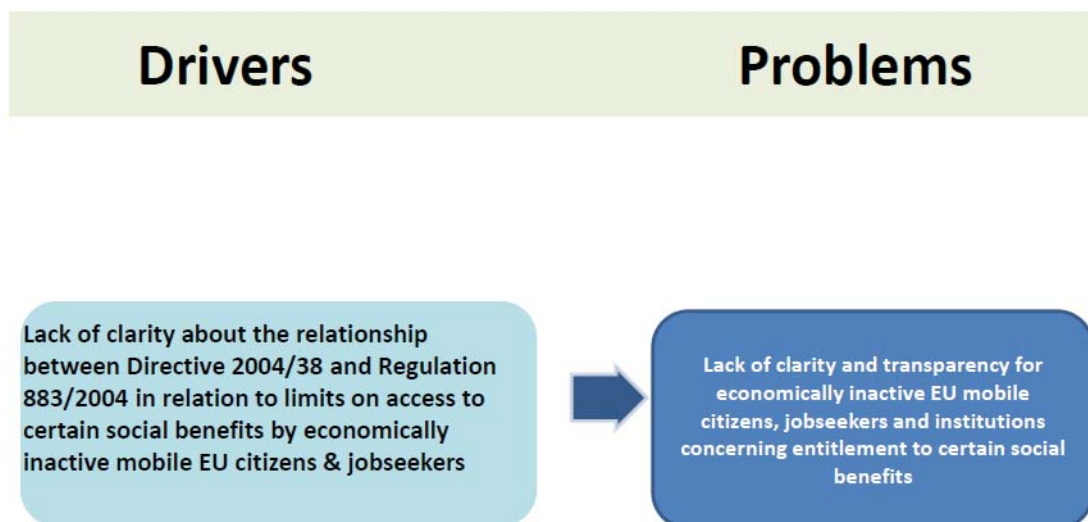

<sup>278</sup> OJ L158, 30.4.2004, p.77.

<sup>279</sup> C-308/14 European Commission v United Kingdom.

impact assessment of alternative options compared to that scenario. Following the judgment, codifying the case law of the Court by introducing a dynamic reference to the limitations to equal treatment in the Free Movement Directive implies that, in relation to economically inactive persons, Member States may make the access both to social assistance and social security benefits, subject to fulfilling the conditions referred to in that Directive. The situation is different in respect of jobseeker whose right of residence is conferred directly by Article 45 of the Treaty on the Functioning of the European Union. As a consequence, for economically inactive citizens, options 1a and 1b have become virtually the same; and option 1c and 2 have been overtaken by the jurisprudence. It should be noted, however, that following this judgment option 1a must be understood as permitting Member States, for economically inactive citizens, to derogate from the principle of equal treatment in respect of social security as well as social assistance where such a person does not fulfil the conditions for legal residence as set out in the Free Movement Directive, while for jobseekers that limitation is only possible in relation to social assistance. As this report had been approved by the Regulatory Scrutiny Board prior to the aforementioned judgment, the authors have not substantially revised the options described below or the analysis of their impact, which does not reflect this differentiated treatment of economically inactive citizens and jobseekers.

## 6.2. Problems with access by economically inactive mobile citizens to certain social benefits

### 6.2.1 *Lack of clarity and transparency for economically inactive mobile EU citizens and institutions concerning entitlement to certain social benefits*

According to the recent jurisprudence of the CJEU, Member States may choose to limit equal treatment for special non-contributory cash benefits claimed by economically inactive citizens and jobseekers to the extent permitted by the Free Movement Directive. Specifically the Free Movement Directive provides that there is no obligation for Member States to award social benefits for an economically inactive citizen for the first three months of residence and after three months Member States may still refuse to award benefits if the person lacks sufficient resources not to impose an unreasonable burden on the host Member State or does not have comprehensive sickness insurance. This is not however apparent from the current wording of Regulation (EC) No 883/2004, which suggests that all mobile citizens are entitled to full equal treatment. In the absence of clear wording within the Regulation, economically inactive EU mobile citizens and jobseekers do not have a clear view of what their rights are. This lack of transparency also affects national social security institutions

which pay such benefits. This is also reflected in the high number of court cases instituted in some Member States (in particular in Germany but also in the United Kingdom) seeking clarity as to the interaction between the Free Movement Directive and Regulation (EC) No 883/2004.<sup>280</sup>

The driver behind these specific problems is the recent jurisprudence of the Court that has changed the previous understanding of the relationship between the Social Security Coordination Rules and the Free Movement Directive. In September 2013 the Court of Justice delivered a judgment in Case C-140/12 *Brey*, subsequently confirmed in Case C-333/13 *Dano* in November 2014, which clarified that Regulation (EC) No 883/2004 on the coordination of social security systems can in certain circumstances be read in conjunction with the provisions of the Free Movement Directive. Both judgments concerned economically inactive EU mobile citizens who were claiming a specific type of minimum subsistence benefit, classified as a “special non-contributory cash benefit” within the meaning of Regulation (EC) No 883/2004. The Court held that these benefits could, under certain conditions, be regarded as social assistance within the meaning of the Free Movement Directive and that therefore the exceptions from equal treatment in the Directive could be applied to such benefits.

These conclusions were confirmed in the Court’s judgment of 15 September 2015 in Case C-67/14 *Alimanovic* where the Court provided clarification of when EU law requires Member States to pay social assistance benefits to jobseekers (mobile jobseekers enjoy a specific legal status under EU law and form a separate category of mobile citizens from economically inactive citizens<sup>281</sup>). In particular, the Court held that special non-contributory cash benefits providing for a minimum level of subsistence and which form part of a scheme which also provides for benefits to facilitate the search for employment<sup>282</sup>, are to be considered as social assistance if this is their predominant function. The Court also held that jobseeking EU citizens who have worked for less than one year, in case of involuntary unemployment retain their status of workers for no less than 6 months as provided for in Article 14(4)b of the Directive. As long as they retain their status as workers, these jobseeking EU citizens benefit from equal treatment and thus are entitled to social assistance benefits for this period of six months. After that period of six months, Member States are not obliged to grant social assistance by virtue of Article 24(2) of the Directive which allows Member States not to confer entitlements to social assistance during the longer period provided for in Article 14(4)b of the Directive. The Court clarified that there was no need to carry out an individual assessment before refusing to grant such benefits beyond the period of six months since such a proportionality test had already been carried out by the legislator by setting the conditions in the Directive.

The recent judgments of the Court mean that Member States can choose to limit equal treatment for special non-contributory cash benefits (and potentially other non-contributory tax financed benefits) claimed by these economically inactive citizens and jobseekers to the extent permitted by the Free Movement Directive. This is not however apparent from the wording of Regulation (EC) No 883/2004, which still suggests that full equal treatment is the rule and furthermore the material scope of this derogation remains unclear pending the judgment of the Court in case C-308/14 *European Commission v United Kingdom*.<sup>283</sup> This means economically inactive EU mobile citizens and jobseekers do not have a clear view of what their rights are. It also affects national social security institutions which pay such benefits: EU legislation does not set out what limitations they can apply to

---

<sup>280</sup> There have been 99 first instance court or tribunal decisions in Germany since 1 May 2010 concerning the relationship between Regulation (EC) no 883/2004 and Directive 2004/38/EC, 67 of which have been appealed to a higher national court. There have been 11 first instance court or tribunal decisions in Germany since 1 May 2010 concerning the relationship between Regulation (EC) no 883/2004 and Directive 2004/38/EC, 2 of which have been appealed to a higher national court.

<sup>281</sup> See Recital 9 and Article 14(4)(b) of Directive 2004/38/EC.

<sup>282</sup> the CJEU has held that Member States must accord jobseekers from other Member States equal treatment in respect of “benefits of a financial nature intended to facilitate access to employment in the labour market of a Member State”, provided the jobseeker can show “a genuine link” with “the employment market of that state” Case C-138/02 *Collins* of 23 March 2004, para. 63.

<sup>283</sup> The case C-308/14 *European Commission v United Kingdom* (judgment pending) relates to the question of whether it is possible to require a right of residence as a condition of access to tax financed family benefits. Advocate General Cruz Villalón's indicated in his opinion dated 6 October 2015 that there was nothing to indicate that the findings of the Court in the cases of *Brey* and *Dano* should apply exclusively to social assistance benefits or special non-contributory benefits with which those cases were concerned (paragraph 74). The scope of “social assistance” and whether or not it may include certain classic social security benefits was also raised by a number of Member States in the Reflection Forum of the Administrative Commission in December 2014 and June 2015.

payment of benefits to economically inactive EU mobile citizens and jobseekers. This is also reflected in the high number of court cases instituted in some Member States (in particular in Germany but also in the United Kingdom) seeking clarity as to the interaction between the Free Movement Directive and Regulation (EC) 883/2004.<sup>284</sup>

The consequences of this problem are that there is a lack of clarity and transparency for EU citizens as regards their right to claim special non-contributory cash benefits in their host state in order to have a minimum subsistence. There is also a similar lack of clarity for mobile jobseekers on whether they are entitled to access subsistence jobseekers' benefits when looking for work in their host State. Moreover, social security institutions which are responsible for taking decisions on claims to benefits made by these groups of mobile citizens do not have the necessary legal certainty in the rules. In particular in relation to the question of whether for the purposes of Regulation (EC) No 883/2004, the exceptions from equal treatment in the Directive apply only to special non-contributory cash benefits providing for a minimum level of subsistence, or whether the principle may extend further to other types of "classic" social security benefits for the purposes of the EU social security coordination rules. This question still awaits clarification in the case of C-308/14 *European Commission v United Kingdom*.<sup>285</sup>

### 6.3. *Baseline Scenario*

Out of a total EU-28 mobile population of 14.3 million in 2014<sup>286</sup>, there were an estimated 3.7 million economically inactive mobile EU citizens<sup>287</sup>. If we assume that the 3.1% average yearly growth of mobile EU citizens between 2009 and 2014 continues between 2015 and 2020, and that the ratio between active and non-active mobile EU citizens also remains constant, then we can expect that in 2020, out of a total EU-28 mobile population of 17.5 million<sup>288</sup>, there will be some 4.4 million economically inactive mobile EU citizens<sup>289</sup>.

This group comprises many vulnerable citizens, for example, old-age pensioners, persons with a disability who cannot work, parents temporarily outside of the labour market as they are looking after children. Nearly 80% of economically inactive mobile citizens derive rights (residence rights and/or rights to benefits) from economically active family members with whom they are living in the host Member State and are entitled to equal treatment with the family members of national workers. However, there still remains a significant group of economically inactive mobile EU citizens who cannot derive rights from others. It is this group of EU citizens that is affected by the current lack of clarity and transparency as regards their right to claim certain social benefits in their host state in order to have a minimum subsistence income on which to live.

Mobile jobseekers are also affected by this lack of transparency. There are in the region of 1 million EU jobseekers looking for employment in Member States other than their own<sup>290</sup>. Assuming that the unemployment rate in the EU between 2015 and 2020 remains at 11.7%, and that the share of mobile EU jobseekers over the total EU population also remains constant at 9%, then we can estimate that in 2020 there will be some 1.2 million EU jobseekers looking for employment in Member States other

than their own. Moreover, 25% of EU citizens say they would definitely (8%) or probably (17%) consider working in another EU country in the next ten years.<sup>291</sup>

#### 6.4. **Objectives for the review of the rules on access by economically inactive citizens to certain social benefits**

This initiative serves to facilitate the exercise of the right to free movement by creating and enabling a conducive environment. It is in the interest of all parties to design co-ordination rules that allow full exercise of citizens' rights whilst making the requirements of Member States clear, manageable and efficient.

As with other elements of the revision, the **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved, and administrative simplicity and enforceability of the rules.

In particular, this is reflected in the need to ensure legal clarity in the rules in relation to the limitations and conditions to the residence of EU citizens and their families in other Member States and the exceptions from equal treatment as regards access to Member States' social assistance systems. This is also an issue of protection of rights as in the absence of clarity in the current rules there is inconsistent treatment of such benefits by different Member States which creates uncertainty for citizens and competent institutions and consequent difficulties in enforceability and litigation risk. Promoting legal certainty is therefore also anticipated to improve effective and efficient administration and reduce administrative burden.

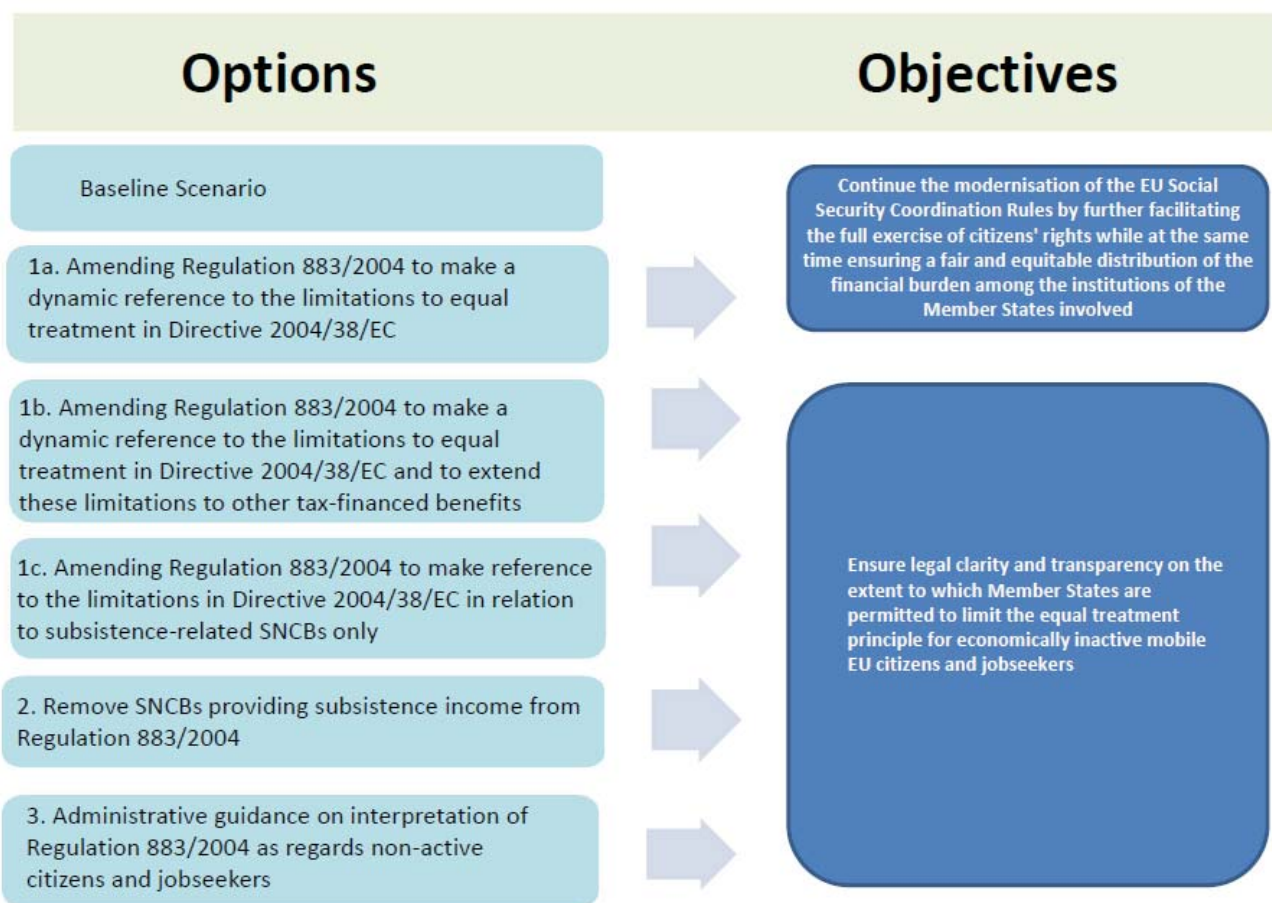

The **specific objective** can be defined as follows:

Ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain tax financed social benefits.

---

<sup>291</sup> Special Eurobarometer 398 – Internal Market, October 2013.

## 6.5. Options for addressing the problems of access by economically inactive mobile citizens and jobseekers to certain social benefits

### 6.5.1 Option 0: Baseline scenario

The case-law of the Court is directly applicable in national law and this option leaves it to national decision-makers to apply the Court's judgments directly. Where questions of interpretation arise, they can be solved in national courts, which if necessary can refer issues to the Court.

### 6.5.2 Option 1: Amendment of Regulation (EC) No 883/2004 to make reference to the limitations in Directive 2004/38/EC

This option codifies the Court's case-law by stipulating that the equal treatment principle of Regulation (EC) No 883/2004 may be limited in relation to payment of certain social benefits to economically inactive mobile EU citizens and jobseekers.

As the discussion with experts in the Administrative Commission in June 2015 showed, it is possible to take either a broad or a narrow approach to amending Regulation (EC) No 883/2004 to make reference to the Free Movement Directive. Option 1 can therefore be sub-divided into three sub-options:

- Introducing a general amendment to the equal treatment principle in Article 4 of Regulation (EC) No 883/2004 by referring to the possible limitations in Directive 2004/38/EC
- Introducing a general amendment to the equal treatment principle in Article 4 of Regulation (EC) No 883/2004 by referring to the possible limitations in Directive 2004/38/EC, but extending the limitations by analogy to other tax-financed benefits

- Making a more limited amendment to Article 70 of Regulation (EC) No 883/2004, which permits Member States to limit equal treatment only in relation to the specific category of special non-contributory cash benefits, which provide subsistence income.

#### *6.5.2.1 Option 1a Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC*

This option would permit Member States to apply the provisions of the Free Movement Directive generally to limit equal treatment in Regulation (EC) No 883/2004. This option would permit national legislators to derogate from the principle of equal treatment in respect of social assistance in accordance with the limitations in Directive 2004/38/EC specifically to provide that Member States are not obliged to award social benefits to economically inactive persons or first time jobseekers for the first three months of residence and further are only required to award social benefits to an economically inactive citizen or first time jobseeker after three months of residence if that person has sufficient resources not to pose an unreasonable burden on public finances and has comprehensive sickness insurance. This option does not propose to define the material scope of social assistance within Regulation (EC) No 883/2004 meaning that it can evolve according to the case law of the Court of Justice.

#### *6.5.2.2. Option 1b: Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC and to extend these limitations by analogy to other tax-financed benefits*

This option would also permit national legislators to derogate from the principle of equal treatment in respect of social assistance in accordance with the limitations in Directive 2004/38/EC as described in option 1a. In addition, it would expressly define the material scope to apply to certain tax-financed social security benefits, specifically non-contributory family benefits, long-term care benefits and sickness benefits for economically inactive EU mobile citizens and jobseekers in the same way as special non-contributory cash benefits, which provide subsistence income.

#### *6.5.2.3 Option 1c Amendment of Article 70 of Regulation (EC) No 883/2004 to make a reference to the limitations in Directive 2004/38/EC in the context of benefits that provide a minimum subsistence income*

This option would make clear that Member States can apply the provisions of the Free Movement Directive to limit equal treatment only in relation to special non-contributory cash benefits providing a minimum subsistence income under Regulation (EC) No 883/2004. This would have the effect of permitting national legislators to derogate from the principle of equal treatment in relation to a limited category of benefits only, namely special non-contributory cash benefits linked to minimum subsistence income payable to economically inactive citizens.

The report of the FreSsco network of experts on free movement of workers and social security coordination identified this as a possible legislative solution for dealing with the Court's recent judgments. It noted that Article 70 of the Regulation would be the appropriate place to incorporate a new provision dealing with access to social assistance benefits.<sup>292</sup>

#### *6.5.3 Option 2: Remove SNCBs providing subsistence income from Regulation (EC) No 883/2004*

This option removes SNCBs which provide a minimum subsistence income from the scope of Regulation (EC) No 883/2004. This would effectively de-classify such benefits as "social security benefits" and would leave them subject to a common, albeit non-coordinated, regime of rules under the Free Movement Directive concerning all benefits classified as social assistance.

The report of the FreSsco network of experts advised against this option on the ground that such a change would be detrimental for both citizens and for social security administrations as many of the practical and protective rules in the social security coordination rules would no longer apply.<sup>293</sup> The option is retained nonetheless as it offers a simple solution for dealing with the impact of the Court's rulings.

#### 6.5.4 *Option 3: Provide administrative guidance*

This option takes a “soft law” approach through which the Commission would draw up administrative guidance on how the Court’s judgments should be interpreted. Such guidelines could deal with both questions of what benefits are covered by the judgments and with the extent to which the rules of the Free Movement Directive limit rights in Regulation (EC) No 883/2004. Such guidance would offer the advantage of containing considerably more detail than a legislative amendment. It is also easier to update and change guidance than in the case of legislation. Moreover, given the opportunities for consultation with national administrators in drawing up this guidance, it should also meet the objectives of ensuring as far as possible a common understanding of the judgments and a uniform application by national social security institutions. This option could stand on its own or be combined with another option.

### 6.6. Stakeholder support

#### 6.6.1 *Baseline Scenario*

This option was supported by nine delegations as a first or second choice in discussions in the Administrative Commission in June 2015<sup>294</sup>. In addition, nine delegations supported the status quo as at least a short-term strategy, given that further judgments of the CJEU are pending<sup>295, 296</sup>.

#### 6.6.2 *Option 1: Amendment of Regulation (EC) No 883/2004 to make reference to the limitations in Directive 2004/38/EC*

##### 6.6.2.1 *Option 1a Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC*

In discussions in the Administrative Commission in June 2015, eleven Member States supported this option as a first or second choice<sup>297</sup>. However, there was no consensus on exactly how such an amendment should be drafted and some of those Member States were in favour of awaiting the outcome of the pending court cases before adopting a fixed position.

##### 6.6.2.2 *Option 1b Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC and to extend these limitations by analogy to other tax-financed benefits*

This option has not been subject to discussions with external stakeholders.

##### 6.6.2.3 *Option 1c Amendment of Article 70 of Regulation (EC) No 883/2004 to make a reference to the limitations to equal treatment in Directive 2004/38/EC in the context of SNCBs that provide for a minimum subsistence level*

No Member State expressly supported this proposal.

---

<sup>293</sup> See Annex VIII at p.52.

<sup>294</sup> Malta, Hungary, Italy, Poland, Portugal, Finland, Lithuania, Sweden and Spain.

<sup>295</sup> Czech Republic, Germany, France, Lithuania, Latvia, Luxembourg, Netherlands, Sweden and United Kingdom.

<sup>296</sup> Case C-299/14 Garcia-Nieto; Case C-308/14 Commission v United Kingdom.

<sup>297</sup> Austria, Belgium, Czech Republic, Germany, Estonia, France, Ireland, Lithuania, Latvia, Poland, United Kingdom

### 6.6.3 *Option 2: Remove SNCBs providing subsistence income from Regulation (EC) No 883/2004*

In discussions in the Administrative Commission in June 2015, two Member States supported this option<sup>298</sup>. Eight Member States regarded this option as being a backward step in the development of the EU rules on social security coordination.

### 6.6.4 *Option 3: Provide Administrative Guidance*

In discussions in the Administrative Commission in June 2015, four Member States favoured this option<sup>299</sup>.

Consultations with social partners and NGOs indicated mixed views as to whether there was a need for change in relation to access to benefits by economically inactive persons. Some stakeholders advocated stronger enforcement of the existing legislation to ensure public confidence in the current provisions.<sup>300</sup> Other stakeholders emphasised the risks to vulnerable mobile citizens and the importance of ensuring such persons were not left without social protection.<sup>301</sup>

## 6.7. What are the impacts of the Different Options

### 6.7.1 *Introduction*

For all of the options assessed, the potentially affected groups are the same. The options are specifically targeted at mobile economically inactive citizens and jobseekers who are unable to derive rights from an economically active family member.

For the purposes of assessing the impact, a range of criteria has been identified with reference to the general and specific policy objectives and the Commission's Better Regulation Guidelines. In relation to **social impact**, the options are assessed against the criteria of **clarification; simplification; protection of rights** and **impact upon fundamental rights**. This analysis draws upon the findings of the FreSsco Legal Experts report at Annex VIII supplemented by the Commission's Services own analysis and the findings from the stakeholder consultations and the Inter-Service Steering Group.

In relation to the **economic impact** and **regulatory costs** for both public administrations and citizens no specific studies have been conducted as, with the limited exception of Option 1b, the options under consideration are codification of the EU case-law which is already directly applicable and therefore there is no anticipated impact on Member States' budgets. However, potential administrative burden of implementing the various options under consideration have been qualitatively assessed.

In relation to option 1b, it should be noted that the estimated budgetary impact may be an under-estimation for the EU-28. Calculations have been based on data from LFS 2012 of proportion of EU28/EFTA migrants residing less than 1 year in their new Member State of residence including the proportion who live in a household with at least one child where no adults in the household are in work for the age-group 15-64 compared with all ages and the proportion aged over 65. This estimation has limitations as it is not possible to identify what proportion of the identified group are unemployed jobseekers or how long such jobseekers may have been seeking work. There is also no information about the level of income or resources of the identified group or whether or not they are currently in receipt of particular social security benefits. These numbers have then been applied to average expenditure per capita in Member States in relation to long-term care benefits, family benefits and sickness benefits. Such a model does not distinguish between contributory and non-contributory systems and also assumes that EU mobile citizens will make use of such benefits in the same proportions as native citizens. The calculation needs to be construed in light of these multiple limitations.

---

<sup>298</sup> Estonia and Ireland.

<sup>299</sup> Spain, Finland, Hungary, Sweden

<sup>300</sup> For example CEC and Business Europe

<sup>301</sup> For example, Eurodiaconia

With reference to coherence with the **general objective**, the options have also been assessed with reference to their impact upon; **legal clarity; risk of fraud and abuse** and ability of Member States to counteract such risks and by reference to the objective of achieving **equitable burden-sharing between Member States** (corresponding to the **specific objective** to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social benefits).

Finally the assessment considers overall coherence with EU objectives with reference to relevant policies identified at section 1.3 of this report.

### 6.7.2 Summary of the impacts of the options for access by economically inactive mobile citizens and jobseekers to certain social benefits

Type of impact	Clarification	Simplification	Protection of rights	Fundamental rights	Economic impacts	Regulatory costs	Risk of fraud and abuse	Equitable burden sharing Member State	Coherence with EU objectives	Overall Effectiveness	Overall Efficiency (cost vs effectiveness)
<b>Baseline Scenario</b>	0	0	0	0	0	0	0	0	0	0	0
<b>Option 1a</b> Legislative Amendment to Article 4	+	+	+	0	0	+/0	+	0	+	++	++
<b>Option 1b</b> Legislative Amendment to Article 4 and extension of limitations	+	+	-	-	0	-/0	+	0	+/-	++	++
<b>Option 1c</b> Legislative Amendment to Article 70	+	+/-	+	0	0	+/0	+	0	+	+	+

<b>Option 3</b> Administrative Guidance	+/0	++	+/0	0	0	+/0	+	0	+	+	+

### 6.7.3 Impacts of Policy Option 1a: Dynamic reference to Directive 2004/38EC

Policy Option 1a: Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC		
<b>Social impact</b>		
Clarification	+	The codification of existing case-law would clarify the rights of EU mobile citizens and would enable citizens to make an informed choice when exercising their rights to move to another Member State.
Simplification	+	The codification of existing case-law would also simplify the process whereby EU mobile citizens and national institutions could verify their respective rights and obligations by making explicit the relationship between Regulation (EC) No 883/2004 and the Directive 2004/38/EC. As this measure contains a dynamic reference to the Directive, it is anticipated that it will not require further amendment even if the case law of the CJEU continues to evolve.
Protection of Rights	+	By increasing clarity the application of the case law of the CJEU, legal certainty is also increased thereby facilitating greater uniformity in application by Member States and facilitating the ability of citizens to enforce their rights.
<b>Financial impact</b>	0	There will be no direct impact on Member States' budgets as this measure simply reflects codification of the case-law of the Court.
<b>Impacts on fundamental rights</b>	0	Mere codification of the case-law of the Court. Any impact on fundamental rights already exists in EU law – the amendment to the Regulation will merely reflect this.
<b>Other impacts</b>		
<b>Regulatory costs</b>	+/0	Costs related to lack of clarity/transparency/legal certainty (for instance litigation costs, legal advice, elaboration of administrative guidance) for both citizens and public authorities could be reduced. However, as this option sets out the limits on the equal treatment principle only in very general terms, it is likely that some litigation on the relationship between the Regulation and the Directive would continue. Public administrations may additionally decide themselves to improve clarity by producing detailed guidance at national level (although such measures will be at their own discretion).

<b>Risk of fraud and abuse</b>	+	This option gives greater visibility to the safeguards in EU law against abusive behavior including the need to prevent economically inactive Union citizens from using the host Member State's welfare system to fund their means of subsistence, which may act as a deterrent to such conduct.
<b>Fair burden sharing between Member States</b>	0	As codification of the case-law this option is not anticipated to have a direct impact on the distribution of financial burden between Member States.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <p>to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social benefits.</p>	+	This option will increase legal clarity and transparency on the rights of economically inactive mobile EU citizens and jobseekers and also on the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for such persons in relation to access to certain social benefits. It is anticipated to thereby improve administrative simplicity and enforceability of the rules.

#### 6.7.4 Impacts of Policy Option 1b: Dynamic reference to Directive 2004/38EC and extension of limitations by analogy

<b>Policy Option 1b: Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC and extend the limitations by analogy</b>		
<b>Social impact</b>		
Clarification	+	The option would clarify the rights of EU mobile citizens and would enable citizens to make an informed choice when exercising their rights to move to another Member State.
Simplification	+	The option would also simplify the process whereby EU mobile citizens and national institutions could verify their respective rights and obligations by making explicit the relationship between Regulation (EC) No 883/2004 and the Directive 2004/38/EC. As this measure expressly defines the material scope to which the conditions of the Directive apply it is possible that it may require further amendment if the case law of the CJEU continues to evolve.

Protection of Rights	-	In relation to any extension of the potential derogation to non-contributory family benefits, long-term care benefits and sickness benefits there will be a loss of rights compared to the baseline scenario. The affected population of economically inactive citizens is estimated at 70.700 of whom approximately 14.000 live in a household with at least one child and of whom 2.500 are aged 65 or older)
<b>Financial impact</b>	0	In relation to an extension of the existing case-law to non-contributory family benefits, there would be a total estimated decrease for the EU-28 of between €37.7 and 79.2 million (equivalent to a reduction of 0.03% to 0.06% of total expenditure on child benefits) <sup>302</sup> in the case of long-term care benefits there would be an average estimated decrease of €31.5 million (equivalent to 0.014% of total expenditure on long-term care benefits) <sup>303</sup> and in relation to sickness benefits there would be an average estimated decrease of €185.1 million (equivalent to 0.017% of total expenditure on sickness benefits) <sup>304</sup>
<b>Impacts on fundamental rights</b>	-	The option is expected to adversely affect the best interests of the child (Article 24), the freedom to choose an occupation and the right to engage in work in another Member State (Article 15), as well as protection of rights for jobseekers who have made use of their right to free movement but who do not retain worker status (Article 45). There may also be an adverse impact on the right to social security and social assistance (Article 34) when compared with the baseline scenario.
<b>Other impacts</b>		
<b>Regulatory costs</b>	-/0	The assessment is likely to be similar to option 1a. However, by extending the limitations of Directive 2004/38/EC by analogy to a wider range of benefit decisions, there may be additional regulatory costs for case handlers in public authorities. Conversely, there may be a reduced risk of ongoing litigation costs as the legislature will have resolved the question of whether or not the limitations of the Directive apply also to tax-financed social security benefits.
<b>Risk of fraud and abuse</b>	+	This option gives greater visibility to the safeguards in EU law against abusive behavior including the need to prevent economically inactive Union citizens from using the host

<sup>302</sup> Estimation based on HIVA's own calculations. It should be noted that the calculation relates to child benefits and therefore the estimated budgetary impact may be an under-estimation for the EU-28. The calculation is made using data in relation to only 9 Member States (although those Member States have on average a higher stock of EU mobile citizens than average) and the calculation needs to be construed in light of these limitations.

<sup>303</sup> Annex XXIV, Table 2, Estimation based on HIVA's own calculations. It should be noted that the calculation relates to average expenditure per capita in Member States which does not distinguish between contributory and non-contributory long-term care benefits systems. It assumes that EU mobile citizens will make use of long-term care benefits in the same proportions as native citizens. The calculation needs to be construed in light of these limitations.

<sup>304</sup> Annex XXIV, Table 3, Estimation based on HIVA's own calculations. It should be noted that the calculation relates to average expenditure on healthcare per capita in Member States using ESSPROS figures. It assumes that EU mobile citizens will make use of healthcare in the same proportions/frequency as native citizens. The calculation needs to be construed in light of these limitations.

		Member State's welfare system to fund their means of subsistence, which may act as a deterrent to such conduct.
<b>Fair burden sharing between Member States</b>	0	This option is not anticipated to have a direct impact on the distribution of financial burden between Member States.
<p>Coherence with General, Specific and wider EU Objectives:</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <p>to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social benefits.</p>	+/-	This option may be considered coherent with the wider EU objective of supporting fair mobility (fair for both mobile citizens and tax-payers in the State of destination) but is less coherent with objectives to promote a social agenda in particular in relation to mobility for more vulnerable groups within the Union.

#### 6.7.5 Impacts of Policy Option 1c: Specific reference to Directive 2004/38/EC (SNCBs)

Policy Option 1c: Amendment of Article 70 of Regulation (EC) No 883/2004 to make reference to the limitations in Directive 2004/38/EC in the context of benefits that provide a minimum subsistence income		
Social impact		
Clarification	+	The codification of existing case-law would clarify the rights of EU mobile citizens and would facilitate citizens to make an informed choice when exercising their rights to move to another Member State. In particular, it is specified that in accordance with the jurisprudence of the CJEU, derogation of the principle of equal treatment solely applies to SNCBs providing for a minimum level of subsistence as listed in Annex X of the Regulation, thereby achieving a greater level of legal certainty.
Simplification	+/-	As per option 1a, the codification of existing case-law would also simplify the process whereby EU mobile citizens and national institutions could verify their respective rights and obligations. The precise nature of the codification ensures the scope of application is clear, however, it is possible further amendments may be necessary if the case law of the CJEU continues to evolve leading to trade-offs between clarity and simplicity.

Protection of Rights	+	As Option 1a and for the same reasons.
<b>Financial impact</b>	0	There will be no direct impact on Member States' budgets as this measure simply reflects codification of the case-law of the Court.
<b>Impacts on fundamental rights</b>	0	Mere codification of the case-law of the Court. Any impact on fundamental rights already exists in EU law – the amendment to the Regulation will merely reflect this.
<b>Other impacts</b>		
<b>Regulatory costs</b>	+/-0	Costs related to lack of clarity/transparency/legal certainty (for instance litigation costs, legal advice, elaboration of administrative guidance) for both citizens and public authorities could be reduced. However, as this option sets out the limits on the equal treatment principle only in very general terms, it is likely that some litigation on the relationship between the Regulation and the Directive would continue. Public administrations may additionally decide themselves to improve clarity by producing detailed guidance at national level (although such measures will be at their own discretion).
<b>Risk of fraud and abuse</b>	+	As with Option 1a
<b>Fair burden sharing between Member States</b>	0	As with Option 1a
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social	+	As with Option 1a although it is foreseen that if the case law of the CJEU continues to evolve there may be trade-offs between clarity and simplicity.

benefits.		
-----------	--	--

6.7.6 *Impacts of Policy Option 2: Remove SNCBs providing for minimum level of subsistence from scope of Regulation (EC) no 883/2004*

**[Policy Option 2: Remove SNCBs providing subsistence income from Regulation (EC) No 883/2004**

<b>Social impact</b>		
Clarification	++	This option achieves clarity by clearly delineating between social security rights which fall within the scope of Regulation (EC) No 883/2004 in respect of which citizens retain a full right to equal treatment and those to which the limitations in Directive 2004/38/EC apply. This would facilitate citizens to make an informed choice when exercising their rights to move to another Member State.
Simplification	++	This option also achieves simplicity by separating the material scope of Regulation (EC) No 883/2004 from Directive 2004/38/EC apply in a manner which means both citizens and institutions only need to refer to one legal instrument at a time.
Protection of Rights	-	A significant disadvantage of this option is that some of the rules in Regulation (EC) No 883/2004, which can be beneficial for mobile EU citizens (e.g. for example, the rule that social security institutions may not reject documents submitted to them in an official language of another Member State, <sup>305</sup> or the rule of assimilation of facts which requires Member States to take into account facts or events occurring in any Member States as though they had taken place on their own territory. <sup>306</sup> ), would no longer apply. It seems likely that it may become more difficult for mobile EU citizens to claim such benefits in other Member States. Some EU citizens could be discouraged from exercising their free movement rights as a result.
<b>Financial impact</b>	0	There will be no direct impact on Member States' budgets as this measure simply reflects codification of the case-law of the Court.
<b>Impacts on fundamental rights</b>	0	Mere codification of the case-law of the Court. Any impact on fundamental rights already exists in EU law – the guidelines will merely reflect this.
<b>Other impacts</b>		
<b>Regulatory costs</b>	--	While there may be some savings for both citizens and public authorities related to lack of clarity/transparency/legal certainty(for instance litigation costs, legal advice, elaboration of administrative guidance) There would be

<sup>305</sup> Article 76(7) of Regulation (EC) No 883/2004.

<sup>306</sup> Article 5 of Regulation (EC) No 883/2004.

		some noticeable administrative costs for Member State social security institutions arising as a result of (a) changes to procedures and (b) being unable to benefit from the existing cooperation procedures for information exchange and verification provided under the Regulation, (for example, to check with institutions in other Member States the validity of documents or accuracy of facts supplied to them). <sup>307</sup> In addition, institutions would not be able to benefit from the efficiencies of the EESSI electronic information exchange platform due to be launched by the end of 2016 with full implementation by 2018. As institutions may be required to separately establish mechanisms for information exchange to ensure rights and obligations are respected.
<b>Risk of fraud and abuse</b>	-	There may be an increased risk of fraud and abuse because Member States would not be able to benefit from the existing cooperation procedures for information exchange and verification provided under the Regulation, if this option were followed. In addition, the provisions in the Regulation concerning recovery of benefits that are paid in error could also not be used. <sup>308</sup>
<b>Fair burden sharing between Member States</b>	0	As with Option 1a.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social benefits.	-	As with Option 1a although it is foreseen that there may be trade-offs between clarity and simplicity of establishing a clear separation between Regulation (EC) No 883/2004 and Directive 2004/38/EC and the protection of rights for citizens and regulatory burden/risk of fraud and error for national institutions arising from the loss of application of the Regulation to SNCBs.

### 6.7.7 Impacts of Policy Option 3: Provide Administrative Guidance

#### Policy Option 3: Provide administrative guidance

#### Social impact

<sup>307</sup> Article 5(3) of Regulation (EC) No 987/2009.

<sup>308</sup> Article 71 to 85 of Regulation (EC) No 987/2009.

Clarification	+/0	Guidance could provide detailed explanations on when limitations on the equal treatment principle could be applied and circumscribe closely the group of benefits which are affected (namely special non-contributory cash benefits providing a minimum subsistence income). Although guidance is not legally binding it is more flexible and easier to update and modify and allows to better explain the legal rules to citizens. However, the non binding character of guidance limits its impact.
Simplification	++	Guidance may be provided in a range of accessible formats, giving precise guidance on specific scenarios which may be easier for citizens to understand than legal text.
Protection of Rights	+/0	By increasing clarity the application of the case law of the CJEU, legal certainty is also increased thereby facilitating greater uniformity in application by Member States and facilitating the ability of citizens to enforce their rights.
<b>Financial impact</b>	0	There will be no direct impact on Member States' budgets as this measure simply reflects codification of the case-law of the Court.
<b>Impacts on fundamental rights</b>	0	Mere codification of the case-law of the Court. Any impact on fundamental rights already exists in EU law – the guidelines will merely reflect this.
<b>Other impacts</b>		
<b>Regulatory costs</b>	+/0	Costs related to lack of clarity/transparency (for instance litigation costs, legal advice) for both citizens and public authorities could be reduced. It is anticipated that these savings may be achieved sooner in the light of the relative ease of implementing guidance compared with a legislative measure. But given the non binding character of guidance this measure in isolation may not entirely reduce litigation risk.
<b>Risk of fraud and abuse</b>	+	As with Option 1a although the benefits are anticipated to be greater in light of the increased transparency of the guidance.
<b>Fair burden sharing between Member States</b>	0	As with Option 1a.
Coherence with General, Specific and wider EU Objectives:  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States	+	As with Option 1a although it is foreseen that there may be trade-offs between clarity and simplicity of establishing clear and accessible guidance and the non-binding nature of guidance which may not be the most effective means of achieving legal certainty or reducing litigation risk.

<p>involved and administrative simplicity and enforceability of the rules.</p> <p>to ensure legal clarity and transparency on the distinctions between the rights of workers, jobseekers and economically inactive mobile EU citizens, including the extent to which Member States' social security institutions are permitted to limit the equal treatment principle for economically inactive mobile EU citizens and jobseekers who claim certain social benefits.</p>		
--	--	--

## 6.8. *Conclusions*

Based on the above table, the following preliminary conclusions can be drawn.

The baseline scenario is the most straightforward to implement. However, this option does not however, address the objective of ensuring legal clarity and transparency nor the wider EU objective of supporting fair mobility.

Option 1a) introduces legal clarity for economically inactive mobile EU citizens and jobseekers and the persons/institutions involved in the enforcement of the legislation. This option addresses the objective identified and at the same time provides flexibility if the case-law on the relationship between the Directive and the Regulation evolves. This option may be considered coherent with the wider EU objective of supporting fair mobility and reflects the case-law of the CJEU. However, it also means that full clarity on the relationship between the Regulation and the Directive will have to await further jurisprudence from the CJEU.

Option 1b) introduces legal clarity for economically inactive mobile EU citizens and jobseekers and the persons/institutions involved in the enforcement of the legislation. This option addresses the objective identified and at the same time provides flexibility if the case-law on the relationship between the Directive and the Regulation evolves. The extension of the limitations to non-contributory family benefits, long-term care benefits and sickness benefits is anticipated to result in a total cost saving estimated at €37.7 and 79.2 millions in relation to family benefits; €31.5 millions in relation to Long-term care benefits and €185.1 millions in relation to sickness benefits for the EU-28 Member States compared with the baseline (although it is also noted there would be a potential negative impact on the social and fundamental rights of economically inactive EU mobile citizens and jobseekers). This option may be considered coherent with the wider EU objective of supporting fair mobility (fair for both mobile citizens and tax-payers in the State of destination) but less coherent with objectives to promote a social agenda in particular in relation to mobility for more vulnerable groups within the Union.

Option 1c) may be considered to provide greater legal certainty. This option also addresses the objective identified but if the case-law on the relationship between the Directive and the Regulation evolves, further legislative changes might be necessary meaning this may not be the most efficient method of achieving the objective nor the wider EU objective of supporting fair mobility.

Option 2 would not contribute to the attainment of the objective identified. On the contrary, it presents a major draw-back since several beneficial rules of the Regulation would no longer apply. This is therefore considered neither an efficient or effective means of addressing the problems identified nor the wider EU objective of supporting fair mobility or objectives to promote a social agenda.

Option 3, on its own, would be less effective and less efficient in achieving the identified objective since the Regulation would not contain all the elements necessary for its direct applicability to the detriment of both citizens and the persons/institutions involved in its enforcement.

## 7. Family Benefits

### 7.1. Current Coordination Rules for Family Benefits

Family benefits are all benefits in kind or cash intended to help to meet family expenses which arise from the obligation to maintain children.<sup>309</sup> This covers a wide diversity of social security benefits including not only the traditional "child benefits" but also other types of benefits for families e.g. to encourage educational attainment, labour market participation by parents or to replace income during child-raising periods.

The principle of exportability contained within the EU social security coordination rules means that when the child of a worker resides in another State, the worker can export the full amount of the family benefits received from the State of activity to the State where the child resides: in fact, a mobile citizen cannot be denied access to family benefits in cash under the national legislation of a Member State solely on grounds that the person concerned and/or his/her family reside in another Member State. The regulation effectively overrules any residency requirement in national legislation regarding such cash benefits and doesn't allow cash benefits to be reduced, amended, suspended, withdrawn or confiscated.<sup>310</sup>

The EU social security rules provide that primary responsibility for payment of family benefits lies with the Member State of economic activity, on the assumption that the country of employment will usually be the country where a mobile EU citizen pays social security contributions and taxes. However, in the field of family benefits, it is very common that families in a cross-border situation to have overlapping entitlements to family benefits. This is because a child normally has two parents, who may each have independent entitlements to family benefits from different States. To address this issue, the coordination rules provide specific anti-overlapping rules which establish an order of priority for the Member States to make payments.<sup>311</sup> Under these rules, the primary competent Member State will pay its family benefits in full, but entitlement to family benefits in cash under the legislation of the Member State with secondary competence will be suspended up to the amount of the benefits due under the legislation of the State that takes priority (usually the Member State of Employment or in the case of two economically active parents, the place of residence of the child). The current rules also provide that in the event of overlapping entitlements the family concerned will always receive an amount equivalent to the highest level of benefits available.<sup>312</sup> Consequently, if the amount of family benefit provided for by the legislation of the former State is higher than that provided in accordance with the legislation of the other State; the former State will pay a supplement or "top up" corresponding to the difference between the two benefits.

A further important principle in the rules on family benefit coordination is that family benefits are considered benefits for the family as a whole.<sup>313</sup> This means that a family member may have a derived right to claim such benefits even if they reside and work in another Member State and have no personal connection to the social security system of the Member State awarding the benefit.<sup>314</sup>

The current rules include an important safeguard for Member States against the risk of abuse or undue burden on national social security systems. There is no obligation for a country to export a differential

---

<sup>309</sup> Article 1(z) Regulation (EC) No 883/2004. The definition expressly excludes advances of maintenance payments and special childbirth and adoption allowances mentioned in Annex 1 of Regulation (EC) No 883/2004.

<sup>310</sup> Article 7 of Regulation (EC) No 883/2004. The current rules do not provide for any such derogation in relation to family benefits while the CJEU has accepted derogation from the principle of export in relation to special non-contributory benefits and unemployment benefits (*Snares*, C-20/96, EU:C:1997:518) although such derogation must be construed narrowly. Article 48 TFEU on the minimum content of the coordination Regulations explicitly mentions two principles: aggregation and exportability of the acquired rights to facilitate the exercise of freedom of movement. For more detailed overview of current EU legal framework, see Annex XXII.

<sup>311</sup> The priority rule is defined in Article 68 of Regulation (EC) no 883/2004. See Annex XXII for details.

<sup>312</sup> The Court has been explicit in its case law by concluding that "the Regulation cannot be applied in such a way as to deprive the worker, by substituting the benefits provided by one Member State for the benefits payable by another Member State, of the most favourable benefits" (Case C-73/79, *Laterza*).

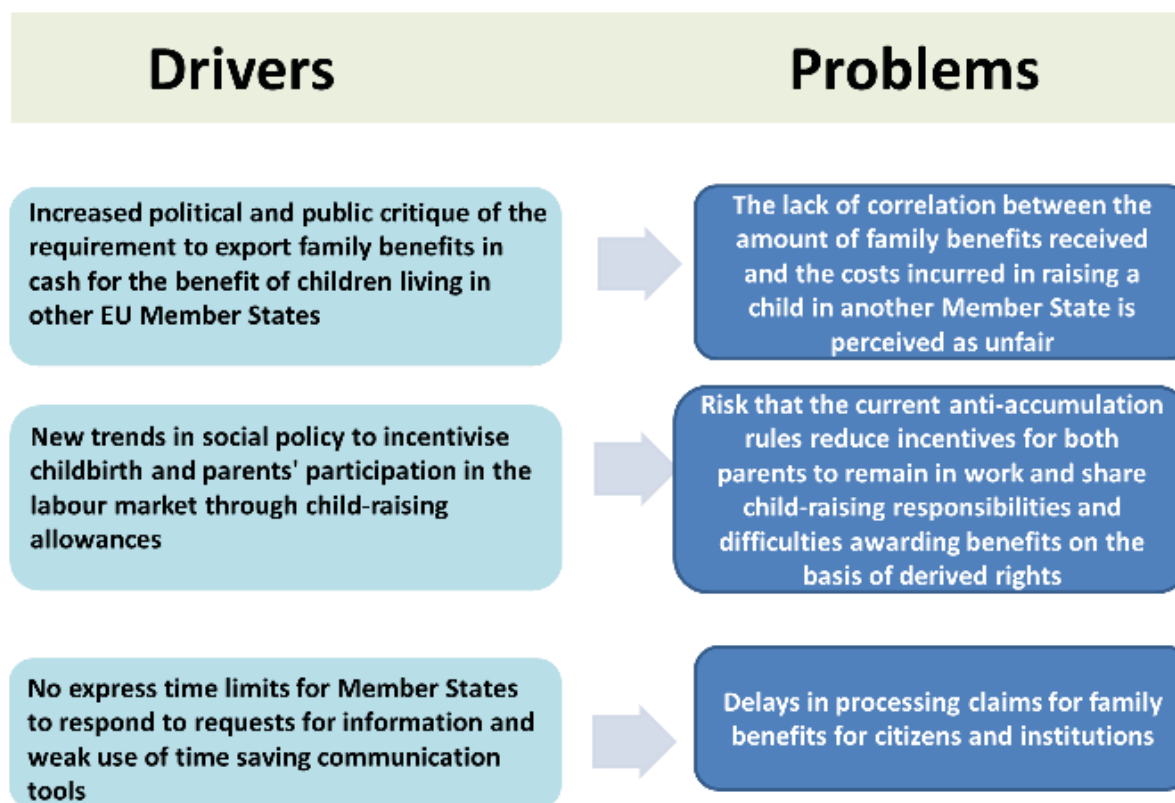

<sup>313</sup> Joined cases C-245/94 and C-312/94 *Hoever and Zachow*.

<sup>314</sup> See for example, Article 68A of Regulation (EC) no 883/2004 and Article 60(1) of Regulation (EC) 987/2009 supporting the rights of a parent or person in loco parentis to assert derived rights.

supplement where a right to family benefit is derived solely on the basis of residence of an EU mobile citizen.<sup>315</sup>

Based on data collected from 19 Reporting Member States and EFTA States in the survey on export of family benefits,<sup>316</sup> a total export of € 983 million in family benefits was declared for 2013, which includes export of child benefits (an important sub-category of family benefits) to 324 thousand households or 506 thousand children living in another Member State. This is equal to a total expenditure of € 942 million. Benefit export amounted to 0.8% of EU-28 expenditure on child and family allowances.<sup>317</sup> On average 1% of child benefits are being exported abroad, which represents 1.6% of total public spending on child benefits.<sup>318</sup>

## 7.2. Problems with the export of family benefits and drivers behind them

### 7.2.1. The lack of correlation between the amount of exported benefits and the costs incurred in raising a child in the State of residence of the child is perceived as unfair

The family benefit systems differ considerably in terms of eligibility criteria, design and generosity across the EU.<sup>319</sup> These differences reflect the diversity in the economic and social context between Member States, which to some extent have been exacerbated by austerity measures adopted in response to the recent economic crisis.<sup>320</sup> For example, in Luxembourg, a family with one child might expect to receive child benefit at the rate of €185 per month, by contrast in Bulgaria, the child benefit

<sup>315</sup> Article 68(2) Regulation (EC) No 883/2004 . In the case of two economically inactive parents, the Member State of residence of the child would have primary competence to pay family benefits in accordance with its national legislation.

<sup>316</sup> Annex XI

<sup>317</sup> In 2012, total family and child allowance expenditure was € 126,043 million. (ESSPROSS, Pacolet 2015)

<sup>318</sup> Table 11, Annex XI (Data based on 16 reporting Member States)

<sup>319</sup> For more details, see section 3, p. 156-169 in Annex XXI.

<sup>320</sup> By mid-2010, austerity measures affecting family policy had either been adopted or announced in 11 Member States (Czech Republic, Denmark, Estonia, Germany, Hungary, Ireland, Italy, Luxembourg, the Netherlands, Spain and the United Kingdom OECD (2011), *Doing Better for Families*).

would be €18 per month.<sup>321</sup> This means that a worker in Luxembourg whose family resides in Bulgaria may be able to export €185 per month to Bulgaria to support his or her family; conversely a worker in Bulgaria whose family resides in Luxembourg would only be entitled to export €18 per month.<sup>322</sup> A worker based in Luxembourg may be entitled to family benefits that represent 190% of the average earnings of a one-earner married couple with two children in Bulgaria, while on average child benefits equal to 10% of the net earnings of household in EU-28/EFTA.<sup>323</sup>

Furthermore, there is a perceived unfairness of the system as in accordance with the statutory definition of family benefits as "all benefits in kind or cash intended to meet family expenses,"<sup>324</sup> the primary objective of such benefits is to help to meet the additional expenses which arise from the obligation to maintain children (e.g. additional or special nutrition, nappies, prams, school books, childcare, etc.). Those expenses will often be linked to the actual costs of goods or services in the place of residence of the child, which means that the level of such expenses can differ significantly from one Member State to another. Viewed from this perspective, recipients of exported family benefits may be in a privileged position compared to nationals because exported benefits may provide a comparatively greater purchasing power in the country of residence.

Such perceptions of unfairness are sustained (reinforced) both by the non-contributory nature of family benefits that are predominantly financed wholly or partially through general taxation<sup>325</sup> and the fact that in the majority of Member States entitlement to family benefits is on the basis of legal residence whereas under the EU social security rules priority is awarded to the State of economic activity.<sup>326</sup> This results in a tension between the EU social security rules and principles of national legislation and leads to the perception that Member States of residence are abdicating their social security responsibilities in relation to children resident within their territory to another Member State.<sup>327</sup> As a consequence of this perceived unfairness, there is a risk of negative attitudes towards migration amongst the general population, as are already observed in the public debate in some Member States, which entails a risk that public and political support for the EU social security coordination rules may be undermined with a subsequent negative impact on labour mobility. There is also a risk of unilateral imposition of restrictive measures by Member States. For example, there have been a number of examples of public criticism of the current EU rules on export of family benefits and counter-proposals by senior politicians challenging the concept of export for family benefits.<sup>328</sup>

This political discourse may be perceived as both a catalyst and a reaction to sentiments expressed by national media outlets and public opinion in some<sup>329</sup> (although by no means all<sup>330</sup>) Member States and

---

<sup>321</sup> In 2014, Luxembourg had a GDP per capita in PPS of more than two and a half times above the EU-28 average while Bulgaria had it less than half the EU-28 . <http://ec.europa.eu/eurostat/tgm/table.do?tab=table&init=1&language=en&pcode=tec00114&plugin=1>

<sup>322</sup> Family living in Luxembourg may receive a differential supplement from Luxembourg up to the level of the national family benefits. For the definition of differential supplement see the glossary in Annex XXIII.

<sup>323</sup> Annex XI.

<sup>324</sup> Article 1(z) Regulation (EC) No 883/2004 . The definition expressly excludes advances of maintenance payments and special childbirth and adoption allowances mentioned in Annex 1 of Regulation (EC) No 883/2004.

<sup>325</sup> 16 Member States, finance family benefits exclusively through general taxation FreSsco, The relationship between social security coordination and taxation law, 2014.

<sup>326</sup> The priority for social security competence accorded to the Member State of Work is a consistent principle across the EU social security coordination rules for both contribution and non-contribution based social security benefits based on the economic logic that the worker usually pays taxes and contributions in the State of employment (Article 11(3) Regulation (EC) no 883/2004).

<sup>327</sup> A member state of residence will only be obliged to pay a differential supplement if the level of family benefits under its national legislation is higher than that available from the Member State of Work. For the definition of differential supplement see the glossary in Annex XXIII.

<sup>328</sup> Statements by the Austrian Foreign Minister Ziarul Financiar: "*The Austrians control Romania's oil, banks, insurance sector and forests, ...*" page: 3 info: by Păslaru Sorin date: Monday, June 22, 2015; Prime Minister of the United Kingdom's speech at JCB, Staffordshire. It includes proposals made as Leader of the Conservative Party, 28 November 2014 <https://www.gov.uk/government/speeches/jcb-staffordshire-prime-ministers-speech>.

<sup>329</sup> Berlingske Tidende: "*Danskerne vil begrænse vandrende arbejdstageres adgang til velfærdsgoder...*" date: Saturday, June 6, 2015 In Denmark, 83% of the respondents in a new survey say that they agree that foreigners should only receive child benefits if their children are living in the country where their parents work.

<sup>330</sup> . Waterfield, 'Poland attacks David Cameron plan to ban Polish and EU migrants from claiming child benefit', *The Telegraph*, 6 January 2014, available at <http://www.telegraph.co.uk/news/worldnews/europe/poland/10553020/Poland-attacks-David-Cameron-plan-to-ban-Polish-and-EU-migrants-from-claiming-child-benefit.html> (last accessed 17 March 2015). He argued that Polish people contributed about double the amount to the British economy than they withdrew in benefits and that in the long run the United Kingdom is receiving the fiscal

is in spite of studies<sup>331</sup> which consistently show both support for<sup>332</sup> and the positive effect of free movement of workers: mobile EU workers make a positive contribution to the mix of skills, fill labour shortages, increase the GDP, and tend to make a net positive contribution to the national budget (including welfare systems). In addition the evidence demonstrates that mobile workers use welfare benefits no more intensively than the host country's nationals.<sup>333</sup> Further two-thirds of Europeans believe that legal immigrants should have the same rights as national citizens.<sup>334</sup> This belief is also reflected in relation to specific studies on equal rights in the field of welfare and social protection.<sup>335</sup>

Underneath the heated political discourse, the situation is more complex. It is to be noted that despite the widely held view that family benefits correlate to the social and economic environment of the competent Member State, the level of family benefits are not directly linked to the minimum or average wage, subsistence level or living costs in any Member State.<sup>336</sup> Moreover, despite the criticism that the general model for determining competence under the EU social security rules is inappropriate for family benefits, it is significant that in 12 out of 28 Member States, family benefits are financed either through a combination of general taxation and employer/employee contributions, or are exclusively contribution-based.<sup>337</sup>

While some critics believe the current model for coordinating family benefits leads to an unfair distribution of burden between the Member State of Work and the Member State of Residence, this does not acknowledge either the fact that a mobile citizen will normally pay taxes and social security contributions in the State of Work. Nor does such criticism acknowledge the financial contribution of the Member State of residence in providing and financing family benefits in kind (such as subsidized child-care services),<sup>338</sup> or benefits outside the scope of the coordination rules, such as advances to maintenance payments and to special childbirth and adoption allowance.<sup>339</sup> In addition, while family expenses may vary according to the actual costs of goods or services in the place of residence of the child, families in a cross-border situation may also face increased expenses (e.g. travel and communication costs to maintain contact or additional child-care costs for the parent with primary caring responsibilities due to the absence of the other parent). There may also be further socio-economic consequences of family separation for example, the impact on the level and extent of labour market participation that the parent with primary caring responsibilities may engage in and the psychological and emotional consequences for the child.<sup>340</sup>

#### 7.2.2. *Risk that the anti-accumulation rules reduce incentives for both parents to remain economically active and share child-raising responsibilities and difficulties in awarding "parent-centred" benefits on the basis of derived rights*

---

contribution of migrants' work, without paying for the education and training that enables them to work. Ziarul Financiar: *"The Austrians control Romania's oil, banks, insurance sector and forests, ..."* page: 3 info: by Păslaru Sorin date: Monday, June 22, 2015.

<sup>331</sup> See review of studies in European Commission, ESDE 2011 (chapter 6); EPC (2013).

<sup>332</sup> Eurobarometer 83, (Spring 2015) "the free movement of people, goods and services within the EU" was regarded as the most positive result of the EU by 57%, ahead of peace (55%) among member states. Both of these items have always been mentioned by at least a half of Europeans since this question was first asked.

<sup>333</sup> See [OECD's International Migration Outlook 2013](#), the Centre for Research and Analysis of Migration study on [Assessing the Fiscal Costs and Benefits of A8 Migration to the UK](#) and the [study](#) by the Centre for European Reform and ICF GHK in association with Milieu Ltd Fact finding analysis on the impact on Member States' social security systems of the entitlements of non-active intra-EU migrants to special non-contributory cash benefits and healthcare granted on the basis of residence.

<sup>334</sup> Special Eurobarometer 380 "Awareness of home affairs", December 2011.

<sup>335</sup> Jurgen Gerhards, Holger Lengfeld, European Citizenship and Social Integration in the European Union, (Routledge 2015).

<sup>336</sup> For example, child allowances in both Luxembourg and Sweden are awarded on a flat rate not related to living costs, average or minimum income and regardless of the relative income level of the recipients. Similarly, Member States don't adjust its level of family benefits to reflect different costs of living within the relevant territory (even where significant variations exist). There may be indirect links to subsistence or minimum wage in relation to certain means-tested family benefits in Belgium, Bulgaria, Croatia and Slovenia. In addition indirect links to cost of living in the Member State concerned is apparent from indexation rules in Austria, Belgium and Slovenia (Annex VI, p.22-25.).

<sup>337</sup> FreSsco, The relationship between social security coordination and taxation law, 2014.

<sup>338</sup> Member State expenditure on family benefits in kind typically ranges between 0.2 and 1.7 percent of GDP . Annex XIII: Table 3.

<sup>339</sup> Article 1(z) Regulation (EC) no 883/2004.

<sup>340</sup> [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2432946](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2432946) <http://opus.bath.ac.uk/46410/>.

The EU social security coordination rules contain a wide definition of family benefits, which include child-raising allowances.<sup>341</sup> A child-raising allowance is a benefit intended to cover wages/income lost when a parent stays home from work to take care of the child and may be calculated by reference to salary or professional income or may be flat-rate.

It is a core principle of the EU social security coordination rules that two Member States are not simultaneously obliged to pay social security benefits for the same purpose in respect of the same period (anti-accumulation principle). This is also the basis of the priority rules for overlapping family benefits explained at section 7.1 above. However, applying the anti-accumulation rules to child-raising allowances is perceived as unfair by some citizens because in contrast to other family benefits a child-raising allowance is intended to cover wages lost when a parent stays home from work to take care of the child. It is therefore perceived as a sum that parent has "earned" and which should be awarded without deduction.<sup>342</sup>

**Example:** David and Marie live with their child in Member State A. David is working in Member State A and Marie is a frontier worker in Member State B. They both work part-time and share child-care responsibilities. Member State A has a child raising allowance calculated with reference to salary while Member State B has a flat-rate child-raising allowance regardless of salary or income. David is entitled to €75 per week based on his salary in Member State A, and Marie is entitled to €25 per week. Member State A is primarily competent to pay child allowance because of child's residence and David's work. Member State B is the secondary competent and obliged to pay only the differential supplement (see Annex XXII for details). In calculating differential supplement, Member State B takes into account the benefits paid in Member State A in line with the anti-accumulation rules. The level of allowance in Member State A (€75) is higher than the amount in Member State B (€25) and therefore Member State B does not pay Marie anything during periods when she takes leave from work to take care of her child. The family gets €75 but it would get €100 if the child-allowance based on individual salary would be treated as individual right and not as an entitlement for the entire family.

Some critics also complain that the application of the anti-accumulation rules undermines the policy objective of promoting greater gender equality by encouraging parents to share child-raising responsibilities as the potential loss in household income that results from the anti-overlapping rules acts as a deterrent against both parents claiming child-raising allowances at the same time.<sup>343</sup> A driver for these challenges is the social security trend among Member States to promote parents' (in particular mothers') participation in the workplace. Reconciliation of work life balance and gender balance is an objective for family policy in 24 Member States,<sup>344</sup> while 22 Member States have a benefit intended to replace income during child-raising periods.<sup>345</sup>

A related problem with the application of the current coordination rules to child-raising allowances is that these are generally considered "parent-centred" rights, intended to protect the individual parent concerned. However, under EU law, family benefits are deemed benefits for the family as a whole. This means that either parent may have a derived right to claim such benefits even if such parent is residing and working in another Member State and has no personal connection to the social security system of the Member State awarding the benefit.<sup>346</sup> Some national authorities complain that there are administrative and practical challenges for their institutions when a claim is made as a derived right by a spouse or partner as it is difficult to determine if national conditions are satisfied. These complexities are exacerbated for salary-related child raising allowances where a claim is made by a

<sup>341</sup> Joined cases C-245/94 and C-312/94 *Hoever and Zachow*.

<sup>342</sup> Annex VI p18 and 26 in relation to Sweden.

<sup>343</sup> For critique of the application of the anti-accumulation rules to salary-related child-raising allowances see Sakslin, M. (2000) 'Social Security Co-ordination – Adapting to Change', *European Journal of Social Security*, 2(2), p184 and Holm, E " Parental Benefits in the Coordination Regulation: Where do they fit in the Swedish Example" *European Journal of Social Security*, Volume 16 (2014), No. 2: p136

<sup>344</sup> The Council of Europe Family Policy Database.

<sup>345</sup> Annex XXV p 7.

<sup>346</sup> For example, David works in country A, while Marie with a child lives and works in country B. Member State A has a salary-related child allowance. David can share part of his parental related benefits entitlements with Marie without any loss to the household income providing that Marie fulfils the conditions under A's national law, i.e. she has taken leave from work to take care of the child.

family member who does not have earnings in the Member State awarding the benefit.<sup>347</sup> Consequently, some Member States refuse to coordinate such benefits as family benefits under the EU Coordination rules, instead classifying them as maternity or equivalent paternity allowances in a manner that circumvents both the anti-accumulation rules and the application of derived rights. The 2012 Nordic Convention<sup>348</sup> excludes benefits intended to compensate for income loss from professional activity when calculating differential supplements for family benefits.<sup>349</sup> In other cases, Member States restrict entitlement to this type of benefit exclusively to a person who is insured under the national social security insurance.<sup>350</sup> Consequently, notwithstanding enforcement action taken by the Commission,<sup>351</sup> very few Member States are currently fully complying with EU law.<sup>352</sup>

The consequence of such divergent approaches is inconsistent treatment of families and uneven distribution of burden between Member States. The other secondary competent Member States are unable to "off-set" such awards when calculating the differential supplement in a manner which may be seen as unfair, if those Member States categorize similar benefits according to the social security rules as family benefits.<sup>353</sup> Likewise, there may be increased accumulation of benefits by families and increased risk of infringement proceedings.

### 7.2.3. Delays in processing claims for family benefits

Situations of overlapping entitlements are very common when insured parents with dependent children live and work in different Member States. The *priority rules* define the process in establishing the primary and secondary competent states and the way to calculate level of benefits and differential supplements.<sup>354</sup> This requires a number of exchanges of information between the Member States and increases time needed to process the claims for the export of family benefits.<sup>355</sup> In addition, a number of sociological changes (that are outside the scope of this initiative such as legalisation of same-sex marriage, increased instances of lone parents, divorce, family breakdown and remarriage)

---

<sup>347</sup> See results of FreSsco mapping exercise Annex VI p27.

<sup>348</sup> A multilateral convention based on Regulation (EC) No 883/2004 between Sweden, Denmark, Finland, Norway and Iceland. Iceland and Norway apply Regulations (EC) Nos 883/2004 and 987/2009 pursuant to the 1994 European Economic Area Agreement. According to the Article 8.2 of Regulation (EC) No 883/2004, such agreements shall be based on the principles of the Regulation and in keeping with the spirit thereof.

<sup>349</sup> Article 11 of the Nordic Convention 2012.

<sup>350</sup> For instance, in Austria entitlement to the income replacement scheme requires (among others) that the person concerned has been employed for a minimum period of six months before childbirth under the Austrian social security insurance. Thus, a person who resides in Austria but is working in another Member State and is therefore subject to the social security scheme of that Member State, is not entitled to income replacing cash childcare benefits in Austria. Similarly in Belgium, in order to qualify under the 'professional' scheme, work has to be carried out in Belgium. For more, see Annex VI (p. 37).

<sup>351</sup> European Commission, June Infringement Package: Key Decisions "Commission requests SWEDEN to comply with EU coordination rules in relation to its parental allowance" 18 June 2015 [http://europa.eu/rapid/press-release\\_MEMO-15-5162\\_en.htm](http://europa.eu/rapid/press-release_MEMO-15-5162_en.htm)

<sup>352</sup> Only four of the seventeen Member States who have salary-related child-raising allowances recognise claims based on derived rights See also the FreSsco report by J. De Coninck, 'Reply to an ad hoc request for comparative analysis of salary-related child-raising allowances', FreSsco, European Commission, September 2015. Annex XXV, p14.

<sup>353</sup> Member States where parental benefits are included in the total sum of family benefits will have higher benefits, and are more often obliged to pay supplements. See an evaluation made by the Swedish Social Insurance Agency on the payment of family benefits Försäkringskassan analyserar 2005:3 Utbetalning av familjeförmåner med stöd av EG-lagstiftningen under 2004. p. 20 and Försäkringskassan analyserar 2007:10 Utbetalning av familjeförmåner med stöd av EG-lagstiftningen \_ under 2006. p. 18.

<sup>354</sup> See Annex XXII for details.: if there are overlapping entitlements to family benefits in cash (i.e. entitlements under two or more legislations in respect of the same family member and for the same period) on different bases, the order of priority is as follows: firstly, rights available on the basis of an activity as an employed or self-employed person, secondly, rights available on the basis of receipt of a pension and finally, rights obtained on the basis of residence. In the case of rights available on the same basis, the Member State where the children reside shall be competent by priority right but in cases where a right exists solely on the basis of residence, there shall be no obligation for the secondary competent Member State to export the differential supplement in respect of children residing in another Member State . It should be noted, these rules apply to family benefits in cash, in the case where a child does not reside in the State which has primary competence, the State of residence of the child will usually be responsible for providing benefits in kind (subject to a family fulfilling conditions of entitlement).

<sup>355</sup> Exchanges of information are necessary to establish relative order of competence depending on the place of residence and economic status of both parents and subsequently to calculate the benefit to be awarded based on the family circumstances as a whole (in the case of the secondary competent Member State this will entail calculation of the differential supplement) . Such calculations may be subject to periodic adjustments relating to changes in the families circumstances or changes to the level of family benefits granted by the other Member State . Where a sum has been awarded to the family on a provisional basis (pending final determination of competence by the Member States concerned), there may be a need for additional exchanges and other administrative tasks to arrange recovery of the overpayment; likewise delays in communicating changes of circumstance may also result in the need to initiate recovery procedures.

have increased the complexity of family structures.<sup>356</sup> These new patterns of family formation, and divergences in legislation between the Member States in relation to legal rights for different family structures have increased the need for the exchange of information and necessitate in many cases sensitive and time-consuming investigations to establish entitlement.

There are considerable delays in processing claims in the field of export of family benefits.<sup>357</sup> For example, data from the Latvian national authorities suggest that in over 65% of cases requests for information to other Member State to establish primary competence take longer than two-months for a response and in some cases even more than eight months.<sup>358</sup> Your Europe report a number of complaints received from citizens concerning excessive delays in processing their family benefit claims or receiving payment of family benefits.<sup>359</sup>

The driver for delays primarily relates to the investigations and subsequent exchange of information between competent institutions in the field of export of family benefits. First, there is no common understanding between Member States as to the deadlines for responding to a request for information from another Member State as the EU rules only oblige to exchange the information "without delay".<sup>360</sup> A second driver is the inefficient exchange of information between competent national institutions. Pending the implementation of a pan-European Electronic Exchange for Social Security Information (EESSI)<sup>361</sup> it is permissible for institutions to exchange information via paper and electronic means in a variety of different formats in a manner which also hinders efficient exchange.<sup>362</sup>

The consequences of long procedures are twofold. The families concerned have to wait for a long time before they receive the full amount of benefit they are entitled to. The regulatory costs and burden for national authorities may increase in circumstances where repeated requests need to be made for information or a provisional decision on calculation on benefits transpires to be incorrect necessitating time-consuming recovery or reimbursement procedures.<sup>363</sup>

#### 7.2.4. *Baseline scenario*

##### *Export of family benefits*

The number of EU mobile workers has increased sharply in absolute terms over the last decade, however in terms of the overall active population it has only gone up one percentage point (from 2.1% in 2005 to 3.3% in 2014).<sup>364</sup>

On the basis of the demographic projections<sup>365</sup> there is no reason to anticipate dramatic increases in the expenditure for Member States in the field of family benefits while the increase in the age-dependency ratio may place greater pressures on national administrations to finance such benefits:

---

<sup>356</sup> Between 1965 and 2011, the crude marriage rate in the EU-28 declined by close to 50 % while crude divorce rate increased from 0.8 per 1 000 persons in 1965 to 2.0. Further, the rate of births outside marriage has increased. In the EU-28 as a whole, some 40 % of children were born outside marriage in 2012. Eurostat, Marriage and Divorce Statistics, June 2015.

<sup>357</sup> The FreSsco mapping exercise revealed administrative problems and delays in all participating Member States, Annex VI, p.16-17

<sup>358</sup> Note presented by Latvian authorities to the Reflection Forum of the Administrative Commission on Social Security Coordination March 2015.

<sup>359</sup> Your Europe Advice, Quarterly Feedback Report No 11 (First Quarter, January-March 2015)

<sup>360</sup> Articles 68(3) and 76(4) of Regulation (EC) No 883/2004 and Articles 2, 60(2) and (3) of Regulation No (EC) 987/2009. The Regulation expressly provides only that provisional decisions on which Member State has primary competence will become binding after two months.

<sup>361</sup> Decision E1 of the Administrative Commission for Social Security Coordination. 12 June 2009 [C 106, 24/04/2010, p. 9](#)

<sup>362</sup> Administrative problems in the cross-border exchange of data associated with paper exchange of documents were reported by a number of Member States. See Annex VI (p. 17).

<sup>363</sup> Only a small minority of national administrations have a good view on the actual administrative burden or are able to support their arguments with quantitative data or a detailed description of the burden. A detailed analysis for seven Member States shows, that the national administration of primary competence spends on averages around two man-hours per case. For details, see Annex XVI

<sup>364</sup> Eurostat, LFS and European Commission calculations.

<sup>365</sup> The total fertility rate (TFR) is projected to rise from 1.59 in 2013 to 1.68 by 2030 and further to 1.76 by 2060 for the EU as a whole. However, during the same period, the proportion of young people (aged 0-19) is projected to remain fairly constant by 2060, while the total age-dependency ratio (people aged below 20 and aged 65 and above over the population aged 20-64) is projected to rise from 64.9% to 94.5%. European Commission: The 2015 Ageing Report: Economic and Budgetary Projections for the 28 EU Member States (2013-2060): Graph I.1.2.

still, a recent OECD Working Paper<sup>366</sup> concluded that public spending on family cash benefits is significantly associated with an increase in the total fertility rate. The fertility rate is projected to rise from 1.59 in 2013 to 1.64 by 2020 in the 2015 Ageing Report. Moreover, the fertility rate is projected to increase over this period in nearly all Member States, with the exception of France.

Intra-EU cross-border workers (i.e. working in a Member State other than the Member State of residence) are the main group of persons concerned by the export of family benefits. Compared to 2010, the number of cross-border workers increased sharply in absolute terms, but in relative terms (as percentage of the employed population) it has stayed at a relatively stable level of some 0.6% of the working population. It moved only from 0.5% of the employed population in 2006 to 0.7% of the employed population in 2014.<sup>367</sup> There is no indication that the relative level of cross-border workers will change considerably between now and 2020. In the 2015 Ageing Report we even read a projected negative growth of the number of employed persons (20-64) over the projection period (2013 to 2060). However, between 2013 and 2020 the number of employed persons would increase by 4.4 million persons (aged 20 to 64): this would result in a projected increase of 26,500 cross-border workers (+2.1%) between 2013 and 2020 (assuming that 0.6% of the labour force continues being employed as a cross-border worker).

EU mobile workers appear to have relatively fewer children compared to native workers (0.31 compared to 0.48 children in 2014).<sup>368</sup> While this may reflect the reality that EU citizens are more likely to be mobile when they do not have dependents, it is notable that the average for EU mobile workers has increased compared to 0.25 in 2004. In addition, statistics show a 39% increase in the number of permits issued to children wishing to join an EU citizen (18.756 in 2008 compared to 26.076 in 2013).<sup>369</sup> This may imply that as the economic outlook in the EU improves that EU mobile parents will be less inclined to seek work in a different Member State while leaving their children behind (at least in the longer-term). Supporting this assumption is the projections for greater levels of female labour market participation<sup>370</sup> as mothers are more likely to relocate as a family to the Member State of work, while men are proportionately more likely to work remotely from the country where their partners and children reside.<sup>371</sup>

In this way it may be anticipated that the instances of export of family benefits may reduce in the longer term as more mobile workers relocate with their families and because of the expected static or even reduced mobility flows. Likewise, in cases of frontier workers, increased levels of labour market participation by parents is likely to increase instances where the Member State of residence of the child has primary responsibility for payment of family benefits. This trend may increase the numbers of cases of export by the secondary competent Member State but reduce the level of benefits paid. Such trends are likely to result in a clearer alignment between the place of residence of the child and Member State with primary responsibility for payment of Family Benefits in a manner which may reduce the perception of unfairness due to the export of family benefits albeit that ongoing pressures created by the age-dependency ratio may in part counteract the impact of these trends. In conclusion, the total spending on family benefits might increase slightly based on the assumption that is associated with the minor increase in fertility rate, but there is no indication that spending related to the export of family benefits will change in relative terms between now and 2020.

<sup>369</sup> There are no reliable data to compare numbers of EU mobile citizens who reside in a different household to their children and the trend in number of permits serves as a proxy for the reunification intentions of families. Eurostat First permits issued for family reasons by reason, length of validity and citizenship [migr\_resfam]

<sup>370</sup> European Commission: The 2015 Ageing Report: Economic and Budgetary Projections for the 28 EU Member States (2013-2060): Graph I.2.4 shows The total participation rate of women (for the age group 20-64) in the EU is projected to increase by 6 pp compared with 1 pp for men.

<sup>371</sup> See Renee Luthra, Lucinda Platt & Justyna Salamońska, Migrant diversity, migration motivations and early integration: the case of Poles in Gemany, the Netherlands, London and Dublin (LEQS Paper No. 74/2014) and further research cited.

### *Labour market participation of women*

Labour Market Participation for women is increasing rapidly with ILO predicting a participation rate of close to 75% in EU28 by 2020.<sup>372</sup> Likewise, in cases of frontier workers, increased levels of labour market participation by parents is likely to increase instances where the Member State of residence of the child has primary responsibility for payment of family benefits (already based on current LFS data in a households where a couple is living with children, 64% of parents are both economically active compared with 25% where only one parent is working). This trend may increase the numbers of cases of export by the secondary competent Member State but reduce the level of benefits paid per case of export by that Member State. Such trends are likely to result in a clearer alignment between the place of residence of the child and Member State with primary responsibility for payment of Family Benefits in a manner which may reduce the perception of unfairness described above.

However, in light of this trend of increased parents' labour market participation combined with the trend of the ageing population and increased family-carer responsibilities it will be increasingly important that there are flexible family policies to facilitate ongoing participation in the labour market during period of child-raising (and other caring obligations) and that barriers to such participation are minimised. Therefore the number and importance of child raising allowances is expected to increase and without common approach to classifying those benefits the problem of inconsistent treatment of families, uneven distribution of burden between Member States and of infringement proceedings will persist.

### *Delays in processing of family benefits*

It is anticipated that reported delays in the processing of applications for family benefits will be reduced by the recent adoption of the decision F2 by the Administrative Commission for Social Security Coordination which imposes maximum time limits for responding to requests for information and by the launch of the Electronic Exchange for Social Security Information (EESSI) scheduled for launch by the end of 2016 with a deadline for full implementation in all Member State by the end of 2018 which will introduce common structured electronic documents and a uniform procedure for all national authorities to follow when processing claims for family benefits.<sup>373</sup>

It may also be assumed that there will be some improvement in public perceptions towards EU mobile citizens' access to family benefits arising from co-existing initiatives outside the scope of this review such as the Communication on Free movement of EU Citizens and their families: five actions to make a difference (COM(2013)837final) and ongoing research and communication initiatives by the Commission such as the development of annual data collection and reporting on the level of export of family benefits among Member States (including as a percentage of national expenditure on family benefits) as compared to expenditure on family benefits in kind for children resident in a Member State will elucidate the debate.<sup>374</sup>

#### *7.2.5. Objectives for review of existing coordination rules on export*

As with all elements of this review exercise, the **general policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.

In relation to family benefits in particular, this is reflected in the need to examine the reasons for perceptions of unfairness concerning the current rules on family benefits both in relation to fair treatment of mobile families and the balance of financial burden between Member States and to examine if there is a need to change the rules in order to counteract the risk of unilateral actions by some Member States. It also reflected in the need to ensure clarity in the rules as they apply to child-

<sup>372</sup> ILO, Economically Active Population Estimates and Projections.

<sup>373</sup> Annex VI, p17.

<sup>374</sup> See also *Socio-economic inclusion of migrant EU workers in 4 cities*, European Commission (2015).

raising allowances recognising the current inconsistent treatment of such benefits by different Member States which creates uncertainty for citizens and competent institutions and consequent difficulties in enforceability. In recognition of the current administrative complexity and delays in processing family benefits, an important criterion in assessing all options under consideration will be the need for administrative simplicity and clarity.

In addition to the general objective the **specific objectives** in the field of family benefits are defined as follows:

- To ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits;
- To reduce barriers or disincentives to parents' ongoing participation in the labour market;
- To ensure family benefits are processed as efficiently as possible.

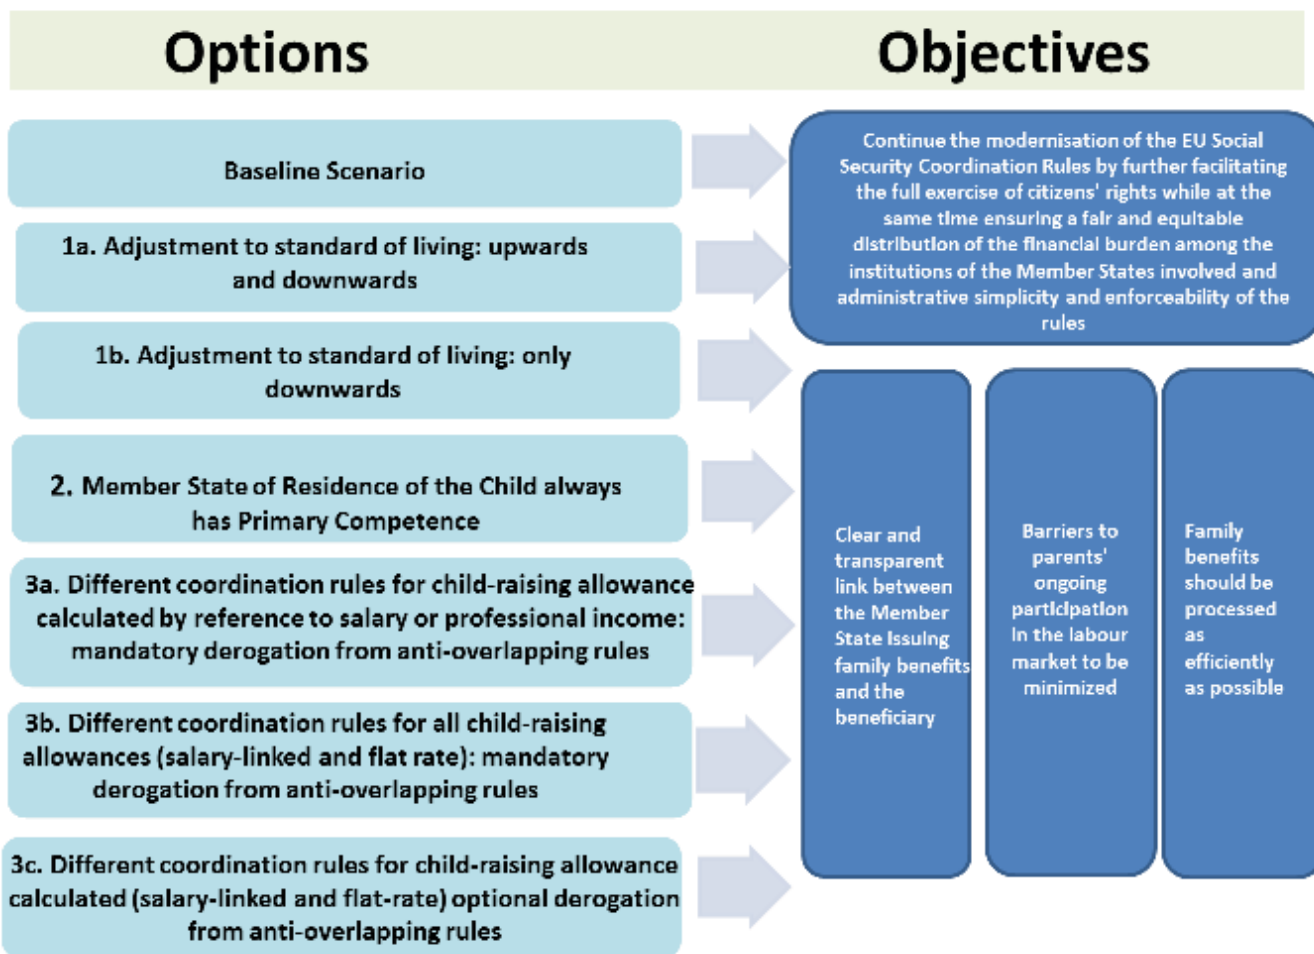

### 7.3. **What are the various options to achieve the objectives concerning export of family benefits**

There will be no specific option proposed for the problem of delays in processing claims for family benefits, as it is anticipated that this issue will be resolved horizontally and through measures already envisaged outside the scope of this initiative.

A number of policy options have been identified to meet the objectives set out in Section 7.2.5. These span from non EU-action all the way to creating specific changes to the legal framework<sup>375</sup>. Whenever a combination of options is possible, this is indicated.

---

<sup>375</sup> As the problems relate to the application of Regulation (EC) Nos 883/2004 and 987/2009, all legislative options concern a change to these Regulations.

### 7.3.1. Option 0: Baseline Scenario:

Family benefits are exported to another Member State at the level of the competent Member State (=State of activity of the worker). They are conceptualised as benefits for the entire family and therefore are not regarded as individualised rights but may be transferrable between either parent who satisfies the conditions of entitlement. In cases of overlapping entitlement to family benefits, the rules of priority apply.

**Example<sup>376</sup> 1.B:** Peter works in Member State A (a country with a higher cost of living) and Marie, his non-working spouse, resides with their children in Member State B (which has a lower cost of living). Peter is entitled to Member State A's family benefits at the same amount as if his family were residing in Member State A. Member State B will not pay a differential supplement because the level of family benefits under its national legislation is lower than that provided in Member State A. Either Peter or Marie can make the claim for family benefits from Member State A.

**Example 2.B:** Anna works in Member State B (a country with a lower cost of living) and David, her non-working spouse, resides with their children in Member State A (which has a higher cost of living). Anna is entitled to Member State B's family benefits at the same amount as if her family were residing in Member State B. If the family is also entitled to benefits in Member State A, Member State A will also pay a differential supplement up to the level of family benefits provided under its national legislation. Either Anna or David can make the claim for family benefits from Member States A and B.

<sup>376</sup> The same two examples will be used to present differences in the options for adjusting the level of family benefits. The assumption is that a country with a higher cost of living has also a higher level of family benefits and vice versa.

### 7.3.2. Option 1: Adjustment to standard of living

Option 1 proposes that the amount of exported family benefits would be adjusted according to the standard of living in the Member State of residence of the child(ren) in two variants (Options 1a and 1b).

In developing this option the Commission has identified a risk that such an option may be incompatible with primary law if it were to be applied to family benefits to which a citizen (and in particular a worker) has an autonomous right existing outside the scope of the Regulation. Therefore it is proposed that option 1a and 1b would only apply to the export of non-contributory based family benefits where there is no pre-existing right of export under national law.<sup>377</sup> This safeguard is important as it may exceed the scope of Article 48 TFEU to propose measures that would increase the disparities arising from the absence of harmonisation between national legislation in a manner that may have negative ramifications for mobile workers.<sup>378</sup>

#### 7.3.2.1. Option 1a: Adjustment to standard of living: upwards and downwards

The amount of exported family benefits would be adjusted upwards and downwards according to the living standard in the Member State of residence of child(ren). First, the standard of living between the primary competent Member State and the Member State where the child resides would be compared.<sup>379,380</sup> Second, this coefficient would be applied to the amount of family benefits payable under the national legislation of the primary competent Member State. In a case, where both parents are in employment, the Member State with secondary competence may also apply the coefficient when calculating the differential supplement. Such an approach would reflect the practice applied for adjustment of remuneration (and in certain cases family allowances) of EU civil servants deployed in service outside Belgium and Luxembourg.<sup>381</sup>

**Example 1.1a:** Peter would receive family benefits from Member State A adapted to the living standard in Member State B and therefore a lower amount than under the current rules. If the amount of family benefits in Member State B is lower than the amount in Member State A (the "adjusted amount"), Member State B will pay nothing.

**Example 2.1a:** Anna will receive family benefits from Member State B increased to reflect the living standard in Member State A. If there is also entitlement to family benefits in Member State A, and their level remains higher than the "adjusted amount" paid by Member State B, Member State A will be required to cover the difference by paying a supplement.

#### 7.3.2.2. Option 1b: Adjustment to standard of living: only downwards

<sup>377</sup> This follows the judgment in *Petroni*, C-24/75, EU:C:1975:129 approved in *Jerzak*, C-279/82, EU:C:1983:228 which provides that according to Articles 45 and 48 TFEU, which constitute the basis of the coordination, "limitation may be imposed on migrant workers to balance the social security advantages which they derive from the Community regulations and which they could not obtain without them", but the Regulations may not withdraw or reduce the social security advantages that derive from the legislation of a single Member State.. On the application of this principle on the differential supplement of family benefits, see the judgment in *Dammer*, C-168/88, not available, paragraph 21 . See Annex VI.

<sup>378</sup> Judgment in *Pinna v Caisse d'allocations familiales de la Savoie*, C-41/84, EU:C:1986:1, paragraph 21 . It is to be noted that in this case, the CJEU ruled that a provision the preceding Regulation, that permitted France to pay the family benefits granted by the Member State of residences of the children instead of the family benefits they granted to children residing in France was unlawful because it gave rise to an indirect discrimination on grounds of nationality and that the right to freedom of movement was at stake if the migrant worker received less than the national workers just because his or her spouse and children remained in the Member State of origin . While there are grounds to distinguish Option 1a from Pinna as it proposes adjustment not substitution of benefits and sets objective criteria for ensuring benefits are linked to protective needs irrespective of the place of residence, the CJEU's findings must be given due weight.

<sup>379</sup> For example, using data compiled by Eurostat . It could be argued that the basket of goods taken for these general statistics is not specifically tailored to the needs of a child, however it could be challenging to develop a more specific and regularly updated source of information.

<sup>380</sup> It could be argued that the basket of goods taken for these general statistics is not specifically tailored to the needs of a child, however it could be challenging to develop a more specific and regularly updated source of information.

<sup>381</sup> Under the Articles 64 and 67(4) of Regulation No 31 (EEC), 11 (EAEC), laying down the Staff Regulations of Officials and the Conditions of Employment of Other Servants of the European Economic Community and the European Atomic Energy Community (OJ 45, 14.6.1962, p. 1385, as amended); the last publication can be found for the period beginning with 1.7.2014 in OJ C 444, 12.12.2014, p. 10. In relation to family allowances, this adjustment only applies if the allowance is directly paid to a person other than the official to whom the custody of the child is entrusted. The model of the EU Staff Regulations could not be applied directly as calculations are based on a coefficient compared to the standard of living in Belgium and Luxembourg not the factor of 100 for the EU-28.

The amount of exported family benefits is adjusted downwards only according to the cost of living standard in the Member State of residence of child(ren). The level of benefit would be limited to the amount provided by the competent Member State. Under this option, a Member State would never pay more than the maximum amount under its national legislation. In cases of overlapping entitlement, the State of residence of the child(ren) will be required to pay a differential supplement in relation to the difference between the "adjusted amount" paid by the primary competent Member State and the amount payable under its own national legislation.

**Example 1.1b:** Peter would receive Member State A's family benefits adapted to the living standard in Member State B and therefore a lower amount than under the current rules. If the amount of family benefits paid in Member State B is lower than the amount paid by Member State A (the "adjusted amount"), Member State B will pay nothing.

**Example 2.1b:** Anna will receive family benefits from Member State B to the maximum rate permitted under national law of Member State B irrespective of the fact that the living standard in Member State A is higher. If there is also entitlement to family benefits in Member State A, and their level remains higher than the "adjusted amount" paid by Member State B, Member State A will be required to cover the difference by paying a supplement.

The same principles in relation to compatibility with Articles 45 and 48 TFEU set out above also apply in relation to Option 1b.

### *7.3.3. Option 2: State of residence of the child always has primary competence*

This option determines new order of priority as follows: 1) country of residence of the child; 2) the country of work; and 3) country of pension. The country of residence of the child has primary responsibility to pay the full amount of family benefits to which the entitlement exists under its national rules. The country of work would top up this amount if the level of family benefits would be higher there.

The principle of priority for the Member State of Residence of the child already exists under the current rules in cases of overlapping rights on the same basis (e.g. where two parents work in different Member States). This option extends this principle to cases where only one parent is in work and is employed in another Member State. The rationale for this proposal is that in the case of family benefits, almost all national legislations are residence based. Therefore it is hoped that the inversion of the priority rules may mean a simpler situation for families in which payments may be processed more quickly.

**Example 1.2:** Marie will receive family benefits from Member State B. If Peter is also entitled to benefits in Member State A, the family would receive a differential supplement from Member State A. The family overall receives the same amount as under the current rules but the division of costs between Member State A and Member State B is different.

**Example 2.2:** David will receive family benefits from Member State A. As the amount of family benefits in Member State B is lower than in the Member State A, Member State B will pay nothing. The family overall receives the same amount as under the current rules but the division of costs between Member State A and Member State B is different.

#### *7.3.4.1 Horizontal Option: Different coordination rules for child-raising allowances: greater emphasis on individual rights and different treatment under the anti-overlapping rules*

This section sets out a number of horizontal options, which may be applied in isolation or in conjunction with any of the options above. As there are no synergies or inter-dependencies between the impacts it is intended to assess the impact of these options separately.

It should be made clear that these options relate solely to the right to claim a social security benefit intended to wholly or partially replace income during periods of child-raising. The option does not

propose to create or extend rights to parental leave which may separately exist under the Parental Leave Directive,<sup>382</sup> national legislation or collective agreement.

#### *7.3.4.2 Different coordination rules for child-raising allowances calculated by reference to salary or professional income: greater emphasis on individual rights and mandatory derogation from the anti-overlapping rules*

Salary-related child raising allowances (or any salary-related components of a benefit which comprises of both salary-related and flat rate elements) would continue to be exportable as family benefits, but would be treated as individual and personal rights which may only be claimed by the parent who is subject to the applicable legislation in question (not by other members of their family). In addition, it is proposed that no anti-overlapping rules would apply to such benefits meaning that they would be payable in full to the parent concerned.

Where under national legislation, parents are permitted to share a salary-related child raising allowance, the parent who is subject to applicable legislation is entitled to the allowance for the maximum duration permitted under national legislation.<sup>383</sup> However, where a family receives a salary-related child raising allowance in more than one Member State, national authorities will be entitled to "off-set" periods of entitlement in another Member State from the overall duration of the benefit (although not the amount).

**Example 1.3a: Peter and Marie live with their child in Member State A (which has a child raising allowance calculated by reference to salary). Marie is a national worker of Member State A. Peter is a posted worker from Member State B. (Member State B has a flat rate allowance).** Member State A is the primarily competent Member State because this is the place of residence of the child. When Marie takes leave to take care of her child she is able to claim the child-raising benefit from Member State A. Peter has no entitlement to salary-related component of the child-raising benefit from Member State A. If Peter claims the child-raising allowance from Member State B, Member State B cannot into account the salary-related benefit from Member State A's child-raising allowance in calculating the level of supplement Peter is entitled to.

**Example 2.3a: David lives and works in Member State A. Anna his wife lives in Member State A but works in Member State B. Both Member State A and Member State B have salary-related child-raising allowances.** Member State A is the primary competent Member State because this is the place of residence of the couple's children. David is able to claim salary-related child-raising benefit during periods he has taken leave to take care of their children. According to Member State A's legislation, each parent is individually entitled to 13 weeks of salary-related child raising allowance. However, as Anna is unable to claim the allowance under Member State A's legislation, David is entitled to 26 weeks of salary-related child-raising benefit (assuming national entitlement conditions are satisfied). Anna is separately entitled to salary-related child-raising benefit under Member State B's law. However, if Anna makes a claim for salary-related child-raising benefit during the same period as David, Member State B will be entitled to take into account periods of benefit that David has already claimed in calculating the length of period of leave although Member State B may not deduct amounts already paid by Member State A when calculating the level of benefit payable to Anna.

#### *7.3.4.3 Different coordination rules for all-child raising allowances (flat rate and salary-related): greater emphasis on individual rights and mandatory derogation from the anti-overlapping rules.*

As a variation to the horizontal option described above, it could also be considered to extend the horizontal option A so it applies to all child-raising allowances regardless of whether they are calculated by reference to salary/professional income or are awarded on a flat-rate basis.

---

<sup>382</sup> 2010/18/EU

<sup>383</sup> taking into account restrictions that may separately exist to the labour law right to parental leave under the Parental Leave Directive 2010/18/EU

**Example 1.3b:** Marie will receive the full amount of child-raising allowance but Peter will have no entitlement to child-raising allowances from Member State A. Member State B cannot take into account any of the child-raising allowance paid by Member State A when calculating the level of child-raising allowance Peter is entitled to.

**Example 2.3b:** David and Anna will be treated in the same way as under example 2.3a

#### 7.3.4.4 *Different coordination rules for all-child raising allowances (flat rate and salary-related): greater emphasis on individual rights and optional derogation from the anti-overlapping rules*

As a further variation to the horizontal options described above, it could also be considered to provide that child-raising allowances (either salary-related only or salary-related and flat-rate) should be treated as individual and personal rights which may only be claimed by the parent who is subject to the applicable legislation in question, however, it is only optional rather than mandatory for a secondary competent Member State to exempt such benefits from the anti-overlapping rules. Such an approach would allow national administrations greater flexibility to promote flexible child-raising arrangements in line with national policy objectives of the Member States concerned but the requirement would not be mandatory.

There will be no requirement to allocate the maximum duration of child-raising allowance permitted under national legislation to the parent subject to the applicable legislation concerned and consequently no requirement to "off-set" periods of taken by the other parent under the law of another Member State.

**Example 1.3c:** Marie will receive the full amount of child-raising allowance but Peter will have no entitlement to child-raising allowances from Member State A. Member State B (as secondary competent Member State) will have a choice whether to take into account any of the child-raising allowance paid by Member State A when calculating the level of child-raising allowance Peter is entitled to. This choice will be exercised in relation to all claims for the benefit concerned (not on a case-by-case basis)

**Example 2.3c:** David will receive 13 weeks of child-raising allowance (the normal period for an individual parent under Member State A's law), the duration of the child-raising allowance that Anna receives will depend on the national conditions of Member State B's law.

#### 7.3.5 *Discarded option*

It was also considered that family benefits would be provided by the Member State of residence of child(ren) under its national legislation only, i.e. no export of family benefits. 4 Member States supported this option.<sup>384</sup>

This option has subsequently been discarded by the Commission on grounds it is considered incompatible with the Treaty on Functioning of the European Union, in particular as the refusal to export family benefits has already been ruled contrary to Article 45 TFEU.<sup>385</sup> The right to family benefits is granted to *workers* by reason of their employment in the Member State of employment. Refusing to grant them the right to equal treatment as regards entitlement to family benefit would amount to a violation of primary law.

<sup>384</sup> Luxembourg, Malta (in relation to family benefits specific to the social or economic conditions of the Member State), Finland and the United Kingdom. Annex II.

<sup>385</sup> Joined Cases C-4/95 and C-5/95, *Stöber and Pereira* ECLI: EU: C: 1997:44 (amongst others).

## 7.4. Stakeholder Support

### 7.4.1 *Baseline Scenario*

In discussions in the Administrative Commission in March and June 2015, 16 Member States<sup>386</sup> were in favour of maintaining the status quo in preference to adjusting benefits to option 1a or b or 2. In consultation with stakeholders also indicated the status quo was favoured by a number of national organisations with responsibility for family benefits such as REIF, SVB, CNAF, CCMISA and FAMIFED. In the response to the public consultation only 33% of organisations and 31% of individuals indicated support for legislative change.<sup>387</sup>

### 7.4.2 *Adjustment to standards of living*

#### 7.4.2.1 *Option 1a: Adjustment to standards of living: upwards and downwards*

Three Member States<sup>388</sup> supported this option in the Administrative Commission. NGOs underlined the unfairness of adaptation, since the workers concerned pay the same taxes, but also the fact that, for the competent Member State, adapting family benefits may have unintended consequences if the concerned families were to move to the Member State as a result. In this sense, it was mentioned that the biggest challenge for local authorities is pressure on public services, and not "benefit tourism".<sup>389</sup> Social partners<sup>390</sup> pointed out that the right to family benefits should be considered attached to the worker and not to the place of residence of the family. In their view lowering the family benefits for mobile workers would in any event constitute unequal treatment.<sup>391</sup> In the response to the public consultation, only a minority of respondents commented on the issue of adjustment of family benefits to the place of residence of the child. Among those that did there were mixed responses, with some respondents indicating strong support for this principle and others strong opposition.

#### 7.4.2.2 *Option 1b: Adjustment to standards of living: only downwards*

No Member States expressly supported this option in the Administrative Commission. Stakeholder feedback was similar to Option 1a.

### 7.4.3 *Option 2: Member State of Residence of the child always has primary competence*

10 Member States<sup>392</sup> supported this option as a first or second choice but 9 Member States<sup>393</sup> were expressly opposed to the option in the Administrative Commission. Some social partners emphasized that the right to family benefits should be considered attached to the worker and not to the place of residence of the family.<sup>394</sup> In the response to the public consultation, only a minority of respondents commented on the issue of a change to the order of competence so the place of residence of the child always has primary competence. Among those that did there were mixed responses, with some respondents indicating strong support for this principle (in particular because they considered it would improve the simplicity and efficiency of the rules and create a stronger link to the economic environment where the child resides). However, others expressed strong opposition to the idea of reducing the link between the Member State of Employment and competence for providing family benefits.

---

<sup>386</sup> Belgium, Bulgaria, Czech Republic, Estonia, Spain, Croatia, Italy, Latvia, Lithuania, Poland, Portugal, Romania, Slovenia, Slovakia, Finland and Sweden.

<sup>387</sup> A public consultation between July and October 2015 invited citizens and organisations to provide their views on the main problems linked to the coordination of unemployment benefits, family benefits and posting of workers.

<sup>388</sup> Denmark, Ireland and France. Annex II.

<sup>389</sup> For example, EURODIACONIA. Annex II.

<sup>390</sup> Annex II.

<sup>391</sup> For example, ETUC and TUC (Trades Union Congress, United Kingdom). Annex II.

<sup>392</sup> Austria, Estonia, Finland, Ireland, Latvia, Luxembourg, Malta, Slovenia, Sweden and the United Kingdom

<sup>393</sup> Cyprus, Germany, France, Italy, Netherlands, Poland, Portugal, Romania and Slovakia

<sup>394</sup> For example, ETUC and TUC (Trades Union Congress, United Kingdom). Annex II.

#### 7.4.4 *Horizontal Option: Different Coordination of child-raising allowances*

This option was initially not envisaged and was developed in response to the stakeholders' feedback.<sup>395</sup>

In March and June 2015, 4 Member States in the Administrative Commission indicated support for an alternative coordination of salary-related child-raising allowances and action was also recommended by the FreSsco network of experts (see Annex VI<sup>396</sup>).

The Council, the Parliament, the social partners, the Advisory Committee on Equal Opportunities for Women and Men and other stakeholders have called for developing a comprehensive set of measures to address women's under-representation in the labour market and to support more equal sharing of family responsibilities. In June 2015, EPSCO Council Conclusions<sup>15</sup> highlighted that measures could include improving the provision of childcare and long-term care, flexible working time arrangements, addressing financial disincentives for both parents (and single parents) to participate in paid work, as well as supporting smoother transitions for women and men between part-time work and full-time employment, and between care-related leave periods and employment. The European Social Partners have also recognised that work-life balance and gender inequality in the labour market remain serious challenges. They have made "promoting better reconciliation of work, private and family life and gender equality to reduce the gender pay gap" a priority in their new joint work programme for 2015-2017.

### 7.5. What are the Impacts of the Different Options

#### 7.5.1 *Introduction*

For all of the options assessed, the potentially affected groups are the same. The options are specifically targeted at mobile EU parents and their children, that is to say: citizens who either work or reside in a different State to that where their children reside. Hence, it may concern both mobile workers and frontier workers or other cross-border workers. It may also concern non mobile citizens and children who have not exercised their right to freedom of movement but who have a parent or partner (or former partner) who is a mobile citizen.

For the purposes of assessing the impact, a range of criteria has been identified with reference to the general and specific policy objectives for family benefits and the Commission's Better Regulation Guidelines. In relation to **social impact**, the options are assessed against the criteria of **clarification; simplification; protection of rights** and **impact upon fundamental rights** (with reference to the **specific objective** this analysis also includes an assessment of the potential impacts of **barriers or disincentives to parents' ongoing participation in the labour market**). This analysis draws upon the findings of the FreSsco Legal Experts report at Annex VI supplemented by the Commission's Services own analysis and the findings from the stakeholder consultations and the Inter-Service Steering Group.

In relation to **Fundamental rights** all options under consideration aim to facilitate the exercise of the right to engage in work in another Member State (Article 15), as well as to a better protection of rights for workers who have made use of their right to free movement (Article 45). At the same time the options seek to ensure the right to equal treatment (Article 21), the best interests of the child (Article 24), rights of the family in particular to reconcile family and professional life (Article 33(2)), the right to property and social security (Articles 17 and 34).

In relation to the **economic impact**, the options are assessed against the impact on Member States' budgets. It has to be noted that 19 Member States and EFTA countries (Belgium, Czech Republic,

---

<sup>395</sup> This option was developed following consultation with Member States in the Administrative Commission in March and June 2015 and feedback from other stakeholders. See Annex II and Annex VI.

<sup>396</sup> SPIEGEL, B. (ed.), CARRASCOSA BERMEJO, D., HENBERG, A. and STRBAN, G., Assessment of the impact of amendments to the EU social security coordination rules on export of family benefits, Analytical Report 2015, FreSsco, European Commission, May 2015 (Annex VI).

<sup>15</sup> 2015 EPSCO Council Conclusions on the Gender Pension Gap.

Denmark, Germany, Estonia, Ireland, Spain, Latvia, Luxembourg, Hungary, Netherlands, Austria, Poland, Romania, Slovakia, Finland, United Kingdom, Iceland and Norway) were able to provide data on the export of family benefits, while 10 (Czech Republic, Germany, Estonia, Latvia, Luxembourg, Hungary, Netherlands, Austria, Slovakia and Iceland) were able to provide a breakdown of exported family benefits by primary and secondary competence<sup>397</sup>. This entails a number of limitations in the assessment of the economic impact of option 2 (reversing priority rules) and the horizontal options (different coordination rules for salary-related child-raising allowances), which will be presented/discussed in full in the section. In particular, for reasons of practicality, the economic analysis has also been conducted based on the assumption that all Member States are in full compliance with the EU social security coordination rules currently in force including in respect of the most recent jurisprudence of the Court of Justice. It should further be noted that in the absence of comprehensive data from the Member States, the economic assessment for the horizontal option is made with reference to ESSPROS figures for parental benefits awarded for children aged 0-3 regardless of whether or not the benefit is indexed to salary or professional income. The estimations must be construed in light of these limitations. The full studies are attached to this report at Annexes XI and XIII<sup>398</sup>.

The **regulatory costs** for both public administrations and citizens in relation to Options 1a, 1b and 2 were assessed through a number of interviews with public officials working for administrations dealing with the export of family benefits (both as primarily competent and secondarily competent Member States) in six Member States (Germany, Denmark, Netherlands, Poland, Romania and the United Kingdom). The full study is attached to this report in Annex XVI.<sup>399</sup> This assessment also takes into account the **specific objective** of **faster and more efficient processing of family benefit claims**.

With reference to coherence with the **general objective**, the options have also been assessed with reference to their impact upon **risk of fraud and abuse** and ability of Member States to counteract such risks and by reference to the objective of achieving **equitable burden-sharing between Member States** (corresponding to the **specific objective** of achieving a **clear and transparent link between Member State paying benefits and recipient**). Finally the assessment considers overall coherence with EU objectives with reference to relevant policies identified at section 1.3 of this report.

The **secondary impacts** of the options on mobility flows was estimated on the basis of case studies in seven Member States (Belgium, Germany, Poland, Romania, Netherlands, Spain and Ireland), with a target population of one-earner families in which the person entitled to the exportability of child benefits works and resides in a Member State different from the one where the dependent family member resides<sup>400</sup>. The full study is attached to this report in Annex XVIII. It should be acknowledged however, that such methodologies are imperfect tools for predicting families' motivations and migration drivers which in practice are likely to be influenced by a far-wider range of factors than purely economic influences.

Finally, when looking in particular at economic impact, regulatory costs and secondary impact for horizontal options a, b and c, it must be noted that these options were developed and refined at a late stage of the impact assessment process. Therefore, in addition to the limitations already highlighted due the limitations on data highlighted above, the late development/refinement of the horizontal options has led to a less detailed assessment of impact, at times only at a qualitative level.

### 7.5.2 Summary table of the impacts of the options for export of family benefits

Type of impact	Clarification	Simplification	Protection of rights	Fundamental rights	Economic impacts	Regulatory costs	Risk of fraud and abuse	Equitable burden sharing Member State	Coherence with EU objectives	Overall Effectiveness	Overall Efficiency (cost vs effectiveness)
<b>Baseline Scenario</b>	0	0	0	0	0 <sup>401</sup>	0 <sup>402</sup>	0	0	0	0	0
<b>Option 1a</b> Adjustment to standards of living: upwards and downwards	-	--	--/+	-	+/- <sup>403</sup>	-- <sup>404</sup>	-	+/-	--	-	-
<b>Option 1b</b> Adjustment to standards of living: only downwards	--	-	--	-	+ <sup>405</sup>	-- <sup>406</sup>	-	++/-	--	-	-
<b>Option 2</b> Member State of residence has primary competence	++	+	+	0	+/- <sup>407</sup>	+/- <sup>408</sup>	+	+/-	+	+	+

<sup>401</sup> €942 m is the budget devoted to exported child benefits in 19 reporting Member States; Annex XIII; Table 9.

<sup>402</sup> Cost for handling export of FB is estimated at on average 1.9 man hours per case for the primary competent Member State and at 1.6 man hours per case for the secondary competent Member State this corresponds to an annual cost in the range of between €40 and €2,000 in selected Member State (variation according to number of cases and labour costs).

<sup>403</sup> Overall decrease of €150m (-15.9%) but increase for Member State with lower cost of living.

<sup>404</sup> Increase of approx. one man-hour per case.

<sup>405</sup> Overall decrease of €156m (-16.6%).

<sup>406</sup> As 1a above.

<sup>407</sup> Decrease of exported benefits of €420m (-30%) but increase in expenditure of State of residence by up to 120%.

<sup>408</sup> Moderate decrease in cases of recovery and overpayments but moderate increase in cases of differential supplement and verification of residence.

<b>Horizontal A</b> Personal rights to salary-linked child-raising allowance mandatory derogation from overlapping rules	++	+	+/-	409 --	+/- <sup>410</sup>	+	+/-	++	++	+
<b>Horizontal B</b> Personal rights for all child-raising allowance mandatory derogation from overlapping rules	++	+	+/-	411 --	+/- <sup>412</sup>	+	+/-	++	++	+
<b>Horizontal C</b> Personal rights for all child-raising allowance optional derogation from overlapping rules	-/+	+	+/-	413 --	+/- <sup>414</sup>	+	+/-	+/-	+/-	+

<sup>409</sup> Estimated Increase in expenditure on exported salary-related child-raising allowances for secondary competent Member State of 62-81%.

<sup>410</sup> Moderate decrease in regulatory costs No need to process/ calculate claims on derived rights. Some new tasks to compare benefits in different Member State.

<sup>411</sup> Estimated Increase in expenditure on exported child-raising allowances for secondary competent Member State of 58-84%.

<sup>412</sup> Same as Horizontal Option a but wider field of application as covers all child-raising benefits.

<sup>413</sup> Maximum impact same as Horizontal Option b (but not all Member States will rely upon the derogation).

<sup>414</sup> Maximum impact same as Horizontal Option b with added advantage that no need to compare duration of claims in other Member States (but not all Member States will rely upon the derogation therefore information exchange for differential supplement may continue).

### 7.5.3 Impacts of Policy Option 1a: Adjustment to standard of living: upwards and downwards

Policy Option 1a: Adjustment to standard of living: upwards and downwards		
<b>Social impacts</b>		
Clarification	-	This option is less transparent than the baseline scenario. There is a significant risk that mobile workers would be less aware of the level of benefits they are entitled to as the amount of the family benefit received would be subject to fluctuations depending on various factors, such as macro-economic criteria or the country of residence of the children during the life-cycle of a family benefit claim. This may affect the citizens' ability to assert and enforce their rights.
Simplification	--	In comparison to the baseline, this option is more complex to apply as it imposes additional obligations for mobile workers and public administrations to state and verify the Member State of residence of the children. Possible changes in the Member State of residence of the children or macro-economic changes would result in additional administrative obligations for the mobile worker and public authorities in changes in the amount of the benefit granted by one and the same Member State.
Protection of rights	--/+	This option will result in EU mobile families receiving either a lower or higher level of family benefits than would normally be awarded by the exporting Member State depending on the cost of living in the country where the child resides. It can be anticipated that the most likely situation is that the family benefits will be lower. Firstly, because trends in labour mobility patterns show a bias in mobility from lower wage destinations towards higher wage destinations. Secondly, because the existing rules relating to the differential supplement already ensure that a family will receive a "top-up" from the secondary competent Member State to the level awarded by that Member State. This existing provision under the baseline scenario already mitigates against the potential disadvantage that a family who resides in a high-cost of living destination but workers in a lower cost of living destination might otherwise experience meaning the positive financial impact for the mobile worker arising from this option are expected to be marginal.
<b>Financial impact</b>	+/-	The adjustment of the amount of exported family benefits could decrease the total expenditure on exported family benefits by € 150 million (15.9%). Member States with a higher cost of living compared to the countries where they currently export family benefits will experience a reduction in their expenditure on exported family benefits – by more than 30% in the case of Germany (€34 million) and Ireland (€4 million), by 13% in the case of Luxembourg, . By contrast, Member States with a lower cost of living compared to the countries where they currently export family benefits will experience an increase in their expenditure on exported family benefits to a level that is higher than permitted under their own national rules. This increase

		would be above 70% for Poland (€ 4 million) and above 40% for Latvia (€ 50,000) <sup>415</sup> , 37% for Estonia, 35% for Slovakia, 21% for Hungary. Extending this analysis to the EU-28, in principle, all Member States with the exception of Denmark (the State with the highest index for comparative price levels <sup>416</sup> ) would have to raise its family benefits at least in respect of export of family benefits to a child resident in Denmark.
<b>Impacts on fundamental rights</b>	-	<p>In the case of a lower adjustment, this option may adversely affect the right to property (in this case social security benefits) (Article 17); the right to equal treatment (Article 21) and the best interests of the child (Article 24) and the right to social security and social assistance (Article 34) when compared with the baseline scenario. In particular, compared to the baseline scenario, workers would receive lower or higher levels of family benefits than their co-workers even though they pay the same taxes and social security contributions. Likewise Member States with a lower cost of living would be required to export family benefits at a higher rate than is awarded to national citizens resident within their territory.</p> <p>Even though there is precedence for deductions from family benefits in the context of the anti-accumulation rules, the fact that these options do not guarantee that the family of a mobile worker will receive a sum at least equivalent to the highest rate available under the overlapping applicable legislation also gives rise to concerns of interference with the right to Property under Article 17.</p>
<b>Other impacts</b>		
Regulatory Costs	--	<p>This option would increase the administrative burden compared with the current rules. The running cases would need further administrative processes as e.g. the updating of the adjustment factors has to be made on a regular basis (even if national amounts do not change). Processing times between the claim being filed and benefit being received could be increased due to the verification of residence. In addition, as application of indexation to rights deriving from worker-status or which exist independently of the application of the Regulation would violate primary law, there will be additional administrative tasks, for example, to distinguish between contributory and non-contributory family benefits in each Member State.</p> <p>On the basis of the interviews conducted with national administrations, it is estimated that the administrative tasks as primarily competent may increase by around one man-hour per case (+49%), mainly due to the increase in the time devoted to the calculation of benefits and the reimbursement activities<sup>417</sup>: The total cost will thus increase of a sum ranging from €12,900 in Romania (+300%) to 1,068,100 (+60%) in Germany<sup>418</sup>.</p> <p>The administrative tasks of secondarily competent Member State, will also increase by around one man-hour per case (+60%), mainly due to the increase in the time devoted to the</p>

<sup>415</sup> Table 13, Annex XIII.

<sup>416</sup> <http://ec.europa.eu/eurostat/tgm/table.do?tab=table&init=1&language=en&pcode=tec00120&plugin=1> (last accessed 25 March 2015).

<sup>417</sup> Table 3-1, Annex XVI.

<sup>418</sup> Tables 3-1, 3-2, 3-3 and 3-4, Annex XVI.

		<p>calculation of benefits, as it becomes more complex. this will translate into an increase in the cost per case (ranging from €1.4 in Romania to €58.3 in Denmark).</p> <p>It is not estimated that this option would increase the administrative burden for citizens, though longer processing times of the cases may well have a negative impact in increasing delays between application and receipt of family benefits<sup>419</sup>.</p>
Risk of fraud and abuse	-	<p>Families could be tempted to declare that their children live in a Member State with a higher factor of adjustment (or even in the Member State with primary competence), as far as the amount of the benefits would depend on the children's place of residence. For the Member State with primary competence, the children's place of residence is usually more difficult to determine than, for example, the place of work, so the risk of abuse could increase necessitating additional activities by Member States to counter this risk. Further, the greater complexity entailed in indexation may increase the risk of administrative error by public authorities.</p>
Fair burden sharing between Member States	+/-	<p>This option shifts the burden from the Member States with a higher factor of adjustment, i.e. those where income and costs are higher, to Member States with lower factors of adjustment. In particular, it will require Member States with lower costs of living to export family benefits at a higher rate than payable to national citizens within their own territory. This shift in burden is exacerbated due to the effect of the differential supplement. As compared with the baseline scenario, more Member States with lower income and costs may be required to pay a differential supplement than under the current rules. Taking into account that migration patterns usually are from Member States with lower living standards to those with higher standards, this option would probably shift the burden from the latter to the former. This could result in a certain disruption of the economic logic that assigns the obligation to pay the family benefits to the Member State receiving the contributions and taxes.</p>
Mobility	-/+	<p>This option could entail a moderate reduction of mobility flows of one-earner married persons who would move without his/her family towards Member States with relatively higher cost of living with subsequent consequences for the skills availability to those labour markets.<sup>420</sup> On a sample of six Member States when all factors are neutral it may be expected to have the following impact: Netherlands (-4%), Germany (-3%), Belgium (-1.1%), Spain (-0.9%) and Ireland (-0.7%) – and an increase towards Member States with relatively lower cost of living – Poland (3%) and Romania (8%)<sup>421</sup>. This would entail consequent reductions/increases in the budget devoted to exported family benefits<sup>422</sup>.</p> <p>However, another possible secondary effect could also be that dependent family members would reunite with the working</p>

<sup>419</sup> Page 32, Annex XVI.

<sup>420</sup> Annex XVIII.

<sup>421</sup> Figure 4.1, Annex XVIII.

<sup>422</sup> Figure 5.1, Annex XVIII.

		<p>partner/parent working in another (with higher living cost) Member States, which would counterbalance the effects of the option<sup>423</sup>. The impact of such reunification may potentially have consequences for the education, health, housing and other systems of the Member State of the economically active citizen. In the context of the low flows anticipated no estimates have been carried out for the economic impact of this.</p> <p>This analysis ignores other variables that may influence a family's decision about whether or not to relocate and needs to be viewed accordingly.</p>
<p><b>Coherence with General, Specific and wider EU Objectives:</b></p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits</li> <li>• Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>• Ensure family benefits are processed as efficiently as possible</li> </ul>	--	<p>This option achieves a greater correlation between family benefits and the cost of living in a manner likely to address the perceptions of unfairness held by some critics. However, it does not fully achieve the aim of achieving a fair distribution of financial burden as it disrupts the economic logic that the State that receives taxes and social security contributions should have responsibility for paying benefits by transferring the economic burden from the Member State of Work to the State of Residence. It also does not achieve a clear and transparent link between the Member State issuing a benefit and the families in receipt of such benefits as Mobile workers will receive lower level of family benefits than nationals notwithstanding the fact they pay the same level of tax and social security contributions (conversely Member States with comparatively lower costs of living may be required to export family benefits at a higher level than payable to citizens resident on their territory in a manner likely to be perceived as unfair by nationals of that State). The option also reduces clarity and legal certainty compared to the baseline particularly in relation to level of entitlement and which benefits may be subject to indexation. It is likely to be administratively burdensome for both citizens and national authorities to apply. This option may increase rather than reduce disincentives to parents' ongoing participation in the labour market during periods of child-raising (at least in relation to non-contributory benefits) as such benefits will not only be subject to the anti-accumulation rules but also subject to reductions based on place of residence of the child. It may also increase delays in processing family benefits.</p>

#### 7.5.4 Impacts of Policy Option 1b: Adjustment to standard of living: downwards only

Policy Option 1b: Adjustment to standard of living: only downwards		
Social impacts		
Clarification	--	As with Sub-option 1a, and for the same reasons, this option is less clear or easy to understand than the baseline scenario. In addition, changes in the relative cost of living between different Member States means it may be even less clear to workers whether they can expect family benefits to be exported at the

<sup>423</sup> Pp. 33-34, Annex XVIII

		national level or indexed at a lower level.
Simplification	-	As with Sub-option 1a, and for the same reasons, this option is less clear or easy to understand than the baseline scenario.
Protection of rights	--	This option is anticipated to have the same social impact as option 1a, exacerbated further compared to the baseline scenario because it does not improve the protection of rights of beneficiaries residing in a Member State with a higher standard of living and further may increase the lack of clarity concerning the level of family benefits payable as indexation will not be applied consistently in all cases
<b>Financial impact</b>	+	There is expected to be a moderate, decrease of € 156 million (16.6%) in the expenditure on exported family benefits would occur. It is predicted that all reporting Member States would now experience either a reduction or no change to their expenditure on exported family benefits compared to the baseline, which will be nearly 40% for Ireland (€ 4.5 million) and above 30% for Germany (€ 36 million) <sup>424</sup> the change is more negligible for Latvia, Poland, Hungary, Slovakia and the Czech Republic where the estimated impact ranges from 0-0.5% (€0-8,230).
<b>Impacts on fundamental rights</b>	-	This option is anticipated to have the same impact upon fundamental rights as option 1a, exacerbated further because it does not improve the protection of rights of beneficiaries residing in a Member State with a higher standard of living.
<b>Other impacts</b>		
Regulatory Costs	--	As with sub option 1a and for the same reasons, this option is more complex to apply, however, the complexity is anticipated to increase because as opposed to uniformly applying a standard co-efficient across all Member States, national administrations will need to analyse in each case whether the relationship between cost of living requires a Member State to export the national level of benefit or whether a downward adjustment should be applied. It is anticipated that these procedures would fluctuate along with changes to the relative cost of living across the EU-28. As per option 1a, it is estimated that the administrative tasks as primarily competent will increase by around one man-hour per case (+49%), mainly due to the increase in the time devoted to the calculation of benefits and the reimbursement activities <sup>425</sup> this will translate into an increase in the cost per case (ranging from €0.8 in Romania to €58.3 in Denmark). Moreover, a change in the number of cases of export of family benefits could also occur as a result of the introduction of this option <sup>426</sup> - see also <i>mobility</i> below. The total cost will thus increase of a sum ranging from €8,700 (+20%) in Romania to 1,063,500 (+60%) in Germany <sup>427</sup> . Administrative tasks as secondarily competent, are also

<sup>424</sup> Table 14, Annex XIII.

<sup>425</sup> Table 3-1, Annex XVI.

<sup>426</sup> Table 3-3, Annex XVI.

<sup>427</sup> Tables 3-1, 3-2, 3-3 and 3-4, Annex XVI.

		expected to increase by around one man-hour per case (+55%), mainly due to the increase in the time devoted to the calculation of benefits, as they become more complex: this will translate into an increase in the cost per case (ranging from €1.4 in Romania to €58.3 in Denmark).
Risk of fraud and abuse	-	As with Sub-option 1a, and for the same reasons, this option may increase incentives for fraud while the greater complexity may increase the risk of administrative error thereby necessitating greater action by public authorities to mitigate these risks.
Fair burden sharing between Member States	++/-	As with option 1a, this option shifts the burden between Member States due to the effect of the differential supplement. However, this option would bring a financial relief for the Member State with a higher factor of adjustment (as they could reduce their family benefits for children living in Member States with lower factors of adjustment, while Member States with lower factors of adjustment would not see any change in their situation in cases where they have to grant benefits for children residing in Member States with higher factors of adjustment.
Mobility	+/-	<p>Like option 1a, this option could also entail a moderate reduction of mobility flows of the target population (one-earner married persons who would move without his/her family) towards Member States with relatively higher cost of living. For example, in a sample of six Member States, this is expected to impact the Netherlands (-4%), Germany (-3.2%), Belgium (-2.2%), Spain (-0.9%) and Ireland (-1.7%), while no increase would occur towards Member States with relatively lower cost of living<sup>428</sup>. This would entail reductions (Belgium, Germany, Spain, Ireland and Netherlands) in the budget devoted to exported family benefits<sup>429</sup>.</p> <p>However, as per option 1a, another possible secondary effect could also be that dependent family members would reunite with the working partner/parent working in another (with higher living cost) Member States, which, again, would nullify the effects of the option<sup>430</sup>. As stated above, this analysis ignores other variables that may influence a family's decision about whether or not to relocate and needs to be viewed accordingly.</p>
Coherence with General, Specific and wider EU Objectives	--	For the same reasons as Option 1a this option is not considered effective at achieving the General and Specific EU objectives, while it may be considered generally neutral in relation to the wider EU objectives, with the exception of the Fresh Start to address the challenges of work-life balance faced by working families, where it is considered to be likely to be incoherent
		Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.

<sup>428</sup> Figure 4.1, Annex XVIII.

<sup>429</sup> Figure 5.1, Annex XVIII.

<sup>430</sup> Pp. 30-31, Annex XVIII.

<ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits</li> <li>• Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>• Ensure family benefits are processed as efficiently as possible</li> </ul>		
---	--	--

7.5.5 *Impacts of Policy Option 2: Member State of Residence of the Child has primary competence*

Policy Option 2: Member State of Residence of the child always has primary competence		
<b>Social impacts</b>		
Clarification	++	As the Member State which is competent by priority is always the Member State of residence of the children, it is clear which Member State has to start granting its benefits and means the EU rules are aligned with the residence system in place in the majority of Member States. Many disputes which today's coordination could cause (if Member States do not agree on which Member State is the primarily competent one) could be avoided.
Simplification	+	On the one hand this option could be regarded as simpler, as it is always the same Member State that primary competence. There is also likely to be a greater stability in order of competence as the Member State of Residence of the child will remain competent irrespective of the economic status of their parents or the place where the parents work. On the other hand, this option could lead to more cases with differential supplements than today (if we assume that in general the family benefits in Member States to which workers migrate are higher than in the Member State of residence of the children) which may lead to ongoing delays in families receiving the full entitlement to family benefits even if benefits from the State of Residence are processed more rapidly.
Protection of rights	+	Families will receive the same level of benefits as under the baseline, but it is expected that benefits which are provided for by the Member State of residence will be processed more rapidly. In residence-based systems this will ensure a greater alignment between the normal rules for entitlement under national legislation and the EU social security rules. It also in part responds to the perception of some Member States and EU citizens that the State that should have primary responsibility for paying family benefits is the one where the children reside (although the obligation remains for the Member State of Employment to pay a differential supplement where the level of benefits in this State may be higher).

<b>Financial impact</b>	+/-	<p>This option will have the effect of shifting the financial burden from the Member State of work to the Member State of residence in cases of export where only one parent in a EU mobile family is economically active (in cases where both parents are economically active the place of residence of the child already has priority under the current rules). It is estimated that, because of a shift of the expenditure from the Member State of residence of the worker towards the Member State of residence of the children, a decrease of approximately €213 million (approximately 29%) in the expenditure on exported family benefits could occur.<sup>431</sup> However, there would also be an increase in the expenditure of the Member State of residence of the child by up to 120%.<sup>432</sup></p> <p>A case study analysis of the impact on two of the main flows of exported family benefits for which data are available, notably from Luxembourg to France (33% of reported total expenditure for export of family benefits) and from Germany to Poland (11% of reported total expenditure for export of family benefits): the application of this option to these flows would result in a reduction in the expenditure for Luxembourg (€60 million) and Germany (€25 million), and an increase in that of France (€60 million) and Poland (€25 million)<sup>433</sup>.</p>
<b>Impacts on fundamental rights</b>	0	<p>The proposed changes to the rules of priority engages consideration of the right to equal treatment (Article 21), as a workers in the State of Employment will receive lower benefits compared to national workers in that Member State. This may give rise to concerns about discrimination in particular in relation to Member States with either tax and contribution based systems or solely contribution based systems. However, there is already precedence for the Member State of Residence of the Child to assume priority in the case of overlapping entitlement on the same basis (both in the case of economic activity and pension rights). This solution may still be considered proportionate in the context of the legitimate aim to reduce accumulation of benefits particularly as the family will receive the same level of benefits overall and so the right to property (Article 17) and the rights of the child (Article 24) are respected.</p>
<b>Other impacts</b>		

<sup>431</sup> This estimation is subject to limitation as only 10 Member States were able to provide a breakdown of exported family benefits according to primary and secondary competence.

<sup>432</sup> The predictions of increased expenditure by the Member State of residence of the child may be over-estimated as it has not been possible to take into account the existence of means-tested criteria applied by some family benefits in predicting the likely increase in expenditure. Annex XIII Table 26.

<sup>433</sup> Figures 8 and 9, Annex XIII.

Regulatory Costs	+/-	<p>Although not fully supported by the qualitative interviews<sup>434</sup> conducted with national administrations, in general, this option is likely to reduce regulatory costs for national authorities as it provides greater certainty for which Member State has primary competence and therefore takes away the obligation under the current rules of this Member State to grant provisional benefits in the event of dispute of competences.<sup>435</sup> This also safeguards that not so many cases of recovery of overpayments will occur (which is often the case today when the final competence differs from the provisional competence and thus overpayments have to be recovered (Article 6(5) and Title IV, Chapter III of Regulation (EC) No 987/2009) and which may entail administrative burden.</p> <p>However, on the other hand, it is anticipated that this option may result in more cases of the need to calculate a differential supplement than under the current rules (taking into account the incentives for mobility from lower wage to higher wage destinations of employment). Furthermore, this option may increase the importance of verifying the child's place of residence (currently only required in cases of overlapping benefits on the same basis – estimated as being 64% of cases<sup>436</sup>) for both national authorities and citizens.<sup>437</sup></p> <p>On the basis of the interviews conducted with national administrations, it is estimated that the administrative tasks as primarily competent will increase by around one man-hour per case (50%).<sup>438</sup> This will translate into an increase in the cost per case ranging from €0.6 in Romania to €58.3 in Denmark, and an increase of the total cost ranging from €5,600 (+13%) in Romania to €642,700 (+37%) in Germany<sup>439</sup>. Looking at administrative tasks as secondarily competent, these will also increase by around 0.8 man-hours per case (47%), mainly due to the increase in the time devoted to the calculation of benefits, as it becomes more complex<sup>440</sup>. This will translate into an increase in the cost per case ranging from approximately €0.6 in Poland to €50 in Denmark, and in an approximate increase of the total cost ranging from €3,500 (+81%) in Romania to €214,800 (+12%) in Germany<sup>441</sup>.</p>
Risk of fraud and abuse	+	<p>The Member State of residence will check the family in the same way as any other family resident there. Usually checking and evaluating the situation is easier in the same Member State than abroad and also if all residents are subject to the same checking procedures. Problems experienced under the baseline scenario, where sometimes the work of a parent in another</p>

<sup>434</sup> It is acknowledged that there is some tension between the data indicated here and the assessment outlined below. This divergence is a consequence of the qualitative nature of the assessment and the fact the assessment was based on the model of a two parent family in which only one parent was economically active rather than blended results involving blended results from a wider range of families including with two economically active parents.

<sup>435</sup> Article 60(4) of Regulation (EC) No 987/2009.

<sup>436</sup> Estimation based on EU-28 averages for labour market participation in two adult households with at least one child under 14 (LFS 2014).

<sup>437</sup> During the consultation of the Administrative Commission in June 2015, five Member States raised concerns that this may increase administrative burden (Cyprus, Germany, Netherlands, Romania and Slovakia). The FreSsco legal experts have also noted potential challenges with determining habitual residence of children Annex VI, p32-33.

<sup>438</sup> Table 3-1, Annex XVI.

<sup>439</sup> Table 3-2, Annex XVI.

<sup>440</sup> Table 3-5, Annex XVI.

<sup>441</sup> Table 3-6, Annex XVI.

		Member State has not been reported would no longer be an issue, as the Member State of residence is the competent one in all cases.
Fair burden sharing between Member States	+/-	This option shifts the burden in cases of only one working parent abroad from the Member State of work to the Member State of residence. In case of a residence-based scheme this could be regarded as fairer, as already without the Regulation all residents would be entitled to the benefits. This would change if the State of residence has a contributory scheme and, has to grant also benefits for persons not contributing to the scheme. This could result in a certain disruption of the economic logic that the Member State receiving the contributions and taxes pays the benefit.
Mobility	0	As this option envisages a redistribution of competence for funding between Member States, with no change in the benefits paid to the recipients, it is not envisaged that it would entail any mobility change <sup>442</sup> .
Coherence with General, Specific and wider EU Objectives  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits</li> <li>• Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>• Ensure family benefits are processed as efficiently as possible</li> </ul>	+	Option 2 introduces legal clarity and simplicity for families and public administrations by establishing a closer alignment between the EU rules and national legislation which generally require residence of a child as a condition of entitlement for family benefits. The rights of families are respected as they will receive the same level of benefits as under the current rules. The rules create a clear and transparent link between the Member State issuing a benefit and the families in receipt of such benefits while retaining the rights deriving from the Member State of Employment. However, it may be regarded as less effective in achieving the general objective of fair and equitable distribution of financial burden between Member States as the effect of this option is to redistribute financial burden away from the Member State of economic activity (which receives a mobile worker's tax and social security contributions) towards the Member State of Residence. In relation to cases where national administrations are not currently required to investigate residence of the child (cases of one economically active parent one economically inactive parent) there may be a slight increase in administrative burden which may in the short term contribute to delays for family members. This option is neutral in relation to wider EU objectives including the Fresh Start to address the challenges of work-life balance faced by working families.

#### 7.5.6 Impacts of Horizontal Policy Option a: Different coordination rules for salary-related child-raising allowances: mandatory derogation from anti-overlapping rules

### Horizontal Option a: Different coordination rules for salary-related child-raising allowances: mandatory derogation from anti-overlapping rules

#### Social impacts

<sup>442</sup> Page 25, Annex XVIII.

Clarification	++	<p>A parent claiming a child-raising allowance will always be entitled to the full level of benefit permitted under national legislation regardless of whether the State where he or she works has primary or secondary competence for family benefits. The question of who has entitlement to claim such benefits is also clarified as it becomes clear there are no derived rights reducing the number of disputes over this issue. This provides greater clarity for parents and national authorities compared with the baseline.</p> <p>However, some parents may find the application of anti-overlapping rules to the maximum duration of child-raising allowances difficult to understand</p>
Simplification	+	<p>This option is simpler to administer for both parents and public authorities compared with the baseline scenario as such benefits are no longer subject to the anti-accumulation rules so the level of benefit to be awarded will be aligned with calculations under national legislation. In addition, the prohibition of claims on the basis of a derived right will mean benefits will be calculated on the basis of actual salaries or professional income earned in the competent Member State. It will no longer necessary to undergo a hypothetical assessment of potential earnings in that State.</p>
Protection of rights	+/-	<p>Under this option, salary-related child raising allowances would be exempt from the anti-accumulation rules, thereby having the advantage that workers would not experience deductions from entitlement under the applicable legislation of the Member State with secondary competence even if the other parent was receiving similar benefits from the Member State with primary competence. In such cases, parents may receive more in benefits than under the current rules in a manner that removes existing disincentives from sharing child-raising responsibilities.</p> <p>However, this option also provides that salary-related child raising allowances would be treated as individual and personal rights which may only be claimed by the parent who is subject to the applicable legislation in question (not by other members of their family). This may have the consequence that some parents currently in receipt of such a benefit as a derived right would no longer have entitlement (although would retain entitlement to any flat-rate child-raising allowances or flat-rate components). The maximum adverse impact could be up to 40% of the number of entitled persons.<sup>443</sup> However, as only a limited number of Member States are currently complying with the requirement to recognise derived rights to employment-related family benefits<sup>444</sup> the adverse effects are likely to be limited in practice.</p>

<sup>443</sup> Table 27 Annex XIII – based on a case-study, the number of incoming-cross border workers who live in a household with one other adult and at least one child aged less than 15.

<sup>444</sup> Only four Member States who have child-raising allowances recognise claims based on derived rights Annex XXV, p14.

<p><b>Financial impact</b></p>	<p>--</p>	<p>Member States with secondary competence may be required to pay more than under the current rules because they will be required to pay a salary-related child-raising allowance in full as they will no longer be entitled to take such benefits into account when calculating the differential supplement.</p> <p>In the absence of comprehensive information on exported child-raising benefits from the Member States<sup>445</sup>, analysis has been conducted using ESSPROS data for Member State expenditure on parental benefits for children aged 0-3. This analysis suggests that this option will lead to an average increase in expenditure of 62% for those Member States who provide a child-raising benefit calculated wholly or partially with reference to salary or professional income exporting benefits to the EU-28 (increasing to an average increase of 81% if only the Member States of residence which have an salary-related child-raising benefit are selected).<sup>446</sup> The extent of the increase may range from 37% (46%) in Slovenia to 210% (432%) in Sweden.<sup>447</sup> It should be noted that this analysis is based on the assumption all Member States concerned are fully complying with the EU social security rules and is made with reference to ESSPROS figures for parental benefits awarded for children aged 0-3 regardless of whether or not the benefit is indexed to salary or professional income or is classified as a family benefit for the purposes of the EU social security rules. The estimations must be construed in light of these limitations.</p> <p>More widely it may also be anticipated that excluding salary-related child-raising allowances from the anti-accumulation rules will increase the level of export for Member States with flat-rate child when acting as the secondary competent Member State. Using the same model of calculation the increase in expenditure compared to the status quo in this case is on average 58% (increasing to an average increase of 84% if only the Member States of residence which have a salary-related, flat-rate or mixed type child-raising benefit are selected).<sup>448</sup></p> <p>A case study on export by Germany as secondary competent Member State of its parental allowance (Elterngeld) to a family of two working parents with two children residing other Member States that also have a salary-related child-raising allowance assuming that such a family is in receipt of the average personal net income for that Member State (one at 100% and the other at 67% of the average wage) anticipates the increase in Germany's expenditure would range from 24% to Poland (increase from €383 to €476) to more than 250% in the</p>
--------------------------------	-----------	--

<sup>445</sup> Only four Member States were able to provide a detailed breakdown of levels of export per benefit type including data on child raising allowances (Germany, Latvia, Hungary and Romania).

<sup>446</sup> Annex XIII Table 24a Average calculated with reference to ESSPROS figures for 13 Member States (Bulgaria, Croatia, Estonia, Finland, Germany, Greece, Hungary, Latvia, Lithuania, Romania, Slovenia, Spain and Sweden . No data was available for Austria, Denmark Italy or Portugal). This analysis assumes that pursuant to the judgment of the CJEU in *Wiering*<sup>446</sup> that a differential supplement should only be calculated by reference to family benefits "of the same kind" that the secondary competent Member State will only make reference to other income-replacement benefits when calculating entitlement to another income-replacement benefit.

<sup>447</sup> Annex XIII Table 24a This analysis is based on the assumption all Member States concerned are fully complying with the EU social security rules and is made with reference to ESSPROS figures for parental benefits awarded for children aged 0-3 regardless of whether or not the benefit is indexed to salary or professional income . The estimations must be construed in light of these limitations.

<sup>448</sup> Table 24b Annex XIII Average calculated with reference to ESSPROS figures for 19 Member States/EEA States (Belgium, Bulgaria, Croatia, Czech Republic, Estonia, Finland, France, Germany, Greece, Hungary, Latvia, Lithuania, Luxembourg, Norway, Poland, Romania, Slovenia, Spain and Sweden. No data was available for Austria, Denmark Italy or Portugal).

		<p>case of Austria (increase from €405 to €1428 paid to the family).<sup>449</sup></p> <p>It is also to be envisaged that some Member States may make savings as a result of this option as they will no longer be obliged to pay salary-related child-raising allowances on the basis of a derived rights, although once again as a number of Member States do not comply with the requirement to grant salary-related benefits on the basis of derived rights the anticipated savings in this regard are limited.</p>
<b>Impacts on fundamental rights</b>	+/-	<p>This option offers superior protection in relation to the rights of the family (Article 33(2)) to reconcile family and professional life by reducing potential disincentives to exercising the right to parental leave. Exempting salary-related child raising allowances from the anti-accumulation rules ensures the right to equal treatment in respect of such benefits as it guarantees mobile citizens working in the Member State of secondary competence would receive a benefit calculated in the same as national workers without deductions and in a manner that promotes the reconciliation of family and professional life. Likewise the right to property (Article 17) is also respected in relation to these workers. While it is noted that some parents may lose entitlement to salary-related child raising allowances currently awarded as a derived right the rights of the family as a whole are protected through the preservation of entitlement for the parent with primary entitlement.</p>
<b>Other impacts</b>		
<b>Regulatory Costs</b>	+/-	<p>In general, this option is likely to reduce administrative burden for national administrations as Member States will be entitled to award salary-related child-raising allowances to EU mobile citizens subject to the applicable legislation in accordance with the normal rules under national legislation. There will no longer be a requirement to include such benefits (which can be subject to fluctuation according to earnings) within the calculation of the differential supplement nor would there be a need to apply a hypothetical calculation in relation to a parent who does not have relevant income or earnings within the competent Member State but who asserts a derived right to benefits.</p> <p>However, it may be anticipated that there will be some increase in administrative tasks for Member States who seek to verify whether or not a benefit available in another Member State should be considered a salary-related child-raising allowance or who wish to exchange information about entitlement to or claims for salary-related child-raising allowance for the other parent in another Member State for the purposes of applying anti-accumulation principles to the duration of a benefit. This will also entail additional administrative tasks for citizens.</p> <p>As this option was developed after commissioning the analysis of regulatory costs at the time of drafting this report it has not possible to draw direct comparisons with the baseline scenario in the same manner as with Options 1a, 1b and 2.</p>

<sup>449</sup>Table 25 Annex XIII.

Risk of fraud and abuse	+	Removal of derived rights is likely to reduce the risk of fraud and abuse as Member States will be able to assess and verify entitlement to salary-related child raising allowances according to their national legislation and normal procedures. However, there will be a need to establish clear policies and procedures to ensure exchanges of information to assess the other parent's entitlement to a benefit in order to apply anti-accumulation principles to the duration of a benefit.
Fair burden sharing between Member States	+/-	This option shifts the burden in cases child-raising allowances to the Member State of work as benefits will be required to be paid in full and for the maximum duration permitted under national legislation (except in cases where there is simultaneous entitlement in another Member State meaning increases to duration may be limited). However, such a change in burden may be considered consistent with the economic logic that assigns the obligation to pay the family benefits to the Member State receiving the contributions and taxes.
Mobility	+	<p>This option may have a slight impact on mobility by removing potential disincentives for parents to move to a different Member State because of the risks that a change in primary competence may have a negative impact on the level of their salary-related child-raising allowances.<sup>450</sup> As noted above there are a range of variables that may influence a family's decision about whether or not to relocate and this prediction needs to be viewed accordingly.</p> <p>As this option was developed after commissioning the analysis of regulatory costs at the time of drafting this report it has not possible to draw direct comparisons with the status quo in the same manner as with Options 1a, 1b and 2.</p>
<p>Coherence with General, Specific and wider EU Objectives</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits</li> <li>• Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>• Ensure family benefits are processed as efficiently as possible</li> </ul>	++	The horizontal options provide greater protection for mobile EU parents in the field of child-raising allowances (calculated by reference to salary/professional income). In general, exempting these benefits from the application of derived rights and the anti-accumulation rules is likely to remove disincentives for parents to share child-raising responsibilities increasing ongoing labour market participation. Other potential disadvantages for EU transnational families concerning duration of a right to benefit are also mitigated (with safeguards to protect over-compensation of families). This option is also likely to decrease regulatory costs for public authorities in administering these benefits by removing the need to calculate the differential supplement and calculate claims on the basis of derived rights increasing administrative simplicity and reducing delays for families in processing claims. By preventing claims on the basis of derived rights to be made in respect of family benefits intended to replace an individual worker's income during periods of child-raising the aim of achieving a clear and transparent link between the Member State issuing the benefit and the recipient is achieved. Although there may be an increase in the economic costs for secondary competent

<sup>450</sup> It is to be noted that the Nordic Council of Ministers identified the inconsistent treatment of parental benefits in the Nordic countries and the application of the anti-accumulation rules to such benefits as a potential cross-border barrier Nordic Council of Ministers, 2012 Freedom of Movement within the Social- and Labour market Area in the Nordic Countries: Summary of obstacles and potential solutions.

		Member States, such an increase is aligned to costs that would otherwise be incurred under national legislation. This option supports the wider EU objectives including in relation to the Fresh Start on maternity and parental leave.

### 7.5.7 Impacts of Horizontal Policy Option b: Different coordination rules for all child-raising allowances: mandatory derogation from anti-overlapping rules

Horizontal Option b: Different coordination rules for all child-raising allowances (salary-related and flat rate): mandatory derogation from anti-overlapping rules		
<b>Social impacts</b>		
Clarification	++	The impact would be the same as horizontal option a, although the advantages would be greater as this would apply to all child-raising allowances (both salary-related and flat rate)
Simplification	+	The impact would be the same as horizontal option a, although the advantages would be greater as this would apply to all child-raising allowances.
Protection of rights	+/-	The impact would be the same as horizontal option a, although the costs and benefits would be greater as this would apply to all child-raising allowances.
<b>Financial impact</b>	--	<p>The financial impact is similar to horizontal option a, however, the number of Member States affected and the range of economic costs is likely to be greater as a result of the extension to all child-raising allowances.</p> <p>Based on ESSPROS data for Member State expenditure on parental benefits it may be anticipated that this option will lead to an average increase in expenditure for secondary competent Member States with child-raising allowances of 58% exporting benefits to the EU-28 (increasing to an average increase of 84% if only the Member States of residence which have an salary-related, flat rate or mixed child-raising benefit are selected).<sup>451</sup></p> <p>The extent of the increase may range from 32% (43%) in Luxembourg to 210% (474%) in Sweden.<sup>452</sup></p>
<b>Impacts on fundamental rights</b>	+/-	The impact would be the same as horizontal option a, although the impact would be greater as this would apply to all child-raising allowances
<b>Other impacts</b>		
Regulatory Costs	+/-	The impact would be the same as horizontal option a, although the anticipated reduction in regulatory burden would be greater

<sup>451</sup>Annex XIII Table 24b Average calculated with reference to ESSPROS figures for 19 Member States/EEA States (Belgium, Bulgaria, Croatia, Czech Republic, Estonia, Finland, France, Germany, Greece, Hungary, Latvia, Lithuania, Luxembourg, Norway, Poland, Romania, Slovenia, Spain and Sweden . No data was available for Austria, Denmark Italy or Portugal).

<sup>452</sup>Annex XIII Table 24b This analysis is based on the assumption all Member States concerned are fully complying with the EU social security rules and is made with reference to ESSPROS figures for parental benefits awarded for children aged 0-3 regardless of whether or not the benefit is indexed to salary or professional income . The estimations must be construed in light of these limitations.

		as this would apply to all child-raising allowances (and conversely the scope of additional administrative tasks to verify duration of leave taken in another Member State could increase for both national authorities and citizens)
Risk of fraud and abuse	+	The impact would be the same as horizontal option a, although the advantages would be greater as this would apply to all child-raising allowances
Fair burden sharing between Member States	+/-	The impact would be the same as horizontal option a, although the benefits would be greater as this would apply to all child-raising allowances.
Mobility	+	The impact is likely to be similar to horizontal option a
<p>Coherence with General, Specific and wider EU Objectives</p> <p>Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.</p> <ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the recipients of those benefits</li> <li>• Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>• Ensure family benefits are processed as efficiently as possible</li> </ul>	++	For the same reasons as horizontal option a this option may be considered effective at achieving the General and Specific EU objectives and also the wider EU objectives, the Fresh Start to address the challenges of work-life balance faced by working families. Further, as this horizontal option encapsulates both salary-related and flat rate child-raising allowances it is slightly more effective at achieving these aims.

### 7.5.8 Impacts of Horizontal Policy Option c: Different coordination rules for all child-raising allowances: optional derogation from anti-overlapping rules

Horizontal Option c: Different coordination rules for all child-raising allowances (salary-related and flat rate): optional derogation from anti-overlapping rules		
<b>Social impacts</b>		
Clarification	+/-	The impact would be the similar to horizontal option b, although the effects would be mixed depending on whether a member state chooses to disapply the anti-accumulation rules or not. Some citizens may find this confusing.
Simplification	+	The impact would be the similar to horizontal option b, although the effects would be mixed depending on whether a Member State chooses to disapply the anti-accumulation rules or not. Some citizens may find this confusing.

Protection of rights	+/-	The impact would be the similar to horizontal option b, although the effects would be mixed depending on whether a member state chooses to disapply the anti-accumulation rules or not. In addition, as this option does not envisage a measure to ensure that where only one parent in a family is subject to the legislation of a Member State, that parent shall be able to claim the allowances for the maximum duration, some mobile families may face disadvantages in national systems which are designed to incentivise parents to share child-raising allowances by limiting the duration that an individual parent can claim a benefit.
<b>Financial impact</b>	--	The maximum impact would be the similar to horizontal option b, although it may be anticipated that not all Member States will choose to derogate from the anti-overlapping rules. In cases where there is no derogation there will be no change from the baseline.
<b>Impacts on fundamental rights</b>	+/-	The impact would be the similar to horizontal option b, although the effects would be mixed depending on whether a Member State chooses to disapply the anti-accumulation rules or not
<b>Other impacts</b>		
Regulatory Costs	+/-	The impact would be the similar to horizontal option b, although the effects would be mixed depending on whether a member state chooses to disapply the anti-accumulation rules or not. However, no additional administrative tasks are envisaged under this option as competent authorities will not be required to exchange information about the duration of claim for child-raising allowances taken by a parent in another Member State.  This will also not entail any additional administrative tasks for citizens.
Risk of fraud and abuse	+	The impact would be the similar to horizontal option b.
Fair burden sharing between Member States	+/-	The maximum impact would be the similar to horizontal option b, although it may be anticipated that not all Member States will choose to derogate from the anti-overlapping rules.
Mobility	0	No material impact on mobility is anticipated as a result of this measure.
Coherence with General, Specific and wider EU Objectives  Continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.  <ul style="list-style-type: none"> <li>• Ensure a clear and transparent link between the Member State issuing family benefits and the</li> </ul>	+/-	This option has the potential to be just as effective at achieving the General and Specific EU objectives and also the wider EU objectives, the Fresh Start to address the challenges of work-life balance faced by working families as horizontal option b with slightly increased simplicity as it does not entail any additional administrative tasks, meaning it is even more simple to apply. However, as the derogation from the anti-accumulation rules is optional rather than mandatory in practice it is likely to be less effective at achieving the goals and the problems identified concerning disincentives to ongoing labour market participation may continue to subsist.

<p>recipients of those benefits</p> <ul style="list-style-type: none"> <li>Remove barriers or disincentives to parents' ongoing participation in the labour market</li> <li>Ensure family benefits are processed as efficiently as possible</li> </ul>		
--	--	--

### 7.5.9 Conclusions

Based on the above tables, the following preliminary conclusions can be drawn.

The baseline scenario, from a merely administrative point of view, is the easiest option to implement and it has the support of a large number of stakeholders. It also offers the same or superior levels of protection to workers and their families as the other options. This option maintains a clear and transparent link between the Member State issuing a benefit and the place where a mobile worker pays taxes and social security contributions. It is anticipated in light of the launch of EESSI and implementation of Decision F2 that efficiency and effectiveness of processing family benefit claims will also be increased.

Option 1a and 1b may be the most effective options in achieving a greater correlation between family benefits and the cost of living, however, they do not fully achieve the aim of maintaining a clear and transparent link between the Member State issuing a benefit and the families in receipt of such benefits as mobile workers as the transparency of the award of family benefits will be reduced compared to the baseline particularly in relation to employment-related benefits. These options may increase rather than reduce disincentives to parents' ongoing participation in the labour market during periods of child-raising leave in the field of child-raising allowances related to salary or professional income as such benefits will not only be subject to the anti-accumulation rules but also subject to reductions based on place of residence of the child. They may also increase delays in processing family benefits. Workers and their families will generally be provided with an inferior level of protection compared to the status quo (in particular in relation to option 1b) as workers will receive lower level of family benefits than nationals notwithstanding the fact they pay the same level of tax and social security contributions. Therefore notwithstanding the potential cost savings (particularly in the case of option 1b) these considerations these options are not considered the most effective at achieving the objectives and therefore are not the most efficient options.

Option 2 introduces legal clarity and simplicity for families and public administrations by establishing a closer alignment between the EU rules and national legislation which generally require residence of a child as a condition of entitlement for family benefits. However, it may be regarded as less effective in achieving the general objective of fair and equitable distribution of financial burden between Member States as the effect of this option is to redistribute financial burden away from the Member State of economic activity (which receives a mobile worker's tax and social security contributions) towards the Member State of Residence. The rights of families are respected as they will receive the same level of benefits as under the current rules although there may be a moderate budgetary impact for those Member States which currently have secondary competence for family benefits in particular those that do not currently have to pay the differential supplement because the level of family benefits in the primary competent Member State is higher. In cases where there is only one economically active parent, the increase in economic burden for the Member State of residence of the child and away from the Member State of employment is contrary to the relative distribution of taxes and social security paid by the family to these Member States. Therefore although in many respects this is an effective option, in light of the anticipated increase in costs for the Member State of residence of the child it is not the most efficient.

Horizontal option

The horizontal options provide greater protection for mobile EU parents in the field of child-raising allowances (either calculated by reference to salary/professional income or all types of such benefit), and by exempting these benefits from the application of derived rights and the anti-accumulation rules will also decrease regulatory costs for public authorities in administering these benefits and reduce delays for families in processing claims. By preventing claims on the basis of derived rights to be made in respect of family benefits intended to replace an individual worker's income during periods of child-raising the aim of achieving a clear and transparent link between the Member State issuing the benefit and the recipient is achieved. These options will entail a significant economic impact for Member States as by disapplying the anti-accumulation rules, Member States with secondary competence will experience an increase in expenditure of on average increase of 62-81% in relation to Horizontal Option a and 58-84% for Horizontal Option b. This financial impact may be mitigated by allowing Member States to derogate from the anti-overlapping rules on an optional basis although this option is less effective at reducing disincentives to labour market participation. There is therefore a trade-off between cost and effectiveness. The risk of a loss of protection for parents currently relying on derived rights to such benefits is assessed as low due to the current low levels of compliance with the existing EU law requirement to award family benefits calculated with reference to salary or professional income on the basis of a derived right.

## 8. Overall Conclusion

The **key policy objective** of this initiative is to continue the modernisation of the EU Social Security Coordination Rules by further facilitating the exercise of citizens' rights while at the same time ensuring legal clarity, a fair and equitable distribution of the financial burden among the institutions of the Member States involved and administrative simplicity and enforceability of the rules.

This initiative serves to facilitate the exercise of the right to free movement by ensuring the social security coordination is effective and efficient and therefore does not act as a deterrent to free movement. It is in the interests of all parties to design co-ordination rules that allow full exercise of rights of citizens whilst ensuring coordination requirements for both citizens and Member States are clear and transparent and thereby easy to apply and enforce.

Achieving greater clarity over the social security coordination system is an important step to face the challenges and controversies that exist over intra-EU mobility and to address demographic challenges ahead of us.

Achieving a system of social security coordination that responds to the social and economic reality in Member States has been one of the central drivers for the Commission to continue the modernisation process of social security coordination that started more than a decade ago.

It is important the rules are fair (in particular in relation to the relative balance of responsibility between Member States who receive or have received social security contributions and the obligation to pay benefits) and that perceptions of unfairness are properly investigated so that they can be addressed where such views are well grounded but challenged where a perception is misplaced. Further the rules should be efficient in terms of cost, administrative burden and risk of fraud or administrative error.

Finally the rules should be effective in relation to meeting the overall goals of coordination in particular safeguarding the continuity of social security protection as citizens move from from one Member State to another.

This report has carefully reviewed the existing rules, taking into account the views of stakeholders to identify actions that may be necessary to achieve this overall objective. This impact assessment report has considered the impact of possible improvements to the rules in four distinct areas:

- Long-term care benefits
- Unemployment benefits
- Access to social benefits for economically inactive mobile EU citizens
- Family benefits

In each area, the Report has identified a number of policy options to address the problems identified outlined below against the baseline (preferred options identified in yellow).

Overview of Options Per Area						
Long Term Care Benefits						
<b>Baseline:</b> No specific provisions for long-term care benefits. Competent Member State provides long-term benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence		<b>Option 1:</b> The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence. New definition of LTC benefits to facilitate coordination ✓		<b>Option 2a :</b> Member State of residence provides all long-term care benefits (in cash and in kind) with reimbursement by the competent State, at the level of the state of residence without supplement by the competent Member State		<b>Option 2b:</b> As option 2a, but with supplement by competent Member State
Unemployment Benefits						
Aggregation of Periods	<b>Baseline:</b> No minimum insurance period to qualify for aggregation. Divergent approach between MS.	<b>Option 1:</b> formalisation of one-day rule	<b>Option 2a :</b> introduction of minimum insurance requirement of 1 month	<b>Option 2b:</b> introduction of minimum insurance requirement of 3 months ✓	<b>Option 3a :</b> taking account of previous earnings having been insured less than 1 month	<b>Option 3b:</b> taking account of previous earnings having been insured less than 3 months
Export of Unemployment Benefits	<b>Baseline:</b> Export for 3 months with the option to extend to 6 months.	<b>Option 1:</b> Extend period of export of UB to minimum 6 months and possibility of further extension ✓		<b>Option 2:</b> Extend period of export of UB for duration of entitlement		
Rules for cross-border workers	<b>Baseline:</b> frontier workers receive UBs in Member State of residence. All other wholly unemployed persons receive UBs from Member State of last activity.	<b>Option 1:</b> frontier worker chooses where to claim	<b>Option 2a:</b> state of last activity pays UB, and frontier worker registers there	<b>Option 2b:</b> state of last activity pays UB, frontier worker can choose where to register	<b>Option 3a :</b> state of last activity only pays UB after sufficient (at least 12 months) work history and frontier worker registers there ✓	<b>Option 3b:</b> state of last activity only pays UB after sufficient work history and frontier worker chooses where to register
Access for economically inactive persons and jobseekers to social benefits						
<b>Baseline:</b> Economically inactive mobile citizens have no right to benefits for first 3 months. After 3 months only if (i)Sufficient resources(ii) Comprehensive sickness coverage	<b>Option 1a</b> Dynamic reference to Directive 2004/38/EC in equal treatment provisions ✓	<b>Option 1b</b> Amendment of Article 4 of Regulation (EC) No 883/2004 to make a dynamic reference to the limitations to equal treatment in Directive 2004/38/EC and to extend these limitations by analogy to other tax-financed benefits	<b>Option 1c</b> Specific Reference to Directive 2004/38/EC (SNCBs)	<b>Option 2:</b> Removing SNCBs providing subsistence from Regulation (EC) No 883/2004	<b>Option 3:</b> Administrative guidance on interpretation of Regulation (EC) No 883/2004	
Family Benefits						
Export of Family Benefits	<b>Baseline:</b> Family benefits payable in full by Member State of Work including for children living in another Member State.	<b>Option 1a:</b> Adjustment to standards of living: upwards and downwards	<b>Option 1b:</b> Adjustment to standards of living: only downwards	<b>Option 2:</b> Member State of residence has primary competence		

Horizontal Option: Child-raising allowances	<b>Baseline:</b> Family Members have a derived right to family benefits. Anti-overlapping rules apply.	<b>Horizontal Option a:</b> individual rights for salary-related child-raising allowances: mandatory derogation from anti-overlapping rules	<b>Horizontal Option b:</b> Individual rights for all child-raising allowances: mandatory derogation from anti-overlapping rules	<b>Horizontal Option c:</b> individual rights for all child-raising allowances: optional derogation from anti-overlapping rules ✓
---	--	---	--	--

Each of these options has been assessed in relation to their social, economic and regulatory impact as well as their effectiveness and efficiency in meeting the general and specific policy objectives. An overview of the impact in relation to **the preferred options** is set out below:

Table - overview of impact of preferred options (impacts grouped per objective)				
General Objective	Facilitate the exercise of citizens' rights	Ensure legal clarity and transparency for citizens, institutions and other stakeholders on coordination rules applicable to them	Ensure a fair and equitable distribution of the financial burden between Member State	Ensure administrative simplicity and enforceability of the rules
<b>Relevant Impact</b>	-Protection of rights	-Clarification	-Financial impact -Fair burden sharing	-Simplification -Regulatory Costs -Risk of fraud and abuse
<b>Long-term care benefits</b>	+	++	0	+
The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence	The inclusion of a common definition for long-term care benefits and uniform criteria for classifying these benefits will bring clarity and consistency to the system.  Receipt of benefits will remain subject to national conditions of entitlement and so a move to another Member State may be more or less advantageous depending on the allocation of benefits in kind and cash in the Member States concerned.	This option takes into account the specific characteristics of long-term care benefits, distinguishing them from sickness benefits and other branches of social security, while maintaining the current method of coordination.	No significant economic impact in comparison to the baseline is foreseen as the same rules will continue to apply.  No fundamental changes in burden sharing, but some benefits not currently coordinated as Long-Term Care Benefits could become subject to the rules. This may lead to some additional cases of export, but also contribute to greater efficiencies by avoiding duplication in the allocation of benefits.	The option will make it easier for citizens to identify and understand the application of the coordination provisions on national long-term care benefits.  Information obligations for national administrations will remain the same as under the baseline scenario.  The option facilitates the comparison of benefits in kind and in cash and could lead to fewer cases of duplication and also fewer disputes between institutions concerning reimbursement.
<b>Unemployment benefits: Aggregation</b>	+	+	++	++
introduction of minimum insurance requirement of 3 months	No substantive loss of rights. Approximately 10,082 mobile EU workers will receive export of	Improved clarity of the EU rules on aggregation, eliminating divergent interpretations	Slight increase of expenditure for the Member State of previous employment, but corresponding decrease	A uniform interpretation of the rules on aggregation will contribute to simplifying the aggregation procedure.

	unemployment benefits from the Member State of previous activity instead of the last State of activity.	between Member States.	of expenditure on unemployment benefits for Member States of last activity. Overall decrease of expenditure amounting to approximately € 29 million is expected.	A clearer link between the award of benefits and contributions paid diminishes the risk of random results.  Overall regulatory costs will remain unchanged.
<b>Unemployment benefits: Export</b>	+	+	+	0
Extend period of export of Unemployment Benefits to minimum period of 6 months and possibility of further extension for whole period of entitlement.	About 24,000 persons will have the possibility to retain their rights to unemployment in case of job search in another Member State for a period of six instead of three months.	Clearer and uniform standards for all persons wishing to take their unemployment benefits with them when looking for a job in another Member State.	The extension of the export period is not expected to have any significant financial impact on the Member States, either at individual or aggregate level, as it only maintains an existing right to unemployment benefits in case of job search in another Member State.  Extended export reduces the risk that a jobseeker has to rely on welfare benefits from the host Member State.	Clear and uniform rules regarding the export period will simplify the procedure for citizens and national administrations.  The introduction of a reinforced cooperation mechanism will reduce the risk of fraud and abuse by ensuring that the jobseeker remains subject to supervision in the host State and so cases of non-compliance with activation measures may be detected.
<b>Unemployment benefits: Frontier Workers</b>	+	+	+/-	++
State of last activity only pays Unemployment Benefits after sufficient (at least 12 months) work history and frontier worker registers there. The current reimbursement procedure is abolished.	This option will result in greater consistency in the treatment of frontier and other cross-border workers.  It will also contribute towards an even stronger link between benefits and contributions, creating better chances for the worker to reintegrate into labour market.	Clear and uniform rules for frontier and other cross-border workers	Across the EU-28, there will be an increase of 6% of the overall expenses for unemployment benefits from € 416 million to € 442 million. This is because frontier workers tend to work in countries with (on the average) higher wages and higher benefits.  It contributes to a shift in burden sharing as the cost of the unemployment benefits will be reallocated in a way that is proportionate to level of contributions or income tax received.	Clear and uniform rules for frontier and other cross-border workers will simplify the administrative procedure and thus facilitate enforcement of existing rules for citizens.  Additional information exchanges are needed between the Member State of last activity and the State of residence as regards the reference period of 12 months. However, in combination with the annulment of the reimbursement procedure, this option has an overall positive impact on administrative burden (-50%).
<b>Access for economically inactive persons and jobseekers to social benefits</b>	+	+	0	+
Dynamic reference to Directive 2004/38/EC in equal treatment provisions & Commission guidance	Greater uniformity in the application of rules by Member States and the ability of citizens to enforce their rights	The codification of existing case-law combined with clear guidance would clarify the rights of EU mobile	No direct impact on Member States' budgets as this measure simply reflects codification of the case-law of the Court.	It will be more straightforward to verify rights and obligations.  Costs related to lack of legal certainty for both

	thanks to more clarity in the application of the CJEU case law, leading to greater legal certainty.	citizens and would enable citizens to make an informed choice when exercising their rights to move to another Member State.	No direct impact on the distribution of financial burden between Member States.	citizens and public authorities could be reduced  Greater visibility to the existing safeguards in EU law against "welfare tourism" may act as a deterrent to such conduct.
<b>Export of Family Benefits</b>	0	0	0	0
Baseline: Family benefits payable in full by Member State of Work including for children living in another Member State.	N/A	N/A	N/A	N/A
<b>Horizontal Option: Child-Raising Allowances</b>	+/-	+/-	-	+
Different coordination rules for all child-raising allowances: optional derogation from anti-overlapping rules	Where Member States choose to disapply the anti-accumulation rules, workers will not experience deductions to child-raising benefits facilitating the right for both parents to share child-raising responsibilities.  However, this advantage is limited as not all Member States will apply the derogation  A limited number of family members will lose entitlement on the basis of derived rights.	In cases where a Member State applies the derogation, entitlement will be aligned to national law, making it clearer for parents to understand. However, this advantage is limited as not all Member States will apply the derogation.  Doubts about who has entitlement to claim such benefits are resolved reducing the number of disputes over derived rights.	The maximum financial impact would be an average increase in expenditure on exported child-raising benefits for secondary competent Member States of 84% (in practice this is expected to be more limited as not all Member States will apply the derogation).  Where applied, there would be a shift in the burden to the Member State of work as child-raising allowances benefits will be paid in full by the secondary competent Member State.	The removal of derived rights is likely to reduce administrative burden and the risk of fraud and abuse as Member States will be able to assess and verify entitlement to child raising allowances according to their national legislation and normal procedures.

The likely economic impact on the individual budgets of Member States is set out on the table opposite. As previously highlighted in the methodology, this analysis is limited to the actual social security costs for Member States for providing social security benefits. It has not been possible to analyse the corresponding receipt of 'contributions' (levies earmarked for social security purposes) into national social security schemes before the contingency occurs. The impact on income taxation is also left aside, as under Regulation (EC) No 883/2004 only contributions are coordinated, while general taxation is not. Analysis has been based on administrative data provided by Member States, it has to be underlined that not all Member States were able to provide data on the different benefits, nor was all data complete. Therefore analysis is provided to the extent possible. No economic impact has been provided where it is assumed that these measures are financially neutral as they either do not confer or limit rights or obligations beyond those already existing under national legislation or EU law.

## Indicative budgetary impact of preferred options against baseline scenario, in € ,000, 2013/2014

	Long-Term Care Benefits				Unemployment Benefits				Access to Social Benefits for Economically Inactive Citizens and Jobseekers				Family Benefits						
	Baseline Annual expenditure (in € ,000)	Option Annual Expenditure (in € ,000)	% change	Member State	Baseline Annual expenditure (in € ,000)	Option Annual Expenditure (in € ,000)	% change	Export of Unemployment Benefits: Extend the period for export of unemployment benefits to a minimum period of 6 months (or end of entitlement period if shorter)	Baseline Annual expenditure (in € ,000)	Option Annual Expenditure (in € ,000)	% change	Aggregation of Unemployment Benefits: Introduction of a minimum period of insurance or (self-)employment of three months before aggregation of unemployment benefits	Baseline Annual expenditure (in € ,000)	Option Annual Expenditure (in € ,000)	% change	The amendment of Article 4 of Regulation (EC) No 883/2004 to make reference to the limitations in Directive 2004/38/EC. This could be combined with guidance to provide a more detailed explanation of the rules.	Baseline Annual expenditure (in € ,000)	Option Annual Expenditure (in € ,000)	% change

Based on the preceding analysis of the options against these objectives it follows that:

For long-term care benefits, option 1 is the most efficient and effective option to fulfil the objectives for long-term care benefits.

By introducing a legal basis for the already applicable rules, this option introduces a regime appropriate to long-term care benefits, while maintaining continuity with the current system. In parallel, it achieves legal clarity and transparency on the rules applicable both for citizens and institutions as well as other stakeholders. Although benefits in kind are provided by the residence State, costs of all cash and in kind benefits provided are at the expense of the competent Member State which ensures a fair distribution of the financial burden. This option however will not solve existing mismatches in case the competent Member State has no benefits in cash and the State of residence has no benefits in kind.

Option 1 is the most cost-efficient and effective option in facilitating the application of the coordination rules.

For the coordination of unemployment benefits, the best compromise would be a combination of option 3a for competence and registration of frontier workers, option 1 for the export of unemployment benefits, and of option 2b for the aggregation of periods in combination with the horizontal option regarding the recognition of periods for the purpose of aggregation.

This combination of options would ensure that:

- a) The Member State of last activity would remain competent for providing unemployment benefits to frontier and other cross-border workers in all cases where those persons have been insured there for at least 12 months, because it can be assumed that this suffices to create a strong link to the labour market of this State;
- b) The Member State of residence becomes competent for those who have not satisfied this requirement and thus have not established such a strong link;
- c) Periods completed in another Member State are only taken into account, where those periods would also have been considered as periods of insurance in that Member State where they have been completed;
- d) The Member State of last activity becomes competent in all other cases for those who have been insured there for at least three months as regards the aggregation of periods;
- e) The Member State of previous activity becomes competent and has to export the benefit whenever this condition has not been satisfied;
- f) Cash benefits are exported, i.e. are paid to unemployed persons looking for a job in another Member State than the competent one for an extended period of at least six months in order to provide sufficient time for an effective job search and increasing access to employment opportunities throughout the Union.

They are also aligned with the general and specific objectives and wider EU policy objectives on active labour market policy such as the 2013 citizenship report (COM(2013)269) which as its key action 1 refers to the proposal to extend the export of unemployment benefits to six months.

For access to social benefits for economically inactive EU mobile citizens and jobseekers the most efficient option responding to the objectives is the amendment of Article 4 of Regulation (EC) No 883/2004 to make reference to the limitations in Directive 2004/38/EC. To increase the effectiveness of this option it could be combined with option 3, which would allow for a more detailed explanation of the rules. This option would increase legal certainty and clarity and transparency while, at the same time, allowing room for a dynamic interpretation of the Regulation as the case-law of the CJEU concerning the relationship between the Regulation and the Directive develops.

This option will increase legal clarity and transparency on the rights of economically inactive mobile EU citizens and jobseekers and also on the extent to which Member States' social security institutions

are permitted to limit the equal treatment principle for such persons in relation to access to certain social benefits. It is anticipated to thereby improve the administrative simplicity and enforceability of the rules.

For family benefits the most efficient and effective combination responding to the objectives is the combination of the status quo with the horizontal option c. This combination will ensure that primary responsibility for family benefits is retained by the Member State of economic activity where a parent pays taxes and social security contributions in a manner, while the Member State which has secondary competence will pay a differential supplement if its family benefits are higher. This maintains protection for family members and upholds the best interests of the child. By introducing the horizontal option c, it is also possible to protect the individual interests of parents who seek to maintain a balance between work and family life during periods of child-raising by placing a greater emphasis on individual rights and supporting those Member States who are actively promoting flexible and family friendly working practices without imposing this obligation. This option has the potential to be effective at achieving the General and Specific EU objectives and also the wider EU objectives, the Fresh Start to address the challenges of work-life balance faced by working families and is simple to apply. This flexible approach will thereby increasing sustained labour market participation by parents during periods of child-raising. However, as the derogation from the anti-accumulation rules is optional rather than mandatory in practice it is likely to be less effective at achieving the goals and the problems identified concerning disincentives to ongoing labour market participation may continue to subsist. It is anticipated in light of measures already foreseen outside the scope of the revision (the launch of EESSI and implementation of Decision F2) that the aim of improving efficiency of processing family benefit claims will also be achieved.

## 9. How would the impacts be monitored and evaluated?

### 9.1. Monitoring indicators

In accordance with the Better Regulation Guidelines, this section provides an outline of the proposed arrangements for monitoring and evaluation (including the proposed indicators). Final monitoring and evaluation arrangements will be approved at a later stage.<sup>453</sup>

Monitoring will take place on two levels. The first level consists of monitoring the implementation of the proposed action by the Commission at EU Level. In its role as the guardian of the Treaties, the Commission closely monitors and assists Member States and citizens in the implementation of the EU social security coordination and of free movement of workers rules by regularly assessing the national legislations and/or practices in place, investigating potential infringements of EU rules in the Member States, filing observations in preliminary references made by the national courts on questions on the interpretation and application of the EU social security rules and responding to individual questions, complaints, petitions or citizens' queries. For example, the Commission's Your Europe Advice and SOLVIT citizens' advice services publish annual reports identifying the number and nature of citizens concerns on particular topics within EU competence including EU social security coordination.

The second level consists of the monitoring by the Administrative Commission to assess the application of the proposed changes at national level. The Administrative Commission has the specific tasks to<sup>454</sup>:

---

<sup>453</sup> Better Regulation Guidelines, Section 2.7, p30.

<sup>454</sup> Article 72 of Regulation (EC) No 883/2004.

- facilitate the uniform application of EU law, especially by promoting exchange of experience and best administrative practices between the Member States;
- foster and develop cooperation between Member States and their institutions in social security matters and facilitate the realisation of actions of cross border cooperation activities in the area of coordination of social security systems;
- modernise the procedures for exchanging information and adapting the information flow between institutions for the purposes of exchanging data by electronic means.

The Commission can request the Member States represented in the Administrative Commission to report on the effective application of the coordination rules in the Member States, especially on the close and effective cooperation between the authorities and institutions in different Member States as one of the key factors for an efficient functioning of the EU rules on the coordination of national social security systems. It is supported by associated networks such as the informal Social Security Coordination Communication Network and National Contact Points on Fraud & Error also comprised of representatives from Member States who are also able to monitor effectiveness of the proposed measures and identify any potential difficulties in application in specific fields.

Moreover, the Member States are under the obligation to compile statistics on the application of Regulation (EC) No 883/2004 and (EC) No 987/2009 and forward them to the Secretariat of the Administrative Commission<sup>455</sup> including in relation to the payment of unemployment benefits; on the coordination of long-term care benefits and the coordination of family benefits to be analysed by the Network of experts on statistics on Free movement of Workers and Social Security Coordination, a consortium of HIVA- KU Leuven, Milieu Ltd, IRIS University Ghent, whose tasks is to collect and analyse the statistical data on an annual basis. Reports are compiled annually on these topics and published on the DG EMPL website.<sup>456</sup>

The Administrative Commission may set up working parties and study groups for special problems. A 'Reflection Forum' was set up in June 2014, consisting of a collective brain storming exercise within the framework of the Administrative Commission on the future challenges for social security coordination. The discussions in the Reflection Forum will provide a platform for analysing, and clarifying issues of common concern on an administrative level and for openly discussing them in the context of social security coordination as part of a wider challenge, irrespective of whether some may be more controversial than others in their political context. The purpose of the Reflection Forum is to frame the discussion of the topics, draw parallels between them and identify specific issues that warrant further action in the future.

The informal Social Security Coordination Communication Network, composed of Member States' representatives dealing with communication issues on EU social security coordination rules, provides feedback to the Commission about the challenges faced in communicating EU rules on social security coordination at national level, and advance proposals in order to improve the quality and availability of information on EU rules on social security coordination. For instance, the revision of the guides on Member States national security systems published by the European Commission to make them more simple, user friendly and adaptable to national website, was based also on a feedback received from the network. The network can thus play a positive role in monitoring the awareness of the rules on long-term care, unemployment benefits, family benefits and access of economically inactive citizens and mobile jobseekers to certain social benefits.

Mechanisms for gathering data in relation to the indicators at both EU level and National Level are already in place with capacity for informing the review on at least and annual basis and therefore there is no need for development of new mechanisms for data collection or to envisage that such methods will entail additional costs for the European Commission or for the Member States to achieve.

---

<sup>455</sup> Article 91 of Regulation (EC) No 987/2009.

<sup>456</sup> Publication of reports is at the discretion of the Commission with the exception of sensitive information or any sensitive reference to single Member States.

Indicators based on the data collection consortium HIVA, Milieu Ltd, IRIS University Ghent are foreseen to be monitored on an annual basis, while surveys on the application of the Regulation are envisaged to be less frequent (every 2-3 years).

## 9.2. Operational objectives for the preferred policy options and their monitoring

### 9.2.1 Long-term care benefits

Table 19: Monitoring indicators for Long-term care benefits

Operational objective	Indicator	Definition/Unit of Measurement <sup>457</sup>	Existing data/Sources
Bring legal clarity and transparency for citizens, institutions and stakeholders by introducing a definition for long-term care benefits, group the rules under a separate Chapter and establish a list of long-term care benefits under Regulation (EC) No 883/2004.	Complaints from citizens on Long-term care benefits	- number of queries and complaints from citizens and institutions about difficulties in exercising their rights.	Yes: Incoming correspondence Commission (annually)
	EU litigation on LTC	No. of national and CJEU cases on the interpretation of EU law on long-term care benefits.	Yes: National Courts/ CJEU
	Complaints from national authorities on Long-term care benefits	Experiences from national institutions with the application of the revised legal framework.	No: Survey in the Administrative Commission
Reduce administrative costs and cases of double payments by providing clear rules of when long-term care benefits in cash and in kind are provided for the same purpose and for the same time frame.	Cases of overlapping payments	amount of benefits in cash and the reimbursement for benefits in kind in Euros.	Yes: Survey in the Administrative Commission/ Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)
	Administrative costs for public authorities	administrative costs per case for processing claims for long-term care benefits in Member State of residence.	Yes: Survey in the Administrative Commission/ Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)
	Complaints from national authorities on Long-term care benefits	Experiences from national institutions with the application of the revised legal framework.	No: Survey by the Administrative Commission
Reduce the number of conflict situations between institutions, resulting in 1 individual complaints, and fewer preliminary or	Complaints from citizens on Long-term care benefits	Number of complaints from citizens about difficulties in exercising their rights.	Yes: Incoming correspondence Commission (annually)

<sup>457</sup> The benchmark against which the indicators will be evaluated will be the data of application of Regulation (EC) No 883/2004, i.e. 1 May 2010.

infraction procedures to be dealt with by the CJEU.			
	EU Litigation on LTC	No. of national and CJEU cases on the interpretation of EU law on long-term care benefits.	Yes: National Courts/CJEU

### 9.2.2 Unemployment benefits

**Table 20: Monitoring indicators for unemployment benefits**

Operational objective	Indicator	Definition/Unit of Measurement	Existing data/Sources
Reduce the number of complaints concerning access to unemployment benefits by frontier workers and cross-border workers	Complaints on coordination of unemployment benefits by frontier workers/cross-border workers	- number of queries and complaints from frontier workers/cross-border workers about difficulties in exercising their rights	Yes: Incoming correspondence Commission (annually)
	EU Litigation on UBs for frontier/cross-border workers	Number of national and CJEU cases on the interpretation of EU law on unemployment benefits for the frontier and cross-border workers	Yes: National Courts/ CJEU
Ensure a better correlation between the level of the unemployment benefits paid and the contributions received for the frontier, cross-border and mobile EU citizens	Level of contributions received vs level of unemployment benefits paid	overall amounts of contributions received and paid per Member State	Yes: Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)
Increase the number of persons exporting their benefits	Number of cases of export of unemployment benefits	Number of persons applying for a PD U2	Yes: Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)
Establish common ground for extending the period of export of unemployment benefits and establish a systematic cooperation and control mechanism to monitor the fulfilment of rights and obligations by the unemployed person when exporting benefits.	Number of exchanges on control measures between Member States	Number of exchanges between Member States in the EESSI system concerning the monitoring of rights and obligations of unemployed person, report on delays and other communication problems	No: Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)
	Concerns/Recommendations from national authorities on unemployment benefits	Exchange of (best) practices between Member States	No: Survey in the Administrative Commission (2-3 years)
	Number of cases of fraud and error in field of unemployment benefits	Reported number of cases of 'fraud and error'	Yes: Annual discussion on fraud and error in the Administrative Commission (annually)
	Concerns/Recommendations from national authorities on	Feedback from communication activities	Yes: Survey in the Informal Communication Network

	unemployment benefits		(annually)
	Concerns from national authorities on aggregation of unemployment benefits	Survey on use of PD U2	Yes: Survey in the Administrative Commission (annually)
Reduce the number of complaints and infringements by establishing clear rules on the aggregation of periods	Complaints on aggregation of unemployment benefits	- Number of Queries and complaints from citizens about difficulties in exercising their rights	Yes: Incoming correspondence Commission (annually)
	Infringement proceedings	Number of Infringement procedures on aggregation of	Yes: European Commission (annually)
Increase the integration of workers in the insurance system of a Member State	Unemployed mobile persons applying for aggregation of insurance periods	Number of applications for the aggregation of periods by wholly unemployed persons	Yes: Survey in the Administrative Commission on Document PD U1 (annually)
	Concerns/Recommendations from national authorities on unemployment benefits	Exchange of (best) practices between Member States	No: Survey in the Administrative Commission (every 2-3 years)
Reduce administrative costs for public administrations between Member States connected the administrative cooperation and control mechanism for monitoring the fulfilment of rights and obligations of unemployed persons who are exporting their unemployment benefits.	Administrative costs for public authorities	For all Member State: Unemployment rate of cross-border and frontier workers, total yearly expenditure on unemployment benefits for frontier and cross-border workers having worked in that Member State and distribution effects between national and cross-border workers	No: Survey in the Administrative Commission Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)

### 9.2.3 Access of economically inactive EU citizens and jobseekers to certain social benefits

**Table 21: Monitoring indicators for access by economically inactive citizens and jobseekers to certain social benefits**

Operational objective	Indicator	Definition/Unit of Measurement <sup>458</sup>	Existing data/Sources
Reduce the number of complaints concerning access to certain social benefits	Complaints from citizens on access to social benefits	- number of queries and complaints from citizens and institutions about difficulties in exercising their rights.	Yes: Incoming correspondence Commission (annually)
	EU Litigation on relationship between Social Security Rules and Directive 2004/38/EC	No. of national and CJEU cases on the interpretation of EU law on long-term care benefits.	Yes: National Courts/ CJEU (annually)

<sup>458</sup> The benchmark against which the indicators will be evaluated will be the data of application of Regulation (EC) No 883/2004, i.e. 1 May 2010.

	Complaints from national authorities on access to social benefits	Experiences from national institutions with the application of the revised legal framework.	No: Survey in the Administrative Commission (every 2-3 years)
--	---	---	---

#### 9.2.4 Export of family benefits

**Table 22: Monitoring indicators for export of family benefits**

Operational objective	Indicator	Definition/Unit of Measurement	Existing data/Sources
Ensure greater clarity on respective responsibilities of Member States for export of family benefits to families in a cross-border situation	Complaints from citizens on export of family benefits	- number of queries and complaints about difficulties in exercising their rights	Incoming correspondence Commission (annually)
	EU Litigation on Family Benefits	No. of national and CJEU cases on the interpretation of EU law on family benefits	National Courts/ CJEU (annually)
Increase the number of cases in which parents are able to export child-raising benefits and reduce the number of complaints concerning their export ensure clarity and consistency in applying these rules	Export of child-raising allowances	- Survey on export of family benefits	Yes: Survey in the Administrative Commission (annual)
	Complaints from citizens on export of child raising allowances	Queries and complaints about difficulties parents experience in exercising their rights	Yes: Incoming correspondence to the Commission (annually)
	EU Litigation on child-raising allowances	No. of national and CJEU cases on the interpretation of EU law on the export of child-raising allowances	Yes: National Courts/CJEU (annually)
Reduce regulatory costs for public administrations in Member States associated with export of family benefits	Speed of processing claims	Time needed to respond to requests for information	No- Survey in the Administrative Commission (annually)  -No Monitoring by Administrative Commission, Technical Commission and Executive Board (annually)
	Number of exchanges between Member States	Number of exchanges between Member States in the EESSI system, report on delays or other communication problems	No - Data collection consortium HIVA, Milieu Ltd, IRIS University Ghent (annually)

### 9.3. Evaluation

In addition, the Commission will evaluate the revised legal framework 5 years after its application in accordance with the Better Regulation Guidelines.

It is anticipated that the Commission submits to the European Parliament, the Council and the Economic and Social Committee, 5 years after the date of implementation of the amended Regulations, and every 5 years thereafter at the latest, an evaluation report on the application of the new instrument.

**10. Annex I: Procedural Information**

## 10.1. Annex I: Procedural Information

The "Revision of Regulation (EC) No 883/2004 and Regulation (EC) No 987/2010" forms part of the Labour Mobility Package, included in the Commission's 2015 Work Programme. The lead DG for this initiative is EMPL.

The preparatory work started in 2009 with the establishment of an ad hoc expert group on long-term care benefits under the auspices of the Administrative Commission for the Coordination of Social Security Systems.

In 2013 and 2014 the preparatory work on a revision of 883/2004 continued, involving an impact assessment and a draft proposal for legislation. The proposal was drafted in response to the 2011 Council's call for a revision of the rules on unemployment benefits in order to strengthen the link between contributions and benefits, and in view of the need to respond to the introduction of a new type of "long-term care benefit" at national level in view of population change.

An Impact Assessment Steering Group (IASG) was set up to discuss the elements of the proposal initially scheduled for adoption in Spring 2014 (coordination of long-term care benefits; export of unemployment benefits; coordination of unemployment benefits for frontier workers) with representatives of the following Commission's services: SG, SJ, ECFIN, MARKT, HOME, ENTR, SANCO, COMM, JUST, RTD, EAC, TAXUD, REGIO and BEPA. The IASG met six times between June 2012 and November 2013. The minutes of the IASG meeting of 25 November 2013, as well as comments received on the draft Impact Assessment Report after the meeting, are annexed to this report in Annex XXIV.

The adoption of the proposal was originally scheduled for spring 2014. However, in view of the European Parliament elections and the changes in political level playing field, the initiative was put 'on hold' and action to follow it up was left to the new Commission.

Preparatory work was resumed in autumn 2014 and continued throughout 2015.

An Inter-Service Steering Group (ISSG) was set up on 19 December 2014 to discuss the Labour Mobility Package, and concerned the following elements of the proposal: coordination of family benefits, aggregation of unemployment benefits, and access to special non-contributory cash benefits for economically inactive persons, with representatives of the following Commission's services: SG, EMPL, MOVE, JUST, CNCET, ESTAT, HOME, NEAR, GROW, SJ, ENER, REGIO, TAXUD, SANTE, TRADE. The ISSG met 6 times between January 2015 and September 2015.

### 1.1.1 Advice from independent experts

A study supporting the Impact Assessment for the elements of the proposal initially scheduled for adoption in spring 2014 (coordination of long-term care benefits; export of unemployment benefits; coordination of unemployment benefits for frontier workers) was carried out by Deloitte Consulting<sup>459</sup> and a final report was delivered on 6 December 2013. Available data (principally through Labour Force Survey<sup>460</sup> and 2012 Ageing Report<sup>461</sup>) was used to model budgetary impacts for all Member States. Further data was collected in a representative

<sup>459</sup> Deloitte, Consulting *Study for the impact assessment for revision of Regulations (EC) Nos 883/2004 and 987/2009*, 6 December 2013. The study can be found in Annex V to this report.

<sup>460</sup> To be consulted at: <http://epp.eurostat.ec.europa.eu/portal/page/portal/microdata/lfs>.

<sup>461</sup> To be consulted at: [http://ec.europa.eu/economy\\_finance/publications/european\\_economy/2012/pdf/ee-2012\\_2\\_en.pdf](http://ec.europa.eu/economy_finance/publications/european_economy/2012/pdf/ee-2012_2_en.pdf).

sample of 14 Member States<sup>462</sup>, and additional quantitative information to support problem definition and assessment of options was delivered by the HIVA KU Leuven Research Institute for Work and Society (HIVA)<sup>463</sup>.

Six studies supporting the Impact Assessment for the further elements of the revision (coordination of family benefits and aggregation of unemployment benefits) were carried out by a consortium under the lead of Fondazione Giacomo Brodolini<sup>464</sup> and by HIVA – KU Leuven Research Institute for Work and Society (HIVA)<sup>465</sup>, and the final reports were delivered in August 2015. Administrative data from Member States<sup>466</sup> and EU available data<sup>467</sup> were used to model economic impact and administrative burden for Member States.

The training and reporting on European Social Security (trESS) network<sup>468</sup> of independent experts in the field of social security coordination evaluated the coordination of long-term care benefits<sup>469</sup>, export of unemployment benefits and coordination of unemployment benefits for frontier workers<sup>470</sup> and the potential legal impacts of the revision of Regulation (EC) No 883/2004 with regard to coordination of long-term care benefits<sup>471</sup>. These three studies were presented in 2011 and 2012 to the Administrative Commission for the Coordination of Social Security Systems. The evaluations looked into the current legal framework of coordination of long-term care and unemployment benefits, identified the challenges that stem from the application of the current EU rules in these areas and identified possible areas for improvement.

The network of independent experts in the fields of free movement of workers and social security coordination in the European Union (FreSsco) evaluated the potential legal impacts of the Revision of Regulation (EC) No 883/2004 with regard to the coordination of family benefits<sup>472</sup>, the aggregation of unemployment benefits<sup>473</sup>, and access to special non-

### *Technical amendments to the EU coordination rules*

Outside the scope of this impact assessment report, but included in the revision package are a number of proposals for technical amendments to the EU coordination rules. These amendments aim to bring clarification to a number of coordination provisions, but not to substantially revise them. These amendments will not have a substantial impact and hence their estimated effects will be explained in explanatory notes to the legislative proposal.

Moreover, the package will also include a 'periodic update' of the Regulations to reflect developments in national legislation that have an effect on the coordination of social security systems in the EU. The aim is to ensure legal certainty for institutions and citizens by making technical amendments the wording of EU provisions or by amending certain annexes. This is, for instance, the case where a benefit ceases to exist in a Member State and has to be deleted from a specific annex to the EU Regulation, or where a wording of a specific article has to be corrected or clarified to avoid misinterpretation.

The proposals for these technical amendments are based either on the proposal of a Member State, or a group of Member States, or of the Commission services. They were discussed and agreed by at least a qualified majority of Member States in the Administrative Commission on the Coordination of Social Security Systems.

Finally, the revision package will include a proposal for a governance change concerning the procedure to amend the country-specific annexes to the coordination Regulations, with which the Commission proposes a simpler and faster legislative procedure to adapt the annexes. This element of the proposal is not expected to have social, economic or environment impacts and is therefore also excluded from the scope of this impact assessment. Its limited effects will be outlined in an explanatory note to the proposal.

Further details concerning the Technical Amendments are contained in Annex XX.

**11. Annex II - Stakeholder consultation**

As the preparatory work for the "Revision of Regulation (EC) No 883/2004 and Regulation (EC) No 987/2010" began in 2009, stakeholders were consulted on several occasions on the different elements which are now subject to revision:

6. Member States were consulted on coordination of long-term care benefits, export of unemployment benefits, aggregation of unemployment benefits, coordination of unemployment benefits for frontier workers, export of family benefits and access to special non-contributory cash benefits for economically inactive persons, within the framework of the Administrative Commission for the Coordination of Social Security Schemes (Administrative Commission).
7. National administrations were also consulted via a specialised online survey on the coordination of long-term care benefits, export of unemployment benefits and coordination of unemployment benefits for frontier workers. Also, a group of national organisation in charge of the payment of family benefits sent a position paper.
8. Social partners were consulted on the coordination of long-term care benefits, coordination of unemployment benefits for frontier workers and export of unemployment benefits in the framework of the Advisory Committee for the Coordination of Social Security Systems, and on the coordination of family benefits, long-term care benefits, and unemployment benefits during a dedicated hearing.
9. NGOs were consulted on the coordination of family benefits, long-term care benefits, and unemployment benefits during an ad-hoc consultation workshop.
10. Two online consultations were also launched, one on the coordination of long-term care benefits, export of unemployment benefits and coordination of unemployment benefits for frontier workers; the other one on the coordination of unemployment benefits and the coordination of family benefits.

It has to be noted that the different consultations presented different degrees of specificity in relation to the options assessed, and due to the high level of complexity of some topics, and the late definition of some options, some consultations have been kept very wide (e.g. the public consultation on aggregation of unemployment benefits; export of family benefits and social security coordination rules on the posting of employed and self-employed persons). A summary of these consultations is given in the sections below.

## 1. Member States

Discussions with the Member States on coordination of long-term care benefits, export of unemployment benefits and coordination of unemployment benefits for frontier workers took place at the meetings of the **Administrative Commission for the Coordination of Social Security Systems**<sup>475</sup> in the period 2009 to 2013.

In relation to the coordination of long-term care benefits, during the Working Party of the Administrative Commission on the revision of EU provision on coordination of long term care benefits and unemployment benefit of 10 October 2013, Member States delegations (some representing their governments' positions, other sharing their opinions as experts) expressed their views on the options under consideration. A majority of delegations supported the creation of a specific definition and/or specific chapter and/or list of benefits

---

<sup>475</sup> While all Member States are represented at the meetings of the Administrative Commission for the Coordination of Social Security Systems, not all delegations necessarily have taken the floor during the several discussions on the different options.

(Luxembourg, Spain, Italy, Portugal, Lithuania, Poland, Belgium, Malta, Sweden, Czech Republic, Hungary and Latvia explicitly supported the option, whilst Austria, Germany, France, Ireland, Slovenia, Slovakia and Greece, without taking definite position, supported some elements of this option or did not object it). Others were in favour of the status quo (Belgium, Greece, Spain, Hungary, Malta, Poland, Sweden, Estonia as well as the United Kingdom and France without declaring their definite position).

A **specialised questionnaire** was also launched by the Commission at the beginning of 2012 on the coordination of long-term care benefits: on the basis of a report<sup>476</sup> prepared in 2012 by the trESS (Training and Reporting on European Social Security) Network, Member States were asked to describe their policy approach with regards to persons in need of LTC, to assess a new definition for LTC benefits, to identify further challenges than those presented in the report.

To the question whether the Regulation should be amended to better coordinate LTC benefits, MS answered as follows:

- Open to any solution: Hungary, Finland;
- There should be a separate Chapter for LTC benefits (including also a definition and elaborated list): Luxembourg, Austria, Greece, Slovakia, Ireland, Portugal, Czech Republic, Lithuania, and Slovenia.
- Special rules for LTC benefits (irrespective of the place – new chapter or Sickness Chapter): Netherlands.
- No change of the existing system of coordination: Poland, Sweden, France.
- All benefits should be regarded as benefits in kind: Denmark.
- No coordination as sickness benefits: Estonia.
- Competence only of the MS of residence: Austria (if safeguarded that no differential payments or subsidiary competence of any other MS – some parameters are elaborated in the note), Lithuania.
- Always the first MS which grants LTC benefits should remain competent is not acceptable: Czech Republic, Lithuania.
- LTC benefits should not be coordinated as pensions: Lithuania, Romania (as invalidity benefits).
- Benefits granted to the carer should be regarded as income and so Title II should apply to the carer: Poland, Ireland (also the existing system seems to focus more on direct benefits than on the provision of services), Hungary.
- A detailed list for the application of Article 34 of Regulation (EC) No 883/2004 should be made: Poland, Bulgaria, Lithuania, France.
- Rights to LTC benefits should be treated as individual rights: Slovenia.

Other remarks:

- Whatever solution is sought, it must be stable, easy to administer and transparent for the citizens, and social tourism must be avoided: Austria.
- Further rulings of the CJEU should be awaited: Finland.
- An introduction of a specific equalisation of claims for LTC benefits: Poland.
- Special rules for LTC benefits should be included in the Sickness Chapter: Italy.

---

<sup>476</sup> trESS Network, *Legal impact assessment for the revision of Regulation 883/2004 with regard to the coordination of long-term care benefits*; Analytical Study 2012, available at: [http://www.tress-network.org/tress2012/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS\\_Analytical%20Study%202012.pdf](http://www.tress-network.org/tress2012/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS_Analytical%20Study%202012.pdf)

- Another possibility would be to follow the same principles as under the Family Benefits Chapter: Czech Republic.
- There should be a non-exhaustive list of LTC benefits: Spain.
- First the work should focus on the application of Article 34 of Regulation (EC) No 883/2004 and on the various CJEU rulings concerning LTC: Lithuania.
- Article 66 (2) of Regulation (EC) No 987/2009 has to be amended to allow for reimbursement of LTC benefits via a separated liaison body: France.
- A better coordination seems to be necessary (it is not yet clear which one): Belgium.

Finally, to the question as whether all LTC benefits should be coordinated in the same way (i.e. one set of coordination rules), or should it be still possible to coordinate them under different Chapters, MS answered as follows:

- All LTC benefits and schemes should be coordinated under one Chapter: Luxembourg, Denmark, Finland, Greece, Bulgaria, Portugal, Czech Republic, Spain, Slovenia, France, Netherlands, Romania.
- Open to both solutions: Finland.
- LTC benefits should be inserted in Article 3 of Regulation (EC) No 883/2004: Luxembourg.
- There should be a more elaborated list of all the LTC benefits covered by the new coordination: Luxembourg.
- LTC benefits should remain coordinated as today under the various chapters of Regulation (EC) No 883/2004: Italy, Hungary (new coordination only for the rest not covered by these special chapters), some MSs refer to some of these cases explicitly.
- Social assistance benefits cannot be coordinated as other LTC benefits: Austria (at least this has to be further examined), Poland, Germany (this also applies to LTC benefits for victims of war), Slovakia, Lithuania.
- Special family allowances for handicapped children shall remain coordinated as family benefits: Austria, Latvia; same opinion concerning medical care allowances for children and supplement to family benefits which are treated as family benefits: Poland.
- LTC benefits granted under the accidents at work and industrial diseases scheme should remain coordinated under the relevant chapter, as this is more favourable for the persons concerned: Austria, Germany, Latvia.
- Benefits which up until now have been regarded as invalidity benefits cannot be treated as LTC benefits: Poland, Germany.
- Benefits in kind and in cash should not be coordinated in the same way: Estonia, Slovakia.
- A better coordination seems to be necessary (it is not yet clear which one): Belgium.

In relation to the **coordination of unemployment benefits for frontier workers**, during the Working Party of the Administrative Commission on the revision of EU provision on coordination of long term care benefits and unemployment benefit of 10 October 2013, Member States delegations (some representing their governments' positions, other sharing their opinions as experts) expressed their views on the options under consideration:

- 8 delegations were in favour of maintaining the status quo (Germany, Ireland, Denmark, Switzerland, Netherlands, Austria, Greece, Slovakia);
- 1 in favour of introducing an option to choose between receiving unemployment benefits from the country of last activity and residence (Hungary);

- and 9 in favour of providing unemployment benefits for all workers from the state of last activity (Czech Republic, Spain, Poland, Italy, Romania, Slovenia, Luxembourg, France, Malta).

In relation to the **export of unemployment benefits**, during the Working Party of the Administrative Commission on the revision of EU provision on coordination of long term care benefits and unemployment benefit of 10 October 2013, Member States delegations (some representing their governments' positions, other sharing their opinions as experts) expressed their views on the options under consideration:

- 9 delegations supported the current provisions (Germany, Spain, Netherlands, Greece, Austria, Denmark, Ireland, France, Belgium);
- and 6 delegations supported the option for a right to export for at least 6 months (PT, Slovenia, Malta, Slovakia, Romania, Italy)

In relation to **export of family benefits**, during a Reflection Forum within the framework of the Administrative Commission meeting on 10-12 March 2015, Member States' delegations (sharing their opinions as experts) expressed their views on the options under consideration:

- a significant majority of delegations favoured maintaining the status quo for ensuring that family benefits were exported at the same rate payable in the state of employment (Bulgaria, Switzerland, Czech Republic, Estonia, Spain, Finland, Croatia, Italy, Lithuania, Lithuania, Latvia, Poland, Portugal, Romania, Sweden, Slovakia and Slovenia)<sup>477</sup>;
- a minority of delegations favoured adjustment of the amount of family benefits to reflect the living standards in the Member State of Residence of the child (Denmark, France, Ireland and Norway);
- a similar minority of delegations favoured the option of no export of family benefits in some or all cases (Austria, Luxembourg, Malta, UK).

In light of the feedback from national experts following consultation within the Reflection Forum of the Administrative Commission, the Commission has developed a new option concerning the priority rules for the payment of family benefits. During a second meeting on 23-25 June 2015, the new option according to which the Member State of residence of the child should always be primarily competent to award family benefits was discussed:

- ten delegations indicated support for this option as a first or second choice (Austria, Estonia, Finland, Ireland, Latvia, Luxembourg, Malta, Sweden, Slovenia, UK) although Sweden indicated they preferred changes in classification of benefits before considering changes in priority and the UK indicated their support for this option was conditional on not having to pay the differential supplement;
- nine delegations were expressly opposed to the new option (Cyprus, Germany, France, Italy, Netherlands, Poland, Portugal, Romania, and Slovakia);
- the most popular option remained maintaining the status quo, which is supported by 17 delegations.

In the discussions concerning export of family benefits, a number of delegations raised concerns about the application of the family benefit rules to child-raising allowances. This concern was expressed by Denmark, Finland, Austria and Sweden. The development of the

---

<sup>477</sup> Belgium also expressed support for the status quo in a written note sent to the Commission

horizontal option was developed at a later stage as a result of the feedback from Member States and other stakeholders.

In relation to **the aggregation of unemployment benefits**, during a Reflection Forum within the framework of the Administrative Commission meeting on 10-12 March 2015, Member States delegations (sharing their opinions as experts) expressed their views on the options under consideration. The discussion revealed widely divergent views of the delegates with a slight majority, however, favouring the maintenance of the status quo. However, some delegations had rather strong views on the issues (in particular Denmark and Greece, who had submitted notes in favour of the 'three-month' option), whereas others were more flexible or declared that they could support more than one option:

- option 1 (maintenance of status quo) was supported by the following delegations: Germany, Czech Republic, Poland, Italy, Portugal, Bulgaria, Estonia, Slovakia, Belgium, Croatia, Slovenia;
- option 2.a (aggregation only after working one month) was supported by: Luxembourg, Finland;
- option 2.b (aggregation only after working three months) was supported by: Greece, Denmark, Malta, Austria, Luxembourg, France, Lithuania, Luxembourg, Romania, UK, Latvia, Ireland.

The supporters of the one-day rule (option 1) rather focused on the needs of (returning) migrant workers and felt the need to ensure that there are no gaps in their protection. The supporters of option 2 (aggregation only after one or three months of work) rather focused on the needs of their institutions and wanted to ensure that unemployment benefits are only paid to those who had made a "substantial" contribution to their own schemes.

In relation to the debate concerning the method of calculation of unemployment benefits:

- the majority of delegations were in favour of maintaining the status quo (i.e. benefits should be calculated solely on the basis of salaries earned in the competent MS) (Czech Republic, Ireland, Portugal, Bulgaria, Estonia, Slovakia, Romania, Latvia, Hungary, Poland, France, Slovenia, Croatia, Lithuania and Italy) – however, a number of delegations caveated their position to make clear it may vary depending on the policy adopted in respect of aggregation. For example, some pointed out that a strengthening of the precondition for aggregation (three-month rule) would make a change of the calculation method superfluous;
- in relation to those Member States who were open to change in the current rules (so that the calculation of unemployment benefits would also take into account salaries earned in another MS), the positions of delegations regarding the policy options concerning were less clear, because many favoured such a change without time limitation. Open for such a change were the following delegations: Denmark, Greece, Germany, Malta, UK, Finland, Netherlands, Luxembourg, Italy, Austria.

The supporters of the status-quo as regards the calculation of unemployment benefits felt the need to ensure that benefits are paid quickly without additional administrative complications. The supporters of a change, i.e. of also taking into account foreign salaries for the calculation of benefits, felt that this would lead to fairer results.

During a second meeting on 23-25 June 2015, delegations were consulted on how to deal with the coverage of unemployed persons in case of introduction of a waiting period for the aggregation of unemployment benefits:

- three delegations (Poland, Portugal, Hungary) expressed concerns about the risk of a gap in protection for mobile workers;
- six Member States (Austria, France, Greece, Ireland, Malta and Romania) all of whom supported the introduction of a 3 month period of insured employment to qualify for aggregation proposed that the gap should be addressed by extending the application of Article 65(5)(a) to mobile workers who have worked for less than 3 months in the country of new employment allowing them to "reactivate" entitlement in the former country of employment. This proposal was opposed by the delegates from Germany, Spain, Sweden, Hungary and Portugal. The UK delegate also had concerns about the practicalities;
- three delegations (Czech Republic, Germany, Sweden) were opposed to specific coordinating measures to address the gap because the numbers of potentially affected unemployed persons were very low and any changes to the rules to address the gap would be administratively burdensome to apply and may risk mobile workers being treated more favourably than nationals.

In relation to **non-contributory cash benefits providing for a minimum subsistence level**, during a Reflection Forum within the framework of meeting of the Administrative Commission meeting on 23-25 June 2015, Member States delegations (sharing their opinions as experts) expressed their views on the options under consideration:

- nine delegations (Czech Republic, Germany, France, Lithuania, Latvia, Luxembourg, Netherlands, Sweden and UK) made clear that they preferred to wait for the outcome of the judgments of *Alimanovic* and *Garcia Nieto* before any firm action is taken;
- eight delegations (Malta, Hungary, Italy, Poland, Portugal, Finland, Lithuania and Spain) favoured the status quo as a first or second choice;
- four (Spain, Finland, Hungary, Sweden) expressed support for the status quo accompanied by administrative guidance;
- twelve delegations supported the option of amending Article 4 as a first or second choice (Austria, Belgium, Czech Republic, Germany, Estonia, France, Hungary, Ireland, Lithuania, Latvia, Poland, UK) although there was no general consensus on the changes needed and some of these views are provisional as it includes Member States who were in favour of awaiting the outcome of the pending court cases before adopting a fixed position;
- finally, two delegations favoured the option of excluding SNCBs from scope of Social Security Regulation (Estonia and Ireland).

## 2. National administrations

A web-based survey among the responsible national public authorities and other key actors with regard to the coordination of unemployment benefits for frontier workers, the export of unemployment benefits and the coordination of long-term care benefits was launched in December 2012 by Deloitte consulting.

In relation to the **coordination of unemployment benefits for frontier workers**, 43% of all respondents think that the competent Member State should be the one in which the person last worked and paid social security contribution, even if a person lives in another Member State. About 27% of the respondents favour a right of choice for workers to claim their unemployment benefits either in the country of last activity or the country of residence. About 25% say that the country of residence should be the competent Member State, even if a person last worked and paid social contributions in another Member State. Applying a country-by-

country analysis, the results are slightly different with regard to the 2nd and 3rd preferred option. In 11 countries (Cyprus, Czech Republic, Finland, France, Hungary, Italy, Latvia, Malta, Netherlands, Portugal, Slovenia), the most popular option among public authorities is that unemployment benefits should be provided by the Member State in which the person last worked and paid social security contributions, even if he/she lives in another Member State.

In several of these countries, there is also strong support for the option where workers would have a right of choice with regard to where to claim their unemployment benefits. The reasons why respondents say to favour this option are: it would put an end to the reimbursement of unemployment benefits between Member States and it is fairer that the Member State which receives the social security contributions is also competent to provide the unemployment benefits. However, several respondents warn that this option entails risks of abuse/fraud. The country of residence may lack an incentive to check the legitimacy of the benefits provided by the competent country and to follow-up the unemployed person during the job-seeking process. In 9 countries (Austria, Belgium, Denmark, Germany, Ireland, Luxembourg, Spain, Sweden, Switzerland), most public authorities are in favour of the Member State in which the person lived being the competent Member State, even if he/she last worked and paid social security contributions in another Member State. These countries are also generally against a thorough revision of the coordination rules. In 5 countries (Czech Republic, Estonia, Romania, Slovakia, UK), the most popular option is that a person should be allowed to choose to claim the benefit either in the Member State of last employment or in the Member State where the person lived (if these Member States are different).

In relation to the **export of unemployment benefits**, almost 45% of all respondents are in favour of giving the possibility of “exporting unemployment benefits” (going to another country to look for a job while continuing to receive the unemployment benefits from the competent institution) until the end of the person’s entitlement to unemployment benefits, according to the rules of the Member State which provides them. 34% of all respondents would like to maintain the current period of export of 3 months with a possible extension of the export of unemployment benefits to 6 months. About 12% would like to extend the period of export in the entire EU to at least six months.

Analysing the replies on a country-by-country basis, the results look differently. The current rule of a three-month period of export with a possible extension to 6 months is the most chosen option among public authorities in 11 countries (Austria, Belgium, Cyprus, Denmark, Estonia, Finland, France, Germany, Lithuania, Luxembourg, Netherlands, Switzerland). In 9 countries (HU, Italy, Latvia, Malta, Poland, Romania, Slovakia, Slovenia, Spain, UK), exporting the unemployment benefit until the end of the person's entitlement to unemployment benefits, according to the rules of the Member State which provides them, is the most preferred option. Only in one Member State (PT), public authorities favour a general period of export of minimum 6 months.

52% of all respondents think that the export of unemployment benefits could lead to increased risk of misuse or abuse of rights. This is also the opinion of most public authorities in 15 Member States. 79% of this group of respondents think that the risk of misuse or abuse of rights is particularly high when the unemployment benefits would be provided until the end of a persons’ entitlement to unemployment benefits, according to the rule of the Member State which provides them. 33% of the respondents also believe that there would be an increased risk of abuse if the period of export would be generally extended to minimum 6 months.

45% of the respondents do not think that misuse or abuse of rights is a risk in cases of export of unemployment benefits. This is also the most dominant position among public authorities in 8 countries.

Public authorities, who believe that the export of unemployment benefits could lead to increased risk of misuse of rights, propose the following mitigation measures to reduce this risk:

- The receiving Member State should feel more responsible for jobseekers who have exported their unemployment benefit from another Member State. Agreements should be made between Member States about the control and the provision of active assistance to jobseekers (HU, Austria, Czech Republic, Ireland, Italy, Lithuania, Netherlands, Poland, Portugal and Slovenia). However, more control of jobseekers by the guest Member State will also increase the administrative burden and costs on Member States (Denmark).
- Some Member States say that the keeping the period of export generally limited to maximum 3 months will limit the risk of abuse and misuse of rights. Extension may be possible, if there is a high probability that the jobseeker will find work at short term (Austria, Belgium, Ireland). Several Member States would like to enhance the role of the receiving Member State in providing information to the competent Member State about the chances of a person to find a job at short-term, so that the competent Member State can take a well-argued decision about extending the period of export in a specific case (BE, Estonia, Czech Republic and France).
  - All jobseekers who have exported their unemployment benefits should be obliged to report about their job seeking activities to the competent Member State (Czech Republic, Germany, Malta, Lithuania and France). Some countries are in favour of monthly reporting by the jobseeker to the competent institution (Germany, Malta and Lithuania); other Member States say that a 3-monthly reporting would be sufficient (FR).
  - One respondent suggests making language courses compulsory in the "guest" country, as language is often the most important barrier to integration in the labour market. Also reducing the height of unemployment benefit over time could provide an incentive to jobseekers abroad to actively apply for a job.
  - In the long-run, it should be possible to introduce an EU-Job pass for every EU citizen which contains his/her social data. Every public employment service should be able to access these data, based on a single European social database (Germany, Netherlands).

When people are exporting their unemployment benefit abroad, 40% of the organisations that deal with claims for exportation of unemployment benefits say that they receive information about the status of these job-seekers from the country of residence, but only on request. About 19% automatically receives information from country of residence. About 10% of the respondents say that this information is not needed. The majority of these respondents cannot say if these job-seekers (who exported their unemployment benefit) had found a job.

In relation to the **coordination of long-term care benefits**, 17% of the national administrations and social security institutions would like to keep the current coordination rules for long-term care benefits. About 28% of the respondents believe that people should be treated equally in the Member State where they are insured and should not have their care benefits reduced if they move to another Member State.

The options where a person in need of care is treated equally in the Member State where he is insured or where he/she lives are considered by national administrations as the best ones to stimulate free movement of persons. The current coordination rules are seen as the **worst** option to stimulate mobility of persons.

In terms of social security coverage, national administrations have a preference for the option in which a person in need of care is treated equally in the Member State where he/she lives and receives LTC benefits there in accordance with national legislation. Also the option where a person receives care benefits in cash from the Member State of residence, supplemented by the Member State of insurance in case of more advantageous conditions (top-up).

Making the competent Member State fully responsible for the provision of the LTC benefits is seen as the best option to ensure a fair share of the financial burden between Member States.

Almost half of the national administrations are of the opinion that all costs for LTC benefits should be borne by the competent Member States (where the migrant person is insured). About one third prefers a system where those costs are shared between the Member State of residence and the competent Member State. The latter option however is seen as the most burdensome in terms of administration.

#### *Views of national organisations in charge of the payment of family benefits*

On 7 October 2015, a group of five national organisations in charge of the payment of family benefits from Belgium, France and the Netherlands<sup>478</sup>, issued a position paper in relation to the possible revision of rules on the export of family benefits, strongly supporting the status quo.

### **3. Social partners**

In relation to the **coordination of long-term care benefits, export of unemployment benefits** and **coordination of unemployment benefits for frontier workers**, social partners were consulted in the framework of the Advisory Committee for the Coordination of Social Security Systems on 24 October 2013.

ETUC (European Trade Union Confederation) noted that in this work the Commission should take into account the experience of cross-border workers – the ETUC has found that these workers are often the first to lose their jobs during an economic downturn and can then be refused unemployment benefits in their Member State of residence. The ETUC's research showed this to be a persistent and spreading problem. ETUC also noted that the current Regulations do not cater sufficiently for certain groups of mobile workers, like apprentices. ETUC also expressed surprise at questions in the public consultation on whether the current regime was abused by migrant workers, given that the document was aimed at finding out how the rights of migrant worker can be improved.

BUSINESS EUROPE commented on the need to strike the right balance taking account of potential costs to Member States and businesses. BUSINESSEUROPE considered that unemployment benefits should be time-limited for those seeking employment in another Member State, and deciding the specific time period left as a national competence.

---

<sup>478</sup> CCMSA – Caisse centrale de la Mutualité sociale agricole, CNAF – Caisse Nationale des Allocations familiales and REIF – Représentation des institutions françaises de Sécurité sociale auprès de l'UE (France); FAMIFED (Belgium); and SVB - Sociale Verzekeringsbank (The Netherlands)

ETUC underlined the pressing need to focus on defending and improving the rights of workers. In particular, if a mobile worker has been employed and paid contributions in another Member State to that in which they are resident, it seems right that the Member State of last activity should pay their unemployment benefits.

A dedicated hearing with social partners was also organised on 10 June 2015 to allow for collecting views on the **coordination of long-term care benefits, export of unemployment benefits, aggregation of unemployment benefits, coordination of unemployment benefits for frontier workers, export of family benefits, and access to special non-contributory cash benefits for non-active mobile EU citizens.**

Employers generally referred to the importance of finding the right balance between promoting labour mobility and combatting fraud.

BUSINESSEUROPE stated, during the workshop and in written statements, that respecting the equal treatment principle and ensuring access to information is key. The package should take a comprehensive approach by also addressing issues like e.g. linguistic skills and EURES. The difference in perspectives between origin and destination countries was also underlined. They also suggested that sectoral approaches may be necessary. Mobile workers should not have access to unemployment benefits after one day of work and article 61 of Regulation 883/04 should be adapted. In relation to export of unemployment benefits, there is no change needed in the current period of export of unemployment benefit for a minimum of 3 months. BUSINESSEUROPE recognised the link with the sustainability of social protection systems and the need to combat fraud and abuse. The Dano case was welcomed as a clarification in this respect.

CEEP (European Centre of Employers and Enterprises providing Public Services) stressed the importance of combating fraud and insuring the sustainability of systems.

UEAPME (European Association of Craft, Small and Medium-sized Enterprises) stated, during the meeting and in written contributions following the meeting, that the provision that the export of unemployment benefits to a second Member State can take place for 3 months (and optionally extended to 6 months, Art. 64.c) should remain and not be extended. UEAPME considers it important that workers are activated to find a job in the Member State of destination as soon as possible, in the interest of both employers and the unemployed. In relation to the coordination of unemployment benefits for frontier workers, UEAPME does not consider the current situation, where an exception is made to the principle that the country of employment is normally responsible for the payment of unemployment benefits, as problematic since a real frontier worker has generally a stronger relationship with the country of residence than the country of employment, which provides good grounds for this Member State to pay the benefits. In relation to the aggregation of unemployment benefits, UEAPME would be in favour of introducing a minimum waiting period in the Member State of last employment before entitlement to social security coverage and notably access to unemployment benefits in that Member State. In relation to export of family benefits, UEAPME considers that the principle of the country of employment being responsible for the payment of family benefits should be maintained. However, if this family lives in another Member State, UEAPME considers it fair to adapt the amount of benefits to the cost of living in that Member State.

EFCI (European Federation of Cleaning Industries) stressed the need to promote mobility of apprentices and the establishment of national systems of apprenticeship to fight youth unemployment.

PEARLE (Performance Arts Employers Association Europe), during the meeting and in a written contribution, emphasised that employers in the live performance sector are confronted with specific issues on social security and posting and need instruments such as one-stop-shop or national centres where they can obtain guidance to comply with the requirements in different countries.

DA (Confederation of Danish Employers) mentioned that electronic data exchange can also be used to combat issues like lacking payments of contributions in the country of origin.

CEC (Confederation of European Managers), during the meeting and in a written contribution, highlighted the necessity to make sure that public authorities designated for the enforcement of the different provisions (and limitations to the enjoyment of benefits) apply rigorously the current legislation and adopt all necessary measures to ensure that workers no longer satisfying the conditions set by legislation are excluded from the benefits.

The trade unions warned that caution should be applied when discussing so-called 'social security tourism' and possible abuses as it might end up in some unilateral action of Member States that are not in line with EU law. Before engaging in a debate on a possible change of the rules, proper analysis should be conducted to assess if the problems are a result of shortages in implementation, or problems that call for legislative action. A holistic approach should be applied to tackle issues such as possible unequal treatment, involuntary mobility and brain drain.

ETUC, during the meeting and in a written statement, stressed the need to base the discussion on labour mobility on proper analysis instead of copying populist propaganda from some Member States. On the coordination of unemployment benefits for frontier workers, ETUC supports the possibility for frontier workers and/or mobile workers who are seeking new employment in another Member State to receive their unemployment benefit for up to six months. On the export of unemployment benefits, ETUC supports the possibility to pay between three and six months. In relation to the aggregation of rights and the level of salary which should be calculated for the unemployment benefit, ETUC is of the opinion that full entitlement to unemployment benefits should be assured and that qualifying periods could be accumulated across Member States. In relation to long-term care benefits, ETUC is of the opinion that a rights based approach to long term care across the EU is urgently needed and calls upon the EU institutions to develop a coherent approach to long term care. In general, ETUC underlined that the principle of full equal treatment in the host country is indispensable, and considers it unacceptable if amendments to the Regulation would touch upon this principle and are guided by the concept of residence. ETUC also stated that if exceptions are considered they should be limited to cases which constitute clear abuses and must be based on sufficient evidence about abuses and / or for reasonable motivations.

TUC (Trades Union Congress, UK) highlighted that the right to family benefits is attached to the worker and not to the place of residence of the family. In their view lowering the family benefits for mobile workers would in any event constitute unequal treatment.

EFBWW (European Federation of Building and Woodworkers) stated that the proposals by the Commission appeared to focus mainly on some national concerns about "benefit tourism", and it underlined that only European problems, and not national ones, should be addressed at European level.

#### 4. NGOs

Representatives from 11 NGOs<sup>479</sup> were consulted in relation to the coordination of long-term care benefits, export of unemployment benefits, aggregation of unemployment benefits, coordination of unemployment benefits for frontier workers, export of family benefits, and access to special non-contributory cash benefits for non-active mobile EU citizens during a meeting on 17 June 2015.

Participants highlighted the importance for the Commission of looking at the definition of worker, of ensuring that existing gaps in social security protection for mobile citizens are addressed, and of strengthening the collection of statistics on intra-EU mobility. They also acknowledged the importance of addressing the issues in the current debate on labour mobility to avoid that free movement becomes an even more contentious issue that it already is. However, they insisted on the importance of preserving the principle of equal treatment, especially for those more vulnerable.

Also, participants underlined the importance of adopting non-legislative measures, arguing that several barriers to free movement of workers linked to social security coordination are the result of incorrect/non application of existing rules, or to the fact that the cooperation between Member States, envisaged by the 2010 reforms of SSC rules, has not been strengthened enough yet.

Access to the labour market for mobile EU workers and jobseekers was mentioned as a specific issues that the Commission needs to look at: specific examples were provided by participants about administrative barriers (notably for jobseekers in Scandinavian countries), and recognition of professional qualifications was also mentioned as a barrier. Also, the issue of destitution of migrant workers was mentioned as a major issue, often resulting in homelessness.

In relation to unemployment benefits, participant expressed their support to the extension of the period of their exportability, in view of the time needed to find a job, and of existing administrative barriers.

In relation to export of family benefits, some participants recognised the need for some compromise in view of the position of some MS opposing export, which would entail the (dynamic) adaptation of exported family benefits to the living conditions of the country where the children of the workers reside. Others underlined the unfairness of adaptation, since the workers concerned pay the same taxes, but also the fact that, for the competent MS, adapting family benefits may prove anti-economical if the concerned families were to move to the MS as a result. In this sense, it was mentioned that the biggest challenge for local authorities is represented by pressure on public services, and not by "benefit tourism".

In relation to long-term care benefits, participants expressed support to the idea of creating a specific chapter for their coordination, underlining that they should be exportable, but also warning against endangering the important link between healthcare and social care.

Written contributions were also received from EURODIACONIA, recommending to extend the duration of the export of unemployment benefits; and from ECAS, recommending to provide explicitly for the exportability of long-term benefits; to extend the duration of the export of unemployment benefits; to ensure full respect for the principle of equal treatment give in the reform of the rules on family benefits.

## 5. Public consultations

### a) EU Citizenship Report

Relevant results of the public consultation on the extension of the right to unemployment benefits in the framework of the EU Citizenship Report<sup>480</sup> have also been taken into account with regard to the export of unemployment benefits.

### b) Online consultation on the coordination of long-term care benefits and unemployment benefits (export of unemployment benefits and coordination of unemployment benefits for frontier workers)

The European Commission launched an online consultation on the coordination of long-term care benefits and unemployment benefits (export of unemployment benefits and coordination of unemployment benefits for frontier workers) on 5 December 2012 to which 299 replies were received. 199 of the replies received were from individuals and 100 on behalf of an organisation or as specialists. Both individuals as well as organisations (including Member States' authorities, trade unions and non-governmental organisations and private companies) from the EU and EEA-EFTA States replied to the public consultation.

The content of these replies has been taken into account in the overall analysis and included in the statistics whenever possible (they did not contain full replies to all questions in the consultation). Not all respondents gave full replies to the consultation and the replies are only reflected in the results to the extent that a reply was received to a particular question.

By nationality, Spanish were the most numerous among individual respondents, accounting for 26.6% of the responses. No replies were received from persons from Cyprus, Denmark, Iceland, Luxembourg and Malta.

Stakeholder category	Number of replies	Percentage
National administration	67	67%
Social partner / Trade union	19	19%
Civil society / Non-governmental organisation	11	11%
Company	2	2%
Unknown	1	1%

#### *Coordination of unemployment benefits*

In relation to the coordination of unemployment benefits, the consultation provided some evidence of the diversity of opinions among individuals and different types of stakeholders. National administrations often had different opinions than the social partners, trade unions,

<sup>480</sup> Action 1 in the Report from the Commission to the European Parliament. The Council, the European Economic and Social Committee and the Committee of the Regions, *EU Citizenship Report 2013: EU citizens: your rights, your future*, COM (2013) 269 final. See [http://ec.europa.eu/justice/citizen/files/eu-citizen-brochure\\_en.pdf](http://ec.europa.eu/justice/citizen/files/eu-citizen-brochure_en.pdf).

civil society and non-governmental organisations. The combination of all opinions allows for a comprehensive view of the current system of coordination of unemployment benefits in the EU, including what are perceived to be the main problems and shortcomings perceived, and what the possible options are for reform.

Almost half of the respondents (49%) were in favour of giving the unemployed person the right to choose to claim unemployment benefits in the Member State of last employment, or in the Member State where the person lived during his/her last period of employment (where these Member States were different). The second most commonly chosen option (40% of the individual respondents) was that the unemployed person should have to apply for unemployment benefits in the Member State where he/she last worked and paid contributions, even if he/she lived in another Member State. In third most commonly chosen option (far behind the first two in terms of percentage of respondents), selected by 7% of the participants, was the option where unemployed workers should claim unemployment benefits in their country of residence, even if they last worked and paid social security contributions in another Member State.

Options	Number of replies	% of Individual replies
The Member State where the person last worked and paid social security contributions, even if he/she lived in another Member State.	72	40,22%
The Member State where the person has lived, even if he/she last worked and paid social security contributions in another Member State.	13	7,26%
The person should be allowed to choose to claim the benefit either in the Member State of last employment or in the Member State where the person has lived (if these Member States were different).	87	48,60%
Other solution	7	3,91%

Individuals and organisations at large shared some views with regard to which Member State should be the Member State competent for the provision of unemployment benefits. Only a small share of both groups (and, within organisations, of each type of stakeholder) considered that the country of residence should be the competent Member State. Individuals were rather divided between preferring a right of choice for mobile workers (49% of replies) and making the country of last activity competent (40%). The same two options were clearly preferred by organisations, but in reverse order. National administrations (47% of them) and civil society organisations and NGOs (78%) were more often in favour of making the country of last activity competent, while social partners and trade unions (47%) preferred the right of choice option).

With regard to the export of unemployment benefits, individuals favoured the export until the end of the person's entitlement (59%) of them. This option also received support among organisations (34% of national administrations and 56% of civil society organisations and NGOs), although less than the maintenance of the current rules, which were the preferred option by national administrations (42% of them) and social partners and trade unions (76%). One option received less support across the respondents (export for at least six months).

Options	Number of replies	% of Individual replies
For three months, with a possible extension up to six months (the current situation under EU law)	43	24,02%
For at least six months	28	15,64%
Until the end of the person's entitlement to unemployment benefits, according to the rules of the Member State which provides them	105	58,66%
Other solution	3	1,68%

Therefore, for both questions making the country of residence competent for paying unemployment benefits an export unemployment benefits for at least six month where the least preferred options and opinions were fairly divided among two other options.

#### *Coordination of long-term care benefits*

A total of 127 individual responses and 45 responses on behalf of national authorities, an organisation or as a specialist were received for the part covering the coordination of long-term care benefits. The results of the public consultation highlight the diversity of opinions regarding the Member State competent for providing long-term care benefits. Opinions on these questions varied both across individuals and among stakeholders.

#### a) Individuals' replies

For individuals, the preferred option was for entitlements to be equal to those in the country of insurance (39%), but two other options (namely: entitlement to be equal to those in the country of residence; maintenance of the current rules) gathered almost 20% of the support. Options where the introduction of a supplement to the long-term care cash benefits is foreseen gathered respectively: 14% if benefits provided by the competent State and 6% if provided by the Member State of residence.

Opinions on the competent Member State and on the level of LTC to be provided	Number of requested records	% Requested records(127)
Should continue receiving benefits as it is today (depending on the Member States' legislation the person	23	18,11%

Opinions on the competent Member State and on the level of LTC to be provided	Number of requested records	% Requested records(127)
might end up in a win or in a lose situation).		
Should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he/she moves to another Member State.	49	38,58%
Should be treated equally in the Member State where he/she lives and receive the care benefits there (including the cash benefits), in accordance with the national legislation.	25	19,69%
Should get care benefits in cash from the Member State of insurance, supplemented by the Member State of residence in case of more advantageous conditions (top-up).	18	14,17%
Should get care benefits in cash from the Member State of residence, supplemented by the Member State of insurance in case of more advantageous conditions (top-up).	8	6,30%
Other solution	4	3,15%

b) Replies by national administrations, social partners, NGOs and other organisations

Opinions among organisations<sup>481</sup> were also divided. The most-selected option was that the current rules be maintained (supported by 36% in total), but based largely on national administrations' opinions (they accounted for 75% of these replies).

Considered per type of stakeholders, the current rules were the preferred option by national administrations (53% of replies). Preference among social partners and trade unions were quite spread among the different options, with some slight preference for the entitlements to be equal to those in the country of insurance. Civil society organisations and NGOs also showed some divergent opinions among them, with the most often-selected option for the entitlement to be equal to those in the country of residence. More insights could not be gained directly from the consultation, since there was no possibility to elaborate on the arguments for selecting each option.

<sup>481</sup> Including national authorities, social partners, NGOs and other types of organisations.

There was consensus among respondents on behalf of organisations that all costs for care benefits provided to an insured person should be borne by the Member State where the migrant person is insured for healthcare or long-term care (67 %) <sup>482</sup>.

	Option A	Option B	Option C	Option D	Option E	Option F

### c) Online consultation on the aggregation of unemployment benefits and on the export of family benefits

DG EMPL launched an online consultation on the coordination of unemployment benefits (aggregation rules) and on the coordination of family benefits (export rules), which ran from 15 July 2015 until 7 October 2015 <sup>483</sup>.

307 responses have been received from 199 individuals and 108 organisations (public authorities; workers' organisations; NGOs; employers; SMEs; companies; think-tanks...) from 25 Member States. Hereunder an overview of the outcome of the consultation.

#### *Export of family benefits*

As it can be seen in the table below, around a third of the respondents believe that the current rules on the export of family benefits should be changed.

<sup>482</sup> This question was not included in the part of the questionnaire addressed to the individuals.

<sup>483</sup> <http://ec.europa.eu/social/main.jsp?catId=333&langId=en&consultId=16&visib=0&furtherConsult=yes>

Question	Individuals	Organisations
Are you aware of the current rules?	61% - Yes	79% - Yes
The current rules are satisfactory?	22%* - disagree or strongly disagree	32%* - disagree or strongly disagree
The current rules could be improved in practice	60%* - agree or strongly agree	65%* - agree or strongly agree
The current rules could be better explained	62%* - agree or strongly agree	79%* - agree or strongly agree
The current rules need to be changed	31%* agree or strongly agree	33%* agree or strongly agree

\* % of those who are aware of current rules 206 respondents in relation to family benefits

A number of comments and proposals for possible changes of the rules on the export of family benefits were also made:

- Mixed views on indexation to country of residence of child
- Member State of residence of child should be competent
- Harmonisation/Unification of European Social Security Schemes
- Improvements to the accessibility and simplicity of scheme
- Improved speed of processing of claims
- Special provisions for single parents and family breakdown/remarriage
- Concerns about inter-dependency between between social security and taxation
- Clarification of certain concept e.g. "benefits of the same kind"; "family members"; "mainly dependent on the insured person" distinction between family benefits and SNCBs

#### *Aggregation of unemployment benefits*

As it can be seen in the table below, more than a third of the respondents believe that the current rules on the aggregation of unemployment benefits should be changed.

Question	Individuals	Organisations
Are you aware of the current rules?	63% - Yes	79% - Yes
The current rules are satisfactory?	33%* - disagree or strongly disagree	42%* -disagree or strongly disagree
The current rules could be improved in practice	33%* - agree or strongly agree	74%* - agree or strongly agree
The current rules could be better explained	55%* - agree or strongly agree	78%* - agree or strongly agree
The current rules need to be changed	33%* agree or strongly agree	40%* agree or strongly agree

\* % of those who are aware of current rules 211 respondents in relation to unemployment benefits

A number of comments and proposals for possible changes of the rules on the aggregation of unemployment benefits were also made:

- General support for concept of minimum qualifying period (3 months to 5 years) before aggregation provided former MS pays benefit
- General support for extension of period of export for benefit (6+6 months)
- Some support for right of choice for where to claim unemployment benefits
- Proposal that EU should harmonise/unify unemployment benefits
- Benefits to be calculated on the entirety of qualification period
- Improved accessibility of information
- Mandatory deadlines for administrative procedures
- Robust procedures to combat fraud

**12. Annex III      Who is affected and how**

The Annex is based on the preferred options (see section 8. of the main report) and presents the practical implications for individuals and public administration that will be the most affected by the initiative.

### **Long-term care benefits**

The preferred option consists of coordination, following the same logic as with sickness benefits, but adding clarifications. The competent Member State provides long-term care benefits in cash and reimburses the cost of benefits in kind provided by the Member State of residence. This legislative proposal would have no impact on rights as such: it would merely reflect the already-applied rules on sickness, while complementing the sickness rules with some specific rules that take account of the characteristics of long-term care benefits.

#### **a) Public administration**

The information obligations for administrations under this option will remain unchanged. The option could reduce disputes between institutions. In an initial phase the new legal definition and the in-or exclusion of long-term care benefits in the definition can increase the administrative burden for Member States and impact the exchange of information between Member States. In the long term, the clarification would save time and money spent per case by the Member States, especially in light of increasing demand for long-term care benefits.

#### **b) Individuals**

The clarification will enable EU mobile citizens to receive all the long-term care benefits to which they are entitled while exercising their right to free movement. It will also contribute to expediting the process by which persons that require care receive the benefits to which they are entitled, by removing much of the uncertainty or conflicts on the part of the Member States involved over the status of the various long-term care benefits.

### **Unemployment benefits**

*Competence for paying unemployment benefits to frontier and other cross-border workers*

The competence for paying unemployment benefits will switch from the State of residence to the State of last activity, if the frontier and other cross-border workers have worked in that State for more than 12 months.

#### **a) Public administration**

The number of cases handled by the employment services in the State of last activity can be expected to increase while it will decrease in the State of residence. Except for the changes in the number of cases, no further changes in the administrative procedures/tasks are expected in comparison to baseline under which – as a rule – this information is anyway required for the purpose of determining whether the qualifying period for a right to benefits under the legislation of the State residence had been completed.

This option may result in more cases of export, whenever a frontier worker for whom the competence has switched from the State of residence to the State of last activity prefers to focus the search for employment in the State of residence and therefore wants to register with the employment service located in that State. The administrative procedures for the export of unemployment benefits are established and therefore the only change expected in this respect is the potential number of cases.

#### **b) Individuals**

The length of insured employment will be certified by means of the PD U1 and this will also enable the worker and the employment services to determine the competent institution. There will be no need for them to provide additional information.

#### *Aggregation of periods of insurance or (self-)employment*

Mobile workers will no longer be able to rely on the aggregation of periods completed in the Member State of previous activity if they have worked for less than three months in the Member State of last activity. However, in this situation, the Member State of previous activity becomes competent. This means that the competence for paying unemployment benefits will switch from the State of last activity to the State of previous activity for mobile workers who have worked less than 3 months in the State of last activity.

#### **a) Public administration**

The number of cases handled by the employment services in the State of previous activity can be expected to increase while it will decrease in the State of last activity. The employment services will also have to take the necessary measures to provide for an export of their unemployment benefit to the Member State of last activity (e.g. provide the person with a Portable Document U2), while the employment service in the Member State of last activity will assume the task of assisting the worker in finding new employment. They will also have

to assume the task of informing the employment services in the Member State of previous activity whenever a mobile worker registers with them, who has not yet been insured for the required minimum period of three months.

This option may result in more cases of export, whenever a mobile worker has not completed the required three-month period in the Member State of last activity. As the administrative procedures for the export of unemployment benefits are established, this would be the only change expected.

## **b) Individuals**

There is no change for the individuals as they continue to register in any case of unemployment with the employment service of the Member State of last activity. It is then the task of this institution to determine, whether it can provide the benefits based, if necessary, on aggregation or whether it has to refer the case to the employment service of the Member State of previous activity.

### *Export of unemployment benefits*

The period for export of unemployment benefits is extended to a minimum period of 6 months with possibility of further extension up to the end of the entitlement period.

## **a) Public administration**

The employment services in the competent State can be expected to have to handle more situations in which the unemployment benefit is exported. This does not necessarily result in an increase of the administrative burden, as they do not have to assume the task of controlling the person during the export period. As before, they will have to provide the unemployed persons with a Portable Document U2 and inform him or her about the duties to fulfil in the State to which they intend to go in order to look for employment.

The employment services in the Member State to which the unemployed person went in order to look for employment will have to register those persons and assist them in their job-searching activities. Moreover, the reinforced cooperation mechanism will require them to report regularly on a monthly basis to the competent institution on the follow-up of the unemployed person's situation, in particular whether the latter is still registered with the employment services and is complying with organised checking procedures.

## **b) Individuals**

Unemployed persons have to register with the employment service of the State to which they went in order to look for employment and provide all relevant information as this has been the case so far. The only change is that the export can be granted for longer periods than before.

### **Access for economically inactive mobile EU citizens and jobseekers to certain social benefits**

The preferred option is the amendment of Article 4 of Regulation 883/2004 to make reference to the limitations in Directive 2004/38/EC. This option will merely codify existing case-law.

#### **a) Individuals**

For economically inactive EU mobile citizens and jobseekers this option would facilitate them to make an informed choice when exercising their rights to move to another Member State. At the same time it is likely to reduce litigation costs and legal advice costs.

#### **b) Public administration**

For administrations this option is likely to reduce litigation costs and legal advice costs as well as the number of requests for benefits.

### **Family benefits**

#### **a) Individuals**

The baseline scenario would have no direct impact on citizens and require no additional procedural steps. However, the introduction of a pan-European Electronic Exchange for Social Security Information (EESSI) is likely to increase the speed and efficiency of processing time to the benefit of citizens.

The horizontal option c is in general likely to entail reduced administrative procedures for claimants as where the derogation is applied the process will be aligned to normal national procedures resulting in a predictable level of income, meaning citizens will be subject to

fewer unexpected changes arising from periodic adjustments in benefit levels in another Member State with a reduced risk of recovery procedures. However, as it will be at the discretion of Member States whether or not they choose to disapply the anti-accumulation rules, these benefits will not be experienced by all families. Families will claim on the basis of the parent with direct entitlement meaning there is a simpler procedure with no need to supply data for hypothetical calculation of salary (although a small number of parents will lose derived rights).

## **b) Public administration**

In relation to the baseline scenario, it is already anticipated that regulatory burdens may be mitigated by the implementation of EESSI, including the adoption of consistent protocols for administering exchanges of information on export of family benefits. The Administrative Commission Ad-Hoc Working Group for establishing the definition of data to be exchanged electronically under EESSI in the field of family benefits is currently working on streamlining processes. The Structured Electronic Document (SED) F001 – Request for determining competences and F002 Reply for determining competences have been developed for establishing competence. Specific exchanges may also be applied where there is a need for detailed information on periods of employment and contribution or medical information related to family benefits for a child or young person with a disability or health condition.<sup>484</sup>

In relation to the horizontal option c, Member States will be entitled to award salary-related child-raising allowances to EU mobile citizens subject to the applicable legislation in accordance with the normal rules under national legislation regardless of whether they have primary or secondary competence for awarding family benefits. In particular, the secondary competent Member State will no longer be required to include such benefits (which can be subject to fluctuation) within the calculation of the differential supplement. Thereby simplifying the calculation procedure and avoiding need for periodic adjustments relating to changes in the families circumstances or salary or the need to arrange recovery of any overpayment that might arise from delays in communicating such changes of circumstance.

There will no longer be any need to apply a hypothetical calculation in relation to a parent who does not have relevant income or earnings within the competent Member State but who asserts a derived right to benefits resulting in considerable simplification for those public administrations who recognise benefits on the basis of a derived right.<sup>485</sup>

However, it may be anticipated that there is some increase in administrative tasks for Member States who seek to verify whether or not a benefit available in another Member State should be considered a child-raising allowance.

---

<sup>484</sup> EESSI Business Use Case: FB\_BUC\_01\_Determine Competences

<sup>485</sup> In practice only four Member States recognise entitlement to child-raising allowances calculated with reference to salary or professional income on the basis of derived rights. Annex XXV p14

<b>1. ANNEXE IV: ANALYTICAL MODELS USED.....</b>	<b>3</b>
<b>2.ANNEX V: IMPACT ASSESSMENT STUDY LONG TERM CARE AND UNEMPLOYMENT BENEFITS.....</b>	<b>17</b>

**ANNEXE IV – Analytical models used in preparing the impact assessment**

Several studies, using different analytical models and methodologies, have been used to prepare the impact assessments<sup>1</sup>. When reliable quantitative information on the totality of impacts of the proposed initiative was not available, the analysis has been mainly based on a qualitative assessment of cross-checked criteria. Since options on the coordination of long-term care benefits, coordination of unemployment benefits for frontier workers and export of unemployment benefits had been assessed in 2013-2014, an update with more recent and newly available data has been conducted in 2015<sup>2</sup>.

A general point in terms of data limitations is that some statistical treatment are based on citizenship (Labour force survey) and therefore identify EU mobile citizens/workers (those living/working in another country than their country of citizenship) – while other data (administrative data collection) are based on headcounts of case where citizenship is not collected and that therefore constitutes a broader definition of mobility , i.e. includes not only EU mobile citizens/workers but also nationals returning to their country of citizenship as well as third-country nationals moving between EU Member States. This means that, at least for the treatments based on the administrative data collection, the Impact assessment adopts a broad definition of mobility and does take into account that not only EU mobile citizens benefitting from coordination but also other groups, which also means that there is therefore no underestimation of the phenomenon when using those data.

Hereunder a detailed list of the analytical models and methodologies which have been used by the different studies.

## **1. Coordination of Long-Term Care benefits**

### *HIVA*

The fact there is no specific coordination regime and a common definition, made it difficult to collect data on LTC. Member States did not explicit collect data on LTC and had no common understanding of LTC benefits. Administrative data on LTC are only available in specific forms dealing with the coordination rules of the sickness chapter. The number of those insured for health care living in another country than the competent country – which sometimes includes long-term care or to which LTC-insurance is closely linked – can be calculated based on the number of PD S1. However, no data are currently collected on the number of PD S1 within the framework of the Administrative Commission. The number of PD S1 was estimated by the sum of 3 categories:

- Cross-border workers (and their family members);
- Retired former cross-border workers (and their family members);
- Other mobile pensioners (and their family members).

Firstly, by way of using the LFS, the number of cross-border workers were estimated. Secondly, we assumed in the calculation model that 20% of the cross-border workers will have an insured family

---

<sup>1</sup> For a detailed description of the analytical models and the methodologies used in each studies, please refer to Annexes V-XIX, and XXVI

<sup>2</sup> Annex XXVI

member. Thirdly, to estimate the total number of retired former cross-border workers, we applied the percentage of cross-border workers on the labour market to the number of pensioners in 2013 and this by individual (former) working Member State and assumed that 1 in 5 retired cross-border workers always had worked in the same Member State of employment. Fourthly, an estimation of the number of migrant pensioners was calculated by using the LFS. Finally, we assumed in the calculation model that 25% of the pensioners will have also an insured family member. The sum of all these categories results in an estimate of the number of PD S1. As next step we have estimated the cross-border expenditure on long-term care in kind and in cash based on figures from the 2015 Ageing Report. Here we have applied the average LTC benefits in cash and in kind per dependent user. It is as mobile citizens (workers, pensioners, their family members) are using this system of LTC as if they were nationals. This involves a ‘potential’ overestimation of the number of users of cross-border LTC benefits and the related expenditure due to fact some Member States consider their LTC benefit as not exportable. At the same time these estimates assume a complete ‘take-up’ of rights by mobile citizens which will not be the case in the baseline scenario.

### *Deloitte*

The data collection and analysis are focused on a representative sample of 14 Member States<sup>3</sup>. The sample of Member States covers seven of the eight welfare state models<sup>4</sup> (given their similarities, the “new” Bismarck-oriented Mediterranean Member States –Malta and Cyprus- not included). The selection of the countries is primarily based on relevant mobility patterns and a balanced coverage in terms of types of the social security systems, more notably in the area of long-term care benefits.

Cluster	Main features	Countries
1. Beveridge oriented	Tax financed more flat rate, but at a lower level of social protection	<u>United Kingdom, Ireland</u>
2. Beveridge oriented Nordic countries	Tax financed, more flat rate, at a high level of social protection, more in kind benefits	<u>Sweden, Denmark, Iceland, Norway, Finland</u>
3. Bismarck oriented	More contribution financed, income related benefits, more in cash oriented, at a high level, the so called ‘corporatist’ welfare state	<u>Belgium, France, Austria, Germany, The Netherlands, Luxemburg, Switzerland</u>
4. Bismarck oriented Mediterranean countries	More contribution financed, income related benefits, more in cash oriented, at a lower level of social protection	<u>Spain, Portugal, Italy, Greece</u>
5. Beveridge oriented Baltic countries	More oriented to neo-liberal welfare state regimes of Beveridge type	<u>Estonia, Latvia, Lithuania</u>

<sup>3</sup> The 14 countries retained, as indicated in the table, are: Austria; Belgium; Denmark; Estonia; France; Germany; Poland; Luxemburg; the Netherlands; Romania; Spain; Slovakia; Sweden and the United Kingdom.

<sup>4</sup> The fact that one or more States belong to the same welfare system does not imply that they will encounter the same problems in terms of the management of social security cases. The administration and the legislation in this area could diverge even within a specific model.

Cluster	Main features	Countries
6. Bismarck oriented Central/Eastern or Visegrad countries	Mixture of Beveridge oriented neo-liberal welfare state but with converging back to corporatist welfare state regime	<u>Poland</u> , Czech Republic, Hungary, <u>Slovakia</u>
7. Bismarck oriented South/East Mediterranean & Balkan countries	Evolving back to a corporatist welfare state regime, at a lower level of protection	<u>Romania</u> , Bulgaria, Croatia
8. New Bismarck oriented Members states of Mediterranean area		Cyprus, Malta, Slovenia

Two types of data sources were used during this study: secondary data (available literature and reports at EU and MS level, particularly the trESS reports; replies to the online public EC Consultation on the need to revise of the current rules; available statistical data with regard to mobility patterns and the use of LTC benefits in cross-border cases) and primary data, collected through interviews and a consultation of the stakeholders (findings from strategic interviews with DG EMPL officials; findings from interviews with stakeholders at EU level, e.g. European umbrella organisations; findings from interviews with key stakeholders at national level (health insurers, healthcare providers); replies to the EU-wide web-based survey among responsible public authorities; new, generated statistical data with regard to mobility patterns and the use of LTC benefits in cross-border cases; findings from the 13 workshops/group interviews and 8 phone interviews on the administrative costs and administrative burden related to the policy options).

## **2. Unemployment benefits: coordination of unemployment benefits for frontier workers**

### *HIVA*

Based on Labour force Survey (LFS) data for 2013 and 2014, an estimation of the number of cross-border workers has been made. In the further analysis we considered all workers who worked in another country than the country of residence as cross-border workers. Workers who worked in a neighbouring country are considered as frontier workers. This is different from the legal definition. National unemployment rates from Eurostat were applied to the number of cross-border workers in order to estimate the number of unemployed cross-border workers. The unemployment rates of the country of last activity and not of the country of residence have been applied on the number of cross-border workers. In order to estimate the budgetary impact of the baseline scenario, the estimated number of unemployed cross-border workers are multiplied by the annual unemployment benefit per unemployed by taking into account the annual average duration of the payment of the unemployment benefit (on the basis of ESSPROS, Eurostat figures and the LFS).

*Deloitte*

The data collection and analysis are focused on a representative sample of 14 Member States<sup>5</sup>. organisations; findings from interviews with key stakeholders at national level (public employment services); replies to the EU-wide web-based survey among responsible public authorities; new, generated statistical data with regard to mobility patterns and the use of unemployment benefits in cross-border cases; findings from the 13 workshops/group interviews and 8 phone interviews on the administrative costs and administrative burden related to the policy options).

### **3. Unemployment benefits: export of unemployment benefits**

*HIVA*

Figures for all EU-Member States on the export of unemployment benefits have become available via the administrative PD U2 Questionnaire launched within the framework of the Administrative Commission (for 2013). Additional data available for Belgium has been used to describe the impact of the prolongation period on finding a job abroad. Finally, figures of Eurostat (based on the LFS) were used to calculate the average duration of the unemployment period.

### **4. Unemployment benefits: aggregation of unemployment benefits**

*HIVA (financial impact for Member States)*

Based on the data from the administrative questionnaire on the aggregation of periods for unemployment the budgetary impact of the current rules and the different alternative options could be calculated. Member States had to provide a breakdown by Member State of origin and a breakdown by length of insurance. The reported cases have been multiplied by the annual average expenditure per unemployed person (also by taking into account the annual average duration of the payment of the unemployment benefit) in order to estimate the public unemployment spending. Option 4 (change of the calculation method) required more detailed information about the unemployed recent migrant worker's salary. No information on the salary earned in the competent Member State as well as in the Member State of origin was collected via the administrative questionnaire. Therefore, wage data published by Eurostat have been used.

*Brodolini (costs for public administrations)*

The methodology for assessing the administrative costs and burden for the national administrations in the Member States handling cases of aggregation of unemployment benefits takes outset in the definition of administrative costs and burden provided by the EC Impact Assessment Guidelines. While doing this, we have adopted a broad definition of administrative information obligations – i.e. we have considered the costs of administrative tasks such as the determination of Member State of competence, the calculation of benefits, and the reimbursement and recovery of benefits in between Member States. In addition, we have looked into the administrative burden for the mobile EU-workers.

The calculations of the administrative costs for the national administrations are as illustrated in the below figure in principle simple. Firstly, the number of cases in the left-hand side of the figure are the annual cases currently registered in six case study Members States (Germany, Denmark, the Netherlands, Poland, Romania, and the UK) – information that has been provided by the HIVA KU Leuven Research Institute for Work and Society via a data gathering exercise. In our main calculations, we assume that the number of cases does not change as a result of revisions to Regulation (EC) No 883/2004. However, we do to illustrate the sensitivity of this assumption also show scenarios where we assume a change in the number of cases based on the results of Task 3 and 4, respectively, of this study.

Secondly, we calculate the unit costs for the national administration – i.e. the current administrative costs per case as well as the changed administrative costs per case as a result of the EU revisions. Such administrative costs per case clearly differ between cases, i.e. there will be easy cases only involving standard administrative tasks while other more complex cases will involve additional tasks. Hence, we estimate in practice average costs.

*Calculation of administrative costs for national administrations*

Most study resources were allocated to the estimation of the man-hours needed to carry out the administrative tasks. Such information is not available from official sources, and so we have gathered the information through interviews with national administrations in the six case study Member States. For this purpose, we identified the national administrations to interview, and we developed interview guides that was applied by our Member States experts/interviewers in the six case study Member States.

It must in this context be acknowledged that most of the man-hour estimates are based on a few interviews only. This is partly because there is often only a few national administrations that handle cases in each of the Member States, and partly because of limited interview resources. Hence, the premise for this analysis and so its results is the uncertainty associated with few assessments that, furthermore, mostly are based on the subjective assessments of the interviewees rather than on actual registrations of time spent on different administrative tasks.

### *Brodolini (secondary impacts)*

The simulations used in the study aim at translating the implications of the proposed revisions into expected income changes. Assuming a connection between income differentials and the propensity to move among EU countries, a variation in mobility flows and in the dimension of the target population is estimated. Finally, taking into account the variation in the latter, the different level of benefits and the redistribution of competences between sending and receiving countries envisioned by the policy options, we give an estimate of the variation in expenditure for the aggregation of periods or salaries for unemployment benefits for the selected countries.

The variation both in mobility and in expenditure, are estimated in relation to the status quo scenario. This scenario is built on a virtual 'baseline year', with a defined level of mobility flows and a defined level of expenditure. The mobility flow is computed as the averages of the most recent values of annual bilateral mobility flows among the selected countries (7 MS for task 3 and 8 MS for task 4). The number of potential cases of aggregation of periods or salaries for unemployment benefits (the 'target population' of task 4) is computed by multiplying the status quo mobility flow registered from a given sending country to a given receiving country with the ratio of unemployed non-national EU28+EFTA individuals on the total number of non-national EU28+EFTA individuals in the given receiving country. Then, the aggregate expenditure is estimated by multiply the target population identified for the average values of the benefits in each selected MS.

It is assumed that the income differences observed in the status quo scenario – along with all other factors that the policy options do not have an impact on – generate the mobility observed in the status quo period both in terms of general mobility flows and in terms of dimension of target population. The influence of unemployment benefits on mobility is evaluated by calculating the change attributable to the various policy options on the amounts unemployment benefits paid in relation to the family income in the country of origin or in the country of previous residence.

Once the income change is calculated, we convert that change into a potential mobility effect, using a theoretical assumptions on the elasticity of migration flows to income changes, which relates elasticity to income differentials for each bilateral combination of countries. As a measure for earnings, we consider the net earnings (PPS-adjusted) of a single individuals without children at 100% of the average wage. Once elasticity is computed, the percentage of income change is translated into a mobility percentage change. The percentage of mobility change is then translated into a change in mobility flows and in potential target population by relating the calculated percentage change to the absolute number of mobile citizens in the status quo case, according to the policy options proposed.

In order to define the expenditure variations, we compute the present level of expenditure by multiplying the number of present potential cases of aggregation of periods or salaries for unemployment benefits by the average amount of unemployment benefits. We then observe the percentage variation of expenditure – total and related to each bilateral relation.

### *FreSsco (legal analysis)*

FreSsco analytical impact assessment reports are based on the description of a specific problem of social security coordination and/or free movement of workers which arises in the application of EU law and which should be subjected to a legal analysis.

Immediately after receiving and confirming the mandate, thorough consideration is given to the selection of the team of experts entrusted with the analysis of the specific legal problem, one of whom is selected as the team coordinator. It is observed that their expertise is to the highest possible extent tailored to the subject matter of the analysis. In addition, two meetings between the experts are organised. One is arranged at the beginning of the task, in order to get acquainted with the task and allocate the responsibilities, and another one before the final results are presented, in order to come to an agreement with the final text. If the deadline, set by the mandate, is too pressing, only one meeting is organised. Nevertheless, in both cases, i.e. one or two meetings, intensive communication between the experts is guaranteed and facilitated during the analysis, mainly by the internal coordinator and the FreSsco management. Only by applying the dialectical method of testing various options, and confirming or rejecting ideas via discourse between the experts, can the best solutions be found. It goes without saying that better and faster results might be achieved when discussions occur *inter praesentes* and not *inter absentes*.

Regarding the report itself, first the existing application of EU law to a specific cross-border situation is presented. To this end, the existing legislative and non-legislative documents as well as decisions of the Court of Justice of the European Union (CJEU) and other bodies (like the Administrative Commission for the Coordination of Social Security Systems) are taken into account. The historical method might be applied in order to discover the reasons for the present legislative solutions.

In the next step of the analysis several options – either enumerated in the mandate and/or discovered during the analysis – which might present a solution to a given problem are tested. Their strengths, weaknesses, opportunities and threats are stressed. In some of the reports, for each of the possible solutions specific criteria are taken into account, such as clarity, simplicity, protection of rights, administrative burden and implementation arrangements, risk of fraud and abuse and potential financial implications.

To this end, not only the relevant EU law is taken into consideration, but other sources as well. These might include relevant literature and academic studies, reports and selected key policy documents of the EU and possibly of other international organisations.

Next to this comparison on an EU (and international) level, a vertical comparative method is applied in order to present the problems and test the solutions in (some or all, depending on the mandate) Member States. A horizontal comparative method at the national level is enabled by mapping the situation in several (or all) Member States.

Logical, grammatical and teleological methods of legal interpretation are relied upon as well. Conclusions are as a rule drawn from the descriptive-analytical method of the research, which might prove useful for selecting the best policy options at national and EU level and for finding the most appropriate normative solutions *de lege ferenda*.

## 5. Export of family benefits

### *HIVA (financial impact for Member States)*

Data of the administrative questionnaire has been used to report figures on the baseline scenario. Member States provided data on their export of family benefits and provided sometimes even more detailed data by the primarily or secondarily competence of the reporting Member State. By making use of the price level indices for consumer goods and services reported by EUROSTAT a correction coefficient between the exporting Member State and the Member State of residence of the child(ren) could be calculated in order to make an adjustment of the amount of exported family benefits to the cost of living in the Member State of residence of the child(ren). The scope of the administrative questionnaire was limited to the number of households and children who received a child benefit from a competent exporting Member State. However, for the calculation of one option (Option 3: Reverse order of competence) the complete reference group affected by the coordination of family benefits had to be taken into account. Also, more information on the average amount of the family benefit on the basis of ESSPROS was required as not all Member States had answered the administrative questionnaire.

### *Brodolini (costs for public administrations)*

The methodology for assessing the administrative costs and burden for the national administrations in the Member States handling cases of export of family benefits takes outset in the definition of administrative costs and burden provided by the EC Impact Assessment Guidelines. While doing this, we have adopted a broad definition of administrative information obligations – i.e. we have considered the costs of administrative tasks such as the determination of Member State of competence, the calculation of benefits, and the reimbursement and recovery of benefits in between Member States. In addition, we have looked into the administrative burden for the mobile EU-citizens and their families.

The calculations of the administrative costs for the national administrations are as illustrated in the below figure in principle simple. Firstly, the number of cases in the left-hand side of the figure are the annual cases currently registered in six case study Members States (Germany, Denmark, the Netherlands, Poland, Romania, and the UK) – information that has been provided by the HIVA KU Leuven Research Institute for Work and Society via a data gathering exercise. In our main calculations, we assume that the number of cases does not change as a result of revisions to Regulation (EC) No 883/2004. However, we do to illustrate the sensitivity of this assumption also show scenarios where we assume a change in the number of cases based on the results of Task 3 and 4, respectively, of this study.

Secondly, we calculate the unit costs for the national administration – i.e. the current administrative costs per case as well as the changed administrative costs per case as a result of the EU revisions. Such administrative costs per case clearly differ between cases, i.e. there will be easy cases only

involving standard administrative tasks while other more complex cases will involve additional tasks. Hence, we estimate in practice average costs.

*Calculation of administrative costs for national administrations*

Most study resources were allocated to the estimation of the man-hours needed to carry out the administrative tasks. Such information is not available from official sources, and so we have gathered the information through interviews with national administrations in the six case study Member States. For this purpose, we identified the national administrations to interview, and we developed interview guides that was applied by our Member States experts/interviewers in the six case study Member States.

It must in this context be acknowledged that most of the man-hour estimates are based on a few interviews only. This is partly because there is often only a few national administrations that handle cases in each of the Member States, and partly because of limited interview resources. Hence, the premise for this analysis and so its results is the uncertainty associated with few assessments that, furthermore, mostly are based on the subjective assessments of the interviewees rather than on actual registrations of time spent on different administrative tasks.

*Brodolini (secondary impacts)*

The simulations used in the study aim at translating the implications of the proposed revisions into expected income changes. Assuming a connection between income differentials and the propensity to move among EU countries, a variation in mobility flows and in the dimension of the target population is estimated. Finally, taking into account the variation in the latter, the different level of benefits and the redistribution of competences between sending and receiving countries envisioned by the policy options, we give an estimate of the variation in expenditure for the export of family benefits for the selected countries.

The variation both in mobility and in expenditure, are estimated in relation to the status quo scenario. This scenario is built on a virtual ‘baseline year’, with a defined level of mobility flows and a defined level of expenditure. The mobility flow is computed as the averages of the most recent values of annual bilateral mobility flows among the selected countries (7 MS for task 3 and 8 MS for task 4). In the definition of the target population interested by the proposed revisions we made use of the HIVA study (Pacolet et al., 2015), which allows to identify, for each selected country, the total number of persons entitled to the export of child benefits. Then, the aggregate expenditure is estimated by multiply the target population identified for the average values of the benefits in each selected MS.

It is assumed that the income differences observed in the status quo scenario – along with all other factors that the policy options do not have an impact on – generate the mobility observed in the status quo period both in terms of general mobility flows and in terms of dimension of target population. The influence of family benefits on mobility is evaluated by calculating the change attributable to the various policy options on the amounts of family benefits paid in relation to the family income in the country of origin or in the country of previous residence.

Once the income change is calculated, we convert that change into a potential mobility effect, using a theoretical assumptions on the elasticity of migration flows to income changes, which relates elasticity to income differentials for each bilateral combination of countries. As a measure for earnings, we consider the net earnings (PPS-adjusted) of a one-earner married couple with two children at 100% of average wage. Once elasticity is computed, the percentage of income change is translated into a mobility percentage change. The percentage of mobility change is then translated into a change in mobility flows and in potential target population by relating the calculated percentage change to the absolute number of mobile citizens in the status quo case, according to the policy options proposed.

In order to define the expenditure variations, we compute the present level of expenditure by multiplying the number of present potential cases. We then observe the percentage variation of expenditure – total and related to each bilateral relation.

#### *FreSsco (legal analysis)*

FreSsco analytical impact assessment reports are based on the description of a specific problem of social security coordination and/or free movement of workers which arises in the application of EU law and which should be subjected to a legal analysis.

Immediately after receiving and confirming the mandate, thorough consideration is given to the selection of the team of experts entrusted with the analysis of the specific legal problem, one of whom is selected as the team coordinator. It is observed that their expertise is to the highest possible extent tailored to the subject matter of the analysis. In addition, two meetings between the experts are organised. One is arranged at the beginning of the task, in order to get acquainted with the task and allocate the responsibilities, and another one before the final results are presented, in order to come to an agreement with the final text. If the deadline, set by the mandate, is too pressing, only one meeting is organised. Nevertheless, in both cases, i.e. one or two meetings, intensive communication between the experts is guaranteed and facilitated during the analysis, mainly by the internal coordinator and the FreSsco management. Only by applying the dialectical method of testing various options, and confirming or rejecting ideas via discourse between the experts, can the best solutions be found. It goes without saying that better and faster results might be achieved when discussions occur inter presentes and not inter absentes.

Regarding the report itself, first the existing application of EU law to a specific cross-border situation is presented. To this end, the existing legislative and non-legislative documents as well as decisions of the Court of Justice of the European Union (CJEU) and other bodies (like the Administrative

Commission for the Coordination of Social Security Systems) are taken into account. The historical method might be applied in order to discover the reasons for the present legislative solutions.

In the next step of the analysis several options – either enumerated in the mandate and/or discovered during the analysis – which might present a solution to a given problem are tested. Their strengths, weaknesses, opportunities and threats are stressed. In some of the reports, for each of the possible solutions specific criteria are taken into account, such as clarity, simplicity, protection of rights, administrative burden and implementation arrangements, risk of fraud and abuse and potential financial implications.

To this end, not only the relevant EU law is taken into consideration, but other sources as well. These might include relevant literature and academic studies, reports and selected key policy documents of the EU and possibly of other international organisations.

Next to this comparison on an EU (and international) level, a vertical comparative method is applied in order to present the problems and test the solutions in (some or all, depending on the mandate) Member States. A horizontal comparative method at the national level is enabled by mapping the situation in several (or all) Member States.

Logical, grammatical and teleological methods of legal interpretation are relied upon as well. Conclusions are as a rule drawn from the descriptive-analytical method of the research, which might prove useful for selecting the best policy options at national and EU level and for finding the most appropriate normative solutions *de lege ferenda*.

## **6. Access for economically inactive mobile EU citizens and jobseekers to certain social benefits**

*FreSsco (legal analysis focussed on access to SNCBs)*

FreSsco analytical impact assessment reports are based on the description of a specific problem of social security coordination and/or free movement of workers which arises in the application of EU law and which should be subjected to a legal analysis.

Immediately after receiving and confirming the mandate, thorough consideration is given to the selection of the team of experts entrusted with the analysis of the specific legal problem, one of whom is selected as the team coordinator. It is observed that their expertise is to the highest possible extent tailored to the subject matter of the analysis. In addition, two meetings between the experts are organised. One is arranged at the beginning of the task, in order to get acquainted with the task and allocate the responsibilities, and another one before the final results are presented, in order to come to an agreement with the final text. If the deadline, set by the mandate, is too pressing, only one meeting is organised. Nevertheless, in both cases, i.e. one or two meetings, intensive communication between the experts is guaranteed and facilitated during the analysis, mainly by the internal coordinator and the FreSsco management. Only by applying the dialectical method of testing various options, and confirming or rejecting ideas via discourse between the

experts, can the best solutions be found. It goes without saying that better and faster results might be achieved when discussions occur inter presentes and not inter absentes.

Regarding the report itself, first the existing application of EU law to a specific cross-border situation is presented. To this end, the existing legislative and non-legislative documents as well as decisions of the Court of Justice of the European Union (CJEU) and other bodies (like the Administrative Commission for the Coordination of Social Security Systems) are taken into account. The historical method might be applied in order to discover the reasons for the present legislative solutions.

In the next step of the analysis several options – either enumerated in the mandate and/or discovered during the analysis – which might present a solution to a given problem are tested. Their strengths, weaknesses, opportunities and threats are stressed. In some of the reports, for each of the possible solutions specific criteria are taken into account, such as clarity, simplicity, protection of rights, administrative burden and implementation arrangements, risk of fraud and abuse and potential financial implications.

To this end, not only the relevant EU law is taken into consideration, but other sources as well. These might include relevant literature and academic studies, reports and selected key policy documents of the EU and possibly of other international organisations.

Next to this comparison on an EU (and international) level, a vertical comparative method is applied in order to present the problems and test the solutions in (some or all, depending on the mandate) Member States. A horizontal comparative method at the national level is enabled by mapping the situation in several (or all) Member States.

Logical, grammatical and teleological methods of legal interpretation are relied upon as well. Conclusions are as a rule drawn from the descriptive-analytical method of the research, which might prove useful for selecting the best policy options at national and EU level and for finding the most appropriate normative solutions *de lege ferenda*.

#### *Access for economically inactive mobile EU citizens and jobseekers to certain social benefits*

In relation to the option extending the derogation from the principle of equal treatment in relation to access to non-contributory family benefits, long-term care benefits and sickness benefits for economically inactive mobile EU citizens and jobseekers, as this was developed quite late in the process, data from the Labour Force Survey (LFS), ESSPROS and the 2015 Ageing report were used to estimate the affected population and economic impact (see Annex XXIV).

# 1 Introduction

## *1.1 Purpose of the document*

This is Deloitte's and HIVA's report to the European Commission, DG EMPL with regard to the "Study for an impact assessment for revision of Regulations (EC) Nos 883/2004 and 987/2009".

## *1.2 Structure and content of the final report*

We have structured the final report as follows:

- Chapter 1 includes a short introduction to the final report;
- Chapter 2 outlines the objectives of this study;
- Chapter 3 recalls the methodology that we have used for this study;
- Chapter 4 presents the current situation with regard to the coordination of LTC and unemployment benefits. We focus specifically on the scale of potentially affected people and the most common mobility patterns
- Chapter 5 contains a definition of the problems under the current rules that were identified for both the coordination of unemployment benefits and the coordination of long-term care benefits.
- In chapter 6, we describe the policy objectives that the Commission aims to achieve with the coordination of LTC and unemployment benefits.
- Chapter 7 aims to describe the likely qualitative and quantitative impacts of the various policy options in relation to the baseline scenario.
- In Chapter 8, we provide an overview of the strengths and weaknesses of the various policy options according to three meta-criteria: efficiency, effectiveness and coherence.
- Chapter 9 contains a summary of the main conclusions of this study (we have also produced this summary in a separate standalone document).
- Chapter 10 contains the annexes attached to this final report.

## 2 Study objectives

The overall objective of the study consists in evaluating the social and economic impacts of a limited number of policy options for a revision of the EU rules in the area of free movement of workers and social security coordination. These rules concern in particular Articles 21, 45 and 48 of the Treaty and Regulations (EC) N°s 883/2004 and 987/2009. The study focuses on the rules on coordination of long-term care benefits and unemployment benefits.

The following tasks were carried out by the research team:

- **The collection of socio-economic data** for determining the scale of the identified problems and the baseline scenario in the area of coordination of social security schemes, in particular with regard to the coordination of long-term care and unemployment benefits. The study should provide the evidence-based description of the baseline scenario and focus on providing supporting data, providing input for the verification of the intervention logic.
- A description of the qualitative and quantitative impacts of the policy options.
- Comparison of the policy options.
- Providing support in the process of **stakeholders' consultation**, namely to:
  - evaluate results of the public consultation (online questionnaire launched online in all EU languages by the EC on 5/12/2013 and closed on 5/3/2013)
  - carry out and evaluate results of a consultation of organisations & networks operating in cross-border regions
  - carry out and evaluate results of a consultation of national institutions and administrations (e.g. employment services, health services).

### 3 Methodological approach

#### 3.1 *In-depth analysis based on a sample of 14 Member States*

The data collection and analysis are focused on a representative sample of 14 Member States. The selection of the countries is primarily based on relevant mobility patterns and a balanced coverage in terms of types of the social security systems, more notably in the area of unemployment and long-term care benefits.

Existing research on the welfare state and the social protection for dependent older persons (long-term care) has shown that a characterisation along the lines of more Bismarck-oriented and more Beveridge oriented welfare states remains fruitful<sup>7</sup>.

- **Bismarck-oriented models** are characterized by income-based contributions earmarked to specific funds destined to cover concrete social risks. They are usually tightly linked to the employment system (contributions made by the employer and/or the employee, and benefits limited to the contributor and his/her family; besides, the job employment sector often determines the corresponding insurance fund).
- **Beveridge-oriented models**, on their side, are based on the idea of universal coverage against the main social risks, providing access to all the citizens. The Nordic countries and the UK represent this approach, though universal coverage became the guiding principle in all European countries during the second half of the 20<sup>th</sup> Century. Some of the “new” Member States, which mainly followed Beveridge-oriented models during the second half of the 20<sup>th</sup> Century, are shifting to a “Bismarck”-oriented model since the 90s.

The system of social protection in the EU is characterized by welfare pluralism. Member States aim at the same or similar goals, however making use of different implementation mechanisms and institutions. Although the differences between social security models are blurring and each country has its own specificities, eight groups or clusters of Member States can be distinguished following their Bismarck/Beveridge orientation. Four models can be differentiated among the “old” Member States (EU-15); similarly, four models can be identified among the “new” Member States.

In spite of the apparent convergence, welfare state regimes remain rooted in history and path dependent that determines further directions for new branches of social protection, like long-term care. Those typologies of welfare state regimes seem to be clustered also geographically, and are characterised also by differences in the development of the welfare state (at a higher or lower level), coupled with higher or lower levels of economic development (GDP) and more or less oriented to in cash or in kind benefits. Those dimensions substantially influence the flows of funds related to the social protection of mobile citizens. The apparent geographic clustering seems also to be confirmed

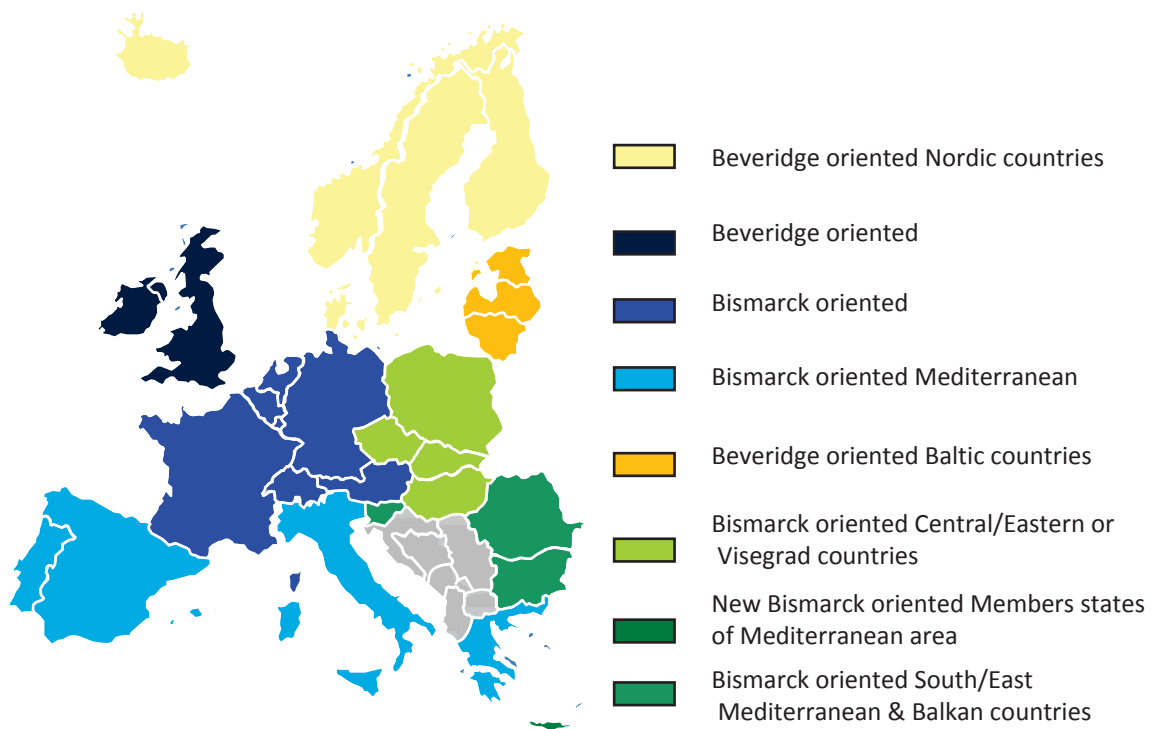

---

<sup>7</sup> See Pacolet J. and Coudron V., 2006 “State of the Welfare State in the EU Anno 1992: Ten years later and with ten new Member States. Welfare State trend spotting”, in Pacolet J., Ed. (2006). *L'Etat de l'Etat-providence dans l'UE en 1992 et dix ans plus tard avec dix nouveaux Etats membres*. (Pacolet, J., Ed.). *La Revue Belge de Sécurité Sociale*.

by labour market mobility<sup>8</sup>. Those typologies appear in similar form in most of the comparative studies of welfare state regimes.<sup>9</sup> Furthermore, research on unemployment systems has yielded similar clusters of countries<sup>10</sup>.

For these reasons, we have decided to use the same sample of countries for both areas (long-term care and unemployment). We selected from each of those regimes one or more countries to cover the welfare state pluralism in Europe. The distinction between old and new will disappear, but we retain it for this study because of the still relative recent occurrence of the enlargement and because of the difference in economic development between both at this point of time.

Figure 1: Welfare state models

Cluster	Main features	Countries
---------	---------------	-----------

<sup>8</sup> European Commission, Posting of Workers in the European Union and EFTA countries: Report on E101 certificates issued in 2010 and 2011.

<sup>9</sup> Delsen, L. & Pacolet J. (2011), 'Globalisation and national social security systems', in M. De Clercq, J. Albrecht & T. Verbeke (eds.), Global policy in Europe. Local policy for a global market: competition or coordination within the EU?, 29<sup>th</sup> Scientific Economic Congress, Acco, Leuven.

<sup>10</sup> See, for instance, the "Benchmarking Unemployment Benefit System" paper published by DG ECFIN in May 2012. Though small differences exist, such as the grouping of Cyprus, Malta, Ireland and the UK, the clustering is essentially the same. The only other relevant difference involves Greece, which is grouped with Central and Eastern countries instead of with Southern/Mediterranean countries, but it will be not covered by this study.

Cluster	Main features	Countries
<b>9. Beveridge oriented</b>	Tax financed more flat rate, but at a lower level of social protection	<u>United Kingdom</u> , Ireland
<b>10. Beveridge oriented Nordic countries</b>	Tax financed, more flat rate, at a high level of social protection, more in kind benefits	<u>Sweden</u> , <u>Denmark</u> , Iceland, Norway, Finland
<b>11. Bismarck oriented</b>	More contribution financed, income related benefits, more in cash oriented, at a high level, the so called 'corporatist' welfare state	<u>Belgium</u> , <u>France</u> , <u>Austria</u> , <u>Germany</u> , <u>The Netherlands</u> , <u>Luxemburg</u> , <u>Switzerland</u>
<b>12. Bismarck oriented Mediterranean countries</b>	More contribution financed, income related benefits, more in cash oriented, at a lower level of social protection	<u>Spain</u> , Portugal, Italy, Greece
<b>13. Beveridge oriented Baltic countries</b>	More oriented to neo-liberal welfare state regimes of Beveridge type	<u>Estonia</u> , Latvia, Lithuania
<b>14. Bismarck oriented Central/Eastern or Visegrad countries</b>	Mixture of Beveridge oriented neo-liberal welfare state but with converging back to corporatist welfare state regime	<u>Poland</u> , <u>Czech Republic</u> , Hungary, <u>Slovakia</u>
<b>15. Bismarck oriented South/East Mediterranean &amp; Balkan countries</b>	Evolving back to a corporatist welfare state regime, at a lower level of protection	<u>Romania</u> , Bulgaria, Croatia
<b>16. New Bismarck oriented Members states of Mediterranean area</b>		Cyprus, Malta, Slovenia

Source: Pacolet J. and Coudron V., 2006 "State of the Welfare State in the EU Anno 1992: Ten years later and with ten new Member States. Welfare State trend spotting", in Pacolet J., Ed. (2006). L'Etat de l'Etat-providence dans l'UE en 1992 et dix ans plus tard avec dix nouveaux Etats membres. (Pacolet, J., Ed.). La Revue Belge de Sécurité Sociale

The 14 countries retained, as indicated in the previous table, are: Austria, Belgium, Denmark, Estonia, France, Germany, Poland, Luxemburg, Netherlands, Romania, Spain, Slovakia, Sweden and United Kingdom.

With the aim of ensuring the representativeness and robustness of the impact analysis, which according to the Terms of Reference may be done by clusters of countries, our sample of Member States covers seven of the eight welfare state models (given their similarities, the "new" Bismarck-oriented Mediterranean Member States –Malta and Cyprus- not included).

The allocation of a country to a specific model (Beveridge or Bismarck-oriented) does not necessarily imply that this country will have the same problems in terms of the management of social security cases compared to the other countries allocated to this specific model. The administration and the legislation in this area could diverge even within a specific model.

We account as well, in the country selection, labour mobility trends. With the selection of those countries we include at least 80% of both the outgoing and ingoing cross-border working citizens in the EU-27. In terms of population, our sample accounts for around 75% of the EU-27 population (cf. from Table 83 until Table 88).

### 3.2 Data sources

Two types of data sources were used during this study:

- secondary data, in particular existing statistical data;
- primary data, collected through interviews and a consultation of the stakeholders.

**Table 1 : Overview of data sources**

Data types	Secondary	Primary
Qualitative	<ol style="list-style-type: none"> <li>1. <b>Available literature</b> and reports at EU and MS level, particularly the trESS reports</li> <li>2. Replies to the <b>online public EC Consultation</b> on the need to revise of the current rules<sup>11</sup></li> </ol>	<ol style="list-style-type: none"> <li>1. Findings from <b>strategic interviews</b> with DG EMPL officials;</li> <li>2. Findings from <b>interviews with stakeholders at EU level</b>, e.g. European umbrella organisations (cf. list of consulted organisations)</li> <li>3. Findings from <b>interviews with key stakeholders at national level</b> (during country visits: public employment services, health insurers, healthcare providers;</li> <li>4. Replies to the EU-wide web-based <b>survey among responsible public authorities</b> (Annex 10.9)</li> </ol>
Quantitative	<ol style="list-style-type: none"> <li>1. <b>Available statistical data</b> with regard to mobility patterns and the use of LTC benefits and unemployment benefits in cross-border cases</li> </ol>	<ol style="list-style-type: none"> <li>1. <b>New, generated statistical data</b> with regard to mobility patterns and the use of LTC benefits and unemployment benefits in cross-border cases</li> <li>2. Findings from the 13 <b>workshops/group interviews and 8 phone interviews on the administrative costs</b> and administrative burden related to the policy options (during the country visits).</li> </ol>

#### 3.2.1 Strategic interviews with DG EMPL officials and other key EC officials

In the initial stage of the study, we conducted 5 face-to-face interviews with EC officials within DG EMPL and DG ECFIN. The interviews with DG EMPL officials served to acquire more detailed knowledge concerning the contextual environment of the study. DG ECFIN officials assisted us in identifying relevant data from the Labour Force Survey (LSF) and the Ageing Working Group that was used for this study. These interviews also led to the transfer of relevant documents to the contractor.

*The list of conducted strategic interviews can be found in Annex 10.10*

#### 3.2.2 Available literature

<sup>11</sup> <http://ec.europa.eu/social/main.jsp?langId=en&catId=699&consultId=12&furtherConsult=yes>

For this study, we made use of a wide ranging and comprehensive desk based research. It encompassed a comprehensive review of available literature on both topics (coordination of long-term care benefits and of unemployment benefit systems) and its implications for mobile workers at EU level. Review of available literature on the subject provided input into three main issues: the underlying causes of the problems that provide the focus for the regulations on the coordination of long-term care benefits and unemployment benefits at EU level;

- ✔ the description of the problem situation and of the policy objectives;
- ✔ the impact of the “baseline scenario” of continuity with the current situation.

Literature that was part of the scope of the review included:

- ✔ Communications, resolutions and legislation at EU level, i.e. Regulation (EC) N° 883/2004 and Implementing Regulation N°987/2009 on the coordination of social security systems, 30.10.2009
- ✔ Relevant Court of Justice rulings (cf. Chapter: Context);
- ✔ Reports and studies at EU level, including the work conducted by the TrESS network;
- ✔ Reports and studies at national level.

### 3.2.3 *Analysis of replies to the online EC public consultation*

---

The European Commission launched on the 5<sup>th</sup> December 2012 a public consultation (<http://ec.europa.eu/social/main.jsp?langId=en&catId=699&consultId=12&furtherConsult=yes>) addressed to:

- ✔ All EU and non-EU citizens who are insured under the social security system of an EU or EEA/EFTA Member State.
- ✔ Any public and private organisations with activities in an EU or EEA/EFTA Member State.

The objective of the consultation was to collect opinions and experience in the area of coordination of unemployment and long-term care benefits for persons who are in a cross-border situation. Furthermore, opinions on possible policy options and further ideas on how to remove existing problems or obstacles in these areas were gathered.

We were asked to analyse and exhaustively report the replies to the EC public consultation.

The consultation received 299 online (+3 email) replies across the EU and EEA/EFTA states. 199 were from individuals and 103 on behalf of an organisation or as specialists. In addition, three other stakeholders did not fill out the online questionnaire, but sent their opinions separately by e-mail.

By nationality, Spanish were the most numerous among individual respondents, accounting for 26.6% of the responses. No replies were received from Cyprus, Denmark, Iceland, Liechtenstein, Luxembourg, Malta and Switzerland.

*The analysis of the public consultation replies is considered a stand-alone document, in line with the ToR. It was submitted to the European Commission before the finalisation of the final report.*

### 3.2.4 *EU-wide web-based survey among responsible public authorities and social security institutions*

---

In order to expand the scope of our analysis to all EU and EEA countries, we launched a web-based survey among the responsible national public authorities and other key actors with regard to both topics. The Commission sent an invitation to the members of the Administrative Commission for the Coordination of Social Security systems in December 2012. After several reminders and prolongation of the deadlines, we finally closed the survey on the 28 February 2013.

We received 81 complete replies to our survey:

- No answers at all were received from the following countries: Bulgaria, Finland, Greece, Iceland, Liechtenstein and Norway.
- 59 respondents have only filled in the survey on unemployment benefits.
- 10 respondents have only filled in the survey on long-term care benefits.
- 12 respondents have filled in both surveys on unemployment and long-term care benefits.

In addition, we received 67 incomplete replies. The incomplete replies were not taken into account in the survey analysis (in the figures and tables) to avoid double counting. However, relevant and useful information, examples or arguments from these incomplete replies were taken into account in the impact analysis.

On top of the countries that have not participated at all in the survey, we have no answer from BE, CY, DK, FR, IE, PT, RO, CH and UK for the questions on LTC. Among these countries, the UK public officials expressed their intention of submitting a reply during the meetings held with them after the survey's deadline. Belgian authorities also expressed in mid-March their intention to provide a reply.

On top of the countries that have not participated at all in the survey, we have no answer from SV for the questions on unemployment benefits.

Some countries from which we have received several completed questionnaire are overrepresented in the aggregated results. Therefore, the analysis of the aggregate results was complemented by the analysis of national replies when necessary.

*The analysis of the on-line survey can be found in Annex 10.9 to the final report.*

### *3.2.5 Interviews with key stakeholders at EU level*

---

In order to complement the EC public consultation (and to address stakeholders that have not replied to the public consultation), a number of face-to-face interviews were conducted with stakeholder parties that are organised at EU level. We particularly addressed: We will particularly addressed:

- networks operating in cross-border regions;
- social partners organised at EU level;
- civil society organisations at EU level.

*The list of interviews with stakeholders at EU level can be found in Annex 10.10 to the final report.*

### *3.2.6 Country visits: data collection at national level*

---

In order to assess the impacts of the policy options, we organised country visits in the 14 countries of our sample. During these field visits, we met the key stakeholders and affected actors in the field of long-term care benefits and unemployment benefits. The field research was conducted by Deloitte and HIVA staff, supported by academic experts with a good knowledge of the national context. A country visit usually took 3 to 6 working days depending on the availabilities of the interviewees. Country visits consisted of interviews with responsible public authorities and other interested parties (depending on the specificities of the national context) and where feasible in the time-frame of our

visits, workshops to be able to assess the administrative costs and administrative burden related to each of the policy options that are being considered. We have privileged face-to-face interviews or group interviews but after our visits in the countries we have had also the opportunity to come-back to some interviewees by phone in order to complete our information.

### 3.2.6.1 Face-to face interviews with key stakeholders

---

For both topics (LTC and unemployment benefits), 5-8 key stakeholders at national level were consulted. In total, we have conducted more than 100 relevant interviews with stakeholders in these 14 Member States.

Interviews with these people fed the problem definition and generated anecdotic evidence and examples and helped us to assess the likely impacts of the different policy options (for example, with regard to the impact on the level of social security coverage of affected persons, changes in administrative burden and costs, impact on the budgets of Member States, expected changes in the EU internal market, etc.).

The (type of) stakeholders differed from country to country and per topic. We consulted:

- ✔ National, (regional or local) institutions and administrations, particularly the public employment services (coordination of unemployment benefits) and healthcare services (coordination of long-term care benefits).
- ✔ Health insurers (coordination of long-term care benefits);
- ✔ Social partners (coordination of unemployment benefits);
- ✔ Civil society organisations operating in cross-border regions.

The face-to-face interviews were based on a semi-structured questionnaire that was prepared by the core team in advance.

*Please find a list of interviews (per country) in Annex 10.10 to the final report.*

### 3.2.6.1 Workshops/group interviews on administrative burden on administrations

---

In order to assess the administrative burden and administrative costs related to the baseline scenario and each of the different policy options, we aimed to organise a one-day workshop per topic (coordination of long-term care benefits and coordination of unemployment benefits) and per country. We used face-to-face interviews and group interviews, where we faced availability or practical difficulties or where we have been referred to only a limited number of key persons that could help us further.

For the assessment of the administrative burden and costs, we used the Standard Cost Model, as requested by the ToR (more detail cf. 4.1.6 – baseline scenario).

The Standard Cost Model (SCM) serves as a useful tool for assessing the administrative cost and administrative burden stemming from Information Obligations (IOs) imposed by a Regulation. We have applied the SCM for assessing the administrative cost and administrative burden of the management of a cross-border case of unemployment benefits.

In our approach, we measured the time (T) the national administrations and stakeholders spent on the information obligations (IO) imposed by the Regulations on cross-border cases. Once we have defined the time spent on each IO, we have multiplied the (average) time by the hourly tariff (W) of those involved in meeting the information obligation (administrative staff). For consistency and comparability with other SCM assessments of EU regulation, the tariff variable used in this study is based on hourly labour costs (plus overheads) per category of employment that has previously been used in recent SCM studies for DG EMPL<sup>12</sup> and our recent Impact Assessment studies we have

---

<sup>12</sup> For instance: *Review of the Working Time Directive 2003/88/EC: measuring administrative costs and burdens of various possible options.* Economisti Associati srl, 21/12/2011

conducted for the Commission. We have applied an average tariff/hour of 18€. The multiplication of the average tariff by the time spent on the IO results in an estimated cost per unit. Then, we have multiplied the estimated cost per unit by the amount of cases per year (N). The following formula summarizes our approach:

$$N \times W \times T$$

### 3.2.7 Available and newly generated statistical data

---

The following data sources were exploited to obtain a detailed quantitative view on the baseline scenario of the coordination of unemployment benefits and LTC benefits:

- Replies to our own questionnaire on LTC and unemployment benefits. The data collection was conducted in 14 Member States by national experts<sup>13</sup>;
- The EU Labour Force Survey (LFS);
- The EC 2012 Ageing Report<sup>14</sup>;
- Other databases from Eurostat (e.g. Eurostat migration statistics<sup>15</sup> and ESSPROS<sup>16</sup>);
- Other data sources (e.g. national reports, EU publications, Audit Board Report).

#### Replies to our own questionnaire on LTC and unemployment benefits by national experts

First, in order to describe and assess the baseline scenario, we deployed a network of national researchers in 14 Member States (Table 121). Their task was to contact the responsible national administrations in order to collect statistical data with regard to a significant number of indicators in the areas of LTC and unemployment benefits. The reporting format for this data collection contained an Excel-file. A manual was provided to the national experts, including a short description of the objectives of the study and of the coordination legislation, more specific concerning the applicable rules on the coordination of unemployment and long-term care benefits. In the annex of the manual, a list with specific LTC benefits by Member State - defined by trESS<sup>17</sup> and based on the MISSOC-tables<sup>18</sup> - was provided. Also, possible contact persons sitting in the Administrative Commission or the Audit Board were provided. The questionnaire referred explicitly to the old E-forms and current Portable Documents (PD)<sup>19</sup> and Structured Electronic Documents (SED)<sup>20</sup> in order to obtain a similar

<sup>18</sup> The EU's Mutual Information System on Social Protection (MISSOC) provides detailed, comparable and regularly updated information about national social protection systems.

<sup>19</sup> Portable documents replace the old E-forms and are issued by the competent social security institutions where one is insured. There are ten portable documents altogether, including the European Health Insurance Card. The documents are issued from 1 May 2010. Today national administrations use in some cases/for some social security branches the old E-forms next to these portable documents or even only the old E-forms.

<sup>20</sup> Art. 1, point 2, (d) Regulation (EC) No. 987/2009 describes a Structured Electronic Documents as "any structured document in a format designed for the electronic exchange of information between Member States." The electronic exchange shall be organized through EESSI (Electronic Exchange of Social Security Information). At this moment EESSI is not yet operational. Nevertheless, SEDs are already available and some of them are transmitted by mail or post.

understanding of the data needs. In the analysis below we refer frequently to these documents. Therefore, we first give a short definition/description of the Portable Documents we refer to:<sup>21</sup>

- *PD U1 certificate*: “The PD U1 certifies periods of insurance and employment or self-employment in another EU country that will be taken into account for the award of unemployment benefits”;
- *PD U2 certificate*: “The PD U2 is the authorization you need to export your unemployment benefit if you are unemployed in an EU country and wish to move to another EU country to look for work”;
- *PD S1 certificate*: “The S1 form allows you (and/or your family members) to register for healthcare if you live in an EU country but you are insured in a different one. The form is delivered per person (not per family)”;
- *PD P1 certificate*: “The P1 form provides an overview of the decisions taken in your case by the various institutions in the EU countries from which you have claimed an old age, survivors or invalidity pension. The information on the P1 is intended to enable you to examine whether any of your pensions have been adversely affected by the interaction of decisions taken by two or more institutions”.

### EU Labour Force Survey (LFS)

Second, we relied on data from the EU Labour Force Survey (LFS). The LFS is the main source of information with regard to the labour market situation and labour market trends in the European Union. While the LFS provides demographic data for all age groups, questions relating to labour market status are limited to persons in the age group of 15 years or older. The economically active population consists of employed and unemployed persons. Employed persons are persons aged 15 year and older, while unemployment persons are aged between 15 to 74 years. The LFS includes estimates of certain aspects of social protection for the whole population. It also contains some data on mobile population (e.g. cross-border workers, frontier workers, (recent) migrants working-age population, migrant pensioners, ...) which can be used as a proxy for certain subcategories of the mobile population or as a benchmark for the total population and the total level of social expenditure, both at current point of time and in the future. The main advantage of the LFS is the data availability for all 27 MS and enables us to calculate proxies for indicators which could not be obtained by the questionnaire in 14 countries. At the same time these proxies could be cross-checked by the available administrative data for some MS collected by the questionnaire. This report presents different cross-tables based on the use of the LFS. We present them as detailed as possible. However, to guarantee reliability of the figures we only take into consideration the row and column totals of the cross-tables in our analysis. Row and column totals which can be assumed as reliable are marked with a \*.<sup>22</sup> Nevertheless, the different cells in these cross-tables are important to estimate the baseline scenario and the different options (e.g. we need to select the cells which describe flows between neighbouring countries to define the number of frontier workers). Most of the cells will fall under the reliable limits. For that reason we refer especially to the reliability limits. The absolute numbers of those reliability limits are also given in Annex 10.7. Cells or even row and column totals with numbers of persons below those figures are considered as not reliable. An additional part of the

<sup>21</sup>

<http://ec.europa.eu/social/keyDocuments.jsp?type=0&policyArea=849&subCategory=868&country=0&year=0&advSearchKey=portdoccombined&mode=advancedSubmit&langId=en>

<sup>22</sup>

Based on the reliability limits for the LFS  
[http://circa.europa.eu/irc/dsis/employment/info/data/eu\\_lfs/LFS\\_MAIN/Related\\_documents/reliab\\_annual\\_average.htm](http://circa.europa.eu/irc/dsis/employment/info/data/eu_lfs/LFS_MAIN/Related_documents/reliab_annual_average.htm)

LFS is the so called 'ad hoc module' which adds a set of questions to the questionnaire. Each year the subject of this module is different. In 2008 an ad hoc module about 'the labour market situation of migrants and their immediate descendants' was added to the core questionnaire. In 2014 this topic will be added again to the LFS which can be considered as an opportunity to analyse some of the specific defined variables in this module.<sup>23</sup>

### EC 2012 Ageing Report

The 2012 Ageing Report was written by the European Commission (DG ECFIN) and the Economic Policy Committee (AWG) and presents projections of the budgetary impact of an ageing population in the EU-27 over the period 2010–2060. The report includes specific scenarios on the LTC public expenditure based on combined information from the System of Health Accounts (SHA) and ESSPROS (European system of integrated social protection statistics). The forecasted LTC public expenditure comprises both in-kind and cash benefits. The breakdown by type of LTC benefit (in cash or in kind), which is a crucial element for the calculation of the baseline scenario, is described in another publication of DG ECFIN.<sup>24</sup> Also the projections regarding employment and unemployment (e.g. amount paid to unemployed persons, number of unemployed persons) and other interesting general variables integrated in the Ageing Report will be used. The underlying assumptions and projection methodologies used in the Ageing Report are described in a separate report of the EC.<sup>25</sup>

### Eurostat data

Eurostat provides statistical information based on national administrative information or statistical surveys organized at national or EU level. Within the context of this project, we have mainly focused on the use of ESSPROS and the available migration statistics. ESSPROS contains data on the expenditure and receipts for all national social protection schemes and allows us to compare the total expenditure on unemployment benefits by a Member State (e.g. unemployment benefits paid to full unemployed persons) with unemployment benefits paid to persons who export their unemployment benefit (PD U2) or who needed to prove completed periods of insurance or (self-)employment in another Member State (PD U1). Also the Eurostat migration statistics are useful to estimate the number of migrants who moved abroad. We were particularly interested in the flows (yearly movements) and stocks (situation at a certain period of time) of recent migrants at working age (aged from 15 or 20 to 64) as well as in migrant pensioners. As mentioned above, also the Ageing Report is using ESSPROS regarding the expenditure on LTC.<sup>26</sup> But also the migration statistics collected by Eurostat, delivered by MS via administrative data or national surveys, will have their importance. Obtaining a reliable view on the number of migrant workers and pensioners will be important to assess the baseline scenarios of unemployment and LTC.

### Other statistical data

Finally also other statistical information was considered. Yearly reports of national administrations and specific national reports discussing the export of unemployment and long-term care benefits delivered general or detailed information. At the same time, some recent reports published on EU

<sup>26</sup> LTC benefits in cash are reported within two ESSPROS functions: 'Disability' and 'Old Age'. Concerning LTC benefits in kind, for some countries proxies have been calculated on the basis of the ESSPROS data (see EC, 2012 Ageing Report).

level describe (labour) migration/mobility (E.g. Eurostat (2011), *Indicators of Immigrant Integration*; European Commission (2011), *Mobility in Europe 2011*).

### Overview of the statistical data sources used

Table 2 provides an overview of the data sources that were used, with a particular attention to their limitations in terms of data availability. It gives a first impression of the strengths and weaknesses of the data. Within the context of this project data should be collected concerning the aggregation of periods of insurance or (self-)employment (PD U1/E301 form), reimbursement of unemployment benefits (SED U020-SED U025), export of unemployment benefits (PD U2/E303 form). Also, data on the number of PD P1 (Summary of pension decisions) could be interesting to determine the competent Member State. Not for all 14 selected MS administrative data was received by the questionnaire. Also, none of the Member States could response to all questions. More data input related to the application of the coordination rules for unemployment was obtained by the national experts compared to the application of the coordination rules for LTC benefits. Reasons for the lack of data for some MS, topics or questions are divers. The fact that administrative forms are received/issued decentralised OR are received on paper documents and not electronically will have a negative impact on the availability of administrative data. Due to the fact LTC is not considered as a specific social security branch in the coordination rules and is embedded within the rules of sickness benefits, MS do not explicit collect data on LTC. However, the PD S1 indicates if the holder is receiving a LTC benefit in cash<sup>27</sup> and a breakdown by nature of benefit is taken up in the SED S080 (claim of reimbursement). Today, still old E-forms are used which excludes the availability and use of information based on those 'new' forms. Also, some MS consider (some of) the LTC benefits in cash as not exportable within the current coordination rules.<sup>28</sup> The response to the questions is explicitly mentioned for each of the described topics below. MS who have answered the questionnaire are also taken up in the column titles (see Annex 10.1.2). Data collected by other administrative sources than by the national experts are inserted in footnotes below the tables (e.g. on the basis of national reports).

The LFS is confronted with a high non-response rate of migrants – and more particularly recently arrived migrants.<sup>29</sup> This will have a negative impact on the sample size and will cause a possible distortion of the composition of the migrant population. One of the limitations of using the LFS is that the calculated proxies do not completely correspond to the legal definitions. E.g. the number of frontier workers is calculated by taking into account the neighbouring countries and not the legal definition (return daily or at least once a week). Some 'small' adjustments could be made in the Labour Force Survey to guarantee useful data collection and more conformity with the legal definitions. Currently, migration statistics from the LFS are based on the 'country of birth' or the 'nationality'. However, to obtain a reliable view on the migrant pensioner one should know the 'competent Member State' or the Member States which are paying an old-age benefit to these pensioners or at least the previous residence of the migrant pensioner (but also for migrant workers). This could be a priority in the ad hoc module of the Labour Force Survey of 2014 'Labour market situation of migrants and their immediate descendants' or in a next module or on a permanent basis in the LFS. It could become a proxy for the number of pensioners who received a PD S1.

<sup>27</sup> See EC (2011), *The 2012 Ageing Report: Underlying Assumptions and Projection Methodologies*, European Union, p. 234.

<sup>28</sup> E.g. (not exhaustive): in France: Allocation personnalisée d'autonomie (APA); in Belgium: Personal Assistance Budget.

<sup>29</sup> See Eurostat (2011), *Indicators of Immigrant Integration. A Pilot Study*, European Union, 253 p.

The 2012 Ageing Report is an important data source for the calculation of the baseline scenario of the coordination of unemployment and LTC benefits as well as for projections of both social security branches. However, these data will have its limitations compared to administrative data. First, no breakdown by type of unemployed person is available. In view of the reimbursement procedure it is necessary to select only cross-border workers and not migrant workers. Also, the Ageing Report made use of assumptions for the calculations of the chapter LTC. As reported in the methodology report (EC, 2011, p. 234) “The choice of methodology and various scenarios is heavily constrained by the availability, accessibility and quality of long-term care data”.<sup>30</sup> Nevertheless, a general agreement was reached of the underlying assumptions and projections for LTC in the Ageing Report and a number of sensitivity tests were carried out. The LTC projections in the Ageing Report are calculated for different scenarios (AWG<sup>31</sup> reference scenario, demographic scenario, high life expectancy scenario, base case scenario, constant disability scenario, shift 1% of dependents to formal scenario, coverage convergence scenario, cost convergence scenario, AWG risk scenario). The AWG reference scenario is used in this research report to calculate the projections on cross-border LTC spending. Thus this involves the assumptions used for this scenario. For calculating the LTC projections assumptions are made in the ageing report for:

- “the future numbers of elderly people (through changes in the population projections used);
- the future numbers of dependent elderly people (changes to the prevalence rates of dependency);<sup>32</sup>
- the balance between formal and informal care provision (assuming a given shift in demand
- or exogenous changes in the availability of informal carers);
- the balance between home care and institutional care within the formal care system;
- the unit costs of care.”

In the Ageing Report, long-term care is defined<sup>33</sup> according to the System of Health Accounts (SHA), “as the sum of the following publicly-financed items:

- Services of long-term nursing care (HC.3) (which is also called “the medical component of long-term care” or “long-term health care”, and includes both nursing care and personal care services), and
- Social services of long-term care (HC.R.6.1), which is the “assistance services” part, relating primarily to assistance with IADL (instrumental activities of daily living) tasks”.<sup>34</sup>

If necessary, the SHA database will be supplemented with data from ESSPROS. The SHA-definition mainly represents in kind benefits. For that reason cash benefits from the ESSPROS functions ‘Disability’ and ‘Old-age’ are added to the SHA database.

The LTC cash benefits are projected separately from LTC benefits in kind – at home or in the institutions.

<sup>30</sup> See Annex 8.2 in the methodology report (EC, 2011, p. 2011) for the applied methodology and the data availability of LTC.

<sup>31</sup> Ageing Working Group.

<sup>32</sup> E.g. EU-SILC data are used to obtain a proxy of “ADL-dependency” rates.

<sup>33</sup> An overview of other definitions is provided in Jorens, Y. & Spiegel, B. (ed.) (2011), ‘*Coordination of Long-term Care Benefits – current situation and future prospects – Think Tank Report 2011*’, trESS.

<sup>34</sup> EC (2012), *The 2012 Ageing Report. Economic and budgetary projections for the 27 EU Member States (2010-2060)*, European Union, Annex I.

The migration statistics contain a number of interesting variables which could be used in the baseline scenarios. Especially variables 'immigration by sex, age group and country of *previous residence*' and 'emigration by sex, age group and country of *next usual residence*' should have an added value. By these variables the last country of residence is known, which is a much better proxy for the determination of the competent country than the variables 'country of birth' or 'nationality'. One of the limitations of these variables is the lack of data for some of the MS as also a detailed breakdown by MS.

As already mentioned above, administrative data as national reports shall be added to the data received from the questionnaire. Next to it, interesting data on European level is collected. One of the tasks of the Audit Board of the Administrative Commission for the coordination of social security systems is 'collect the necessary data and carry out the calculations required for establishing the annual statements of claims of each Member State'.<sup>35</sup> Information about the claims of reimbursement (based on actual expenditures or fixed amounts) of healthcare costs, which includes also LTC, is collected by the Audit Board. However, at this moment the Audit Board has only a detailed view on the outstanding claims between countries and not on the total yearly amount of claims received/issued by MS.

Some first conclusions can be made concerning the availability of information. The questionnaires launched within the framework of this study, and the collected data, show that important data is missing and that data should be collected more systematically. Particularly, the data collection on the number of insured persons (PD S1) by type of person (insured person, family member of insured person, pensioner and family member of pensioner) should be granted priority. Also, an analysis of the total yearly number and amount of claims for health care seems to be of the utmost importance. This should be taken up by the Audit Board of the Administrative Commission.

The launch of questionnaires related to the use of PD A1 (posted workers), EHIC (European Health Insurance Card – Health insurance), PD U2 (exportation of unemployment benefits) as well as the planned questionnaire on PD S2 (planned/scheduled care) by DG EMPL are important steps to collect more administrative information at EU level. Also, the launch of an electronic exchange system between national administrations could be seized as "an opportunity" to collect more data. Especially the detail of some of the structured electronic documents will be useful. E.g. the SED S080 (claim of reimbursement) offers the possibility to select data concerning the number of persons who received LTC benefits in kind and the related claim (however, only for actual expenditure). At this moment we have no information with regard to this point. For the benefits in cash a further analysis of the administrative data collected within the context of the Ageing Report 2012 might be useful.

---

Yes	*National reports/information from Austria, Germany and Belgium.
	Competent Member State	P1	No		No		Partial	*ESSPROS: total expenditure old-age benefits	Partial		No	

Source: own figure based on the data collection

Both figures below provide a first overview of the applied methodology to estimate/calculate the budgetary impact of the baseline scenario and the different options. It was the ambition to collect in 14 Member States administrative data from the competent institutions. Afterwards, the results would have been extrapolated to the EEA countries and Switzerland. However, the scale of this administrative data collection in terms of number of Member States which have responded and in terms of available data in these Member States was too limited to assess in detail the baseline scenario and the different options. As result, mainly data from the LFS, the Ageing Report and the Audit Board Report was exploited to estimate the number of involved persons and the budgetary impact. Both schemes are described in detail in chapter 4.

## 4 Baseline scenario

Before further elaborating the problems that we identified with regard to the current coordination rules, we would like to give some insights in the number of cross-border workers and pensioners in the EU-27 that are affected by the coordination rules, their main mobility patterns and their use of long-term care and unemployment benefits. Cross-border workers and pensioners – and their insured family members – are the two main groups which impact cross-border expenditure on unemployment and LTC benefits.

The table below summarises the statistics that are described and discussed in detail in the next sections.

*On several occasions we refer to the official administrative documents in use for the coordination of social security systems. Three sets are in use, the original set of 'E-forms', a limited number of new documents on paper called the 'portable documents PD' (including the European Health Insurance Card) and the Structured Electronic Documents (SEDs) that in the future will be used for the electronic exchange of information between the involved administrations. For the list and content of the portable documents PD and the SED's see <http://ec.europa.eu/social/main.jsp?catId=868>, where also a description of the previous E-documents can be found: see on that web page Related Documents: former E-forms. The three set of documents are simultaneously in use in the different MS and this for a transition period. For that reason we refer sometimes simultaneously to documents from the different sets. For the relevance of those documents for the collection of statistics of cross border use of social security benefits see the interim report of an on-going trESS-project: Pacolet J. & F. De Wispelaere, with input from J. Hajdu & G. Berki (2013), Collection of statistical data concerning the application of Regulations (EC) Nos 883/2004 and 987/2009 (A.C. 017/12), Interim Report for the Administrative Commission: <http://ec.europa.eu/social/BlobServlet?docId=10026&langId=en>*

**Table 3: Synoptic overview of the scope of the cross border use of unemployment benefits and LTC benefits under scrutiny\*\***

Indicator	Year	Unit	Amount/ number	Type variable
<b>Coordination of unemployment benefits</b>				
<b>Cross-border workers within EU-27</b>	2010-2011	in thousand	1.032,0	stock

## 4.1 Coordination of unemployment benefits

In the next section, we present a number of basic tables on the number of cross-border workers (incl. frontier workers) and recent migrant workers.

Based on Labour force Survey (LFS) data, an estimation of the number of cross-border workers can be made (based on the question ‘*What is the name and address of the local unit of the enterprise where you work?*’ and variables ‘COUNTRYW’ (country of place of work) and ‘COUNTRY’ (country of residence) in the database. These LFS data were also used in another, recent report on ‘cross-border commuting’<sup>36</sup>. However, some interpretation problems appear. While legally a distinction should be made between the free movement of workers and of services, this distinction is not made by this question in the LFS. The applicable rules differ considerably between cross-border workers and posted workers. Cross-border workers will be insured in their country of employment while posted workers are still insured in their country of residence. For that reason we assumed that the LFS question covers both cross-border workers (within the rules of free movement of workers) and posted workers (within the rules of free movement of services). Ideally, the LFS should make this distinction to avoid possible interpretation problems. In the further analysis we considered all workers who work in another country than the country of residence as cross-border workers. Workers who work in a neighbouring country are considered as frontier workers (as also is assumed in the report ‘Mobility in Europe 2011’) (which is not equal to the legal definition of a ‘frontier worker’)<sup>37</sup>.

### 4.1.1 Scale of cross-border mobility of workers in EU-27

#### 4.1.1.1 Number of cross-border workers

Table 4 gives an overview of the number of cross-border workers<sup>38</sup> and frontier workers<sup>39</sup> in the EU-27. The average of 2010 and 2011 is calculated to avoid outliers. To guarantee reliability of the figures we only took into consideration the row and column totals of the cross-tables. However, the details in the different cells are important to estimate the baseline scenario and the different options (e.g. we need to select the cells which describe flows between neighbouring countries to define the

<sup>36</sup> EC, Mobility in Europe 2011

<sup>37</sup> See art. 1, (f), Regulation (EC) No. 883/2004: “frontier worker” means any person pursuing an activity as an employed or self-employed person in a Member State and who resides in another Member State to which he returns as a rule daily or at least once a week.

<sup>38</sup> For the purpose of the data collection, cross-border workers are workers who are employed in another Member State than the Member State of residence.

<sup>39</sup> For the purposes of the data collection, frontier workers are workers who work in a neighbouring country. This is different than the definition in Regulation (EC) No 883/2004, according to which frontier workers are defined as workers who return to their State of residence on a daily or weekly basis.

number of frontier workers)<sup>40</sup>. The national employment figures (living and working in the same country) are yellow coloured while the figures coloured in red are the neighbouring countries of a specific country.

The table shows that on average **1 million cross-border workers are employed in the EU27 or 0.5% of the total employed population**, of which on average **701.000 frontier workers** are employed in a neighbouring country. This implies that 68% of the cross-border workers can be assumed as frontier workers. These figures are similar to the results in the 'Mobility in Europe 2011' Report which reports *"that just 5 people in 1,000 of those employed commute across borders between EU Member States"* and *"some 63% of cross-border commuters go to work in a bordering country"*<sup>41</sup>.

In general, we observe an increase of the number of cross-border workers between EU-27 MS of 1.4% between 2010 and 2011 (see Table 81 and Table 82). The Report 'Mobility in Europe 2011' already observed this increase for earlier years (with a slowdown for more recent years).

### Outgoing cross-border workers

In absolute figures, most outgoing cross-border workers live in Germany (165 thousand), France (160 thousand) and the Slovak Republic (117 thousand). However, in terms of share in national employment (see Table 83), the highest impact is observed in the Slovak Republic (5.0%), Estonia (3.1%) and Belgium (2.2%). For Belgium (97%), the Netherlands (95%) and Ireland (88%) most of the outgoing cross-border workers are employed in a neighbouring country. While for Romania (1%), Lithuania (5%) and Latvia (9%) few of the outgoing cross-border workers are employed in a neighbouring country. As Croatia joined the EU on 1 July 2013 it is interesting to look at the number of cross-border workers of this country. For 2011, 20.6 thousand outgoing cross-border workers from Croatia were counted primarily going to Italy and Germany (see Table 81).

### Incoming cross-border workers

Most incoming cross-border workers are employed in Germany (186 thousand), Luxembourg (130 thousand) and the Netherlands (110 thousand). The highest impact of incoming cross-border workers on the national employment is identified for Luxembourg (37.4%), Austria (2.4%) and Belgium (1.4%). Most of the incoming cross-border workers in Luxembourg (99%), the Czech Republic (98%), Austria (94%) and the Slovak Republic (94%) are living in a neighbouring country. Only 6.6% of the incoming cross-border workers employed in Italy, 10% in Romania and 11% in the UK are living in a neighbouring country. A very popular country for incoming cross-border workers is Switzerland. In 2011, Switzerland employed 320 thousand incoming cross-border workers mainly coming from France (see Table 81 and Table 82).

#### 4.1.1.2 Number of posted workers

As it is possible that the LFS data also include posted workers in the number of cross-border workers, the profile of the cross-table of cross-border workers from the LFS is compared with this from the number of PD A1 certificates issued (certifies which social security legislation applies to the holder of the form). This was done by calculating the row and column percentages and indicating the 3 MS with the highest percentages.

<sup>40</sup> See information on LFS and its reliability in 3.2.7.

<sup>41</sup> This 63% is calculated for the group of cross-border workers living in EU AND Non EU countries. This is a broader group of cross-border workers compared to our analysis.

First, we compare the data of the outgoing cross-border workers with these from the outgoing posted workers (See Table 84 and Table 87). Germany (14 times), the Slovak Republic (8 times) and Poland (8 times) appear most frequently in the top-3 of 'sending' MS concerning cross-border workers. At the same time most important (in top 3) sending MS for posted workers are Germany (26 times), Poland (22 times) and France (20 times). However, the spread of sending countries is somewhat more diverse for cross-border workers compared to posted workers (more concentrated in Germany, Poland and France as sending countries).

Also the spread over MS receiving incoming cross-border workers was compared with this for MS receiving incoming posted workers (see Table 85 and Table 88). Germany (17 times) and the UK (12 times) are the most important working countries for cross-border workers while posted workers mostly are sent to Germany (18 times), France (12 times) and the Netherlands (10 times).

The relationship between the two variables can be calculated by the correlation coefficient.<sup>42</sup> We see a strong positive linear relationship (0.76) between the variables 'incoming posted workers' and 'incoming cross-border workers', which implies the same MS receive as well cross-border workers as well as posted workers, probably to be considered as attraction pools of mobile workers. Besides, there is also a strong positive linear relationship (0.71) between the 'outgoing posted workers' and 'outgoing cross-border workers'.

#### 4.1.1.3 Migration of workers

---

The possible number of PD U1 issued is also influenced by recent migrant workers. Eurostat migration statistics are collecting the number of migrant workers (from 15 to 64 years) who have moved from one EU-country to another in 2011 (Table 5). One of the limitations is the lack of figures for BE, BG, HU, MT, NL, PL and RO.

For those countries of which figures are available, we observe most migrant workers migrated to Germany (237 thousand in 2011), the UK (185 thousand in 2011) and Spain (54 thousand in 2011).

This table shows also the importance of Romania as emigration country. Also here we have calculated the relationship between 'incoming migrant workers' and 'incoming cross-border workers'. We observe a strong positive linear relationship (0.70) between both variables, which implies that the same MS are dominant or less dominant. Within this group of recent migrant workers the unemployment rate of their current country of employment has been used to estimate the number of unemployed recent migrant workers.

---

<sup>42</sup> The closer the coefficient is to either  $-1$  or  $1$ , the stronger the correlation between the variables.  $+1$  = the case of a perfect positive (increasing) linear relationship (correlation) and  $-1$  in the case of a perfect decreasing (negative) linear relationship.

#### 4.1.1.4 Estimated number of unemployed cross-border workers

---

Making the breakdown between unemployed cross-border workers and migrant workers is important for different reasons. First, it gives a first impression of the impact both categories have on the number of issued PD U1 certificates and the budgetary impact on the unemployment expenditure. Second, Member States can only claim a reimbursement for the unemployment benefits they have paid to cross-border workers.

National unemployment rates are applied on the number of cross-border workers.<sup>43</sup> The national unemployment rates of 2010 (from 20 to 64 years) defined in the 2012 Ageing Report were used. Also, the unemployment rates of the country of employment and not of the country of residence have been applied on the number of cross-border workers calculated by way of the LFS. This results in an **estimation of 73.7 thousand unemployed cross-border workers of which 45.2 thousand frontier workers** (Table 6). These figures will be used to estimate the expenditure as well as the claimed reimbursement of the provision of unemployment benefits to cross-border workers taking into account the baseline scenario and the policy options.

#### 4.1.1.5 Estimated number of recent migrant workers

---

The same unemployment rates are applied on recent migrant workers. As no data are available for BE, BG, HU, MT, NL, PL and RO no exhaustive view on the number of unemployed recent migrant workers can be obtained. When we extrapolate these figures for the EU-27, **128 thousand unemployed migrant workers** are counted (Table 7). The chance is rather high that this group will need a PD U1 certificate to prove periods of insurance or (self)-employment in another country.

#### 4.1.1.6 Estimated number of proven period of insurance (PD U1)

---

By counting the estimated number unemployed cross-border workers (4.1.1.4) and migrant workers (4.1.1.5) together, we become a total result of 202 thousand unemployed persons who may need a PD U1 certificate to prove periods of insurance of (self)employment from another country. This seems rather a minimum estimation compared to our other estimation of unemployed persons who will issue/receive a PD U1 certificate, namely **341 thousand unemployed persons** (see Table 8).

---

<sup>43</sup> Currently the average unemployment rate in incoming country is used, while the unemployment rate of foreign EU nationals is usually somewhat higher than nationals of the declaring country. However, the activity rate of foreign EU nationals is considerably higher and their employment rate is also higher. So compared to the size of the working age population the share of unemployed is not higher for foreign EU nationals.

**Table 6: Estimated number of cross-border workers who will become unemployed, in .000**

#### 4.1.2 *Aggregation of periods of employment/insurance/self-employment*

---

When making the decision to grant the unemployment insurance benefit all completed unemployment insurance periods in other member countries shall be taken into consideration. The unemployment insurance periods completed in different countries are then to be aggregated. In the following paragraphs, we aim to assess the extent to which periods of insurance and (self-) employment in another EU Member State were taken into account when granting unemployment benefits. Therefore, the number of PD U1 or E301 forms received and issued was counted.

Ideally, a distinction should be made between frontier workers, ‘other’ cross-border workers and migrant workers:

- Frontier workers return to their country of residence daily, or at least once a week.
- ‘Other’ cross-border workers return to their country of residence less than once a week.
- Migrant workers worked and lived already in the competent MS before their unemployment but will prove completed periods of insurance or (self-)employment in another Member State.

For only some EU Member States, it was possible to make this distinction.

Furthermore, in our original questionnaire, we aimed to find data which would make it possible to distinguish between the number of PD U1/E301 forms received each year and the number of ‘unique persons’ behind these forms. This distinction might be relevant, as a single person can submit more than one form during a single year. However, in this analysis both questions are discussed together in the ambition to extrapolate to an EU-27 level.

Also, we did not ask specifically for the number of PD U1/E301 forms issued by each EU Member State (questionnaire was limited to 14 MS). Nevertheless, it was possible to obtain statistics for some other EU Member States and these are included in this report.

We compared the number of documents received and the number of documents issued. This for two specific reasons: firstly, it enabled us to fill gaps in the data on the PD U1/E301 forms received. Secondly, it allowed us to cross-check the data collected (e.g. whether the number of PD U1/E301 received forms from a specific EU Member State equals the number of PD U1/E301 forms issued by the other EU Member State).

Below, results from the questionnaire regarding the aggregation of periods are summarised. It will be mentioned explicitly in the text when another source than the questionnaire is used. Also, we will refer to the different tables added in Annex of this report. The number of received PD U1 certificates will be compared to the total number of unemployed persons. For this, data from the ‘unemployment – LFS adjusted series’ was used. An unemployed person is defined in the LFS as “a person 15 to 74 years of age (16 to 74 years in ES, IT and the UK) who was not employed during the reference week, had actively sought work during the past four weeks and was ready to begin working immediately or within two weeks” (Eurostat)<sup>44</sup>.

---

##### 4.1.2.1 Number of received and issued PDU1/E301 forms

---

<sup>44</sup> [http://epp.eurostat.ec.europa.eu/cache/ITY\\_SDDS/en/une\\_esms.htm](http://epp.eurostat.ec.europa.eu/cache/ITY_SDDS/en/une_esms.htm)

## Number of PD U1/ E301 forms received

Data on the number of **PD U1/ E301 forms received** (or 'unique' persons involved) was collected for Belgium, Estonia, France, Poland, Romania, Slovak Republic, Sweden and UK. Only for four countries the distinction between frontier workers, cross-border workers and migrant workers could be made: France, Poland, Romania and Sweden. For the other EU Member States, it was not possible to obtain data.

In 2012, the competent institutions in Belgium took 2,400 PD U1 forms into account in granting an unemployment benefit (cf. Table 59 and Table 61). This is not the actual number of PD U1's received by the Belgian competent institution; which shall be (much) higher. Only the PD U1's which were used to grant an unemployment benefit because of a too short period of insurance or (self-)employment in Belgium are counted. Most of the PD U1 documents taken into account were for periods of insurance and (self-)employment completed in neighbouring countries, primarily the Netherlands (45.5%) and Luxembourg (31.9%), but also France (5.4%) and Germany (4.9%). The figure for Spain was also relatively important (4.9%). As the average number of unemployed in Belgium in 2012 was 369,000, this implies that only 0.7% of Belgium's unemployed made use of the PD U1 document to receive an unemployment benefit.

Between 2010 and 2012, the number of PD U1/E301 forms received by Estonia increased by 38% (from 1,505 to 2,082) (cf. Table 59 and Table 61). Of these, 53.5% were issued by Finland (in 2012). The proportion of the unemployed in Estonia providing a PD U1 to receive an unemployment benefit in 2012 was 2.9%.

In 2011, 50,003 people were granted an unemployment benefit in France which took periods from other EU Member States into account (see CLEISS (2012), *Rapport Statistique 2011*)<sup>45</sup>. Of this group, 49,961 were in the cross-border worker category and 42 were migrant workers (however, based on article 61 Regulation (EC) No. 883/2004 and not art. 65)<sup>46</sup>. As in the case of Belgium, most of the PD U1/E301 forms received were issued by neighbouring countries, in particular Switzerland (48.2%), but also Luxembourg (20.7%), Germany (15.1%) and Belgium (14.8%). The percentage of the total average number of unemployed in France in 2011 providing a PD U1 form was 1.8%.

Poland received a PD U1 for 13,884 cross-border workers (77.8% of the total) and 3,980 migrant workers (22.2% of the total) in 2011 (Table 59, Table 60 and Table 61). The forms were primarily issued by the United Kingdom (42.3%), the Netherlands (18.6%), Ireland (10.2%) and Germany (9.2%). In 2011, 1.2% of Poland's unemployed provided a PD U1 to receive an unemployment benefit. For Poland, as well the number of PD U1 documents received as the number of 'unique persons' concerned are known. One person received 1.1 PD U1 documents (19,432 forms compared to 17,481 'unique' persons).

For Romania, data was available only on the PD U1 documents delivered by migrant workers. In 2012, 92 forms were received, of which 66% applied to Spain (Table 36).

It was estimated by the national competent institution that the United Kingdom received some 300 PD U1/E301 forms (Table 59 and Table 61). Compared to the data from other Member States,

---

<sup>45</sup> <http://www.cleiss.fr/docs/stats/rapportstat2011.html>

<sup>46</sup> Comment received by HIVA – KU Leuven from CLEISS.

this seems a rather low figure. It means that only 0.012% of the UK's unemployed would have provided a PD U1 form.

In 2012, the Slovak Republic received 10,912 PD U1 forms (Table 59 and Table 61). Most were issued by the Czech Republic (27.9%), United Kingdom (22.1%) and Hungary (15.9%). The Slovak Republic ranked with Estonia at the top end of the range of the percentage of the unemployed receiving unemployment benefit based on evidence from a PD U1, i.e. 2.9%.

Finally, Sweden received 2,202 PD U1/E301 forms in 2011 (Table 60 and Table 61). Of these, 1,762 were from cross-border workers (80%) and 427 were from migrant workers (20%). The forms mainly came from Norway (42.8%) and Denmark (36.6%). Of the total number of unemployed in 2011, 0.6% had proven periods of insurance or (self-)employment in other Member States to confer unemployment rights in Sweden.

### Number of PD U1/E301 forms issued

Data on the number of **PD U1/E301 forms issued** were collected for Belgium, Estonia, Luxembourg and Romania (Table 64).

**Belgium** issued 11,522 PD U1 forms in 2011 (Table 64). No breakdown by receiving EU Member State is available, but there is data by nationality. Of the total, 22.9% were issued to Belgian nationals. According to a recent report (Pacolet, et. al., 2012)<sup>47</sup> which sought to provide a detailed profile of French, Belgian and German frontier workers and their knowledge and use of, and satisfaction with social security benefits (especially sickness benefits), 33% of the frontier workers living in France and working in Belgium are born in Belgium. However, a PD U1 might also be issued for a migrant worker coming from Belgium but living and working in another Member State. Of the PD U1's issued by the Belgian authorities, 61.2% were for French nationals.

---

<sup>47</sup> Pacolet, J., De Wispelaere, F. & De Coninck, A. (2012), *The social security rights of frontier workers. A survey on their knowledge, use and satisfaction, focusing on sickness benefits*, HIVA-KU Leuven.

Between 2010 and 2012, the number of PD U1 forms issued by **Estonia** increased by 45.3% (from 428 to 622 forms) (Table 64). Of these, 73% were used to request an unemployment benefit in Finland.

The number of PD U1/E301 forms issued by **Luxembourg** is indicative of the popularity of this country for mobile workers (Table 64). In 2012, Luxembourg issued 18,875 PD U1 forms, an increase of 5.9% compared to 2010. A high percentage of the forms were received by the French authorities (63.1%). An important number also went to Belgium (15.9%) and Germany (15.4%).

**For Romania**, we were only able to obtain the number of PD U1 forms issued for migrant workers. In 2012, this was 5,067 (Table 64).

### **Estimated number of PD U1 to be received: mid-term (2015) and long-term projection (2020)**

Data on the total number of PD U1 forms received was obtained from six EU Member States (Belgium, France, Estonia, Poland, Slovak Republic and Sweden) by way of the launched questionnaire. The proportion of unemployed (LFS definition 'Average annual unemployed persons (from 14 to 75 years)') with proven periods of insurance or (self-)employment from other Member States entitling them to unemployment rights is for this group of countries on average 1.6%.

Based on the number of received PD U1 forms by 6 Member States and data from the 2012 Ageing Report, we aimed to make projections of the baseline scenario for 2015 and 2020. For these calculations we will use the number of unemployed persons between 20 and 64 years calculated for 2010 and projected for further years (which differs from the definition used above for an unemployed person (from 14 to 75 years)). From the data we have collected in these Member States, we learned that in general 1.6% of the unemployed persons (from 20 to 64 years) received a PD U1 to prove a period of insurance of (self-)employment from another Member State. This percentage was applied to the total number of unemployed persons residing in Member States for which we found no data. By counting together the survey data together with these estimates, we estimate the total number PD U1 on 341 thousand issued certificates.

If we take into account the unemployment projections for 2015 and 2020 (between 20-64) – found in the 2012 Ageing Report and calculated by applying an unemployment rate to the labour force - the absolute number of issued PD U1 is expected to decrease to 324 thousand forms by 2015 and to 300 thousand forms in 2020. However, here we take only the evolution of the number of unemployed persons into account. Besides, also other variables can/will change in the future (e.g. share of PD U1 compared to total unemployment).

**Table 8: Estimated number of received PD U1 in the EU-27: 2010, 2015 & 2020**

Source: Estimate based on collected administrative data and 2012 Ageing Report

#### 4.1.2.2 Expenditure on unemployment benefits based on PD U1

##### Estimated share of actual expenditure on unemployment benefits based on PD U1 in total expenditure on unemployment benefits (2010)

It is interesting to see how much is paid to those in unemployment with proven certified periods from other Member States and how much of global national expenditure on unemployment benefits this amount represents. We received data on this from only three Member States: Belgium, France and Sweden (Table 63). More detail (i.e. a distinction between cross-border workers and migrant workers) was available for France and Sweden.

In **Belgium**, € 10.5 million was paid (in 2012) to those who needed a PD U1 to receive a Belgian unemployment benefit, or 0.2% of the total expenditure on full unemployment benefits (Table 63). Of this, 47.8% was paid to unemployed who proved a period of insurance or (self-) employment in the Netherlands.

**France** paid € 516.8 million in 2011 to people in unemployment who aggregated their periods (mostly cross-border workers) or 1.8% of total expenditure (Table 63 based on CLEISS – Rapport Statistique 2011)<sup>48</sup>. Of this, 59% of the amount was paid to those with a PD U1 issued by Switzerland.

<sup>48</sup> <http://www.cleiss.fr/docs/stats/rapportstat2011.html>

Finally, **Sweden** paid € 22.6 million to this group in 2011. Of this, 90.4% was paid to former cross-border workers and 9.6% to migrant workers. Overall, this was 1.1% of total expenditure on full unemployment benefits. Of the total, 48.8% was paid to unemployed who proved insurance periods or (self-)employment in Denmark.

### Estimated annual expenditure on unemployment benefits based on PD U1: projections for 2015 and 2020

The maximal annual amount paid to unemployed persons (if we assume that the unemployed did not find a job during the first year of unemployment) who received a PD U1 to prove an insurance period or (self) employment from another Member State can be counted by multiplying the number of estimated PD U1 with the unemployment benefit per unemployed person (in 2010 prices; projected in the 2012 Ageing Report). For 2010, a maximal cost of € 2.07 billion was found. The cost is expected to increase (in absolute figures) to € 2.19 billion in 2015 and to € 2.22 billion in 2020 (in prices of 2010), driven by an increase of the unemployment benefit per unemployed person. However, the breakdown by unemployment cross-border workers and migrant workers is not available. This will be needed to calculate the amount of reimbursement claims between Member States in the baseline scenario and in the other policy options.

**Table 9: Yearly estimated amount paid to unemployed persons who received a PD U1 2010, 2015 & 2020 (in EUR)**

Source: Estimate based on estimated number of PD U1 and 2012 Ageing Report

#### 4.1.3 Export of unemployment benefits

---

#### 4.1.3.1 Number of issued PD U2

---

The PD U2 is the authorisation which an unemployed person needs to export his/her unemployment benefit if (s)he wishes to move to another EU country to look for work. The competent national institution is responsible for granting this authorisation.

Statistics on the extent to which requests to export unemployment benefits are **accepted or refused** are available for Sweden and Poland. In 2012, Sweden refused 37% of the requests for a PD U2 (Table 65). In 2011, only 19% of the requests were refused. The Polish competent institution refused 23% of the requests (in 2011). No further information could be collected on the proportion of persons who requested a prolongation of the export period to 6 months (the acceptance/refusal ratio).

For ten EU Member States (Austria, Belgium, Denmark, Estonia, Luxembourg, the Netherlands, Poland, Slovak Republic, Sweden and United Kingdom), data were received on the **number of PD U2 issued** (Table 65).

**Austria** issued 1,186 PD U2's (in 2012) (detail by Member State is not available) (Table 65). This is 0.63% of the average annual unemployed persons.

**Belgium** issued 1,081 PD U2's (in 2011), of which most for France (46.3%) but also 16.9% for Spain (Table 65).

**Denmark** provided 1,108 authorisations (in 2011) to seek a job abroad of which 18.9% for the United Kingdom, 12.5% for Germany and 12.4% for Spain (Table 65).

**Estonia** issued 64 PD U2's (in 2012), which was a decrease of 7.2% compared to 2011 (69 forms) (Table 65).

**Luxembourg** issued 148 PD U2's (in 2012), mainly to seek a job in France (32.4%) and Portugal (24.3%) (Table 65 based on Report of 'Le gouvernement du Grand-duché de Luxembourg. Agence pour le développement de l'emploi – Les activités de l'agence pour le développement de l'emploi en 2012')<sup>49</sup>. The number of PD U2's issued decreased by 16.1% in 2011 compared to 2010, but increased again in 2012 by 28.7% compared to 2011. In 2012, the number of authorisations granted in Luxembourg to look for a job in another Member State was 1.14% of the average annual number of unemployed persons. This is the highest percentage in our sample of described Member States.

**Poland** issued 118 PD U2's (in 2011), mainly for Germany (34.7%) and the United Kingdom (33.9%) (Table 65).

The competent institution in the **Netherlands** issued 637 PD U2's in 2012, of which 18.2% both for Germany and for Austria (Table 65 based on report UWV – Kwantitatieve informatie 2011).

**Romania** issued 11 PD U2's in 2012 (Table 65).

The **Slovak Republic** issued 79 certificates in 2012, mainly to look for a job in the Czech Republic, Germany and the United Kingdom (Table 65).

---

<sup>49</sup> <http://www.adem.public.lu/publications/index.html#Rapports>

In 2012, **Sweden** issued 264 PD U2/E303 forms (Table 65 based on report IAF)<sup>50</sup>. This was 11% fewer than in 2011. Most of the forms were for those wanting to look for a job in the United Kingdom (15.4%) or Spain (14.7%). More detail about trends in the number of PD U2/E303 forms issued and the profile of the jobseeker is available for Sweden. There has been a strong decrease in the number of PD U2/E303 forms issued in last decade. E.g. in 2004, even 1,036 E303's were issued. 87.4% of the unemployed who received a PD U2 form (between May 2010 and August 2011) actually went abroad to look for a job. These jobseekers were mainly aged between 30 and 39 (44%). More unemployed women (58%) than men (42%) went looking for a job abroad. 46% of those with a PD U2 who were not born in Sweden were seeking a job in their country of birth.

Finally, it was estimated by the competent national institution that the **United Kingdom** issued about 300 PD U2's (Table 65).

**For the EU-27**, an estimate of the number of PD U2's issued can be made by using the statistics collected together with data from Eurostat (LFS definition 'Average annual unemployed persons (from 14 to 75 years)'). We have the total number of PD U2's issued for 10 EU Member States, collected by way of launching a questionnaire. This suggests that on average only 0.11% of the unemployed looked for a job abroad. Extrapolating this percentage to arrive at an estimate of the total number of PD U2's issued in the EU-27 each year the resulting estimation is an annual issue of 23,700 PD U2's.

Policies on refusal/approval of **requests for a prolongation** vary considerably between Member States. For example, Sweden refused all 35 requests for prolongation in 2011, while Poland in the same year accepted all 20 requests for prolongation (Table 66).

The main aim of the possibility of exporting unemployment benefits under the current rules is that the unemployed person actually finds a job abroad. A proxy for the **success rate** could be calculated for the unemployed from Belgium, Poland and Sweden who have moved abroad (export PD U2) and for the unemployed from other Member States who have sought a job in the Netherlands (import PD U2) (Table 67). Of the unemployed in Belgium who received a PD U2, 44% actually found a job abroad. The success rate for the unemployed people coming from Belgium in the two most popular Member States for looking for a job, namely France and Spain, was 46% and 36%. However, this should be considered as a broad definition of the success rate for Belgium. It is based on the number of people who are no longer registered within the Belgian National Employment Office after their period of export. This might be for different reasons: they have found work in the country of export, they have found work in Belgium, or they moved to some other country. The success rates for Poland and Sweden are 10% and 12%. For the incoming jobseekers in the Netherlands<sup>51</sup>, a success rate of 22.8% was obtained. So the rates are highly variable.

#### 4.1.3.2 Number of received PD U2

Figures were available for the **number of PD U2's received** in five Member States (Estonia, France, Luxembourg, the Netherlands and Sweden) (Table 68).

<sup>50</sup><http://www.iaf.se/Global/Fakta%20om%20arbetsl%C3%B6shetsf%C3%B6rs%C3%A4kringen/Vilka%20personer%20s%C3%B6ker%20arbete%20i%20Europa%20med%20svensk%20arbetsl%C3%B6shetsers%C3%A4tning.pdf>

<sup>51</sup> Information from the Dutch Institute for Employees Insurances (UWV) provided by Fleur Veltkamp (DG EMPL).

In 2012, **Estonia** received 41 PD U2's, mainly from Ireland. This is an increase of 17.1% compared to 2011 (35 forms received).

For **France**, only the number of received E303 forms in 2011 is available, mainly issued by Switzerland and Norway (Table 68 based on CLEISS – Rapport Statistique 2011)<sup>52</sup>.

**Luxembourg** received 171 certificates for jobseekers in 2012, many of them coming from Portugal (based on Report of 'Le gouvernement du Grand-duché de Luxembourg. Agence pour le développement de l'emploi – Les activités de l'agence pour le développement de l'emploi en 2012')<sup>53</sup>. The number of PD U2 received by Luxembourg has increased in recent years, mainly due to a spectacular increase in the number of jobseekers coming from Portugal.

In 2012, **the Netherlands** received 483 PD U2's, mostly from Spain.

Finally, **Sweden** welcomed 691 jobseekers from other Member States. The number of persons seeking a job in Sweden has fluctuated strongly over the years (lowest in 2000 and highest in 2004).<sup>54</sup>

Observing the row totals for the number of issued PD U2 forms (Table 65), France, Germany, Spain and the United Kingdom seem to be the most popular Member States in which to look for a job.

#### 4.1.3.3 Mid-term and long-term projection of the number of exported unemployment benefits

Statistical data about the number of PD U2 issued was already obtained for 10 EU Member States. This administrative information could be compared by the number of unemployed persons between 20 and 64 years calculated for 2010 and projected for further years (which differs from the definition used above for an unemployed person (from 14 to 75 years)). On average 0.11% of the unemployed persons in the countries of which administrative information is available moved abroad to seek work and export their unemployment benefits. This percentage was applied to the number of unemployed persons (20-64) in the other 17 EU Member States.

Taking together both components (survey data and estimates) we estimate that 23.7 thousand unemployed persons have exported their unemployment benefits in 2010. Based on the projections of the 2012 Ageing report, the number of jobseekers moving abroad would decrease to 22.8 thousand unemployed persons in 2015 and 21.2 thousand unemployed persons in 2020.

Source: Estimate based on collected administrative data (cf. Annex 10.1.1 – UB) and 2012 Ageing Report

#### 4.1.3.4 Number of exported unemployment benefits vs. total number of persons seeking a job abroad

Jobseekers can create a CV in EURES and make it available for registered employers and EURES advisers helping employers to find suitable candidates. Those people generally still reside in their origin country. In June 2013 about 1 million jobseekers were registered on the EURES Portal (= current stock). Most registered jobseekers live in Spain, Italy and Portugal. As this number is the current stock of registered jobseekers it is necessary to have also an overview of the yearly new registered jobseekers. This could be a proxy of the total number of (unemployed) jobseekers looking for a job abroad but not a good proxy of people looking for a job in another country in which they already established. Between June 2012 and June 2013 about 274 thousand new persons registered on the EURES Portal. We estimated that about 23.7 thousand unemployed persons receive a PD U2 which is 8.7% of the total number of ‘new’ registered jobseekers in EURES.

**Table 11: Number of jobseekers registered in EURES cv online and comparison with estimated number of PD U2 certificates issued, by country of residence, in .000**

Country	Jobseekers registered in EURES (stock)			Number of PD U2 issued	% share PD U2 in total registerd jobseekers

#### 4.1.4 Estimated cross-border expenditure on unemployment benefits

In order to estimate the budgetary impact of the baseline scenario, the estimated number of unemployed cross-border workers based on the LFS and the unemployment rates of the Ageing Report is multiplied by the annual unemployment benefit per unemployed person (in 2010 prices; projected in the 2012 Ageing Report). For each of the flows between Member States (in the different cells) the unemployment benefit of the country of last activity and the unemployment benefit of the country of residence was taken into consideration (see Table 89).

Under current rules unemployed frontier workers must claim unemployment benefits in the country of residence while unemployed other cross-border workers can choose to claim unemployment benefits in the country of last employment or in the country of residence. Due to fact the other cross-border worker can choose, an assumption has to be made about how many of them return to the country of residence and how many stay in the country of last activity. We assume first that 50% of the other unemployed cross-border workers will return and 50% will stay. An alternative assumption could be based on the rational decision which Member State (country of last activity or country of residence) is paying the highest unemployment benefit.

The actual total yearly expenditure is estimated based on the unemployment benefit per unemployed person in prices 2010 (unemployment benefit spending in 2010 prices / (labour force \* unemployment rate)) taken up in the 2012 Ageing Report as also the estimated unemployed cross-border workers. This yearly expenditure assumes that the unemployed person did not find a job during the first year of unemployment.<sup>55</sup> A breakdown between the expenditure by the country of residence (Table 43) or the country of last activity (Table 44) is made. We also refer to bilateral expenditure between countries.

The baseline scenario (option A) whereby frontier workers have to return to the country of residence and other cross-border workers can choose between the country of residence or the country of last activity involves a yearly expenditure of € 540.0 million of which € 392.4 million related to frontier

<sup>55</sup> The reader has to take this assumption into account when reading the estimated budgetary impact. A more 'realistic' calculation of the yearly expenditure could be obtained by taking into consideration the average duration of the unemployment (which is an indicator in the LFS) and the specific national rules concerning the maximum length of the payment of the unemployment benefit.

workers when assuming that 50% of the other cross-border workers are returning to their country of residence (Table 89 - baseline scenarioA1). This involves that 81% of the yearly expenditure on cross-border workers will be paid by the country of residence and 19% by the country of last activity.<sup>56</sup> The specific expenditure for frontier workers will be fully covered by the country of residence.

Assuming for the baseline scenario that other cross-border workers choose on the basis of the amount of the unemployment benefit (= rational decision) (baseline scenarioA2), involves a yearly expenditure of € 638.5 million or an increase of 18.2% compared to the first baseline scenario (Table 90). 70% of this expenditure shall be paid by the country of residence while 30% by the country of last activity (Table 90). It implies that in more than 50% of the cases it is more interesting to claim an unemployment benefit in the country of last activity.

#### 4.1.5 *Reimbursement claims*

---

##### 4.1.5.1 Number and value of received reimbursement claims

---

The unemployment benefits paid by the country of residence and the country of last activity do not completely reflect the burden sharing of unemployment benefits. Also the amounts of reimbursement should be taken into account.

Claims can be made by the country of residence to the country of last activity for fully unemployed frontier workers but also for other cross-border workers who have decided to register with the competent institution in their country of residence. The country of last activity shall reimburse the unemployed benefits provided in the country of residence during the first three months or five months (when the unemployed person during the preceding 24 months, completed at least 12 months of (self)employment in the country of last activity). Data were collected on the number of claims received (as debtor) and the number of claims issued (as creditor) (Table 71 and Table 72).

It was possible to describe the position as debtor (from request until receipt of reimbursement) in the case of six Member States (Belgium, Denmark, Germany, Poland, Romania and Slovak Republic). This means that we have data on the cross-border workers who had worked in these Member States but are receiving an unemployment benefit in their current country of residence.

In 2011, **Belgium** received reimbursement requests for an amount of € 11.3 million or 3,664 cases (Table 71). France accounted for 84.6% of the cases and 73.8% of the amount requested. This is not surprising when we look at the number of PD U1 forms issued by Belgium.

**Denmark** received 1,637 reimbursement requests, of which 67.5% came from Germany (Table 71).

There was no detailed information for **Germany**, but the comment was made by the competent institution (received by the national expert) that some 7,000 reimbursement requests had been received (in the second semester 2011 and first semester 2012) (Table 71).<sup>57</sup>

---

<sup>56</sup> However, also the amount of the reimbursement claim should be taken into account. This will imply a higher amount paid by the country of last activity. But also the duration of the unemployment will have an important impact. Actually, the total cost could be allocated to the country of last activity when the duration of unemployment of the unemployed frontier worker/ other cross-border worker is lower than 3 or 5 months and when the claim of reimbursement by the country of residence is equal or lower than the unemployment benefits paid in the country of last activity.

<sup>57</sup> Comments received from competent institution in Germany:

*"For several reasons we cannot provide detailed information on statistical data about reimbursement:*

**Poland** only received 84 claims, for an amount € 207,000, mainly issued by Germany (Table 71). Further detail on the treatment of the reimbursement request is available for Poland. Poland partially accepted 88% of the reimbursement requests, 4% were not accepted and 7% were entirely accepted. This might be due to the fact that the amount of reimbursement cannot be higher than the amount payable under the legislation of the country of last activity (see art. 65, 6 Regulation (EC) No. 883/2004).<sup>58</sup> E.g. when we compare the 'Unemployment benefit per unemployed person in 2010 prices' calculated in the 2012 Ageing Report we find that the yearly unemployment benefit in Germany (€ 8,919) is much higher than in Poland (€ 397). The impact of this legal boundary will be discussed further in this report.

In 2011, **Romania** received reimbursement claims for an amount of € 49,167 (Table 71). Most of the claims were sent by Germany. Romania partially accepted 54% of the reimbursement requests, while 45% were not accepted and only 1% entirely accepted. Also here will the maximum amount of reimbursement play an important role as the unemployment benefit paid in Romania will be in some cases lower than the unemployment benefits paid in other Member States.

Finally, in 2011 **the Slovak Republic** received reimbursement requests for an amount of € 102,000 (Table 71).

#### 4.1.5.2 Number and value of issued reimbursement claims

---

The position as creditor can be described for the same six Member States (Table 72). This means that we collected data on cross-border workers receiving unemployment benefits in these Member States after having worked in other Member States.

In 2011, **Belgium** sent 3,353 reimbursement requests for an amount of € 8.7 million (Table 72). Most of these claims were sent to neighbouring countries (France, Germany, Netherlands and Luxembourg).

**Denmark** only issued eight reimbursement requests (Table 72).

No detail was available for **Germany**. However, the relevant German institution sent yearly about 16,000 reimbursement requests (second semester 2011 – first semester 2012) (Table 72). See for the German case the comments made as debtor (footnote).

**Poland** issued 7,599 reimbursement requests in 2011 for an amount of € 4.7 million (Table 72). Most of the Polish claims were received by the United Kingdom (41% of cases) and the Netherlands (23%

---

1. The numbers are still not stable for diverse reasons. E.g.

\*\* the reimbursement rules have recently changed (with the introduction of Decision U4 of the Administrative Commission) and may change again in future;

\*\* MS (Member States) changed / will change the way / periodicity how they submit their claims;

\*\* some rather large MS have not sent any claims until now (probably because of problems within their administrations);

\*\* One important partner for Germany is Switzerland. We do not yet have meaningful statistical data because the application period of the reimbursement procedure is rather short.

2. We do not know whether our partner MS would agree that we provide information regarding claims from or towards the respective MS. Therefore we can only provide a rough estimation about yearly reimbursement claims. The estimation is based on claims from the second semester 2011 (submitted in the first semester 2012) and the first semester 2012 (submitted in the second semester 2012).

\*\* yearly claims from Germany (Germany as creditor): 16.000 cases;

\*\* yearly foreign claims towards Germany (Germany as debtor): 7.000 cases".

<sup>58</sup> This limitation is not foreseen in the healthcare chapter of Regulation (EC) No. 883/2004. It would have an important impact on the amounts of reimbursement for LTC benefits in kind.

of cases). The debtor country rejected 71% of these Polish claims, while 29% of the claims were entirely accepted. The rejection rate is mainly influenced by the decision of the United Kingdom to reject all claims (644) from Poland.

**Romania** sent a total amount of € 33,000 of reimbursement claims, mainly to Germany and Luxembourg. Of Romania's claims, 76% were entirely accepted and 24% not accepted (Table 72).

Finally, the **Slovak Republic** claimed an amount of € 2.4 million, of which 42.9% was sought from the Czech Republic (Table 72).

The extent to which Member States experience labour mobility will have an impact on the number and amount of reimbursement claims.

For example: The number of incoming cross-border workers in Belgium is high, but the number of outgoing cross-border workers is even higher (Table 83). This high degree of labour mobility results in high levels of reimbursement requests sent and received. The amount of reimbursement requested (€ 8.7 million in 2012) will to a large extent compensate for the unemployment benefits paid out by the Belgian competent institution to former cross-border workers (€ 10.5 million in 2012). Germany, Poland and the Slovak Republic have a high number of outgoing cross-border workers which results in a much higher number/amount of claims issued compared to claims received. At the same time, Denmark and Romania attract more cross-border workers, which results in a higher amount/more case of claims received. The reimbursement procedure mainly affects Luxembourg and Switzerland, which have a high number of incoming cross-border workers (see Table 81, Table 82, and Table 83).

#### 4.1.5.3 Estimates of current reimbursement claims for the EU-27

---

A breakdown between claims for 3 months or 5 months is not available in the data of the launched questionnaire.<sup>59</sup> None of the responding countries could make this distinction in our questionnaire. In order to make an estimate, we will assume 3 months of claims (minimum scenario). Another crucial element which we should take into account for the calculation is the fact that the amount of reimbursement by the country of last activity is limited to the maximum unemployment benefit the unemployed person would receive in case of unemployment in the country of last activity.<sup>60</sup> For this exercise, we have multiplied the estimated number of unemployed cross-border workers based on the LFS and the unemployment rates of the Ageing Report by the unemployment benefit per unemployed person for three months (in 2010 prices; projected in the 2012 Ageing Report). For that reason the figures concerning the estimated yearly expenditure on unemployment benefits for unemployed cross-border workers should be read together with the figures dealing with the estimated reimbursement claims to assess who is sharing the burden of unemployment.

For each of the flows between MS (in the different cells) the unemployment benefit of the country of last activity and the unemployment benefit of the country of residence is taken into consideration (see also Table 95). The unemployment benefit of the country of residence will be used to calculate the claim of reimbursement. Also, this claim will be compared with the actual reimbursement taking into account the rule that the reimbursement cannot be higher than the amount payable, in the case of unemployment, under the legislation of the country of last activity (=maximum amount). The actual reimbursement will be equal to the claim when the unemployment benefit in the country of

---

<sup>59</sup> Art. 65, 6 and 7, Regulation (EC) No. 883/2004.

<sup>60</sup> See art. 65, 6, Regulation (EC) No. 883/2004; art. 70 and Annex 5 Implementing Regulation (EC) No. 987/2009.

residence is lower than or equal to the unemployment benefit in the country of last activity. The actual reimbursement will be equal to the unemployment benefit in the country of residence (=maximum amount) when the unemployment benefit in the country of residence is lower than the country of last activity (Table 95-Table 99).

The baseline scenario A1 whereby frontier workers have to return to the country of residence and other cross-border workers can choose between the country of residence or the country of last activity involves a claim of € 108.8 million of which € 98.1 million for frontier workers when we assume that 50% of the other cross-border workers return to their country of residence (Table 95). However, these claims are based on the unemployment benefits paid by the country of residence and not on the maximum payable amount by the country of last activity. It implies for this baseline scenario that the reimbursement will be 24% lower than the possible actual claim (see baseline scenario A1a - Table 96).

If other cross-border workers are making a rational decision on the basis of the amount of the unemployment benefit (baseline scenario A2a - Table 97 & Table 98), the claim will increase with 3% compared to the baseline scenario A1a whereby 50% of the other cross-border workers are returning to their country of residence.

#### *4.1.6 Estimated current administrative costs and burden*

---

##### *4.1.6.1 Data limitations*

---

In order to allow the stakeholders to identify the time spent on the information obligations related to the Regulations, we have defined prior to our visits in the Member States a standard legal process stemming from the Regulations, in cooperation with the Commission.

During our first visits, we noticed several issues concerning this process:

- National administrations have developed their own administrative processes for processing/handling documents related to cross-border cases for unemployment benefits and long-term care. These differ substantially between the Member States. As a result, the experts in the respective countries faced difficulties in plugging the suggested administrative processes into their national way of working (processing documents);
- The legal process encompassed several sub-administrative processes and documents and therefore Information Obligations (IOs). The complexity of the different processes proved to be an obstacle in making precise estimations of the (estimated) time spent for each of the processes. The experts were often not able to provide robust data on the time spent per each of the steps defined by the legal process.

Moreover, as the Regulations impose “principles” of coordination more than specific information obligations in the sense of the SCM, and as the principles were already applied partly or integrally by the administrations or applied still differently, it proved to be impossible for the stakeholders to differentiate the specific administrative burden<sup>61</sup> created by the Regulations from the *business-as-usual* (the administrative tasks they would perform anyway in the absence of the Regulations).

---

<sup>61</sup> The administrative burden is burden created by a legal requirement while the administrative cost is the full cost of an administrative process, including the business as usual.

Another consequence of the nature of the Regulations is that each national process is different, meaning that it results in different requirements, documents, times and complexity. It makes it impossible to standardize one process that fits all national specificities.

There are examples demonstrating the complexity of the processing of cross-border cases for unemployment benefits which can result in administrative cost and burden for Member States' authorities:

- The occasionally 'blurry' distinction between frontier workers and other cross-border workers, the distinction between wholly and partially unemployed frontier workers, the highly interpretable character of the criteria to determine the residence of a worker, the provisions on the aggregation of periods of insurance, employment and self-employment, and the reimbursement mechanism were mentioned as factors rendering the current coordination rules as complex;
- While these regulatory distinctions intend to reflect the complexities of real situations and account for the actual differences between different types of cross-border workers and different types of national systems, the result is a striking variety of possible cases in which the interpretation of the rules carried out by each institution plays a significant role;
- There are notable differences in the interpretation and application of the rules on the aggregation of periods and the extension of the period of export of unemployment benefits;
- The classic distinction between frontier workers and other cross-border workers has become more problematic. Inter alia, the improvement and reduction in the cost of different means of transportation has allowed workers to cover ever larger differences to commute daily or weekly for work. The elements fixed in Article 11 of Regulation (EC) No 987/2009 are broad enough to prevent mobile workers to know with certainty their country of residence and hence the legal regime applicable to them in case of unemployment;
- The reimbursement mechanism was often criticized, including claims considering that it should be made more transparent (Belgium) and that clear guidelines should be provided to each country (Luxembourg).

While the interviewees in certain countries defended that the current rules are sufficiently clear (e.g. the German Employment Services), the prevalent view was that the current coordination rules do not facilitate transparency and could be simplified. The burdensome character of the current rules was also criticized in countries which did not call for a revision of the coordination rules.

The diversity of opinions and practices in the application of certain aspects of the coordination rules is a testimony to the complexity of the rules and the lack of transparency they generate (since, given a similar situation in different regions, the similar outcome is not guaranteed). This complexity and incoherent understanding and application of the rules create a substantial (administrative) burden for the (national) administrations. This 'burden' is inherent to the management of cases where different understanding and national administrative processes apply; it goes beyond the definition of the administrative burden of the SCM where it is related to legal information obligations.

Around 40% of the participating public administrations reported that the EU rules create significant administrative costs and burden for national administrations. They consider the different types of

forms/documents used per country, the varying requirements/understanding in terms of the information needed to fill out the documents, their mandatory or optional character and advance the procedures, and the different delays in the completion and transmission of documents as some of the most salient and recurrent problems. The reimbursement mechanism was repeatedly mentioned as a source of burden mainly due to the slow and ineffective communication between Member States.

*“There are high administrative costs in what concerns to the reimbursement of the unemployment benefits that were paid. Moreover, we would highlight the delay on the treatment of the processes and the requests for payment that are denied. Because the EU rules create significant administrative costs and burdens for national administrations, EU law is not uniformly “understood” and applied by Member States and vice versa. ... Paper SEDs are not always suitable for the exchange of information and not all MS use the same documents/forms. Reimbursement procedures create high administrative burden and important costs for both the MS of last activity and the MS of residence and the cost/benefit ratio is not effective, mainly for the MS of residence. The communications between institutions is slow and needs to be more effective.”*

Several public officials expect the administrative burden to decrease in the next couple of years as a result of learning effects after the successful implementation and alignment of the rules. While the adoption of the Regulations took place ten years ago, it has taken time to fine-tune the implementation of the new rules and procedures. The lack of sound implementation of the new rules and procedures is particularly visible in a number of Member States. According to the online survey, 64% of the administrations stated that the communication (with other Member States) works well in general. However, there are problems with specific Member States. These reported problems are expected to be the main source of administrative costs.

Technological evolution could resolve some of the problems related to cooperation and communication. However, divergent interpretations of the rules and the information requirements for the completion of portable documents will continue to pose difficulties in the proper application of the Regulations.

In light of the limitations associated with the quantification of information obligations stemming from the application of the Regulations, we have adapted our approach for quantifying the IOs resulting from the Regulations and for assessing the (potential) impact of the policy options on the overall administrative process. In our analysis, we focused on a selected number of documents for which the stakeholders were able to provide robust information on a) the time spent to process/handle a document and b) the (approximate) number of cases.

We have collected useful information on the processing of documents related to cross-border cases for unemployment benefits on a) the estimated time and b) the number of cases in the following countries: Belgium, Poland, Luxembourg and Romania by means of a workshop. Other countries have provided a wealth of qualitative information which is useful for understanding the underlying problems related to the processing of the different documents and for assessing the (potential) impacts of the different options.

Despite the data limitations resulting from the problems discussed in this chapter, the assessment of the administrative cost (baseline scenario) for a number of key documents provides a robust basis for

assessing the theoretical impact (positive or negative) of the different policy options on the administrative cost.

#### 4.1.6.2 Aggregation of periods of employment/insurance/self-employment<sup>62</sup>

---

The number of PD U1/E301 documents received/issued provides insight into the extent to which periods of insurance and (self-) employment in another Member State were taken into account when granting unemployment benefits. For the purpose of the assessment of the administrative costs, we do not make any distinction between PD U1 documents and E301 documents (Member States are using either of the documents, depending on their national administrative processes). Both documents are treated interchangeably for the purpose of this exercise.

In the framework of this study, we have collected data on the number of PD U1 documents 'issued' and 'received'. The following countries provided data on the total number of PD U1 documents 'issued': Belgium, Estonia, Luxembourg and Romania. With regards to the number of PD U1 forms 'received', we have collected data for Belgium, Estonia, France, Poland, Romania, Slovak Republic, Sweden and the UK. In addition, we have collected data on the aggregation of periods of employment/insurance/self-employment by means of a workshop in the following countries: Belgium, Poland and Romania (data provided for E301 only).

In order to assess the administrative costs for the EU-27 stemming from the processing of the PD U1 documents, we have carried out the following steps according to the Standard Cost Model (SCM)<sup>63</sup>:

##### Calculation of the unit cost per case:

The unit cost per case (processing/handling of a PD U1 form by the administrative staff – clerk level) provides insight into the total cost for processing one single PD U1 document (in a given Member State). It is based on the following formula:

$$\text{Time (T) x Wage (W)}$$

During the workshops and interviews in the Member States, we have collected data on the average standard time spent for processing/handling a PD U1 document for the following countries: Poland (5 minutes), Belgium (60 minutes) and Romania (363 minutes)<sup>64</sup>. As the data show, there are stark differences between the lowest time for processing data/information (Poland - 5 minutes) and countries where the processing time is relatively higher (Romania - 363 minutes). Belgium (60 minutes) ranges in the middle.

In Poland, for example, the process for handling PD U1 documents is automatized - Poland uses the portable documents efficiently (the administrative staff faces less administrative burden). According to the interviewees (national administration), the handling of the documents is reported to be less burdensome.

---

<sup>62</sup> See also 10.8

<sup>63</sup> Based on the following formula: Number of cases (N) x Wage (hourly tariff) (W) x Time (minutes) (T).

<sup>64</sup> We have also received a rough, undetailed estimation of the issuance of E 301/PD U1 documents for the Netherlands (source: public employment service UWV). The average administrative burden to issue this document is estimated at 30 minutes (comparable to Belgium's estimates). 90% of the cases is processed within 8 weeks.

In Romania, on the other hand, the administration of E301 documents (note: not PD U1 in this case) is reported to be more burdensome. According to the interviewees, the administration of simple cases, with limited or no clarifications requested from the beneficiary or employer, may take minimum 1 hour of work in total for the person in charge<sup>65</sup>. The administration of complex cases, with a lot of missing, inadequate or incorrect information in the dossier, may request up to 8 hours of effort from the person in charge. In such cases, the respective civil servant assumes an active role in the completion of a correct dossier and starts giving phone calls, researching different taxes and employment data bases etc.

Based on the interviewees' responses for Poland, Belgium and Romania, it can be assumed that these three countries give good indications for calculating the average unit cost for processing/handling a PD U1 document: Poland (low administrative burden – 5 minutes), Belgium (average administrative burden – 60 minutes) and Romania (high administrative burden – 363 minutes).

For consistency and comparability with other SCM assessments of EU regulation, the tariff variable used in this study is based on hourly labour costs (plus overheads) per category of employment that has previously been used in recent SCM studies for DG EMPL<sup>66</sup> and our recent Impact Assessment studies we have conducted for the Commission. We have applied an average tariff/hour of EUR 18. It results in a rate per minute of EUR 0.3 (EUR 18/60 minutes).

The **average unit cost for the EU-27 is EUR 42.8**. It is calculated on the following basis: Time ((5 minutes (Poland) + 60 minutes (Belgium) + 363 minutes (Romania)) / 3) x Wage 0.3 = **EUR 42.8**

## 1. Number of cases:

We have collected data for the number of PD U1 documents 'received' for the following countries: Belgium, Estonia, France, Poland, Slovak Republic and the UK. We have estimated the number of PD U1 documents for the other EU-27 countries on the basis of our own calculations based on collected administrative data and the 2012 Ageing Report (see section 4.1.2.1 for more detailed information on the number of PD U1/E301 forms 'received' and 'issued'). We were able to calculate the estimated administrative cost for the EU-27 on the basis of this data. The total estimated number of PD U1 documents 'received' in the EU-27 in 2010 is around **340 000**.

## 2. Calculation of the administrative cost (per Member State and for the EU-27)

We have calculated the administrative cost for processing PD U1 documents on the basis of this formula:

$$\text{Time (T)} \times \text{Wage (W)} \times \text{Number (N)}$$

---

<sup>65</sup> There are no legislation/manual/ instructions/guidelines explaining step by step what the Romanian authorities need to do specifically for each procedure for unemployment under the Regulation; in fact, no other Romanian authority has prepared any specific national legislation/manual/instructions/guidelines related to the implementation of the Regulation, with the exception of the Pensions Authority. The Regulation 883/2004 is implemented in Romania via the Intermediary Body (National Labour Office) and Competent Institutions (County Labour Offices – 42 in total). The Intermediary Body mainly acts as a facilitator of contacts between Romanian institutions and foreign ones, as well as trainer and day-to-day support to county offices meeting difficulties in implementation of the Regulation. In the Intermediary Body there are two persons working on the Regulation (one person is 100% dedicated to the activities related to the Regulation, the other one dedicates approximately 70% of his/her time to the Regulation).

<sup>66</sup> For instance: Review of the Working Time Directive 2003/88/EC: measuring administrative costs and burdens of various possible options. Economisti Associati srl, 21/12/2011. This study presents a tariff per MS and per level (managerial and clerical staff) that we have averaged. The result is in line with the tariff we use in other SCM that we have conducted for other European Commission DGs.

The table below presents the total estimated administrative cost for processing PD U1 documents. The **estimated total cost for the EU-27 in 2010 was EUR 14 604 326**. Within the EU-27, the estimated total cost for processing PD U1 documents was highest (> EUR 1 million) in a number of the old Member States (in descending order): Spain, France, Germany and Italy. It was lowest (< EUR 100 000) in descending order in Sweden, Estonia, Slovenia, Cyprus, Luxembourg and Malta.

**Table 12: Estimated administrative Cost - PD U1 ('received'), EU-27, EUR, 2010**

Country	Unemployed persons (20-64) - 2010 (in .000)	PD U1 (received)		Total	Total cost (in EUR)
		2010/2011/2012 Survey	2010 Estimate		
BE	385	2,400		2,400	102,720
BG	351		5,541	5,541	237,141

Source: Estimate based on collected administrative data and 2012 Ageing Report and data provided during the workshops on administrative burden (Belgium, Poland and Romania).

We have also calculated the average administrative cost for processing/handling a number of other documents, based on the data available. We were only able to produce the administrative cost for processing PD U1 documents ('received') for the EU-27 as we had data available for the EU-27 on the basis of our own calculations (there are no calculations for the other documents presented below).

We have calculated the administrative cost for 'issuing' a PD U1 document ('issued') for Poland and Belgium (based on the data we have collected during the workshops in the different countries). The total estimated cost for 'issuing' a PD U1 document in Poland is estimated at EUR 19 800. The amount is EUR 103 698 in Belgium. The table below presents the estimated cost for 'issuing' a PD U1 document for Poland and Belgium.

**Table 13: Estimated administrative Cost – PD U1 ('issued'), Poland and Belgium, EUR, 2013**

	Poland	Belgium
Unit cost per case (EUR)	6.6	9
Number of cases	3000	11522
Total cost (EUR)	19800	103698

Source: Deloitte, Workshop, Poland and Belgium

We have also estimated the cost for the following documents for Poland<sup>67</sup>:

- SED U004 'Salary Info' (answer on SED U003);
- SED U006 'Family Info' (answer on SED U005).

The table below presents the estimated cost for processing the above-mentioned documents in Poland. The total estimated cost for processing a SED U004 document 'Salary Info' in Poland is EUR 402. The cost for processing SED U006 documents 'Family Info' is estimated at EUR 825.

**Table 14: Estimated administrative Cost –SED U004 'Salary Info', SED U006 'Family Info', Poland EUR, 2013**

SED U004 'Salary Info' (answer on SED U003)	
Unit cost per case (EUR)	4.2

#### 4.1.6.3 Export of unemployment benefits<sup>68</sup>

The PD U2 form is the authorisation which an unemployed person needs to export his/her unemployment benefit if (s)he wishes to move to another EU country to look for work. The competent national institution is responsible for granting this authorisation. There is a wide variety of practices in the EU-27 with regard to granting (and prolonging) authorisation to export unemployment benefit.

We have collected data on the number of PD U2 documents 'issued' for ten EU Member States: Austria, Belgium, Denmark, Estonia, Luxembourg, the Netherlands, Poland, Slovak Republic, Sweden and the UK. Taking together both components (survey data and own estimates) we estimate that 23.7 thousand unemployed persons have exported their unemployment benefits in 2010 (see section 4.1.3.3 for a detailed discussion on the calculation of the number of PD U2 'received' and on the methodology for calculating missing data).

We have calculated the administrative cost for processing/handling a PD U2 document for the EU-27 using the following methodology:

##### **1. Calculation of the unit cost per case:**

The average unit cost per case is based on the data we have received from Poland (the only country for which we have received robust data on the time spent for processing a PD U2 document<sup>69</sup>). The average unit cost per case that we found concerns the export of an unemployment benefit to 3

<sup>67</sup> Poland has provided the most comprehensive data set on the administrative burden resulting from the information obligations stemming from the Regulation during the workshop.

<sup>68</sup> See also 10.8

<sup>69</sup> A rough, undetailed estimation was collected for the Netherlands (source: public employment service UWV). UWV estimated the average time needed to issue a PD U2 document at 1.5 hour. 90% of the cases are estimated to be processed within 5 weeks.

months<sup>70</sup>. Following the formula Time (T) x Wage (W), we have estimated an average unit cost per case (PD U2 'issued') at **EUR 4.5**<sup>71</sup>.

The estimated unit cost should be treated with caution as it is based on one case only (Poland). As discussed in the section on the 'aggregation of periods', Poland seems to have an efficient (automatized) system for processing/handling PD documents (the processing of the documents is reported to be less burdensome). Therefore, it is to be expected, that the Polish example presents a rather positive picture on the overall time spent to process these documents. Other countries, such as Romania (which reported a much higher time spent for processing the PD U1 document) may report longer periods for processing/handling these types of documents. Due to data limitations, we have calculated the average unit cost on the basis of the Polish example.

## **2. Number of cases:**

We have collected data on the number of PD U2 documents 'issued' by means of a questionnaire for the following countries: Austria, Belgium, Denmark, Estonia, Luxembourg, the Netherlands, Poland, Slovak Republic, Sweden and United Kingdom. In 2010, the total EU-27 number of PD U2 documents 'issued' is estimated at around 23 700.

## **3. Calculation of the administrative cost (per Member State and for the EU-27)**

We have calculated the administrative cost for processing PD U2 documents ('issued') on the basis of this formula:

$$\text{Time (T) x Wage (W) x Number (N)}$$

The calculation includes the time spent on national administrative procedures supporting the processing of the SEDS and the time needed for processing the SED.

The table below presents the total estimated administrative cost for processing PD U2 documents. The **estimated total cost for the EU-27 in 2010 was EUR 106 695**. Within the EU-27, the estimated total cost for processing a PD U2 documents was highest (> EUR 10 000) in a number of the old Member States (in descending order): Spain, Germany and France. It was lowest (< EUR 500) in descending order in Slovenia, Slovak Republic, Estonia, Cyprus Malta and Romania.

---

<sup>70</sup> We were not able to collect data on the average unit cost of a case where an unemployed persons export his unemployment for 6 months. Therefore, we needed to rely on a qualitative assessment to know how the administrative burden shifts if the export period is prolonged from 3 to 6 months.

<sup>71</sup> Average time to process a PD U2 document in Poland is approximately 15 minutes. The average wage (clerk) is estimated at EUR 0.3 per minute (EUR 18 per hour): 15 x EUR 0.3 = EUR 4.5.

**Table 15: Estimated administrative Cost –PD U2 ('issued'), EU-27, EUR, 2010**

Source: Estimate based on collected administrative data and 2012 Ageing Report and data provided during the workshops on administrative burden (Poland).

We have also estimated the cost for the following documents for Poland<sup>72</sup>:

Competent employment service:

- SED U011 'Effect to Entitlement - Export' (answer to SED U010);
- SED U012 'Request for monthly follow-up'.

Employment service of the MS where jobseeker has gone:

- Process PD U2;
- SED U007 'Request Document on Export';
- SED U009 'Notification Registration - Export';
- SED U010 'Circumstances Affecting Entitlement - Export' (linked with U3 form);
- Issue of PD U3 (linked with SED U010);
- SED U013 'Monthly Follow-up' (answer on SED U013);
- SED U028 'Request Entitlement to Export'.

<sup>72</sup> Poland has provided the most comprehensive data set on the administrative burden resulting from the information obligations stemming from the Regulation during the workshop.

The tables below present the total estimated administrative cost for processing the respective documents presented according to a) competent Member State and b) employment service of the Member State where the jobseeker has gone. The estimated unit cost per case is based on the data provided by Poland (T: time and W: wage (EUR 0.3)). Note that the unit cost per case differs from the one calculated for processing the PD U2 document in the documents presented below. We have not calculated the EU-27 average cost for all documents due to data limitations. Be aware that these costs occur separately, others are combined. There is no overview of the total number of flows. In the future this should be made possible by EESSI.

#### 4.1.6.4 Reimbursement claims<sup>73</sup>

---

Claims for reimbursement can be made by the country of residence to the country of last activity for fully unemployed frontier workers but also for other cross-border workers who have decided to register with the competent institution in their country of residence. The country of last activity reimburses the unemployed benefits provided in the country of residence during the first three months or five months (when the unemployed person during the preceding 24 months, completed at least 12 months of (self)employment in the country of last activity). Reimbursement procedures are defined under art. 65(6) and (7) of Regulation (EC) No. 883/2004 and art. 70 of Regulation (EC) No. 987/2009.

##### **1. Calculation of the unit cost per case:**

The average unit cost per case is based on the data we have received from Poland (the only country for which we have robust data on the reimbursement claims. Following the formula  $\text{Time (T)} \times \text{Wage (W)}$ , we have estimated an average unit cost per case for each of the individual documents.

##### **2. Number of cases:**

We have collected data on the number of cases for Poland for a number of documents. There are no estimated data available for calculating the estimated total number of cases of reimbursement claims in the EU. For a detailed discussion on the number of claims received (as debtor) and the number of claims issued (as creditor) (see section 4.1.5)..

##### **3. Calculation of the administrative cost (Poland)**

We have calculated the administrative cost for processing a number of documents related to reimbursement claims for Poland by applying the following formula:  $\text{Time (T)} \times \text{Wage (W)} \times \text{Number (N)}$ .

Data were collected for the following documents:

Member State of residence:

- SED U020 'Reimbursement Request';
- SED U025 'Reimbursement Receipt/Closing notification'.

Competent Member State:

- SED U021 'Reimbursement Full Acceptance' (possible answer to SED U020);
- SED U022 'Reimbursement Non Acceptance' (possible answer to SED U020);
- SED U023 'Reimbursement Partial Acceptance' (possible answer to SED U020);
- SED U024 'Reimbursement Payment Notification'.

The table below presents the total estimated administrative cost for processing the following documents for Poland presented according to 'Member State of residence' and 'Former working Member State':

## **4.2 Coordination of long-term care benefits**

### *4.2.1 Scale of cross-mobility of pensioners*

---

Pensioners and cross-border workers – and their insured family members – are the most important group impacting cross-border expenditure on LTC benefits.

The recent migrant pensioners (aged 65 and over) who have moved from one EU-country to another in 2011 are counted in the Eurostat migration statistics (Table 20). Also for this group of recent migrant pensioners we are missing figures for BE, BG, HU, MT, NL, PL and RO. Especially the UK (11 thousand in 2011) and Spain (10 thousand in 2011) are important migration countries for pensioners.

Ideally, a table with the current stock of pensioners by previous country of residence should be available because this variable is probably the best proxy to estimate the number of pensioners insured in another country than the country of residence and to calculate the amount of LTC reimbursements between countries.

**Table 20: Migrant pensioners (65 years or over) in 2011 by country of previous residence, EU-27**

#### 4.2.2 *Number of persons insured for LTC*

---

The number of those insured for health care living in another country than the competent country – which sometimes includes long-term care or to which LTC-insurance is closely linked – can be calculated based on the number of PD S1s - or E106 forms (insured person), E109 forms (family member of insured person) and E121 forms (pensioner and family member of pensioner).

The PD S1 form allows a person to register for healthcare in the country of residence when insured in a different one. The form is delivered per person (not per family). The distinction between the types of person insured for health care is still made by the PD S1. For that reason, the questionnaire (limited to 14 MS) asked for the number of insured persons, family member of insured persons, pensioners and family members of pensioners. Only two Member States (Belgium and Luxembourg) provided a breakdown of the number of PD S1 issued by type of person (Table 73). More general data was obtained for two other Member States (the Netherlands and Slovak Republic). The questionnaire asked only for the **number of PD S1s issued**. However, the number of PD S1s received could also be given. For example, there are data on the number of PD S1's received by Belgium (including by type of insured person) (Table 74). For reason of this poor response to our administrative questionnaire we opted for an estimate of the PD S1. Two large categories can be distinguished (see also tables above). PD S1 forms will be issued to cross-border workers (and their family members) and mobile pensioners (and their family members).

##### 4.2.2.1 *PD S1 issued to incoming cross-border workers and their family members*

---

A PD S1 is issued to incoming cross-border workers and in some cases also to their family members (e.g. when the partner is inactive). Based on our survey we observed the following for Luxembourg and Belgium.

As **Luxembourg** attracts a lot of cross-border workers, it issues a high number of PD S1 forms. As of end March 2011, 162,638 cross-border workers were insured in Luxembourg (Table 73). They resided mainly in neighbouring countries: 48.1% in France, 24.9% in Belgium and 24.7% in Germany. In addition, 60,868 family members of cross-border workers working in Luxembourg were insured there, or 37.4% of the number of cross-border workers. It should be noted that more than one family member can be related to a cross-border worker (inactive partner and children).

For **Belgium**, only figures on incoming frontier workers were received. As of end-June 2012, there were 46,484 frontier workers in Belgium, of whom 79.1% resided in France (Table 73). The number of family members of cross-border workers employed in Belgium and insured in this Member State was 512. A striking figure is the percentage of family members residing in Poland who are insured in Belgium (32.8% of the total number of family members of persons insured in Belgium).

Due to the lack of data, it is necessary to use other data sources in estimating the number of insured cross-border workers **for the EU-27**. By making use of LFS data, the number of cross-border workers can be estimated.<sup>74</sup> On average, one million cross-border workers live in one EU-27 Member State but work in another (average of 2010 and 2011). Cross tables provide insights into their country of residence and country of employment. We consider the row and column totals as the most reliable,

---

<sup>74</sup> Based on the question 'What is the name and address of the *local unit* of the enterprise where you work?' and variables 'COUNTRYW' (country of place of work) and 'COUNTRY' (country of residence) in the database. As already mentioned also posted workers who are insured in their country of residence can be captured by this question.

in line with the reliability limits provided by Eurostat for the LFS.<sup>75</sup> The bilateral cells between countries need to be interpreted with even more care. All cells should be compared with these reliability limits. However, by taking two years together, the cells can be assumed to be relevant by avoiding outliers and by counting more observations. We will need them for further calculations. Most cross-border workers are employed in Germany (186,000) and Luxembourg (131,000). The country of employment will have to issue a PD S1 for all these cross-border workers living in another country.

#### 4.2.2.2 PD S1 issued to pensioners moving to or living in another Member State

---

A PD S1 can also be issued to pensioners (and their family members) who move to or live in another Member State than the competent Member State. Chapter I 'Sickness, maternity and equivalent paternity benefits', section II 'Pensioners and member of their families' in Regulation (EC) No. 883/2004 makes the distinction between 'Right to benefits in kind under the legislation of the Member State of residence' and 'No right to benefits in kind under the legislation of the Member State of residence'.

First, we look at the Regulation when a pensioner is entitled to benefits in kind under the legislation of the Member State of residence. Art. 23 states that: "A person who receives a pension or pensions under the legislation of two or more Member States, of which one is the Member State of residence, and who is entitled to benefits in kind under the legislation of that Member State, shall, with the members of his family, receive such benefits in kind from and at the expense of the institution of the place of residence, as though he were a pensioner whose pension was payable solely under the legislation of that Member State."

Second, we look at the Regulation when a pensioner is entitled to benefits in kind under the legislation of the Member State of residence. Art. 24, 2 makes a distinction between being only entitled to benefits in kind under the legislation of a single Member State and being entitled to benefits in kind under the legislation of two or more Member States: "*(a) where the pensioner is entitled to benefits in kind under the legislation of a single Member State, the cost shall be borne by the competent institution of that Member State; (b) where the pensioner is entitled to benefits in kind under the legislation of two or more Member States, the cost thereof shall be borne by the competent institution of the Member State to whose legislation the person has been subject for the longest period of time; should the application of this rule result in several institutions being responsible for the cost of benefits, the cost shall be borne by the institution applying the legislation to which the pensioner was last subject.*"

We do not have data on the relative shares of exclusive or mixed pensions. It is a share between 0 and 100% that could be used as minimal or maximal estimate. The average would be 50% of those two extreme hypotheses.

This legislation is important in making an estimation of the number of pensioners who received a PD S1 form from a specific Member State. First, we discuss the data from the Member States of which data has been received (Table 73).

---

<sup>75</sup> [http://circa.europa.eu/irc/dsis/employment/info/data/eu\\_lfs/LFS\\_MAIN/Related\\_documents/reliab\\_annual\\_average.htm](http://circa.europa.eu/irc/dsis/employment/info/data/eu_lfs/LFS_MAIN/Related_documents/reliab_annual_average.htm) and Annex VII

As of end of March 2011 (= number of insured persons living abroad at that moment), **Luxembourg** had issued 7,622 PD S1 to pensioners mainly moving to/residing in Belgium, France, and Germany (Table 73). There were also, 2,798 family members of pensioners moving/residing in another Member State insured in Luxembourg.

Belgium had issued 28,166 PD S1's (situation end of June 2012) to pensioners (Table 73). Most of these forms were issued to pensioners moving to/residing in France (42.3%). More 'surprising' is the high number of PD S1's issued to pensioners moving to/residing in Spain (22.5%) and Italy (15.7%). It confirms, yet for Belgium, the hypothesis of pensioners moving to Mediterranean countries and also of Italian migrant workers moving to their country of origin/birth.

If we want to estimate the total number of pensioners in the **EU-27** who have received a PD S1 form, other data sources have to be used. The legislation to determine which Member State is competent has a strong impact on the calculations. The number of pensioners moving abroad can be estimated by the LFS. We already discussed the limitations of the LFS regarding the interpretation of the number of pensioners who moved abroad after their retirement.

#### 4.2.3 *Number of persons receiving LTC benefits in cash*

---

There are data from five Member States (Austria, Belgium, Germany, Luxembourg and United Kingdom) on **exported LTC cash benefits** (Table 75 and Table 78).

Before describing the data, some explanation is needed. Some of our national experts who collected the data did not receive any data in their Member State because the LTC benefit in cash was not considered to be exportable (e.g. APA in France<sup>76</sup>; Romania<sup>77</sup>). At the same time, no (detailed) data were available for some Member States. Moreover, not every Member State has an LTC benefit in cash.<sup>78</sup>

In 2012, 2,570 people exported *Pflegegeld* from **Austria** to another Member State (Table 75)<sup>79</sup>. This was only 0.6% of the total number of people entitled to it (444,000 persons). The number exporting this LTC benefit decreased between 2010 and 2012 by 7.4%. A breakdown by Member State could be made for February 2012, where 70% of this LTC benefit in cash was exported to Germany.

Data were collected for three types of LTC cash benefits cash in **Belgium** (Table 75). 27 people living abroad were entitled to the *Flemish Care Insurance*. The estimated cost is € 42,000. This is only 0.01% of the total number entitled to this LTC cash benefit (217,400 in 2011) (Table 78). In addition, on average 30 people exported *the Integration allowance OR the allowance for assistance to the elderly* from Belgium to another Member State. Thus, export of these Belgian LTC cash benefits was very limited. The competent institution assumes that the *Personal Assistance Budget* is not exportable.<sup>80</sup> For that reason no data was provided by them. It was not possible to collect exact figures on how

---

<sup>76</sup> The French competent institution CNSA stated in an email to HIVA KU Leuven that "*the Allocation personnalisée d'autonomie (APA) benefit supposes a condition of residence in France*". However, we read in a trESS national report for France that "*in practice though, it seems that the APA is sometimes exported to other Member States (especially Belgium) by the French local authorities which are in charge of their granting.*"

<sup>77</sup> The Romanian competent institution stated that the "*Health Insurance Houses do not insure persons for LTC for benefits in kind and in cash*".

<sup>78</sup> See 'list of cash benefits and benefits in kind as referred to in Article 34 of Regulation (EC) No. 883/2004' (<http://ec.europa.eu/social/main.jsp?catId=868&langId=en>) and the MISSOC tables.

<sup>79</sup> See also [https://www.statistik.at/web\\_de/statistiken/soziales/sozialleistungen\\_auf\\_bundesebene/bundespflegegeld/index.html](https://www.statistik.at/web_de/statistiken/soziales/sozialleistungen_auf_bundesebene/bundespflegegeld/index.html)

<sup>80</sup> The Flemish Agency for Disabled Persons stated that the Personal Assistance Budget only is granted to persons domiciled in Belgium.

many people receive an *allowance for children with disabilities supplementary to child benefit*. However, an estimate could be made. There were in 2011 42,242 children of foreign cross-border workers entitled to a child benefit paid by Belgium.<sup>81</sup> Also, in Belgium, there are in total 2.1% children with disabilities. This percentage was applied to these 42,242 children. This results in an estimate of 900 children entitled to an *allowance for children with disabilities supplementary to child benefit* or a total cross-border expenditure of € 3 million.

In 2010, 1,875 people living abroad were assessed to receive in cash *Pflegeversicherung* ('Pflegegeld') from **Germany** (Table 75).<sup>82</sup> This was a decrease of 9.7% compared to 2006. The assessment was mainly asked for by people living in Spain (30.3%) and Austria (27.8%). The competent institution estimates that on average 5,000 persons living abroad receive the *Pflegeversicherung* from Germany.<sup>83</sup> This accounts for an expenditure of € 3 million (Table 78). This is 0.2% of the total number of people in the *Pflegeversicherung* (2.4 million persons in 2010) or 0.01% of expenditure (€ 21.5 billion).<sup>84</sup>

In 2011, **Luxembourg's LTC Insurance** was exported to another Member State in 359 cases, especially to Germany (51.8%) (Table 75)<sup>85</sup>. This number represents some 2.3% of beneficiaries of LTC in Luxembourg). This involves a total yearly cross-border expenditure of € 3.6 million (Table 78 based on CNS, *Décompte de l'assurance dépense de l'exercice 2011*<sup>86</sup>). The Luxembourg report on social protection 2011 observes "Toutefois, le nombre de personnes bénéficiant de prestations et résidant à l'étranger est très faible alors que la population protégée résidant à l'étranger est importante" (p. 148).<sup>87</sup> This illustrates that our further calculations on cross border LTC expenditures will be considered as theoretical and maximized.

Finally, total numbers were collected for three types of LTC cash benefits in the **United Kingdom** (Table 75 and Table 78). In 2011, 4,210 people exported the *Disability Living Allowance* from the United Kingdom, a cross-border expenditure of £11 million. Again the impact is limited to 0.1% of the total beneficiary population (3.2 million persons) receiving this cash benefit or 0.1% of total expenditure (£ 12.6 billion). The *Attendance Allowance* is received by 1,090 persons living abroad at a cost of £ 3 million. Finally, the *Carers Allowance* is exported by 230 persons to another Member State at a cost of £1 million.

The relative importance of the number of cross-border users and related expenditure on these LTC benefits in cash is very limited compared to the total number of users and expenditure on LTC benefits in cash by a Member State. It mostly fluctuates between 0.01% and 0.6% of total number of users and expenditure.

#### 4.2.4 Number of persons receiving LTC benefits in kind

<sup>87</sup> [http://www.mss.public.lu/publications/rapport\\_general/rg2011/rg\\_2011.pdf](http://www.mss.public.lu/publications/rapport_general/rg2011/rg_2011.pdf)

The number of persons who received a LTC benefit in kind and the cost involved can be calculated via the Structured Electronic Document (SED) S080 (claim for reimbursement) (point 3.14 '*Long-term care benefit*' amount AND /OR point 3.20 '*Nature of benefits*' = long-term care). However, this is only for reimbursements determined on the basis of actual expenditure and not on the basis of fixed amounts. Some Member States receive only fixed amounts calculated on the basis of a formula defined in Regulation (EC) No. 883/2004. Even though Member States can use the SED-forms related to health care, they still use the old E-forms (E125 'Individual record of actual expenditure', E126 'Rates for refund of benefits in kind' and E127 'Individual record of monthly lump-sum payments'). There is a limitation in that LTC is not mentioned on the E 125 form, which makes it very difficult to calculate LTC benefits in kind.

None of the Member States could respond to our question asking for a calculation of the number of people receiving a LTC benefit in kind and the cost involved (Table 76 and Table 77).<sup>88</sup> However, a proxy of the use and cost of the export of LTC benefits in kind was noted for Belgium. We saw that 28.3% of the claims received by Belgium via an E125 form were applicable to persons aged between 65-80 and 10% to persons aged older than 80. 27.9% of the claims received by an E125 form involve persons aged between 65-80 and 16.5% aged older than 80 (Table 77). This pattern is also visible in the other direction: 10% of the E125 claims sent by Belgium to other Member States involve someone aged 65-80 (or 20.3% of the amount of claims issued) and 5% are for people aged older than 80 (or 20.5% of the amount of claims issued) (Table 77).

#### *4.2.5 Estimated number of PD S1 issued by category and estimated expenditure on LTC benefits*

---

Our questionnaire aimed to obtain an overview of the number of persons insured for LTC benefits in kind and in cash, the extent to which these people actually received benefits and the corresponding cost of the benefits provided (reimbursed by the competent Member State).

However, this exercise requires detailed information from the reporting Member States concerning the issue of PD S1 by status (insured person, pensioner, family member of the insured person and family member of the pensioner) and the claims (e.g. by SED S080 – only for actual expenditure in kind). We observed that many of the Member States still use the 'old' E-forms to communicate with other national administrations or with the citizens involved. For example, the E-106 form (certificate entitlement to sickness benefits in kind insured person), the E-109 (certificate entitlement to sickness benefits in kind family members insured person) and the E-121 form (certificate entitlement to sickness benefits in kind pensioner and family members of the pensioner) were replaced by the portable document (PD) S1 (and SED S072 'Entitlement document – residence'). Nevertheless, the total number of these three forms is still counted to calculate the number of persons insured to sickness benefits in kind, who reside in a Member State other than the competent Member State. This detail was only collected for two Member States in our sample. That is why other data sources needed to be exploited.

The number of persons who received LTC benefits in kind could be calculated by extracting data from the SED S080. In principle, the general method of reimbursement is the refund on the basis of actual

---

<sup>88</sup> E.g. Belgium: it has to be mentioned that LTC benefits in kind included in the health insurance (old age homes, nursing homes, district nursing) or other social care could not be documented, although they especially are included in the LTC-definition used in the 2012 Ageing Report.

expenditure and exchanged between the competent national authorities by the use of SED S080 (former E125) which is an individual claim for an actual expenditure. The receipt of LTC is explicitly mentioned in this form (point 3.14 'Long-term care benefit' amount AND point 3.20 'nature of benefits': Long-term care). This detail would deliver us valuable information about the number of persons who received long-term care. Only by a way of exemption, those Member States<sup>89</sup> whose legal or administrative structures are such that the use of reimbursement on the basis of actual expenditure is not appropriate, can reimburse benefits in kind on the basis of fixed amounts for some specific categories: family members who do not reside in the same Member State as the insured person and pensioners and members of their families. Each of these Member States has to calculate the monthly fixed amount (average costs) per person, which should be as close as possible to actual expenditure. The method of calculation is defined in the implementing Regulation (EC) 987/2009. For the exchange of the information needed for the refunds on the basis of fixed amounts SED S095 (former E127) is used. That form is an individual record of monthly lump sum payments. However, a long-term care category is not explicitly taken up by this form. A possible proxy is the selection of SEDs S095 forms handling a claim of a person aged 65+ (see point 2.5 'Lump sum category' in this SED). However, today both forms (SED S080 and SED S095) are not used by Member States. The E125 form (actual expenditure) and E127 form (fixed amounts) do not mention the specific category 'long-term care'. By this, it was not possible to count the number of persons who received long-term benefits in kind. Again, we had to look for alternative data. We estimated the probable number of PD S1 and will use it further to estimate the use of health care and LTC.

Three categories of PD S1 are identified:

- Cross-border workers (and their family members);
- Retired former cross border workers (and their family members);
- Other mobile pensioners (and their family members).

First objective was to calculate the number of persons who are insured to sickness benefits in kind living in a Member State other than the competent Member State. To work as detailed as possible a distinction should be made between the different categories of insured persons. By the Labour Force Survey, the number of cross-border workers was calculated for 2010 and 2011. An average of both years was calculated to improve the representativeness of cell data and to exclude outliers. Calculations were made only for the EU-27 Member States. On average 1 million cross-border workers are employed in another EU-27 Member State than the Member State of residence, or 0.48% of the total working population. The working countries will issue a PD S1 to these incoming cross-border workers while the countries of residence will receive this PD S1. However, as already mentioned also posted workers can be included by the definition used in the LFS. These persons are still insured in the country of residence. The cross table illustrates which countries are mostly involved in this cross-border mobility of workers (Table 81). Most of the PD S1 certificates have been issued by Germany (186.1 thousand forms) and Luxembourg (130 thousand forms) while most of the PD S1 have been received by Germany (165.4 thousand forms) and France (159.6 thousand forms). The accurateness of these survey figures can be verified by the administrative data we received from two Member States (Belgium and Luxembourg) (Table 73). Luxembourg issued 162.6 thousand PD S1 forms to insured persons (situation end of March 2011), which is somewhat higher compared to the LFS estimation of PD S1 issued. For Belgium we know from the administrative survey that 46.5

---

<sup>89</sup> Annex III Regulation (EC) No. 987/2009: Ireland, Spain, Cyprus, the Netherlands, Portugal, Finland, Sweden, the United Kingdom, Norway.

thousand PD S1 certificates were issued to frontier workers (only cross-border workers coming from France, Germany, Luxembourg and the Netherlands). Based on data of the LFS, 50.1 thousand frontier workers should have received a PD S1 certificate from Belgium.

Second, the number of family members of insured persons who are insured in a Member State other than the competent Member State should be counted. They should be added as 'dependent persons'. We assume that 20% of the insured persons will have an insured family member. This assumption is based on data we received on the PD S1 from Belgium and Luxembourg, the inactivity rates published by Eurostat based on the LFS and a study we recently published.<sup>90</sup> Based on our questionnaire, the number of insured family members in proportion to the number of insured persons was very low in Belgium (almost 1 in 100) but high in Luxembourg (1 in 3). On the basis of the results of the LFS, Eurostat publishes on a quarterly basis the inactivity rate (inactive population as a percentage of the total population) (see 10.5). The main reason for inactivity of young people is participation in education, while retirement is the main reason for older people. For that reason we only looked at the population between 20 and 64 years. On average 24% of the population between 20 and 64 years old is considered as inactive. In our study we observed 22.8% of the frontier workers are living together with a partner who is inactive. A household counts on average 1.2 children which assuming the same composition in active and non-active households will fall also under the social security system of the cross-border worker when the partner is inactive (or 27.4% of the frontier workers).<sup>91</sup> Together, this is about 50% of the number of frontier workers. For those reasons, the assumption that 20% of the insured cross-border workers have an insured family member is perhaps rather a conservative hypothesis. A more liberal assumption could be made (e.g. 40% of the cross-border have an insured family member). We keep the conservative assumption since other hypotheses could overestimate the number of issued PD S1 (see below). Generalizing this percentage of 20% to the whole population, an estimation of 206.5 thousand family members of insured persons who have received a PD S1 is obtained.

Third, the number of persons who live in another Member State than the competent Member State has to be estimated. To determine the competent Member State, Regulation (EC) No. 883/2004 makes a distinction between pensioners and member of their families who have right or NO right to benefits in kind under the legislation of the Member State of residence'. Three different scenarios appear (see EC (2011), *The coordination of healthcare in Europe*, page 17):

- “the Member State of residence, if the person concerned is in receipt of a pension from that State entitling him/her to benefits in kind (even where the person concerned is in receipt of pensions from one or more Member States);
- the Member State responsible for paying the pension entitling the person concerned to benefits in kind if s/he resides there, if the person concerned is not in receipt of a pension in his/her State of residence (even where s/he is in receipt of benefits in kind in this State by virtue solely of his/her residence);
- the Member State responsible for paying a pension entitling the person concerned to benefits in kind if s/he resides there, to whose legislation the pensioner was subject for the longest period, if s/he is in receipt of pensions from several Member States other than the Member State where s/he resides”.

---

<sup>90</sup> Pacolet, J., De Wispelaere, F. & De Coninck, A. (2012) *The social security rights of frontier workers. A survey on their knowledge, use and satisfaction, focusing on sickness benefits.*

<sup>91</sup> It was suggested by the IA Steering Group to extract additional household data from the LFS. We consider the data from the study described above as a good alternative.

This is perhaps the most difficult exercise, since there is no correct variable available in the LFS which can be considered as a good proxy for the scenarios described above. For that reason, we defined two separate scenarios. First, we have estimated the number of retired cross-border workers. When the cross-border worker only worked abroad he/she will receive only a pension from that Member State. In that case the former working country will be the competent Member State. When he/she was also for a period of time employed in the country of residence, he/she will receive a mixed pension. In that case the country of residence will be the competent Member State. The average would be 50% of those two extreme hypotheses. In our estimation we assume that all cross-border workers receive only a pension from their former working country. Nevertheless, also other scenarios can be considered. To estimate the total number, we applied the percentage of cross-border workers on the labour market (total average of 0.48%) (Table 81) to the number of pensioners in 2010 (figure from 2012 Aging Report- variable 'Pensioners aged 65+') and this by individual (former) working Member State. E.g. 2.42% of the employment in Austria is related to incoming cross-border workers. This percentage is applied to the 1.8 million pensioners in Austria which results in an estimation of 43.9 thousand persons receiving only a pension from Austria whereby Austria will also be the competent Member State and will issue a PD S1 since this retired cross-border worker lives in another Member State. This assumption results in an estimation of 419.5 thousand pensioners who were previously working abroad.

Finally, an estimation of the number of migrant pensioners in 2011 is calculated by using the LFS (= selection of 'retired persons aged older than 60 at arrival' of which country of birth= EU27 and country of residence=EU27). We have used 'country of birth' as a proxy of the competent Member State (an alternative is 'Nationality'). This was the only best practical option in the ambition to determine the competent Member State. In total 190.5 thousand pensioners live in another EU Member State than their country of birth (no data available of the number of pensioners living in Germany and Romania).<sup>92</sup> We assume the country of birth is the competent Member State and will issue a PD S1. By the Eurostat migration statistics already figures on the number of recent migrant pensioners (aged 65 and over) who have moved from one EU-country to another in 2011 were obtained (see also table). However, for this group of recent migrant pensioners no data were available for BE, BG, HU, MT, NL, PL and RO as migration country. For the limited group of countries, already 44 thousand pensioners migrated to another Member State in 2011. It seems that the total group of 190.5 thousand pensioners (stock value) who moved after retirement to another Member State is a (small) underestimation from the real situation.<sup>93</sup> However, as the 'popular' Mediterranean countries are already inserted in the table of recent migrant pensioners the total number of recent migrant pensioners will not that much higher. In 2011, 10 thousand pensioners migrated to Spain. Based on the LFS a total number of 61.4 thousand retired persons older than 60 at arrival lives in Spain. 3.6 thousand pensioners moved to France in 2011 while based on the LFS a stock of 34.1 thousand migrant pensioners was obtained. The proportion between flow and stock seems for both countries more or less realistic.

Finally, we had to estimate the number of family members of pensioners who live in another Member State than the competent Member State. We assume that 25% of the pensioners will have

---

<sup>92</sup> Remark received from L. Aujean (DG EMPL): 'BE has detected a coding error for YEARESID (from 2008 on). By this, the number of persons with YEARESID = 1 is strongly overestimated'.

<sup>93</sup> From the perspective that when there is an equal flow of migrant pensioners each year, the stock of 190.5 pensioners covers only 4 years of flows of pensioners.

also an insured family member. Based on the administrative data from the questionnaire, a percentage of 37% was calculated for Luxembourg and 20% for Belgium. This assumption results in an estimation of another 152.500 family members of pensioners who live in another Member State than the competent Member State.

By counting these different components together, we estimated a total number of about 2 million insured persons living in another Member State than the competent Member State (cf. 10.4.1). Some 60% is determined by the present cross-border workers which imply some 40% is related to mobile pensioners. In the future this share of retired former cross-border workers and mobile pensioners probably will increase. Most PD S1 certificates are issued by Germany (18.6% of total), UK (11% of total) and Luxembourg (10.5% of total) (table). Most of these forms were received by France (15.7% of total) and Germany (13.8%). Belgium seems also to receive a high number of PD S1 certificates (11.4% of total). However, the calculations for Belgium as destination country for migrants are probably not reliable due to problems with the variable 'years of residence'.<sup>94</sup> Just to illustrate the ambitions of these estimates, the calculated figure for Luxembourg as competent state of PD S1 and so by definition also insured for LTC, of 207 thousand insured persons is 262 thousand in the administrative questionnaire.

However, these figures should always be considered as an estimation of the number of PD S1 certificates based on several assumptions.<sup>95</sup> As explained above, we are confronted with several data limitations that had a significant impact on our calculations. By adding some additional questions to the LFS and by becoming an exhaustive view on the number of migrating pensioners by the Eurostat migration statistics most of these data limitations would be solved which would result in a more reliable 'proxy'.

---

<sup>94</sup> 'BE has detected a coding error for YEARESID (from 2008 on). By this, the number of persons with YEARESID = 1 is strongly overestimated' (remark received from L. Aujean, DG EMPL.).

<sup>95</sup> These estimates could be compared with administrative data. Administrative data is available for Belgium, Luxembourg and Spain. Belgium issued 80.8 thousand PD S1 forms (without data about the number of 'other insured cross-border workers') compared to an estimated number of 113 thousand PD S1 forms issued (Table 73 and Table 21). Luxembourg issued 262.7 thousand PD S1 forms compared to an estimated number of 207 thousand PD S1 forms issued (Table 73 and Table 21). Belgium received 114 thousand PD S1 forms compared to an estimated number of 225 thousand PD S1 forms received (Table 74 and Table 21). Spain received about 155 thousand PD S1/E121 forms (only for pensioners) while we become an estimated number of PD S1 forms of 88 thousand received by Spain for pensioners living in Spain but insured in another country (see Table 21 and ICF GHK & Milieu Ltd (2013), *A fact finding analysis on the impact on the Member states' social security systems of the entitlements of non-active intra-EU migrants to special non-contributory cash benefits and healthcare granted on the basis of residence*, commissioned by DG EMPL via DG Justice Framework contract, Table A9.9, p. 253). We can conclude that for some Member States the number of PD S1 forms received/issued will be overestimated (e.g. number of received PD S1 forms by Belgium) while for other Member States the number of PD S1 forms received/issued will be underestimated (e.g. number of received PD S1 forms by Spain, number of issued PD S1 forms by Luxembourg).

**Table 21: Estimated number of PD S1 issued by category of citizen, in .000**

Source: Estimate based on data from LFS and 2012 Ageing Report

The table above provides the estimated cross table for the stock of provided (by competent member state) and received (by country of residence) portable documents S1. We can again read the table row by row or column by column. Each column shows the total number persons where the state is competent for and in which countries those persons are resident. Each row shows the total number of persons residing in their country and with a foreign state competent for their social protection and how this is distributed over those countries. We immediately observe that in absolute figures those cells are dominated by the large countries, but on top of that it seems to be concentrated among a limited number of countries. For instance taking the first row and column we can see that of the 69 thousand PD S1 received for persons living in Austria, 52 thousand come from Germany, 3 thousand from Slovakia and 2.8 thousand from Italy. The top 3 of competent states for S1 counts for 84 % of the total. Reading the column for Austria, of the 177 thousand PD S1 issued some 65.2 thousand persons are living in Germany, 43.5 thousand living in Slovakia, and 36.4 thousand living in Hungary. These 3 largest countries count for 82 %. Those 'concentration ratios' of the share or the 3 largest countries (in concentration analysis it is called the  $C_3$ ) can be calculated for each country either by country of residence or by country of competence. We observe that especially Germany (20 times in top 3 of competent MS) and the UK (16 times in top 3 of competent MS) are the most 'important' competent MS (in % of residents insured in another MS than the competent MS). The picture of the most 'important' MS of residence (in % of persons living in another MS than the competent MS) is more diverse.

The share of the largest countries includes only the information about those large countries, without telling something about the share of the other countries. For that reason in the economic analysis of the distribution some alternative measures are in use, the Herfindahl index weighting the share  $m_i$  with its own, what will over accentuate the large shares, but includes in any case all shares, and the Entropy index that weights each share with the logarithm of the inverse of this share, what reduces the importance in the concentration analysis of large countries. To make those concentration indexes intuitively more appealing a 'number (here of countries) equivalent' is calculated what stands for the number of countries of the same size that ends up in the same Herfindahl or entropy index than we will obtain in reality, but now of the same size. Those indexes are calculated as follows:

When  $m_i$  is the share of country  $i$  in the total for EU 27 of a certain on pages  $n$  variable, then the Herfindahl index  $H = \sum_{i=1}^{27} (m_i)^2$  and its number equivalent  $NE_H = 1/H$ ; the entropy index

$$E = \sum_{i=1}^{27} (m_i) \cdot \log_2\left(\frac{1}{m_i}\right) \text{ and its number equivalent } NE_E = \text{antilog}_2 E.$$

In reality we look here at 27 countries but they are already of an unequal size of the population. We calculate that those countries are unequal according to the size of their population similar to only  $NE_H$  of 10.4 in the EU 27 of the competent countries and a  $NE_E$  in the EU 27 for the competent countries of 13.4. The respective  $NE_H$  and  $NE_E$  of the total population is 10.6 and 14.3, illustrating how dominant the total population figures are. Those figures illustrate further how the Herfindahl index weights the largest share more, resulting in a lower number of countries.

Those are the distributions that can be expected in proportion with the population. What is now the distribution for the 27 member states of their issued PD S1 as a competent country and distributed by countries of destination or residence and the number of PD S1 received as a country of residence and distributed over competent country. Both  $NE_H$  and  $NE_E$  are calculated where the number (here

number of countries) equivalent of Herfindahl over accentuates the concentration. Those figures are provided in Table 23. But first we have to look at the first two columns that tell us if either a country is more a country of residence or a competent country. Some are even both. Then we can see if the number equivalent is large or small. Looking for the lowest number we find  $NE_H$  in the resident countries of the number of competent states of some 1.8 in Austria or 1.3 and 1.4 in respectively Ireland and Estonia illustrating that the number of competent countries the people living there is small. Those countries will also be identified with similar figures but somewhat higher for the number equivalent of entropy in the residence country for the number of competent countries. They tell us that the distribution of the number of PD S1 according to country of competence is as those persons are coming from one to two or three countries. Some other countries demonstrate much higher numbers, illustrating that the people come from much more countries.

The same analysis can be made for either Entropy or Herfindahl indexes in the country of competence for the number of countries of residence, illustrating over how many countries the PD S1 issued are spread. This implies that people for whom the country is competent are limited to a small number of countries they are residing in, or to a larger number. For each country their index as a country of residence or a country of competence can be compared, for instance illustrating that the country is competent for people coming from a large or small number of countries while the people residing there with a PD S1 come from a small or large number of competent countries. Different patterns can be observed. For instance Belgium and Austria have an opposite profile, with Belgium being competent for people residing in a limited number of countries, while hosting people with a larger number of competent states. Austria was hosting people with a smaller number of competent states, while it is competent for a larger number of countries.

#### 4.2.6 Estimated cross-border expenditure on healthcare and LTC

As next step we have estimated the cross-border expenditure on health care and long-term care based on figures from the 2012 Ageing Report (variables 'Health care spending in 2010 prices per person', 'Population (million)' and 'Long-term care spending in 2010 prices (in billion Euros)').

We calculated our estimates on average benefits for the total of the insured population. It is as mobile citizens (workers, pensioners, their family members) are using this system of LTC as if they were nationals. This involves a 'potential' overestimation of the number of users of cross-border LTC benefits and the related expenditure due to fact some MS consider their LTC benefit as not exportable. At the same time these estimates assume a complete 'take-up' of rights by mobile citizens which will not be the case in the baseline scenario.

To get as close as possible to the applicable rules in Regulation (EC) No. 883/2004 a distinction had to be made between LTC benefits in cash and in kind. In the 2012 Ageing Report this breakdown is not available. Nevertheless, in a paper of DG ECFIN the public expenditure on LTC as % of GDP by type of care was published for each of the 27 EU Member States.<sup>96</sup> The yearly health and LTC (by type) expenditure per capita could be calculated for each of the Member States. These amounts are applied to the total number of insured persons who received a PD S1 certificates to estimate the claims issued as creditor and received as debtor for health and LTC.<sup>97</sup>

Following rules are kept in mind when constructing the calculation model for the baseline scenario:

- LTC benefits in kind are provided according to the legislation of the Member State of residence and reimbursed by the competent Member State;
- LTC benefits in cash are provided according to the legislation of the competent Member State.

For the baseline scenario on LTC the current budgetary impact is calculated as well as the number of insured persons (Table 24, Table 25 and Table 28).

#### 4.2.6.1 Estimated actual cross-border expenditure on LTC

**The overall budget is estimated at € 994.7 million of which € 618.3 million (62% of total budget) is related to LTC benefits in kind and € 376.4 million (38% of total budget) is related to LTC benefits in cash (Table 24).**

Compared to total national expenditure of LTC (variable 'Long-term care spending in 2010 prices' – 2012 Ageing report) the share of the cross-border LTC expenditure is limited to **0.4% of total EU expenditure** or 0.008% of total GDP of the EU-27 (variable 'Long-term care spending as % of GDP' - 2012 Ageing Report). Those low but realistic percentages illustrate we are making estimates literally on the frontier of the borderline of those systems, what results in 'marginal' shares in relative terms, but nevertheless substantial in absolute terms.

In absolute figures Germany (€ 172.9 million), the Netherlands (€ 166.3 million) and Luxembourg (€ 119.4 million) are the most important debtor countries taking into account the total cross-border expenditure on LTC.

In % of total spending, 29.4% of national expenditure on LTC by Luxembourg is granted to cross-border workers and pensioners (and their family members). In reality we observed not the tenth of this figure, illustrating probably also the difference of the use of LTC by the rest of the population and by the cross-border mobile population (see comments again on the situation in Luxembourg).<sup>98</sup>

Nevertheless, by using this 'real life information' (as the LTC expenditures and the hypothesis that the cross-border mobile citizens are in a similar way entitled and using LTC as the rest of the population) this is not only an optimistic interpretation of the application of the coordination principles, but it reflects also the possible implications of changes in those systems. For instance a shift of a LTC system from in kind to in cash systems ('consumer oriented' payment systems) that is

<sup>96</sup> Lipszyc, B., Sail, E. & Xavier, A. (2012), *Long-term care: need, use and expenditure in the EU-27*, Economic Papers 467, EU. (see table 3 p. 15). [http://ec.europa.eu/economy\\_finance/publications/economic\\_paper/2012/pdf/ecp469\\_en.pdf](http://ec.europa.eu/economy_finance/publications/economic_paper/2012/pdf/ecp469_en.pdf)

<sup>97</sup> The use of those 'expenditures per capita' (for the total population) is warranted since the number of estimated persons refers also to insured workers and related family members, what should imply their share of the total population.

<sup>98</sup> See also report CNS, *Décompte de l'assurance dépense de l'exercice 2011*. [http://www.cns.lu/files/publications/Decompte\\_AD\\_2011.pdf](http://www.cns.lu/files/publications/Decompte_AD_2011.pdf)

under discussion in many countries, will have an impact on the application of the coordination regulation. Countries less oriented to in cash benefits (for instance Luxembourg, but probably also other countries) and countries substantially oriented to in cash (as the Netherlands), and the impact of this in those estimated flows, clearly ‘pop up’ in our calculations.

Main debtor countries for LTC benefits in kind received in another member state than the competent Member State are again Germany (€ 120.1 million), Luxembourg (€ 104.1 million) and the Netherlands (€ 73.2 million).

The highest total amounts of LTC benefits in cash to cross-border workers and pensioners are paid by the Netherlands (€ 93.1 million), Germany (€ 52.8 million) and Austria (€ 49.8 million).

#### 4.2.6.2 Cross-border expenditure on LTC: mid-term and long-term projections

Based on the projections, the cross-border expenditure on LTC will increase to €1.3 billion in 2020 (0.009% of GDP) and €1.8 billion in 2030 (0.010% of GDP). An estimated number of 93 thousand mobile workers and pensioners residing in another Member State than the competent Member State would have receipt LTC in 2010. Projections let increase the number of recipients to 106 thousand persons in 2020 and 121 thousand persons in 2030 (Table 24 and Table 27).

**Table 24: Estimated LTC cross-border expenditure baseline scenario (in € billion), as % of total spending and projections 2020 and 2030**

Source: Estimate based on data from LFS, 2012 Ageing Report and Lipszyck, B., Sail, E. & Xavier, A. (2012), *Long-term care: need, use and expenditure in the EU-27, EU*.

Based on the constructed table on the number of PD S1, as a total of cross-border workers, retired cross-border workers and other mobile pensioners, and for all their family members, we made estimates on the potential users of LTC. We make a difference between benefits in cash and benefits in kind. This is not only an important distinction in the LTC itself, but also in the coordination regulation. We apply on this total PD S1 the same percentages of use of LTC in cash or in kind as is the case in the total population of the EU 27. This is acceptable since the structure of this 'S1 population' is similar to the total population including an active population, retired persons and their family members. Those percentages of users are derived from the Ageing report 2012 (additional data was delivered by DG ECFIN, necessarily for making a distinction between LTC in kind, LTC in cash and informal LTC). Based on those figures and the total spending on long-term care in cash and in kind in the EU 27 Member States also the average spending per dependent person benefitting either in cash or in kind benefits is calculated. In Table 25, we provide for the total population by each country the % of users in cash and in kind and the average amount.

Source: Estimate based on data from LFS, 2012 Ageing Report and additional data delivered by DG ECFIN

We will apply in three scenarios (the baseline scenario is described in this chapter and two options are described in chapter 8) those figures to calculate the number of people either benefitting from an benefit in cash or in kind, and the total amount of LTC spending that this implies. For each pair of country of resident combined with a competent country either the percentage of use but also the spending per dependent person can be defined on the level of the country of residence or the country of competence. Both dimensions, % of use and amount per user matter. The level of development of a LTC system is a matter of the 'breadth' or the number of persons that might be eligible, and of 'depth' or the amount of spending per dependent person. By applying those parameters to the number of cross-border mobile persons, we treat them in the same way as the 'national' total population, as is the ambition on this EU Coordination regulation. The difference

between the three scenarios is that we make the hypothesis that both the use % and the amount are based on the country of residence or the country of the competent state.

In the baseline scenario we estimate that some 48 thousand mobile citizens are using LTC in kind, defined on the usage rate and average spending per dependent person. This implies a total cost of € 618 million, spend in the country of residence and also to be reimbursed by the competent state. We further estimate the total users of in cash benefits at 45 thousand. The total spending in cash is € 376 million, directly paid by the competent state to the dependent person. In terms of the coordination regulation it is an export of the benefit in cash. In total some 93 thousand users of LTC are estimated or a total budget of € 995 million.

Most important creditor countries for the expenditure of LTC benefits in kind are France (€ 171.9 million), Belgium (€ 138.8 million) and Germany (€ 82.1 million) (table). The highest amounts of LTC benefits in cash are also paid to insured persons living in these countries but who are insured in another Member State.

#### 4.2.6.3 Actual number & value of reimbursement claims

---

It is important that (some of) these estimates could be verified by way of existing administrative data. Important data on health are collected by the Audit Board which is attached to the Administrative Commission (Art. 74 Regulation (EC) No. 883/2004). One of the defined tasks of the Audit Board is “collect the necessary data and carry out the calculations required for establishing the annual statement of claims of each Member State”. It implies that a view on the number and the amount of claims for healthcare in kind, which includes LTC, should be obtained from this information. However, it is limited to benefits in kind and not benefits in cash, so even there is this official source not ‘exhaustive’ and are additional (probably national) sources and data collection at European level needed. There is also another limitation. At the moment, the Audit Board reporting is (also legally) oriented at outstanding stocks of mutual claims. The budgetary impact of those LTC expenditures is in terms of flows of yearly expenditures and yearly new claims for reimbursement of those expenditures. Unfortunately, at the moment there is no specific reporting of the annual bilateral new claims between countries but only of the outstanding claims. The total new claims by creditor country were however available for 2011 in the reporting of the Audit Board. We applied the bilateral distribution of those totals over the debtor countries based on the structure of the outstanding stock. So assumptions could be made to estimate the amount of claims of LTC benefits in cash. Data concerning the claims introduced on health care by the creditor countries (based on fixed and actual amounts) in 2011 (taking into account that these claims submitted in 2011 will deal about provided health care mainly from 1 or 2 years ago) have been used to estimate the amount of claims of LTC benefits in kind received or issued (cf. 10.4.2). What we already know from data available within the Audit Board are the outstanding claims from creditor countries divided over the debtor countries (cf. 10.4). This detailed breakdown by debtor country for the outstanding claims is also used for the newly introduced claims in 2011 (cf. 10.4). So we assume that the breakdown of the newly introduced claims by debtor country is similar to this of the outstanding claims. It implies also that debtor countries which have important delay’s in payment will influence this assumption. This assumption results in a detailed cross-table (debtor and creditor country) of the LTC claims introduced in 2011. On top of that an additional hypothesis needs to be made on the share of LTC benefits in kind compared to the total level of health and LTC expenditures (by using variables ‘Health care spending as % of GDP’, ‘Long-term care spending as % of GDP’ – 2012 Ageing Report and the breakdown of LTC by type – see Lipszyck, B., Sail, E. & Xavier, A. (2012)). This results in a cross-table of introduced claims on LTC benefits in kind whereby also the debtor countries are known (see Table 29). We arrive at a total amount of LTC reimbursement of € 592 million. This grand total, estimated on different sources with different hypotheses, is very similar to the estimate we made in the previous exercise (also some € 618 million, in the baseline scenario).

The three main creditor countries based on the administrative data from the Audit Board are France (€ 207.2 million), Belgium (€ 113.3 million) and Germany (€ 74 million). These are the same main creditor countries as obtained by way of the calculation model based on several assumptions (table above). At the same time also the amounts of reimbursement claims are more or less similar to each other. Nevertheless, we observe an important underestimation of the claims issued by Spain in the calculation model when observing the administrative data from the Audit Board.

But also the three main debtor countries are the same in both methodologies, namely Germany, Luxembourg and the Netherlands. Also the received claims are to a high extent similar for Germany and the Netherlands but differ somewhat for Luxembourg.

Finally, also data we received from Belgium on the total number of issued claims on health can be used. In 2011, Belgium issued an amount of € 336 million claims of which € 137.2 million claims for persons aged 65 and older (which can be considered as the main group of dependent persons and recipients of LTC in kind). This amount is very close to the estimated issued claims on LTC by Belgium, namely € 138.8 million.

For the estimated figures on total health spending, we observed that at least for the EU 27 total but even for the individual Member States, they seems to be good proxies for the figures we found in those administrative data of the Audit Board. This could be an indicator the methodology used is reliable, but also that the real expenditures converge with what is expected because this is a mature system of social protection and well settled ways of coordination. For few of the estimated values on LTC on even the totals by country of residence or competent state, we obtained in the survey administrative information. It was so also difficult to systematically cross check our estimates with this administrative information. There are further several reasons why our theoretical calculations based on the hypothesis that the cross border citizens might differ from official statistics. We observe that most of the times no separate statistics could be obtained, or were made. Other reason is that LTC is not always recognized as such in the national situation, or is not considered as falling under the coordination regulation, or finally there can be a lack of knowledge on those entitlements, leading to non-uptake. This can result in substantial differences between what could have been found, and what we estimate in theory.

#### 4.2.6.4 Limitations: right of choice of country to receive sickness benefits

---

For cross-border workers different rules apply when the insured person is worker or pensioner. Within the sickness chapter of Regulation (EC) No. 883/2004 specific rules are adopted for active cross-border workers and their family members (art. 17 and 18) which will also have an impact on LTC. Cross-border workers have the right of choice to receive sickness benefits in kind in the country of residence (as defined in art. 17 – in accordance with the legislation in the country of residence and reimbursed by the competent country) or in the competent country (as defined in art. 18,1 – in accordance with the legislation in the competent country). It implies that about 1 million insured cross-border workers (with a PD S1) have the right to choose between LTC benefits in kind in the country of residence OR in the competent country. This will have budgetary consequences for the competent country, especially when the cross-border worker is taking a rational decision taking into consideration the most advantageous, most extensive, most expensive ‘LTC insurance package’. However, we observed from a recent study (Pacolet, De Wispelaere & De Coninck, 2012) that the main reason to choose for a specific health care system is the familiarity with the health care provisions. Most of the time, this will be in the country of residence. Despite this right of choice, most cross-border workers choose to receive benefits in kind in their country of residence (Ibid.). This right of choice is also applicable to the family members. However, art. 18.2 states that family members of a **frontier worker** “shall be entitled to benefits in kind during their stay in the competent Member State, unless this Member State is listed in Annex III of Regulation (EC) No. 883/2004”. Restrictions appear for Denmark, Spain, Ireland, Netherlands, Finland, Sweden and United Kingdom. Retired cross-border workers lose this right to choose. However, Regulation (EC) No. 883/2004

introduces some new rules applicable to this specific group (art. 28). Retired frontier workers are entitled to benefits in kind in the country of last activity, insofar as this is a *continuation of treatment* begun in that Member State (art. 28.1). Also, retired frontier workers (and their family members) who have *worked at least two years in the five years before their retirement as frontier worker* will be entitled to benefits in kind in the country of last activity (art. 28.2). This only applies if the country of last activity and the competent country are both listed in Annex V of Regulation (EC) No. 883/2004: Belgium, Germany, Spain, Luxembourg, Austria and Portugal. The retired cross-border worker will need a PD S3 'Medical treatment for former cross-border workers in former country of work' to receive benefits in kind the country of last activity. We did not make any hypothesis on this right of choice.

Source: Estimate based on data from the Audit Board, 2012 Ageing Report and Lipszyck, B., Sail, E. & Xavier, A. (2012), Long-term care: need, use and expenditure in the EU-27.

##### Introduction

For long-term care benefits, we have applied the same approach as for the unemployment benefits due to the same limitations with regards a standard process including the same Information Obligations in the sense of the SCM methodology.

For long-term care, it appears that the situation is even more complex than for unemployment benefits, as it encompasses different cares that are not understood in the same way in the whole EU and that imply a fragmented landscape of responsible and implementing actors in some Member States (e.g. over 70 different bodies are involved in Germany, while each of the 17 regions of Spain also has a different system; in many Member States, local entities are a dominant actor, etc.). The different national specificities result in a large variety of situations which may have a significant impact on the administrative burden when dealing with cross-border cases for long-term care.

There are a number of examples demonstrating the complexity of the processing of cross-border cases for long-term care which can result in administrative cost and burden for Member States' authorities:

- According to the interviewees, there is legal uncertainty about which benefits should be coordinated under the Sickness Chapter. Some countries still do not consider the care (social assistance) they provide as being included in the Sickness Chapter;
- In our survey to the national administrations, around 50% of national administrations that are opposed to changes to the current coordination rules state that the current rules need only to be better applied in practice and to be better explained. National administrations who are in favour of a change of the current rules say that the identified problems (legal uncertainty, complex regulation and uneven applications of the rules by Member States) will persist if no change occurs;
- Not in all Member States (particularly not in Member States that generally are in favour of keeping the status quo such as Germany, Austria and the Netherlands) administrative burden was perceived a major concern by national administrations. One Danish interviewee gave the following argument to put the administrative burden into perspective:  
*“Before 2009, Germany did not ask reimbursement to Denmark for costs that it incurred by provision of LTC services to citizens that fell under the Danish system, based on a special agreement between both Member States. However, recently, Germany asked to reintroduce a reimbursement system again between both countries. The fact that Germany asked to reinstall a reimbursement system again shows that other aspects seem more important for Germany than administrative burden from reimbursement claims, for example the financial impact of LTC services provided by Germany.”*
- A German health insurance considered the reimbursement of LTC benefits to be slow and problematic from an administrative point of view:

*“There are EUR 500 000 – 600.000 interest costs per year that my organisation has to bear because of non- or late payment. The reimbursement mechanism is not*

---

<sup>99</sup> See also 10.8

*functioning well and needs a substantial revision of the rules. There is an outstanding amount of EUR 12-13 million in 2013. Late payments can be the result of checks/scrutiny of services rendered by the country of residence; however, the checks do not justify a waiting period of up to 18 months in some cases. The time needed for checks should be reduced substantially. The reimbursement mechanism could be made more efficient by using lump sum compensation mechanism. However, the views about its effectiveness are divided amongst the insuring companies.”*

- An Austrian representative of a health insurance fund confirms the long processing time of reimbursement:

*“Particularly the reimbursement of LTC benefits in kind by the competent MS poses difficulties. Often, the information about the amount/costs of benefits in kind rendered by the Member State of residence reaches the competent Member State (which reimburses these costs) very late. Regularly, it takes 1-1.5 years to reimburse such claims. The rules stipulating information procedures should be more detailed (e.g. duty for monthly information provision of the value of the benefits in kind rendered by the MS of residence). The time-bound provision of information by all Member States is of key importance as to ensure an effective application of the reimbursement mechanism”.*

In general, regardless if they believed that administrative burden from the current rules is a major problem or not, only a small minority of national administrations have a good view on the actual administrative burden or are able to support their arguments with quantitative data or a detailed description of the burden. The lack of concrete (quantitative) evidence adds to the difficulty for making a sound judgment about this issue.

In terms of substantiation of the administrative costs related to the current rules and considering the limitations of the application of the SCM methodology in this exercise, we present in the table below the estimated costs related to processing of the PD S1 document.

Despite the data limitations resulting from the problems discussed in this chapter, the assessment of the administrative cost (baseline scenario) for the PD S1 document provides a robust basis for assessing the theoretical impact (positive or negative) of the different policy options on the administrative cost.

The methodology for assessing the administrative cost is based on the following formula:

$$\text{Time (T)} \times \text{Wage (W)} \times \text{Number (N)}$$

The hourly rate is EUR 18 per hour. We provide an estimate for the total number of cases for processing PD S1 documents for the EU-27.

### **Estimated current administrative cost (Baseline Scenario)**

The PD S1 form allows a person to register for healthcare in the country of residence. This form is delivered per person (not per family). The number of PD S1 forms issued provides insight into the number of people who (may) receive LTC benefits in another Member State. In the framework of this study, we have collected data on the number of PD S1 documents ‘issued’ by category of citizen and have estimated expenditure on LTC benefits. In addition, we have collected data on the number of PD S1 documents issued for Poland and Belgium by means of a workshop with experts in the

respective countries. In this section, we use the data available to calculate the estimated administrative cost for processing a number of documents related to long-term care in a cross-border case.

In order to assess the administrative costs for the EU-27 stemming from the processing of the PD S1 documents, we have carried out the following steps according to the Standard Cost Model (SCM):

### 1. Calculation of the unit cost per case:

The unit cost per case (processing/handling of a PD S1 form by the administrative staff – clerk) provides insight into the total cost for processing one PD S1 document. It is based on the following formula:

$$\text{Time (T) x Wage (W)}$$

During the workshops in the Member States, we have collected data on the average standard time spent for processing/handling a PD S1 document. Robust data are available only for Poland. The estimated time for processing one PD S1 document in Poland is estimated at 60 minutes.

The hourly rate for processing the administrative tasks is EUR 18; this results in a rate per minute of EUR 0.3 (EUR 18/60 minutes). The average unit cost for the EU-27 per case of handling a PD S1 document is EUR 18<sup>100</sup>. It is calculated on the following basis: Time (60 minutes) x Wage (EUR 0.3).

Caution should be paid when interpreting this estimated unit cost as the result is based on an example of one country only (Poland) which seems to have a rather efficient way of processing PD documents (see also the discussion on the processing of PD U1 documents above). It can be expected that the time for processing a PD S1 document in the other Member States may differ (substantially). Due to data limitation, however, we have calculated the administrative cost on the basis of the Polish example.

### 2. Number of cases:

In our research, we have estimated data for the number of PD S1 documents ‘issued’ for the EU-27 countries on the basis of our own calculations based on data from LFS (for a detailed discussion on the estimated number of PD S1 issued by category of citizen, see section 4.2.5 in this report). The total estimated number of PD S1 documents ‘issued’ in the EU-27 is estimated at around 1 980 000.

### 3. Calculation of the administrative cost (per Member State and for the EU-27)

We have calculated the administrative cost for processing PD S1 documents on the basis of this formula:

$$\text{Time (T) x Wage (W) x Number (N)}$$

The table below presents the total estimated administrative cost for processing PD S1 documents. The **estimated total cost for the EU-27 is EUR 35 632 000**. Within the EU-27, the estimated total cost for processing PD S1 documents was highest (> EUR 3 000) in a number of the old Member States (in

---

<sup>100</sup> Standard time (60 minutes) x EUR 0.30 (average wage – clerk level) = EUR 18

descending order): Germany, the UK, Luxembourg, the Netherlands, Austria and Italy. It was lowest (< EUR 100) in a number of the new Members States (in descending order): Cyprus, Bulgaria, Slovenia, Estonia, Malta, Lithuania and Latvia.

**Table 30: Estimated administrative cost - PD S1 'issued', EU-27, EUR, 2013, in 000**

Country	Competent country

Source: Own calculations based on data from LFS and workshop in Poland

We have also calculated the administrative cost for processing a number of other documents related to long-term care benefits for Poland by applying the following formula: Time (T) x Wage (W) x Number (N). Data were collected for the following documents:

Member State of residence:

- Service of E125 forms.

Competent Member State:

- Request for the issue of S1 document/ E100 series form (service of E107/E001 forms);
- Registration of the S1 document;
- Registration of the E100 -series form (part B);
- Service of SED S001 documents;
- Issuing E125 forms.

There are no data available for the EU-27 for these documents; a calculation of administrative cost for these documents is therefore not possible at this stage. We present the data only for Poland, where robust data are available. The table below presents the total estimated administrative cost for processing the documents for Poland presented according to 'Member State of residence' and 'Former working Member State':

## 5 Problem definition

### 5.1 Introduction

The free movement of persons, one of the “four freedoms” offered by the internal market<sup>101</sup>, is one of the most important principles of the EU and a fundamental right of EU citizens. The rights to move, to reside and to work freely within the territory of the Member States are enshrined in both the Treaties (Article 21, 45, 49 and 56 TFEU) and the Charter of Fundamental Rights (Preamble, considerations 15 and 45). Legally resident third country nationals can also enjoy certain rights to free movement within the territory of the Union<sup>102</sup>.

Preventing disadvantages in the social security rights of citizens when they move is necessary to make the right to free movement effective. As such, Article 48 TFEU states that “The European Parliament and the Council shall ... adopt such measures in the field of social security as are necessary to provide freedom for workers”. To comply with such mandate, currently Regulation (EC) No 883/2004 and the Implementing Regulation (EC) No 987/2009 coordinate Member States’ social security schemes. Regulation (EC) No 883/2004 started to apply in May 2010, and replaced previous Regulation (EEC) No 1408/71.

The EU legislation does not replace the different national social security systems, but coordinates them in situations with an intra-EU cross border element. EU regulations coordinate the cross-border aspects of the social security systems of EU Member States plus Iceland, Liechtenstein, Norway and Switzerland.

Removing the obstacles to mobility for European citizens is one of the priorities of the European Commission. It has been highlighted on several occasions under President Barroso’s tenure (including with occasion of the European Year of Workers Mobility 2006, the European Parliament report on citizenship in 2009, the Monti report on the Single Market, President Barroso’s political guidelines, Commission Work Programme 2013) that despite the important legal acquis in the area of free movement of workers, European citizens still face problems and obstacles when moving across borders within the EU. Labour mobility across Member States remains low<sup>103</sup>, as emphasized in the 2012 Annual Growth Survey<sup>104</sup>. In line with this priority, the Commission issued a policy communication in April 2012 (“Employment package”), in which it identified the EU’s biggest job potential areas and the most effective ways for Member States to create more jobs. Among other objectives, the employment package also aims to contribute to a genuine EU labour market.

---

<sup>101</sup> Article 3 (2) TEU and Article 26 (2) TFEU

<sup>102</sup> Cf. Council Directive 2003/109/EC of 25 November 2003 concerning the status of third-country nationals who are long-term residents.

<sup>103</sup> Merely 2,8% of the European working age population (between the ages of 15-64) resided in a Member State other than their own in 2010 (EU Labour Force Survey 2010).

<sup>104</sup> COM (2011) 815, Communication from the Commission, Annual Growth Survey 2012.

In the same perspective, the Commission announced, in the EU Citizenship report 2013 "EU citizens: your rights, your future"<sup>105</sup> that it would propose a revision of the social security coordination regulation, looking in particular into extending the export of unemployment benefits for longer than the mandatory three months, to make it easier for citizens to look for a job in another EU country (action 1).

The EU regulatory instruments in the area of social security coordination constitute necessary elements for making intra-EU mobility a reality and for the smooth operation of the EU labour market. They date back to the 1950's and have been amended on numerous occasions in order to take into account developments at EU level, changes at national level and rulings of the Court of Justice. Both the Member States and the Commission have the obligation to make sure the Regulations are fit to meet today's needs and reflect the developments in national and EU legislation, the case-law of the Court of Justice and the socio-economic context.

Regulation (EC) No 883/2004 represents a step in the modernisation of social security coordination rules, adapting them to changing realities at EU and national levels. The legislative process for the modernised rules lasted over 10 years, a period during which important socio-economic changes took place in the EU and the Member States (including two enlargements) and where the Court of Justice delivered a number of important rulings. The regulation strengthened the principles of coordination and brought improvements in several social security branches. It did not, however, in the Commission's view, lead to the expected results in the areas of coordination of unemployment and long-term care benefits.

To fully align coordination in these areas with developments at EU and national level, and meet the citizen's needs, the Commission has set in motion the process for a possible partial revision of Regulations (EC) Nos 883/2004 and 987/2009. The initiative covers the area of coordination of unemployment and long-term care benefits. It is also linked to the overarching EU objectives as reflected in the "Europe 2020 – A strategy for smart, sustainable and inclusive growth"<sup>106</sup>, which calls for the EU to encourage mobility and for European citizens to make more use of their freedom of movement, as well as to ensure that a vulnerable part of the EU population is enabled to live in dignity and is not exposed to the risk of poverty when exercising the right of free movement.

The initiative for a partial revision of the coordination regulation includes the present preparatory study for an impact assessment. As a first step, the current problems with regard to the coordination of long-term care and unemployment benefits are described and assessed. Further background details are briefly presented for each area and then the existing problems are discussed in depth. A problem tree was drafted based on documentary analysis, survey data complemented by statistical data analysis and interviews with stakeholders in 14 Member States. The problem tree reflects the problems discussed in detail in the text of the report and their underlying causes (drivers). It also links them to the policy objectives, which are divided into operational, specific and general objectives.

Given the substantial and thorough work conducted by the trESS network on the topic, we refer to the studies conducted by the network on both topics for an in-depth legal analysis on existing and

---

<sup>105</sup> COM(2013) 269 final

<sup>106</sup> COM(2010)2020

potential problems under the current coordination Regulation. The reports have been used as sources for this study.

## ***5.2 Coordination of LTC benefits***

Long-term care benefits were not explicitly mentioned in Regulation (EEC) No 1408/71. This is still the case in Regulation (EC) No 883/2004, with the exception of one overlapping provision (art.34). The coordination regulation does hence not include a definition of “long-term care”, nor does it contain a specific chapter for the coordination of these benefits. Long-term care benefits do however fall within the material scope of the coordination Regulation. The Court of Justice ruled that, in the absence of a specific legal regime for their coordination, they must be regarded as “sickness benefits” within the meaning of the Regulation and coordinated as such.

Long-term care benefits are increasing in importance given the demographic changes in the EU (namely, the ageing of the population). Member States continue to develop special schemes for persons in need of care, and national legislative developments (including new types of benefits) abound but vary across Member States. Since the last decade, the European Union has been promoting access, high-quality and sustainable healthcare and long-term care in Member States.<sup>107</sup>

<sup>108</sup>On 9 September 2010, the European Parliament adopted a Resolution on “Long-term care for older people” calling for a development of the Social OMC. To take into account this development, the Commission adopted in 2013 the Social Investment Package, describing the national orientations in this field.

Given these developments, the number of rulings delivered by the Court of Justice in this area and the problems persisted in the area (as highlighted by the trESS network) justify analysing the possibility of revising the coordination rules.

The current system of coordination of long-term care benefits thus presents a series of problems to which the “no policy change” option would not provide any solution. They are described in detail below, based on the information gathered through the various data collection activities conducted for this study. The problems are summarised visually in a problem tree, included at the end of the section. The problem tree links the problems to objectives, and also depicts the drivers behind such problems. General information about problems and the stakeholders’ view on the need to change the rules is first presented.

40% of the organisations that participated in the EC public consultation declared to have noticed problems of application of EU law in this field. In Deloitte’s survey of national administrations, 60% of national administration has experienced problems in the application of the current coordination rules.

A general complexity of the EU Law regulation on the coordination of long-term care is widely regarded as root problem of the current system according to the interviews conducted in 14

---

<sup>107</sup> COM(2005)76 “Working together, working better – A new framework for the open coordination of social and protection and inclusion policies in the European Union”.

<sup>108</sup> SWD(2013)44 final, adopted on 20.02.2013.

Member States. This complexity results in and is at the same elicited by a number of more specific problems.

The most recurrent problem, mentioned by 24% of all type of organisations participating in the public consultation was that migrant workers are not sufficiently aware of their rights under EU law. The second problem most commonly mentioned was that national administrations do not apply EU law correctly. Then came the problems with the cross-border communication between institutions of Member States and that national administrations do not provide EU workers with sufficient and correct information.

Looking into specific problems and who raised issues with them in the consultation, the lack of awareness of migrant workers about their rights was mostly pointed out by social partners and trade unions and national administrations. The incorrect application of EU law by national administrations was pointed out mainly by national administrations. No national administration, social partner, trade union, non-governmental or civil society organisation considered that migrant workers are abusing the possibilities of EU law. Two respondents (one on behalf of a company and an unknown one) did so. However, none of them was able to elaborate on such claim.

Interviewed civil society organisations active in the area (EUROCARERS and the AGE Platform) stated problems related to the lack of effective protection of migrant workers. However, it must be noted that some of these claims were linked to the residence requirements in national legislation, which is beyond the scope of the (coordination) regulation. They also concerned the interpretation and application of the law at national level.

The general attitude towards the need (or lack thereof) of modifying the rules of the different stakeholders participating in the EC public consultation was the following:

**Table 34: General attitude towards need to change the current LTC coordination rules**

National public authorities	<p>➤ Almost half of the respondents (48%) preferred to change the current coordination rules. Furthermore, about 20% of the group of respondents who think that the current coordination rules should be continued think that the rules should be better explained or better applied in practice.</p>
Trade unions and social partners	<p>➤ 83% of trade unions and social partners are in favour of changing the rules. Only 17% of the responding trade unions and social partners' representatives are in favour of keeping the current coordination rules. Two other alternatives are more popular: the option where the Member State of competence fully provides the LTC benefits for insured people residing abroad (33%) and the option where the Member State of residence provide LTC benefits in cash supplemented with a supplement by the Member State of insurance (25%).</p>
Civil society/NGOs	<p>➤ 88% of civil society representatives would like to break the status quo. All other policy options are considered as better than the baseline scenario.</p>
Individual respondents	<p>➤ 82% the individuals that have responded to the public consultation are in favour of changing the current rules. Keeping the current rules is</p>

	only the third preferred option. Two other options received more support: the option where the Member State of competence fully provides the LTC benefits for insured people residing abroad (39%) and the option where the Member State of residence provide the LTC benefits according to its national legislation (29%).
--	---

### 5.2.1 Problems of classification of long-term care benefits under EU law

Each country has its own social security system, where the risk of reliance of care is covered in very different manners. Differences include the definition (or lack thereof) of a definition for long-term care, the branches of the social security system and/or public assistance schemes under which the risk of reliance on care is covered, and the specific type of benefits granted.

#### ➤ Lack of common definition of LTC benefits under EU law & Lack of common criteria to determine them

There is no agreed definition of LTC benefits at EU level. There is no agreement on the definition of the risk of reliance on care and to determine common criteria for LTC benefits.

The OECD has adopted its own definition of long-term care, but it has no binding legal status under EU law.<sup>109</sup>

Member States might or might not have an official definition for long-term care. Among those that have definitions, these vary. The trESS Think Tank Report 2011 on the coordination of long-term care benefits (“Coordination of Long-term Care Benefits – current situation and future prospects”) included the following synoptic table regarding the definition of LTC in the different Member States:

**Table 35: Lack of common definition of LTC benefits under EU law - comparison of definitions**

Definition of social risks / LTC benefits	Range of definitions	Comparison with the OECD definition	Member States
Yes	General definition	Member State's definition is equal or broader (more sophisticated and detailed) than the OECD definition	BE (Flemish care insurance), CZ, LV, LU, PT, ES, DE
		Member State's definition is more restricted (less sophisticated and detailed) than the OECD definition	AT, CY, DK, EE, FI, IS, NL, SI

<sup>109</sup> As quoted in the OECD's Working Paper “The long-term care workforce: overview and strategies to adapt supply to a growing demand”: ([http://search.oecd.org/officialdocuments/displaydocumentpdf/?doclanguage=en&cote=delsa/elsa/wp2/hea\(2009\)1](http://search.oecd.org/officialdocuments/displaydocumentpdf/?doclanguage=en&cote=delsa/elsa/wp2/hea(2009)1)), the OECD's definition is the following: “Long-term care is a range of services required by persons with a reduced degree of functional capacity, physical or cognitive, and who are consequently dependent for an extended period of time on help with basic activities of daily living (ADL), such as bathing, dressing, eating, getting in and out of bed or chair, moving around and using the bathroom. This is frequently provided in combination with basic medical services such as help with wound dressing, pain management, medication, health monitoring, prevention, rehabilitation or services of palliative care. Long-term care services also include lower-level care related to help with instrumental activities of daily living (IADL), such as help with housework, meals, shopping and transportation.”

	Various descriptions, depending on the particular scheme/benefit	BE, FR, HU, IE, IT, LT, PL, CH, LI, SE
<b>No</b>		BG, GR, MT, NO, RO, SK, UK (conditions for entitlement are defined for each benefit)

The European Court of Justice established in the *Molenaar case* (C-160/96, Para.3) that a person is reliant on care if “a permanent need were to arise for those insured to resort, in large measure, to assistance from other persons in the performance of their daily routine (bodily hygiene, nutrition, moving around, housework, and so on)”. In various rulings, the ECJ has outlined elements of LTC benefits that are to be regarded as sickness benefits for the purposes of coordination. trESS compiled in an annex to their Think Tank Report 2011.

The national administrations interviewed (including quite clearly Austria, Belgium, Germany the Netherlands and Spain) considered the lack of a common definition or criteria as a major obstacle for an effective coordination of LTC benefits and a smooth implementation of the current rules. National administrations in many Member States expressed their preference for a common definition of LTC and a detailed list of LTC benefits per Member State. However, some Member States - Sweden, Finland en Belgium – expressed their concern that several benefits in their system could then be seen as LTC benefits, while they do not consider them to be subject to the current coordination rules.

### ➤ **Diversity of benefits that can/should be considered as LTC benefits in the MS & Benefits situated under different social security branches**

The risk of reliance on care is covered under different branches of the social security system and/or public assistance schemes.

This further complicates coordination at EU level, as “national” benefits are often coordinated under different regimes (including sickness, old age, family protection, work accidents and occupational diseases, invalidity, survivors and social assistance); they can be in kind or in cash or even a mixture of both; they can be social security benefits or social assistance benefits, contributory or non-contributory; they are processed by a wide range of bodies and institutions, which complicates control. In addition, the LTC beneficiaries are diverse (and might vary across countries: workers, unemployed persons, pensioners, survivors, family members) and the development of LTC benefits is not homogeneous in the different Member States. Differences in national systems and no common understanding of the concept complicate the coordination of LTC benefits at EU level.

The insights gained during the country visits confirmed the diverse ways in which Member States cover the risk of reliance on care and how this, in the view of the public officials directly in charge of applying the coordination rules, complicates the coordination. While EU rules aim to coordinate, and not harmonise, the national social security schemes, a root problem is perceived to be in the different manner in which the Member States recognise, consider and deal with LTC benefits.

Firstly, Regulation (EC) No 883/2004 aims to coordinate social security schemes. However, the risk of reliance of care is not covered in all countries by branches of the social security system. It is, in some cases, covered by public or social assistance schemes. Secondly, following the ECJ’s case-law, LTC benefits are to be coordinated as sickness benefits. However, LTC benefits present certain distinctive

characteristics that make them different from sickness benefits, and benefits addressing the reliance on care might be coordinated under different social security branches (including family, old age and invalidity) in different. Thirdly, while the ECJ has outlined elements of LTC benefits that must be regarded as sickness benefits for the purposes of coordination, but there is still no common definition or agreed exhaustive list of criteria that allow to identify benefits as LTC benefits (however, the Court has ruled on particular benefits of certain countries (as is the case in the UK) that must be considered as LTC benefits for the purposes of coordination). All this renders the precise identification of benefits, provided under any social security of public assistance scheme, that must be considered as LTC benefits for the purposes of coordination. It generates uncertainty and hampers the understanding and ownership of the rules by national administrations, which might hold different views on the benefits that fall under the scope of the coordination regulation.

Four basic positions were identified during the country visits:

- Specific, dedicated system of LTC;
- LTC benefits considered as sickness benefits;
- LTC as a complement to pensions;
- LTC as social assistance.

The trESS network attempted to provide a picture of the statutory organisation of LTC in all Member States, simplifying to a certain extent the characteristics of national schemes to group countries in six different categories. The following, included in their Think Tank Report 2011, summarises their work:

**Table 36: Diversity of benefits that can/should be considered as LTC benefits in the MS & Benefits situated under different social security branches**

Statutory organisation	Classification	Member States
Global care system and/or unifying legislation	Social security	BE (Flemish care insurance), LU, NL
	Public assistance	CY, EE, ES, UK*
	Combination of both social security and public assistance	DK, SE* (although social security element is by far the strongest)
Differentiated approach (disintegrated care system)	Social security	CZ
	Public assistance	LV, MT, RO
	Combination of both social security and public assistance	AT*, BE, BG, CH, FI*, FR, GR, HU, IS IE, IT, LI, LT, NO, PL, PT, SK, SI, DE*

\* Some (or all) of the benefits of these states have been declared as “normal” sickness benefits for the purpose of the application of Regulation (EC) No. 8823/2004 by the ECJ or the EFTA Court.

The main issues have been identified through interviews in countries for which LTC benefits are not part of the Social Security system. This refers mainly to countries in which LTC is considered as social assistance, or assimilated to social assistance. Social assistance is explicitly excluded from the coordination Regulations (Art.3.5 Regulation (EC) No 882/2004). In these cases, the transposition of the Regulation into the national legislation, and the subsequent application of the coordination mechanisms, becomes highly problematic. Amongst the countries visited, this is the case in Estonia, Romania (where the benefits that would fall under LTC are part of the social assistance system), Spain (although a specific regulation for LTC exists in Spain, these benefits are not part of the Social Security system; they are provided as “Social services”, which can be assimilated to social assistance), Slovakia and France (there is no explicit definition of LTC benefits in the French legislation)<sup>110</sup>. This complicates the application of the coordination rules in these cases.

As an example from the visits conducted to these countries, the authorities from the National Health Insurance Institute of Romania (*Casa Națională de Asigurări de Sănătate*) considered that, given the lack of definition of long-term care regulated at EU level and materials submitted by the Administrative Commission, the coordination of long-term care benefits does not fall under their competence. They referred us to the Ministry of Labour, Family and Social Protection, which in turn declined to have further discussions, indicating that “The Regulations specify very clearly that they do not cover social assistance, only social security. The benefits that would fall under long-term care benefits are of social assistance”. Similarly, the officials of the French *Direction Générale de la Sécurité Sociale* expressed the difficulties they are suffering to apply the coordination rules. In France, benefits are granted by territorial bodies, and are not linked to contributions. Citizens do not contribute during their lives to cover the risk of reliance on care, but are granted benefits if and when in need of them, based on their residence. Benefits in kind are provided directly in care centres or at the person’s home. Both the degree of reliance on care and the resources of the concerned person are assessed. However, it is not possible to identify the citizens who have worked and/or resided abroad. While there is no lack of willingness to comply with the coordination rules, there are practical difficulties. An internal procedure has been launched to try and solve the issues.

<sup>110</sup> In Poland, different branches of social security have their own definitions of “LTC” and “LTC benefits” (with a different scope and function).

The branch of the Social Protection system under which the benefits fall in each country determines the method by which they are financed, which in turn impacts the willingness of Member States to pay for or reimburse certain benefits provided to mobile citizens. In the EU, contributory benefits (based on LTC contributions by citizens) and non-contributory benefits (based on residence) co-exist. Similarly, benefits are means-tested (that is, the resources of the person in need of care are assessed to determine his/her contribution to the costs of providing the benefits) in some countries, but not in others.

LTC benefits can be in kind or in cash. The benefits available in each country, the way they are provided, and the eligibility conditions, vary per country. In an attempt to shed some light on the diversity of benefits per country, trESS grouped them according to the type of benefits (in kind, in cash or both) and their organisation (provider, spending and benefits) per Member States. The following table is included in the Think Tank Report 2011:

**Table 37: Diversity of LTC benefits system: in cash, kind or both**

Benefits in kind/cash or both	Organisation (choice of provider / spending / benefit)	Member States
<b>Only benefits in kind</b>	Only state-run	/
	Only private institutions and/or informal caregivers	/
	Combination of both public and private institutions and caregivers	EE, FR, IS, LV
<b>Only benefits in cash</b>	Freedom of choice regarding the spending of the allowances	BE (Flemish care insurance)
	No freedom of choice regarding the spending of the allowances	/
<b>Combination of both benefits in cash and in kind</b>	Possibility to choose and/or combine and/or substitute both types of benefits	AT, BE, CY, DK, HU, IE, LU, MT, NL, PL, RO, SK, SI, SE, DE
	No possibility to choose and/or combine and/or substitute both types of benefits	BG, CH, CZ, FI, GR, IT, LT, NO, PT, ES, UK, LI

trESS updated this mapping in their Analytical Study 2012 “Legal impact assessment for the revision of Regulation 883/2004 with regard to the coordination of long-term care benefits. The initial mapping was complemented with the replies submitted by the Member States to a questionnaire sent to the Administrative Commission members (A.C. 18/12). The questionnaire included questions about the definition, mapping and description of the national schemes. The results are presented in annex to the report, with a detailed list of the benefits in each country that should be considered LTC benefits for the purposes of the coordination. However, it should be noted that this list has no official validity. It only constitutes a (highly elaborated) theoretical exercise. During the country visits, the list of LTC benefits per country prepared by trESS received mixed reviews.

In line with the general problem of classification of LTC benefits under EU law and the drivers outlined, the trESS Think Tank Report 2011 identified and discussed in more detail the following challenges:

- Differences in national systems – no common understanding;
- Huge variety of LTC systems;
- Social security or social assistance;
- Benefits with elements of LTC considered as benefits from other branches of social security by Member States.

### ➤ **Distinct character of LTC benefits**

LTC benefits vary across countries. They can be in cash or in kind, which affects the determination of the competent country for providing them and for bearing their cost. Their variety across countries is compounded by the fact that certain Member States are introducing new mixed-types of benefits. In these cases, it becomes increasingly difficult to determine the nature (in cash or in kind) of the benefit.

The same or similar benefits might be considered in kind in one country and in cash in others (this was the case, as reported by the national experts involved in trESS Analytical Study 2012). Regardless of how the benefits are considered or recognised in domestic legislation, however, the ECJ case law should be applied with regard to the distinction between benefits in kind and in cash.

As outlined by trESS, traditional benefits in kind do not usually present any problems. However, benefits in cash are more problematic. In these cases, the circumstances under which the money is given must be considered. In case money is given to the person so that he decides the use to make of it, respecting his autonomy and being paid out irrespective of any bill to be presented, the benefit should be considered as a cash benefit. In any other case where the use of the money must be justified by bills on services purchased, the benefits should be considered in kind.

Whilst the distinction between benefits in kind and in cash is not particularly problematic for sickness benefits, it becomes more complicated for LTC benefits (which must be coordinated as sickness benefits). We refer to trESS Analytical Study 2012 for a more detailed analysis of the problems the distinction between benefits in kind and in cash can cause in the following situations:

- Loss, withdrawal or suspension of LTC benefits when the beneficiary changes his or her residence to another country;
- Accumulation of the benefits in cash of the competent Member State and the benefits in kind for the same purpose of the Member State of residence (Article 34 of Regulation (EC) No 883/2004);
- The application of Article 34 of Regulation (EC) No 882/2004 in relation to Member States which have opted for lump-sum reimbursements;
- General aspects of accumulation of cash benefits and/or benefits in kind also outside Article 34 of Regulation (EC) No 883/2004.

Beyond the pure distinction between benefits in kind and benefits in cash, there are other mismatches caused by applying the coordination rules devised for sickness benefits to LTC benefits. Sickness and LTC benefits differ in their aims, instruments and means. Several articles of the Regulation (including Articles 19, 21 and 28) are not designed for LTC benefits but should be

applicable to them, even if their wordings do not refer to them. In terms of goals, while traditional sickness benefits in cash are mostly related to the loss of salary or income, LTC benefits in cash can have other goals (therefore making the provisions on the calculation of benefits in cash under Article 21 (2) to (4) of little importance to LTC benefits). These problems were also identified by trESS, which considered as a challenge the “mismatches of concepts as a result of the inclusion of LTC benefits in the chapter on sickness benefits”.

To complement the information provided about the problems of classification of LTC benefits under EU law with insights from the country visits, during these several national administrations (in Germany, Austria, Poland and the Netherlands) expressed to be in favour of clearly listing all LTC benefits (in kind and in cash) that are considered to be LTC benefits in other Member States or that should or could fall under the coordination Regulations. A German health insurance fund representative stated that *“the lack of a clearly defined list of LTC benefits makes any coordination between Member States difficult and slow”*. An interviewee from the Austrian national administration added: *“The present list attached to the Regulation is helpful but insufficiently concrete and meaningful for categorising the different national LTC benefits (in kind and in cash). Therefore, a concrete ‘benefits catalogue’ should be drafted, listing the available benefits in EU/EFTA and Switzerland with precise definitions of the types of benefits, the level of the amount, the essential eligibility criteria and the competent administration.”*

Similarly, these national administrations would also like to better define “social assistance”, as more benefits could be qualified as a LTC benefit than often believed. A representative of a Polish national administration stated with regard to social assistance: *“Several Member States claim to only have social assistance benefits, which fall outside the scope of the Regulation. However, some of these might be qualified as LTC benefits”*. A Danish interviewee proposed to use the decisions of the ECJ as input to a common definition of LTC and the listing of LTC benefits (in particular the Molenaar case<sup>111</sup>).

### *5.2.2 Uneven application of coordination rules by Member States*

The application of the coordination rules is uneven among countries. It appears that the exchange of portable documents, the recognition of entitlement to LTC benefits, and the claims for reimbursement (impacting, in the cases foreseen in Article 34 of the Coordination Regulation, the cash benefits perceived by the beneficiary) would vary significantly across countries. This was reported during the interviews conducted in the country visits. The biggest problem according to the national administrations that responded to the EC public consultation is the incorrect and uneven application of the EU rules by national administrations (32% of them see this as a major concern). This is confirmed by another opinion revealed by the EC public consultation: among the organisations considering that there is no need to change the rules (53.3% of the total), the majority (79.17%) was not entirely satisfied, considering that they should be better explained or better applied in practice.

As an illustration of the opinion of public authorities believing that the rules do not need to be changed, but should be better applied in practice, a German health insurance fund representative stated the following: *“Local health insurance funds - often the entry point for citizens’ claims – are insufficiently informed about the current rules and regulations which apply according to the EU*

---

<sup>111</sup> Molenaar, C-160/96, Para. 3

*Regulation. Current problems result from a wrong application of the current rules, not from the legal text itself; the coordination rules as such are sufficient and considered as good. The current problems could be reduced substantially, if the current rules were implemented more thoroughly by the different stakeholders involved in providing long-term care services in the different Member States”.*

The differences in the way in which Member States cover the risk reliance on care and the different social security branches and/or social assistance schemes under which they are granted can lead to an uneven application of the coordination rules. Member States hold their own opinions on which benefits provided under their legislation should be considered as LTC benefits falling under the scope of the coordination rules. They cling strongly to such opinions, as evidenced during the country visits conducted, including expressing still disagreement with ECJ’s rulings (such was the case in the United Kingdom for instance). European organisations consulted (EUROCARERS and the Age Platform) raised concerns about the incorrect application of the coordination rules in some Member States. trESS encountered similar issues, as reported in their Think Tank Report 2011: “Many Member States do not recognise some benefits as LTC benefits that at European level would be considered as such. In some cases those benefits are considered, at national level, as social assistance benefits and are therefore excluded from the scope of the Regulation. In other cases, the fact that the benefits are still considered (by the said Member States) as special non-contributory benefits of a mixed type prevents them from being exported. Both ways of interpretation seem contrary to the spirit of European law. Unfortunately, it is not easy to convince Member States to change their minds and behaviour.”

### *5.2.3 Gaps in social protection of mobile citizens*

---

The current coordination rules make it possible to leave a person reliant on care completely devoid of protection in very specific cases. A person reliant on care may be left with no protection if he/she receives LTC benefits (only) in kind from a Member State and moves to a Member State that covers the LTC protection only by means of benefits in cash<sup>112</sup>.

This risk of a gap in protection of mobile persons was regarded as a minor problem by the majority of the national administrations: only three organisations responding to the EC public consultation considered it as a major problem. National administrations mostly considered a loss of social protection as a theoretical possibility and they were not able to identify effective cases of a complete lack of protection.

Beyond this gap in protection resulting directly from the design of the coordination rules, problems in the protection of mobile citizens reliant on care can appear due to the uneven application of coordination. As outlined in the previous points, trESS perceived issues in this regard and European organisation active in the area consulted for this study also voiced their concerns, quoting actual cases during the interviews. These same organisations also alluded to the fact that the imposition of residence conditions to perceive long-term care benefits in kind, as is the case in several Member States, also results in an effective lack of protection; mobile citizens reliant on care would be less protected, or completely unprotected, during the time spanning from their change of residence to the completion of the requested period of residence.

---

<sup>112</sup> Cf. case C-208/07, Chamier Glisczinski

On another hand, significant disparities in the level of development of LTC benefits across countries have been observed. This was not perceived as an issue *per se* by the Member States. The generosity of each national system will always be different, and must be assessed in the context of the whole national social protection system. Social protection systems are designed with the aim of being internally balanced, and tend to compensate the relative weaknesses in certain benefits with more generous provisions in other fields. To some extent, individual workers will always have to gauge the amount and generosity of benefits they would be entitled to in each country when making a decision about mobility. In this sense, it should be borne in mind that the Regulation aims for the coordination, and not harmonisation (this falls out of the EU competencies in the field) of the systems.

However, interviewees in Member States with more generous benefits did point at the risk of losing quality of care when moving to another Member State, due to the fact that LTC benefits are not developed homogeneously in all Member States. In some, a mature, high-quality LTC scheme exists, while in others LTC benefits hardly exist. This makes LTC benefits different from other social security benefits (where the issue is more about higher or lower benefits in different Member States). The heterogeneous development of LTC benefits in all Member States was also considered a challenge by trESS. As was outlined in their Think Tank Report 2011, a complete scheme exists in some countries, while in others this type of benefits barely exists. Such a situation does not however arise in other branches of social security, where the development is much more common and standard (such as in sickness protection). The situation for LTC is different. Thus, according to trESS, “Any cross-border movement may not only involve a quantitative loss of rights, but also a qualitative loss or rights or simply the removal or elimination of a possible right”.

#### *5.2.4 Risk of double-payments for the same risk*

---

While art.34 of Regulation (EC) No. 883/2004 intends to avoid the overlapping in LTC benefits, the lack of an EU-wide definition (and, relatedly, of a well-suited coordination regime) of LTC benefits, creates loopholes in the application of the article. Its application is impossible in many cases (e.g., cases in which countries do not consider their benefits in kind as LTC benefits at the European level; or cases in which the benefits are coordinated under different chapters – e.g. pension, family benefits).

However, social tourism in the case of LTC was generally not seen a risk by interviewees.<sup>113</sup>

Although most of the interviewed national administrations considered this risk to be rather low, concerns were raised which did not lie for the most on the possibility of double-payments for the same risks, but rather on the lack of operability of the system and the lack of visibility of Member States on the costs incurred into and the reimbursements claims received or entitled to issue<sup>114</sup>. The differences in the concept of LTC benefits and their treatment across Member States lead to a lack of operability of the reimbursement and mechanism of deduction for the avoidance of double payments set up by Article 34 of the Coordination Regulation. Countries lack information on the LTC benefits cross-border workers are entitled to in other countries, and therefore cannot always adjust

---

<sup>113</sup> See also ICF GHK & Milieu Ltd (2013), *A fact finding analysis on the impact on the Member states' social security systems of the entitlements of non-active intra-EU migrants to special non-contributory cash benefits and healthcare granted on the basis of residence*, commissioned by DG EMPL via DG Justice Framework contract, 275 p.

<sup>114</sup> Long-term care benefits in kind are reimbursed under the same rules as sickness benefits in kind.

the level of benefits provided accordingly. The exchange of portable documents does not always take place.

Sometimes, the recognition of the entitlement to LTC is not asked (no EU forms are exchanged), conveying the idea that some beneficiaries are content with the benefits they receive from the competent Member State or might not be aware that they should notify a country of residence about the benefits that they receive. In other occasions, the benefits are provided to cross-border citizens just as they are provided to nationals, without a possibility to distinguish them (and no reimbursement between Member States takes place). As illustration of this fact, a Danish interviewee stated:

*“How many foreigners live in Denmark and are awarded LTC benefits by Denmark? We do not know that because our public authorities do not ask for it. We do not make the distinction between cross-border or mobile citizens and Danish people. If they have the right to live here, their Danish municipality will provide them the benefits”.*

Frequent complaints about the reimbursement mechanism were received during the interviews conducted in different Member States. Given the frequent criticism, and given that the reimbursement mechanism is directly linked to the avoidance of double payments, it appears that this aspect of the coordination bears watching.

Additionally, practical problems concerning the identification of beneficiaries were sporadically raised. It seems that in certain cases the information sent by the competent Member State to the Member State of residence (or vice-versa) would not be detailed enough to identify the person in question. Social Security numbers or even national ID numbers would be provided to the other country, for which such information would not be sufficient; in other cases, the simple indication of the name and last name, without any additional details, would not be enough to identify the person either. However, this is a cross-cutting challenge for the entire EU coordination system and not strictly limited to the coordination of long-term care benefits.

### *5.2.5 Instability of the current system of coordination of long-term care benefits*

---

In the lack of a comprehensive and coherent coordination regime well suited to the particularities of LTC benefits, it is the CJEU which constantly has to make clarifications. The system can thus be altered at any moment by a CJEU ruling.

Legal uncertainty was identified as an issue. The authorities interviewed at national level, dealing on a daily basis with the coordination of LTC benefits, confirmed the problems derived from the lack of a common definition and treatment of LTC across countries, and the poor fit that the coordination as sickness benefits provides on certain aspects. To a certain extent, the perception that the major issues have already been addressed by the case law of the CJEU was shared. However, the general view amongst those interviewed was that indeed the system is unstable and prone to constant modifications.

Similarly, the level of complexity of the regulatory framework and the rulings of the CJEU render the issue not easily accessible for all the concerned staff public authorities. The changes introduced by the CJEU require regular updates and continuous formation in the Member States' administrations.

### 5.2.6 *Citizens not sufficiently understanding their rights under EU law*

---

The complexity of the legal framework, including the lack of common definition and/or classification of long-term care benefits at EU level, and the large disparities across countries' regimes results in an uneven application of the coordination rules. This results in a non-transparent, uncertain system, where citizens are not able to determine beforehand their entitlements in each country. Our findings confirm the lack of upfront visibility mobile citizens have on their entitlements. In the EC public consultation survey, the statement "Migrants are not sufficiently aware about their rights under EU law" was supported as one of the three major problems of the coordination mechanism by 57% of individual respondents, 40% of trade unions/social partners' representatives and 26% of national administrations.

Interviews during field visits suggest that certain broad differences can be perceived amongst mobile workers. The more highly educated, tech-savvy amongst them would be making use of the Internet (including questions submitted to national administrations) to inform themselves about their entitlements in different countries and conditions. However, others would be making their mobility decisions rather blindly as it comes to entitlement to LTC benefits.

It seems, in particular, that mobile workers would have limited knowledge about the LTC benefits in kind to which they would be entitled in a different country (those are determined based on the legislation of the Member State of residence), and how that would affect any other LTC benefits they currently perceive or would perceive in the competent Member State (notably, reductions in cash benefits due to the enjoyment of LTC benefits in kind in another country).

This lack of knowledge apparently affects public authorities as well. Except for specifically dedicated bodies or units, the amount of public employees potentially dealing with a LTC case is very high while the frequency of the cases is low. While the cases can often be transferred to units with more specific knowledge, it appears that some obscurity would persist, even within the administrations, as to the exact content and entitlements of particular workers in cross-border situations. In this regard, findings from the public consultation survey reveal that 10% of the national administrations and 13% of the social partners' representatives say that national administrations provide insufficient and/or incorrect information to mobile persons. One civil society representative argued that "*Staff working in state bodies as well as migrant workers do not understand the rules. They need to be simple so that everyone knows what the entitlement is in each country. Also simple so that they are applied correctly and fairly.*"

Similarly, the wide range of bodies and institutions dealing with the claims appears to generate certain issues of communication and to complicate the processing of claims. A Belgian health insurance fund representative argued: "*You do not know to whom in the other Member State you can address your question. The responsible local public authority is not always known. The contact details of the Zorgkassen (Care funds), for example, are not adopted in the European database (EURES).*"

Systems also vary significantly in each country depending on the amount of competencies devolved to the regions and local entities. The size, population and number of bordering countries influence the number of cases. The distribution of competencies within each country impacts decisively the way the claims are dealt with (including the average length of the process), ultimately affecting the

beneficiaries. Generally, it was gathered that individual civil servants, numbering in thousands in many countries, are the entry point for the claims. Except for dedicated ones, handling LTC claims from cross-border workers is only one amongst a wide range of responsibilities and sometimes health insurance funds only have 1-2 cross-border cases per year. This makes it difficult to instruct a large workforce on the particularities of these cases. The complexity of the rules adds to this difficulty. Therefore, detailed knowledge of the rules not only affects citizens, but also public authorities. One Danish national administration representative argued:

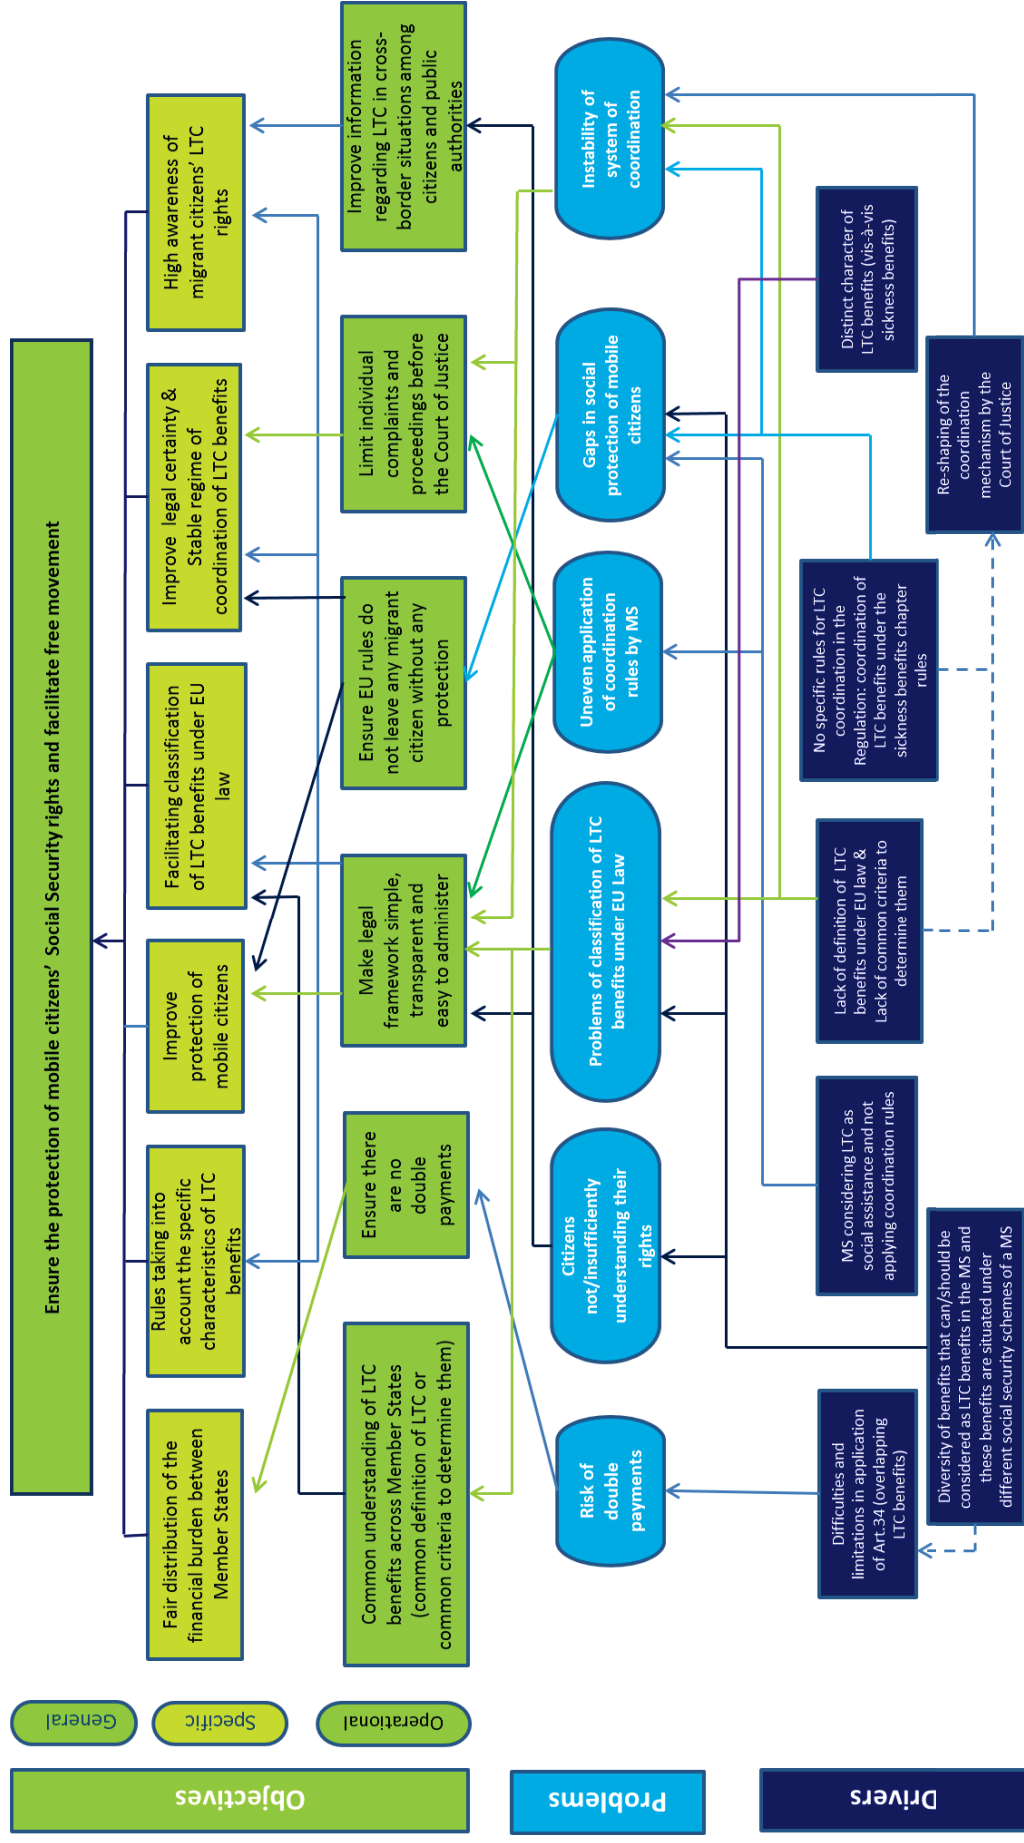

*“Several municipalities in Denmark – the competent level to provide most LTC benefits in kind to the citizen - did not even know that they could claim reimbursement from other Member States for the LTC benefits that they had provided to foreign residents in Denmark”* (foreign citizens insured in another Member State and resident in Denmark).

#### *5.2.7 Coordination of long-term care benefits: Problem tree*

---

The following problem tree, based on the information collected through the different data collection activities conducted for this study, summarizes in a visual way the main problems the current rules for the coordination of long-term care benefits present. The problem tree links the problems to policy objectives, in the upper part, and to the drivers behind such problems, in the lower part. Objectives are divided in general, specific and operational, following the methodology of the EC Impact Assessment Guidelines. The relationships between the individual objectives at each of the three levels are also depicted.

Figure 4: Problem tree - coordination of LTC benefits

### 5.3 *Coordination of unemployment benefits*

Unemployment benefits fall within the material scope of the coordination Regulation. Chapter 6 of Regulation (EC) No 883/2004 is dedicated to “Unemployment benefits”. Therefore, in contrast with LTC benefits, there are specific rules for the coordination of unemployment benefits. The coordination rules have not changed substantially in comparison to Regulation (EEC) No 1408/71. There were limited amendments to the provisions on the calculation of unemployment benefits (in the light of the case-law of the Court of Justice) and to the provisions on export of unemployment benefits (a possibility to extend the export period from three for six months, upon a decision by the competent institution, was included). Notably, a limited reimbursement mechanism between Member States was also introduced. It covers the unemployment benefits provided by the country of residence to unemployed frontier or cross-border workers.

The Council already agreed in 2001 on Parameters for the modernisation of the coordination Regulations with regard to unemployment benefits.<sup>115</sup> The modernisation should result in a simplification of the coordination rules on unemployment benefits to enhance their readability and transparency.

However, apart from the adaptations previously outlined, the rules did remain similar as in former Regulation (EEC) No 1408/71. The trESS on the right to actively search for a work in the EU (possibility to extend the export period) and the changes applied to the calculation of benefits can be seen as elements of modernisation of the rules. Given the accrued internal mobility in comparison with the period of the previous regulation (approved in 1971), so does the introduction of the reimbursement provisions. However, no major simplification of the rules took place. The introduction of the reimbursement mechanism actually added some complexity to the coordination rules. These changes reflected a compromise achieved in the search for consensus (unanimity was then needed to change the coordination rules). In addition, a new provision (Article 65a) was introduced<sup>116</sup> to address a legislative gap in order to ensure the protection of rights of self-employed workers, in line with Article 48 TFEU.

The discussions in the Administrative Commission and in the Council<sup>117</sup> have demonstrated that this compromise is complex and is subject to different interpretations and misunderstandings. Against this backdrop, the Commission made a declaration for launching a broader revision of the unemployment chapter of the coordination regulation at the EPSCO Council in December 2011.

We describe in the following text the main problems elicited via the data collection activities conducted for this study. The problems are summarised visually in a problem tree, included at the end of the section. The problem tree links the problems to objectives, and also depicts the drivers behind such problems.

---

<sup>115</sup> Document 15045/01 of 6 December 2001. Parameter 10 stated: “The unemployment chapter must be simplified with due respect for the current coordination rules. However, it must be extended to cover the self-employed schemes existing in a number of Member States. In addition, the unemployed person must be guaranteed the right to search actively for work in the Union, with payment of unemployment benefit in cash being maintained for a period of at least three months under simplified conditions”.

<sup>116</sup> Regulation (EU) No 465/2012 amending Regulation (EC) No 883/2004

<sup>117</sup> The Council discussed several provisions of the Unemployment Chapter (namely Article 65 and new Article 65a) in the framework of adoption of Regulation (EC) 465/2012, which introduced miscellaneous amendments to the Regulation (EC) No 883/2004.

To further facilitate the understanding of the problems, and to substantiate their analysis, we first provide some additional background information and discuss one of the main drivers behind the identified problems, i.e., the complexity of the current coordination rules. Discussing this driver, which involves elaborating on different elements of the current rules, is relevant because it has a horizontal effect on the remaining drivers identified. The complexity of the rules is both caused by and reflected in the diverse aspects and cases contemplated by the current coordination rules. The support for a revision of the rules, as well as the sentiment or opinion of different stakeholders on particular issues is also provided by reflecting the results of the EC's public consultation and Deloitte's survey to national administrations.

## Complexity of current coordination rules

The coordination rules were generally perceived as complex during the interviews conducted with public authorities and other stakeholders. The results of the online survey launched by Deloitte and the EC public consultation also point to such complexity and to the effect that, it becomes difficult for migrant workers and national institutions to know with certainty which are the workers' rights under EU law.

In the online survey conducted by Deloitte among public authorities, 19.6% pointed out directly that "EU rules are too complicated" as one of the main problems noticed regarding the application of EU law in the area of unemployment benefits. Other responses also elicit such complexity. More precisely, 72% of the participating institutions thought that Member States are not correctly or uniformly applying EU law, whilst 60% considered that migrant workers are not sufficiently aware of their rights. These problems - which stem directly from a lack of simple, clear rules - were the most often selected by public institutions. In addition, 47% saw a problem in the ineffective and burdensome communication, while 39.2% saw administrative burden as a problem. Both of these problems could also be considered a certain by-product or consequence of complex coordination rules.

44.4% of the representatives from public institutions participating in Deloitte's survey considered that the current coordination rules need to be changed. An additional 19.4% thought that, although they do not need to be changed, they should be better applied in practice (incorrect or uneven application can also stem from the complexity or lack of clarity of the rules). 12.5% of the respondents to the survey considered that, while the coordination rules need to be changed, they should be better explained. Among the 44.4% of representatives from public institutions that considered that the coordination rules need to be changed there were also concerns related to shortcomings of the coordination rules in defining precisely certain procedures or concepts, leading to a degree of obscurity that renders the coordination complex in practice.

Similar results were obtained in the EC public consultation. Three problems which can be linked to the complexity of the rules were the three most frequently selected by the respondents. 38% of the national administrations, 41% of the social partners and trade unions, and 56% of the civil society and non-governmental organisations considered that the lack of awareness of migrant workers about their rights (which results to a certain extent from complexity of the rules) is one of the three main problems of the application of EU law in the area. It was the problem noticed most frequently by each of these groups of stakeholders. The second problem encountered most often by the stakeholders consulted was the slow and/or ineffective communication between institutions of Member States; it was selected by 38% of national administrations, 24% of social partners and trade unions and 33% of civil society organisations. Another problem related to the complexity of the coordination rules was the third most-frequently noted problem. It referred to the fact that national institutions do not provide migrant workers with correct and sufficient information (29% of national administrations, 24% of social partners and trade unions and 33% of the civil society and non-governmental organisations participating selected this problem). More directly, for 13% of the national administrations and 12% of the social partners and trade unions, the excessive complexity of EU law was one of the three main problems of application of EU law in the area. For 23.6% of national administrations, the incorrect application of EU law by national institutions or administrations is also a top-three concern.

While they did not consider it necessary to change the coordination rules, 18% of the national administrations participating in the public consultation believed that the rules should be better explained, as did 29% of the social partners and trade unions. Another 20% of the national administrations thought that the rules should be better applied in practice. Among those who believed in the need to change the coordination rules (27% of national administrations, 35% of social partners and trade unions and 66% of civil society and non-governmental organisations) there were also concerns related to concrete aspects that render the coordination rules complex.

According to the stakeholders, different elements contribute to the complexity and lack of transparency of EU coordination rules. These include:

➤ **The distinction between frontier workers and other cross-border workers & the determination of cross-border workers' country of residence**

The first element of complexity comes from the distinction between migrant workers, frontier workers and other cross-border workers. The distinction is difficult to apply in practice, and becomes blurry in certain cases. During the interviews carried out it was generally agreed that, while there are marked differences between “classic” frontier workers and other types of cross-border workers, the latter are becoming less and less common and the distinction between frontier workers and other cross-border workers is increasingly blurry.

Typical frontier workers are considered to maintain stronger links with their country of residence, and are perceived as less likely to leave it due, inter alia, to family links. However, it was pointed out that the distinction between frontier workers and other cross-border workers is often rather complicated<sup>118</sup>. Even more, the distinction between cross-border workers and cases of foreign workers considered as national workers (i.e. migrant workers), whereby migrant workers become resident in the country of activity, also appears to be blurry. Relevant differences were also reported among frontier workers. As mentioned during the interviews conducted in Germany, frontier workers range from workers who live barely some minutes or kilometres away from their place of work to others who cover distances over 500 km. This challenges the original conception that frontier workers are close (in terms of distance and commuting time) to their place of employment (and hence unemployed frontier workers to their country of last activity).

It can also create conflicts with national law. Thus, for example, in order to be considered an unemployed person (and hence be entitled to unemployment benefits), the individual concerned must be close (in time and geographical terms) to his/her district or area<sup>119</sup>. Frontier workers covering greater distances to go to work do not fall into this category. On a similar note, according to the ZAV-IPS Frankfurt, not all national authorities inform the migrant workers sufficiently or correctly where to claim unemployment benefits, due in part to the fact that there is a lack of clarity regarding the “real” and “false”<sup>120</sup> cross-border workers.

---

<sup>118</sup> Cross-border workers are persons who work in one Member State and reside in another. Frontier workers are a sub-category of cross-border workers who work in one Member State and reside in another where they return daily, or at least once a week.

<sup>119</sup> In Germany for instance, the regulation requires individuals to reside in the area so as to be entitled to unemployment benefits. Luxembourgish authorities also mentioned the German case as an example of how conflicts with national legislation can arise. Although the Law in Luxembourg does not make such a requirement (unemployed workers living in Belgium, France and Germany can perfectly receive unemployment benefits).

<sup>120</sup> “Real” or “classic” frontier workers could be considered as those who live almost literally on the border, just a few kilometres away from their place of work, so they do not have to cover long distances and could also easily, if needed, make themselves available for

In accordance with the views gathered, the determination of the country of residence remains difficult in practice, as it is subject to a high degree of interpretation. The criteria for the determination of residence set out in Article 11 of Regulation (EC) No 987/2009 are, according to the interviewees, broad and cannot be applied straightforwardly. This generates some uncertainty. Public authorities do not often have sufficient information at their disposal to control the frequency of return home of frontier workers, and the distinction between frontier workers and other cross-border workers fades out in many cases. Furthermore, economic development and infrastructural improvements reduce progressively the importance of physical distance. In these circumstances, the distinction between frontier workers and cross-border workers established by the Regulation adds an element of complexity that is on occasion not fully coherent with reality. As an example, the British authorities made explicit allusions in the interviews conducted to the case of Polish workers, whom in many cases are apparently not considered as resident in the United Kingdom even after living and working there for years<sup>121</sup>. Polish authorities, on their side, stated that the assessment criteria of the habitual residence test for cross-border workers does not work well and results in administrative burden. The Federal Ministry of Labour, Social Affairs and Consumer Protection of Austria (BMASK) considered that there should be a clear definition of a cross-border worker in the Regulation.

The distinction between frontier workers (and, within those, between wholly and partially unemployed frontier workers<sup>122</sup>) and cross-border workers is important because it determines where the unemployed workers can register and claim unemployment benefits.

While wholly unemployed frontier workers must register and ask for unemployment benefits in their country of residence, cross-border workers other than frontier workers have the choice between their country of residence and the country of last activity. On one hand, this distinction might be confusing for the workers, who may not be aware of their own status. It might also be confusing for the public authorities. Problems regarding the lack of awareness of migrant workers about their rights, as well as problems concerning the fact that national institutions or administrations do not provide migrant workers with correct and sufficient information have been reported (see above). On the other hand, the right of choice given to cross-border workers other than frontier workers introduces an element of uncertainty for public authorities. It requires communication efforts with other Member States to have information on the situation of particular workers.

### ➤ **Rules on aggregation of periods of insurance, employment and self-employment**

A second element of complexity is provided by the rules on the aggregation of periods. We hereby refer to the evidence provided on administrative burden in the baseline scenario chapter. The coordination Regulation provides for the aggregation of periods of insurance, employment or self-employment conducted under the legislation of different Member States for the purposes of the acquisition, retention, recovery or duration of unemployment benefits. A specific provision is

---

interviews, training courses and also administrative procedures, at their place of last employment –“abroad”, but close by-. “False” or “non-classic” frontier workers would those who indeed cover much larger distances to go to work, yet still come back “home” often enough to receive the consideration of frontier workers and therefore could enjoy a favourable taxation system.

<sup>121</sup> The assessment of habitual residence by the United Kingdom has been contested by the European Commission in an infringement procedure.

<sup>122</sup> Regulation 883/2004 establishes a distinction between wholly unemployed frontier workers and partially or intermittently unemployed frontier workers (art.65.1-2 Regulation (EC) No. 883/2004). Wholly unemployed frontier workers must register and apply for unemployment benefits in their country of residence, while partially or intermittently unemployed frontier workers must register in their country of last activity.

introduced for the cases in which the right to benefits is conditional on the completion of periods of insurance. In these cases, the periods of employment or self-employment completed under the legislation of another Member State shall not be taken into account unless such periods would have been considered to be periods of insurance had they been completed in accordance with the applicable legislation.

Therefore, the coordination rules (Art.61 (1) of Regulation (EC) No 883/2004) start by drawing a distinction between cases where the national legislation of the competent Member State makes the entitlement and the length of the unemployment benefits subject to the completion of periods of insurance on one hand and, on the other hand, cases where the legislation makes the entitlement conditional on the completion of periods of employment. By so doing, the regulation intends to reflect actual differences in national systems.

The conditions to consider certain periods completed under the national legislation as periods of insurance, employment and self-employment under national legislation vary across countries. Since the acquisition, retention, recovery or duration of unemployment benefits are linked to the different periods of each type completed, and the consideration of the same periods might vary across countries, this makes it complicated for mobile workers to know their rights. This is also the case for public authorities (therefore, workers cannot always solve their doubts by asking to the administration). This diversity of opinions of the national administrations is well documented in the annexes to AC 470/11.

In particular, the interviews carried out with public officials pointed towards particular issues with the periods of self-employment. The regulation of self-employment varies significantly across countries. In some of them, contributions to Social Security, including for the coverage of the risk of unemployment, is entirely voluntary. In others, there are no schemes for self-employed workers at all. The way unemployment benefits are financed also varies across countries. While in certain countries the funds come exclusively from contributions of self-employed workers (e.g. Spain and Denmark), in other countries there is contribution from the State's budget (e.g. Luxembourg). This in turns impacts the consideration of periods of self-employment as periods of insurance. Self-employment periods might not be considered as periods of insurance, and therefore not generate the right to unemployment benefits. Concerns about the particularities of self-employed workers were particularly raised in Spain. In the view of the Spanish public authorities, art.61 (1), second paragraph, fails to account sufficiently for the complexity brought about by the significant differences across countries. Representatives from French authorities also criticised the coordination rules in this aspect, suggesting that the coordination regulation should clearly set out from the beginning a difference between those countries that provide unemployment benefits to self-employed workers and those that do not (they could be specified in an Annex, covering potentially conflicting situations). The rules should then be different for each group of countries. In Belgium a representative from the National Employment Office pointed out the different interpretations that Member States make of periods of insurance. He signalled, as an example, the classification of self-employed periods treated as insurance period. Two specific cases for Belgium were provided as examples:

- *OSSO-assurance (overseas social security office)<sup>123,124</sup>: periods of employment in another country insured by an OSSO-assurance were considered as 'Belgian periods'.<sup>125</sup> This is no longer the case. Now, it is necessary to have/prove a Belgian period of insurance to receive an unemployment benefit. In addition, foreign periods outside the EEA, not employed as a posted worker, will not be mentioned on the UI-form.*
- *Belgium does not have unemployment insurance for self-employed persons. Self-employed persons living in Belgium and working in another Member State will not receive a Belgian unemployment benefit. However, these periods of self-employment will be taken into account when the person was afterwards employed as cross-border worker/frontier worker OR accomplished a Belgian period of insurance OR is a migrant person who has accomplished also a Belgian period of insurance.*

The Confederation of the German Trade Unions also reported occasional problems with the aggregation of periods. These occurred in cases of short-term employment contracts and in cases when the former employer could no longer be traced.

Hence, while the coordination Regulation should cover all different contingencies, it follows from the opinions gathered in several Member States that the wide variety of cases that can occur is not, allegedly, sufficiently addressed by the Regulation. Self-employment's peculiar characteristics and the disparity of its regulation across countries add to the overall complexity of EU rules. Mobile workers, and even officials in national public institutions, are put in a difficult situation to find out with certainty and *a priori* the entitlements of migrant workers. Public authorities in many of the countries visited (including Austria, Denmark, France, Germany, Poland and Spain) generally supported a clarification of the rules on the aggregation of periods of insurance, employment and self-employment (therefore acknowledging the problems stemming from the current ones).

trESS identified this same issue in their Think Tank Report 2012. As stated in the report, "A major problem in the field of the application of the aggregation rules is that the interpretations of these rules differ significantly among the Member States' institutions. Especially in cases where the national legislation makes benefit entitlement conditional on the completion of periods of insurance, different approaches are taken with regard to periods of employment or self-employment, which under the legislation under which they were completed are not regarded as periods conferring entitlement to unemployment benefits". The report outlines different problems arising from the application of the aggregation rules, including the periods of (self-) employment to be taken into account and the periods to be taken into account with regard to voluntary schemes. Other practical problems are also mentioned.

**➤ Provisions on the export of unemployment benefits: minimum period of export of three months with a possible extension to six months (discretionary decision of the competent institution)**

<sup>123</sup> [http://www.dosz-ossom.fgov.be/user\\_docs/02-12-Brochure-Anglais.pdf](http://www.dosz-ossom.fgov.be/user_docs/02-12-Brochure-Anglais.pdf)

<sup>124</sup> OSSOM offers a broad social protection to anyone:

1. who works outside the European Economic Area and Switzerland.
2. who is a citizen of Switzerland or of a Member State of the European Economic Area (Nationals of other countries must be employed by the Belgian State, the Regions or the Communities or by a company with registered office in Belgium.)

<sup>125</sup> See also cases *Bozzone* (87/76) and *Laborero/Sabato* (82 and 103/86).

A third element contributing to the lack of transparency is the regime for the exportation of unemployment benefits (cf. Table 131: Export of unemployment benefits - current practices). The regulation foresees a minimum period of export of three months, with a possible extension to six months. However, there are not fixed criteria for the concession or refusal of the extension. The decision is taken by the competent institution, which applies its own set of criteria or, in some cases, has no pre-defined criteria at all. The competent institutions in the Member States are supposed to apply discretionary power, meaning (according to the ECJ) an assessment of the situation of each individual case (and not the adoption of a general policy decision on the prolongation or not of the export). This reduces, in practice, the transparency for the workers, who cannot know in advance the likely duration of their export period, which might in turn affect their mobility decision. In addition, some countries do not grant the export at all (such as the UK).

Certain interviewees (including British public officials, a representative from the Confederation of the German Trade Unions and certain EURES advisors) considered that the duration of the period needs to be clearly defined (be it three months, six months or other duration –they held different views-). A time-span (as is the case, with a span between three and six months) can easily lead, in their view, to a misinterpretation by the citizens, and is ineffective in practice.

The interplay between the current coordination rules and national rules can also create conflicts in practice. This was the case in Germany, where it was reported that it is not possible for recipients of Hartz IV benefits (Arbeitslosengeld 2) to export their unemployment benefits; it is only possible to export the “true” unemployment benefits (Arbeitslosengeld 1). This is, allegedly, often unclear to the citizens who seek advice (e.g. at EURES).

### ➤ **Reimbursement of unemployment benefits between Member States**

Even though they do not impact EU citizens directly, the rules on reimbursement between Member States also add to overall complexity of the system and represent a source of administrative burden for Member States. Several claims were raised during the interviews with public officials pertaining the inefficiency and burdensome character of the reimbursement mechanism (they are described more in detail below).

Depending on the conditions, the Member State of last activity might have to reimburse the Member State of residence the benefits provided during the first three or five months to a frontier or cross-border worker.

The reimbursement provisions are a novelty of Regulation (EC) No 883/2004, as they were not included in Regulation (EEC) No 1408/71.

### ➤ **Communication between institutions of Member States**

Communication between institutions of Member States is clearly perceived as an area with substantial margin for improvement. Under the current coordination rules, problems of ineffectiveness and derived burden are reported by a significant number of public authorities. They are also noticed by other stakeholders.

As previously reported, the results of both Deloitte’s online survey and the public consultation carried out by the Commission reveal shortcomings in the communication between institutions of

Member States. In Deloitte's survey, 47% of the public authorities saw a problem in the ineffective and burdensome communication. Only 10.6% of the respondents considered that the communication is fast, efficient and effective; over twice as many respondents, in contrast, indicated that cross-border communication is slow, burdensome and/or ineffective.

In the EC public consultation, 38% of national administrations, 24% of social partners and trade unions and 33% of civil society and non-governmental organisations ranked the slow and/or ineffective communication between Member States as one of the three main problems of application of EU law in this area. It was the second most-frequently selected by the respondents who replied on behalf of organisations.

The complexity of the current system is reflected in the use of different types of documents for exchanging similar information. As an example, according to representatives from the Polish government:

*"There are too many documents that are used to confirm basically the same information (e.g. U002/U017/E301). Other countries use other forms such as PD U, PD S, PD F, etc. This may result in confusion among migrant workers and may lead to the loss or reduction of their entitlement to unemployment benefits. The documents need to be clear and be used universally across the EU."*

### *5.3.1 Unawareness of rights of mobile workers among workers and public authorities*

---

As has been discussed above, the complexity of the rules generates problems both for mobile workers and for public authorities to know with certainty the rights mobile workers are entitled to under EU law. The results of both Deloitte's survey and the EC public consultation, as well as the interviews conducted at national level point towards a relatively low level of awareness of rights. While workers would actively look for information upon becoming unemployed, the complexity of the rules and the uncertainty that surrounds the interpretation and application of certain ones would persist as obstacles for a high level of awareness of rights.

### *5.3.2 EU rules not sufficiently taking into account changing job market conditions & Risk mobile workers enjoy less favourable conditions for reintegration into the labour market*

---

The coordination rules try to ensure that migrant workers receive unemployment benefits in the conditions most favourable to the search for new employment. Under the current coordination rules, cross-border workers other than frontier workers can choose to register and apply for unemployment benefits in their country of residence or in their country of last activity. The onus is on them, then, to ponder the pros and cons of both systems and opt for the one they consider more beneficial given their circumstances. Wholly unemployed frontier workers, meanwhile, must register and claim unemployment benefits in their country of residence. As a supplementary step, they might also register as job seekers in the employment service of their country of last activity. However, if they do so, the compliance with the job-seeking obligations of the country of residence takes priority over the requirements of the country of last activity. As such, the rule mandating frontier workers to claim unemployment benefits in their country of residence is based on the assumption that they enjoy the most favourable conditions for seeking employment in their country of residence. Due to changing job market conditions, such assumption is nowadays questionable.

In interviews carried out for this project, particularly with public officials, as well as in our online survey, several interviewees and respondents manifested the view that unemployed frontier workers might not enjoy the most favourable conditions for seeking employment in their country of residence. Instead, they could have better chances of finding a job in their country of last activity. The qualification conditions that apply, the value attached by employers to experience in a particular market, and the importance of professional networks are some of the factors that might turn the country of last activity into a more attractive option for frontier workers. In this sense, a British public official argued that *"as research shows, many of the opportunities to find a job are due to formal networks, not informal ones"*. He argued that formal networks would be stronger for the frontier worker in his/her country of last employment, while informal networks would be stronger in his/her country of residence.

However, it was also noted during the interviews that it is not possible to generalise. Each case is different. The most relevant factors to determine the chances of finding a job are the educational background, qualifications and experience of the job seeker as well and the conditions of the job market in the area concerned. Demand for specific skills and the economic conditions of a specific area are paramount (as evidenced particularly in times of economic crisis, where unemployment rates vary strikingly across countries and regions). Therefore, it is difficult to determine, on a general basis, whether frontier workers enjoy a better chance of finding a job in their country of residence or in

their country of last activity. At any rate, precisely because of the importance of individual circumstances and the swings in the economic prospects of each region over time, the assumption that unemployed frontier workers enjoy better conditions for seeking employment in their country of residence does not seem to hold.

The Court of Justice did indeed identify an exceptional application of the rule for other cross-border workers to unemployed frontier workers, who have better prospects of finding another job in the State of last activity and could therefore apply for unemployment benefits there (Case C-1/85 *Miethe*).

While the Court has recently stated that the provisions of the new Regulation (the *Miethe* case concerned the previous coordination regulation, dating from 1971) are not to be interpreted in the light of its earlier case-law<sup>126</sup>, it does not deny the existence of a certain type of frontier workers who, having maintained particularly close personal and business links with the country where they were last employed, have better chances of reintegrating into working life in that Member State.

Therefore, while not denying frontier workers the chance of receiving support from a public employment service to find a job, it appears that the current coordination rules do not necessarily reflect the current job market conditions for unemployed frontier workers.

It should be noted, however, that some opinions in favour of making the country of residence responsible for the provision of unemployment benefits to frontier workers were also voiced. They were partially based on the belief that the country of residence offers the best chance for frontier workers to find a job. This was the case in Germany. According to the German Employment Services, unemployed workers receive an optimal support to find employment when they are supported by the employment services in the country of residence; in such cases, there are no disadvantages for the jobseeker resulting from the participation in reintegration services, such as travel costs, uncertainty about training courses, advanced vocational training, etc. In addition, the German Federal Ministry of Labour and Social Affairs argued that when receiving unemployment benefits from his/her country of residence, the unemployed person receives benefits which are in line with the person's direct environment (e.g. cost of living and wage level) and is offered equal treatment compared to "national" unemployed persons. This system also guarantees, in their opinion, an undivided competence that ensures a proper functioning of the chain of reintegration –granting of services and control.

The previously discussed (increasingly) blurry distinction between certain frontier workers and some other cross-border workers, as well as the differences between different types of frontier workers (some of them maintain particularly strong links with the country of last activity, which creates effective differences between them and other frontier workers who remain more attached to their country of residence), also reflect changes in the job market not fully accounted for by the current coordination rules.

In addition, public authorities interviewed in Slovakia pointed out that the current coordination regulation is focused on the problems of the "old" EU Member States. Regulation (EC) No 883/2004

---

<sup>126</sup> See Case C-443/11 *Jeltes*. Following the Court's ruling, the grant of unemployment benefits by the Member State of residence applies even in relation to wholly unemployed frontier workers who have maintained particularly close links with the State of their last employment.

was enacted on 29<sup>th</sup> April 2004, two days before ten new Member States officially joined the European Union (1<sup>st</sup> May 2004). These interviewees argued that the “old” Member States generally had (and have) higher living standards than the new entrants, while their social security systems also vary. These differences affect the actual results of the implementation of the coordination rules. One interviewee, for instance, pointed out that “the motivation for a Slovak worker to go abroad largely differs from the one from old EU Member States”.

### *5.3.3 Unbalances distribution of financial burden*

---

#### **➤ *Member State of residence bearing costs of unemployment benefits and other social security benefits without receiving contributions and with only limited coverage by reimbursement mechanism***

The impact of the current coordination rules on the fair sharing of financial burden among Member States is different with regard to frontier workers and to other types of cross-border workers.

The Member State of residence must bear the costs of the unemployment benefits of frontier workers, even though it has not received any contribution from them. Furthermore, it also has to bear other social protection costs related to the unemployed worker and his family.

The unfair character of the rules for the Member State of residence, in terms of distribution of costs between Member States (considering the link between the reception of contributions from workers and the expenditure in unemployment benefits), was agreed by the vast majority of the public authorities interviewed.

In general terms, it was agreed that to provide for a fair sharing of burden, the country receiving contributions should be in charge of paying out the unemployment benefits. In other words, there should be a link between contributions and payments.

Cross-border workers other than frontier workers can choose to claim their unemployment benefits in their country of residence or in their country of last activity. For those who choose the country of residence, the same reasoning just explained for wholly unemployed frontier workers applies. For those who choose their country of last activity, the Member State that received contributions from the worker bears the costs of the unemployment benefits.

In the online survey conducted among public authorities, these considered clearly the best option, from the point of view of a fair sharing of the financial burden between Member States, that the country where the person last worked and paid social security contributions (even if he/she lived in another Member State) should provide the unemployment benefits (it received a score of 3.19 in a scale of 1 to 4). By comparison, the options stating that the benefits should be provided by the Member State in which the person last lived (even if he/she last worked and paid social security contributions in another Member State), and that the unemployed person should be allowed to choose to claim the benefit either in the Member State of last employment or in the Member State of residence, were both similarly scored (2.29 and 2.28, respectively) and clearly below the option making responsible the country of last activity (see Annex 10.9).

As mentioned previously, a reimbursement mechanism exists. According to it, the Member State of last activity must reimburse the benefits provided to wholly unemployed frontier workers during the

first three or five months (depending on the periods of employment or self-employment completed by the worker) to the country of residence. As long as the unemployment spell of the concerned worker lasts for longer than the period of reimbursement, the current coordination rules impose an unfair burden on the Member State of residence. In this situation, the Member State of residence has not received contributions from the unemployed worker, yet it has to cover his/her unemployment benefits and possibly also bear other social protection costs. Numerous public officials with direct experience in the matter interviewed considered that the coverage of the reimbursement is not sufficient to compensate the expenditure in unemployment benefits (let alone other social security expenses) given the average duration of unemployment spells. Among those, the following quote was received from Portuguese civil servant:

*“The reimbursement of 3-5 months by the competent Member State is considered as peanuts compared to the costs that we face in paying out unemployment benefits to Portuguese seasonal workers who have worked abroad. That is why we are so much in favour of a system where they would claim their unemployment benefit in the country of last employment”* (Portugal has a significant amount of seasonal workers who work abroad during a certain period of time while retaining their habitual residence in Portugal. When they come back and become unemployed, Portugal has to pay the unemployment benefit of these people).

However, the duration of the reimbursement period was considered sufficient to provide for a fair distribution of the costs by the public authorities interviewed in some Member States, including notably Luxembourg and the United Kingdom. Public officials in the United Kingdom argued that around 50% of unemployed workers there found a job within 13 weeks of becoming unemployed, and the remaining ones do it before six months. Therefore, the coverage of the reimbursement mechanism seemed appropriate to them.

#### ➤ **Other problems of unfair sharing of financial burden**

Other aspects of the current coordination also stood out as factors causing an unfair distribution of financial burden. These can generate an uneven distribution of the burden in one direction or the other, that is, unfair for the country of last activity or unfair for the country of residence. These include:

- The lack of a minimum period of employment required for the determination of the competent Member State: the current coordination rules do not fix any minimum amount of time of employment to determine the Member State of last activity. Thus, periods of employment of barely a few days or two or three weeks are enough to consider a country as the country of last activity; as such, the country in question will be responsible for the provision or reimbursement of unemployment benefits. Cases of this kind were reported during the interviews (inter alia, by public authorities in Austria, Belgium, France, Germany, Luxembourg and Spain). This can generate an unfair burden on the concerned countries (for instance, a country might have to reimburse up to three months of unemployment benefits for a worker that has only worked in the country for a few days).
- The exclusiveness of the last salary for the determination of the benefits the unemployed worker is entitled to: currently the last salary of the migrant workers is used to calculate the benefits he/she is entitled to (following art.62 Regulation (EC)

No 883/2004). It is possible that such last salary has been perceived only for a very short period of time (see previous point). Salary conditions might also vary abruptly between the country of residence and the country of last activity (and hence possibly between the unemployed person's two latest remunerated activities). In these cases, the last salary might not be a good indicator to use as a basis for the calculation of the benefits, in the sense that it might lead to benefits disproportionate to the contributions paid by the worker over a representative period of time. The worker might end up in a winning or losing situation, and situations of unfair sharing of the burden (via reimbursements) might arise. It was alleged by numerous public officials that previous sources of income, over a more extended period of time, should be considered for the calculation of unemployment benefits.

**Examples of the first of these problems gathered during the interview include:**

*"A lot of people exporting their unemployment benefit quickly find an interim job in the Netherlands. Then they become unemployed after a while which makes them entitled to Dutch unemployment benefits, if they live in the Netherlands"*

*"A Polish person with a U2 document moves to Belgium. If he finds an interim job for a month in Belgium, he can be entitled to a Belgian unemployment benefit if his periods of employment are aggregated. This is social tourism."*

As evidenced by the second example, concerns about the lack of a minimum period required to determine the country of last activity (and hence potentially competent for providing unemployment benefits) are linked to concerns about a certain misuse or abuse of rights.

TrESS discussed the aforementioned problems and expanded briefly on them when dealing with the problems brought about by the adoption of the system of reimbursement of between Member States. These problems relate directly to the distribution of the financial burden between Member States. The following problems were listed in the Think Tank Report 2012:

- The State of last employment or last activity may be obliged to reimburse some amounts although the person concerned would not have been entitled to benefits under its legislation. The application of a foreign legislation is binding, which may in principle collide with the apparent neutrality of coordination provisions.
- The State of residence ameliorates its situation with respect to the provisions of Article 71 of Regulation 1408/71, but in many cases the reimbursements do not fully cover (three to five months) the cost of the unemployment or other benefits awarded.
- The amounts reimbursed may not be proportional to the periods completed in the Member State of last employment or last activity. No minimal period of insurance is required for the start of the obligation; an insurance period of only one day may suffice.
- The State of residence is obliged to be in a position of creditor and needs to require the correspondent reimbursement from the debtor.
- The maximum amount provided in paragraph 6 of Article 65 can be a theoretical amount, taking into account that the real amount payable by the State of last employment or last activity could amount to zero. Member States frequently disagree on this maximum amount.
- The administrative procedure is very complicated and burdensome. Delays of reimbursement are common and frequent. For the State of residence, there always is

the uncertainty whether and when it will receive the reimbursement. This objection weighs most heavily against the reimbursement approach.

In addition, trESS reported persistent problems regarding the joint interpretation of the reimbursements, as some Member States declared they may not follow Decision U4 of the Administrative Commission (the decision constituted nevertheless a positive step towards a joint interpretation of the reimbursement rules). Practice also shows, according to trESS assessment, that there is uncertainty as to how to handle claims for reimbursement, and institutions seem in general to lack the experience to properly assess reimbursement claims.

As additional information beyond the pure problems identified in this regard, the following table summarises the opinions of the participants in the EC public consultation and Deloitte's online survey regarding the question of which Member State should provide the unemployment benefits (which is intimately linked to the sharing of the financial burden between Member States):

#### National public authorities

According to the EC public consultation findings, a large majority of the respondents is in favour changing the rules. Only 11% of national public authorities think that the unemployment benefits should be provided by the Member State where the person has lived (as is currently the case for wholly unemployed frontier workers), even if he/she last worked and paid social security contributions in another Member State (third preferred option of national public authorities after the right of choice option -47%- and the country of last activity option -38%).

This percentage significantly differs from the 26% derived from the Deloitte survey findings (the country of last activity option was also the third preferred). Analysing the replies to the Deloitte survey country-by-country, maintaining the status quo is the preferred option of respondents from national public authorities in nine countries (AT, BE, DK, DE, IE, LU, ES, SE, CH), compared to the ones from 11 Member States in favour of making the country of last activity responsible for providing the unemployment benefit.

#### Trade unions and social partners:

88% of the trade unions and social partners who have responded to the public consultation preferred breaking the status quo. Keeping the current rules was the least preferred option amongst this group.

#### Civil society/NGOs

78% of civil society organisations and NGOs that responded to the public consultation preferred a change of the current coordination rules. The current rules were the second preferred option after the granting the right of choice for frontier workers).

#### Individuals:

93% of individual respondents to the public consultation preferred to change the current rules.

#### 5.3.4 *Migrant workers receiving low returns on their contributions*

---

Wholly unemployed frontier workers must currently claim unemployment benefits in their Member State of residence. However, these workers paid contributions to Social Security, covering the contingency of unemployment (or contributed otherwise, such as via taxes paid to the Treasury, to the financing of such benefits), in their country of activity. Therefore, frontier workers receive unemployment benefits based on a different system than that to which they contributed. This leads to situations in which certain wholly unemployed frontier workers may lose out on benefits, and receive unemployment benefits below what their contribution should have enabled them to. In other words, they do not receive benefits proportional to their contribution.<sup>127</sup>

This existence of this problem was manifest, according to the public authorities interviewed. Some cases of glaring disproportion were reported during the country visits.<sup>128</sup>

As trESS pointed out in the Think Tank Report 2012, problems might also arise when there is a switch in the applicable legislation. Once a person is qualified as a wholly unemployed frontier worker or a non-frontier worker who continues to habitually reside in the State of residence, the State of residence will be, in virtue of Art.65, the competent State for the provision of social security benefits. The State of residence becomes then responsible for the payment not only of unemployment benefits, but also of sickness and family benefits. This change of system might give rise to disputes, especially when applying the legislation of the State of last employment would have resulted in a more favourable outcome for the person concerned and/or his family members.

Cross-border workers other than frontier workers, on their side, have the right to choose to claim unemployment benefits either in their country of last activity or in their country of residence. Hence, barring any major problems in terms of information about their rights in each country, they are able to compare the total benefits they are entitled to in each country and therefore avoid problems of lack of return on their contributions. However, as explained earlier when commenting on the complexity of the current coordination rules, there are widely perceived issues among EU mobile workers regarding a lack of awareness of their benefits. This was noted by public administrations as one of the main problems related to the application of EU law in the only survey conducted by Deloitte, as well as in the EC public consultation. Other stakeholders also declared to have noticed this problem, while the majority of individual respondents (general public) declared not to know (27.4%) or only have a vague idea (29%) about their rights under EU law. While the interviews carried out with public officials directly involved in the matter during country visits (clearly in France and Romania) confirmed that, upon becoming unemployed, mobile workers become much more aware about their rights, it appears that they would still face challenges to know with the certainty their entitlements. Thus, Deloitte's survey and the EC public consultation showed that there appear to be problems concerning the level of awareness of the coordination rules among public authorities, causing them on occasion to provide migrant workers with incorrect and/or insufficient information. In these cases, cross-border workers other than frontier workers could also end up

---

<sup>127</sup> The situation can also be the reverse. Frontier workers might enjoy comparatively high benefits, over what their contribution should enable them to earn. However, in this case the rules would not present problems in terms of lack of return on contributions or loss of rights to benefits.

<sup>128</sup> As an example, the Austrian authorities interviewed put the example of a Hungarian frontier worker, resident in Hungary and having worked for 30 years in Austria with an average monthly salary of € 2 000, who becomes wholly unemployed. This person, upon becoming unemployed, receives unemployment benefits of around €110 per month during three months; had he lived in Austria, he would get approximately €1 100 for a period of minimum nine months.

missing a return on their contributions if failing to identify the Member State that would provide them with the higher unemployment benefits and/or the highest chances of reintegration in the labour market.

Using the “impact on social protection” as a proxy for return on contributions, the public authorities participating in Deloitte’s survey ranked the right of choice as the best option (a score of 2.79 in a scale of 1 to 4), followed by the “country of last activity” (2.67). The “country of residence” option (currently applied to wholly unemployed frontier workers) received a lesser score than both of them (2.53). These results are consistent with the arguments presented.

Additionally, issues with the aggregation of periods could also lead to the loss of entitlements. In these cases, workers would also receive unemployment benefits which are not commensurate with the contributions paid. No glaring issues of this kind were identified in the interviews carried out with public administrations.

### *5.3.5 Risk of loss of rights to benefits*

---

The aforementioned informational challenges for EU citizens and administrations can result in a loss of benefits for mobile workers. The complexity of the coordination rules creates challenges for workers to know their rights, which can result in migrant workers being unprotected (being left without any unemployment benefits) because they requested unemployment benefits in the wrong Member State. As staff working in national administrations also face challenges in obtaining an in-depth knowledge about the migrant workers’ rights, they are not always able to advise workers so as to avoid situations of losses of benefits.

TrESS points directly at the complexity of the legal framework as a potential source of problems, and in particular to the fact that the applicable legislation for the granting of unemployment benefits varies depending on whether the person concerned is wholly or partially unemployed. Regulation 883/2004 does not define these concepts, and while decision U3 of the Administrative Commission provides criteria to determine whether a person is to be regarded as a partially or wholly unemployed person, the interpretation of the criteria can still create problems. The unemployed person might see his/her application rejected because of the different interpretation of the facts and criteria that apply.

Changes in the applicable legislation, discussed previously, can also lead to a comparative loss of benefits.

However, this loss of rights was not considered a major issue by the stakeholders interviewed. While the relative lack of knowledge about their rights was confirmed during the interviews, and the challenges for the public authorities themselves were echoed, the general perception of the public authorities was that the system was not failing to protect the workers. No cases where a total loss of rights had occurred due to informational barriers and lack of transparency of the system, were reported by any interviewed representatives of national administrations.

9.8% of the public institutions participating in our online survey considered as one of the three main problems of application of EU law in the area is that “EU rules do not provide for the effective protection of social rights of migrant workers”. These included the following claim from an Austrian civil servant: “Many migrant workers are unaware which institution could support them. As the

*regulation is quite unspecific (for example, how long do you need to work in a foreign country to be entitled to unemployment benefits), each country adds its own rules which makes it difficult for jobseekers. If a cross-border worker loses his job and moves from country A to country B: Country A is not responsible because he does not live there anymore, and country B is not because he did not work there before... A German public official, meanwhile, stated that "Not all national authorities inform the migrant workers sufficiently ... Migrant workers from abroad ( Eastern European Countries) are not sufficiently informed about their rights - social insurances, employees entitlements, contracts etc. A lot of guest workers are not well informed about minimum wages or collective labour agreements and usually earn less than a domestic worker."*

Two representatives of national administrations (out of 55) and one representative from the social partners (out of 17) participating in the EC public consultation considered that "EU rules do not provide for an effective protection of social rights of migrant workers" as an important problem.

The divergent Member States' interpretations of Article 61 of Regulation 883/2004 also can lead occasion to the loss of benefits by unemployed workers. A survey launched in the Administrative Commission showed that divergent interpretations of art.61 lead some Member States to an application of the rules that does not conform to EU law. These issues, confirmed in the European Report 2011 of the trESS network, can have a negative effect on the rights of migrant worker –who may not qualify for unemployment benefits as a result-.

Other issues in terms of incorrect application of the coordination rules can also lead to loss of rights to benefits. 29% of national administrations participating in the Deloitte online survey and 22% of those participating in the EC public consultation considered that, while they do not need to be changed, the coordination rules should be better applied in practice.

The following issues were reported in Poland: According to the Ministry of Labour and Social Policy, certain institutions of Member States of last activity refuse to grant unemployment benefits (and consequently to export those benefits) to cross-border workers other than frontier workers only because they are not residents of that Member State (this in breach of Art. 65(5) (b) in connection with Art. 65(2) third sentence of Regulation 883/2004). Certain institutions do not fulfil their obligations as stipulated in Art. 12(1) in connection with Art. 54(1) of Regulation 987/2009 and make the persons concerned acquire their insurance records (on PD U1) from other Member States on their own. In addition, certain institutions do not fulfil their obligations as stipulated by Art. 54(3) of Regulation (EC) No. 987/209 and make the persons concerned acquire certificated of their family situation (on the outdated forms E302) form Member States on their own. This applies especially to the UK.

The shortcomings of communication between the institutions of Member States can also cause a certain loss of rights to workers by unnecessarily depriving them temporarily of their rights. Only 10.6% of public authorities participating in Deloitte's online survey considered that cross-border communication with other Member States is fast efficient, and effective. In contrast, in the opinion of 25.5% of the respondents the cross-border communication is slow, burdensome and/or ineffective. For the remaining 63.8%, it generally works well, but there are specific problems with certain Member States. During the country interviews, such bilateral issues between different countries were confirmed. The slow or ineffective communication can affect the unemployed people insofar as it can lead to delays in the processing of documents. Since the payment of unemployment

benefits depends upon the completion of the administrative procedures, unemployed workers are directly affected by issues in cross-border communication between institutions. These issues were mentioned by several Member States representatives (for instance in Denmark, the Netherlands and France).

In Belgium, it was reported that the issue of the U1 document by the competent Member State can take six to eight weeks; in the meantime, the unemployment benefit cannot be paid to the unemployed person. In addition, it was stated that not all the necessary documents are provided by the institution or the unemployed person when they are requested (e.g., C4 form, pay slip) and that there are enormous differences across countries in the number of asked “verification documents” (e.g., contracts, pay slips, information about the unemployed person or information about the last employer) when the Belgian unemployment office request a U1 document. Certain countries (notably France) would request a large amount of documents.

Long delays in the exchange of documents were also reported in France.

In Romania, problems were noted in certain cases, notably concerning the missing feedback from requests made to other Member States. Due to this, it was reported that a case can be solved in a timespan ranging from one month and a half to an undetermined duration. In addition, according to the public officials’ interviews, approximately 30% of the forms requested to other Member States were not received or were received with delays, after following up on the initial request.

Another claim related to the loss of rights to benefits was made in the Netherlands: *“The current rules are pretty difficult to apply if a frontier worker is made redundant by a company within the framework of a collective redundancy. In this case, he could benefit from social plan arrangements concluded between the company and trade unions. Many social plans provide topping-up mechanisms where the company supplements the unemployment benefit of his former employee. Supplements are calculated on the basis of the unemployment benefit system of the competent Member State. For frontier workers, who have to claim their unemployment benefit in the country of residence, this kind of topping-up mechanisms could generate unforeseen situations (in their benefit or in their disadvantage)”*.

### *5.3.6 Barriers to job-seeking abroad*

---

Member States’ practices regarding the extension of the period of export of unemployment benefits (from three to six months) vary significantly. As reported in the trESS network Think Tank Report 2012, on the Coordination of Unemployment benefits, some countries have developed their own criteria to assess the convenience of granting the extension, while others assess each individual case on the basis of the reasons mentioned in the request. In some Member States, granting the extension is exceptional; while others do not apply the extension at all (such is the case in Sweden, the Netherlands and the United Kingdom) (cf. p.121 and Table 39).

In those cases when the extension is never granted, or only granted on an exceptional basis, the practices of the competent Member States equates to a lack of facilitation of job-seeking abroad (and hence of labour mobility across the EU).

No set of objective, homogeneous criteria to decide on the granting of the extension across Member States exist. This creates comparative disadvantages between workers in different countries. Those

who see their petition of extension directly rejected, without an assessment of the circumstances of their case, are denied of a chance to facilitate their job seeking abroad.

The workers who are denied the extension of the export do maintain the right to receive unemployment benefits for the remainder of their period of entitlement upon condition of their return to the competent Member State. While maintaining the protection of the workers, this presents an effective obstacle to job-seeking abroad.

According to their replies to the Deloitte online survey, public authorities correlated the duration of the period of export with the impact on labour mobility (the current rules received a score of 2.47 in a scale of 1 to 4, while the option of raising the minimum period of export to six months received a score of 2.54 and the option of making the export possible until the end of the person's entitlement received a 2.72 score). In other words, the longer the possibility to export unemployment benefits, the longer the impact on labour mobility. Therefore, if the duration of the export of benefits is limited due to the different national practices, labour mobility is curtailed.

trESS also reported additional problems of a more practical nature that can hamper job-seeking abroad. These include delays due to the difficulty of finding the required information in time, and also the insistence of many institutions on receiving a confirmation of the jobseeker's registration with the employment services in another MS. This is relevant because the benefits will only be paid after this confirmation. Jobseekers may also encounter difficulties to register with the employment services in another MS, as experience shows. There are also differences with regard to the monthly follow-up information, and there is no uniform approach concerning the use of the PD U2 and the SED S009. Some institutions still use E- forms without any reference to the new Regulations.

As additional information, the opinions of stakeholders participating in the EC public consultation and Deloitte's online survey about the rules on the export of unemployment benefits are summarized as follows:

#### National public authorities

According to the EC public consultation's findings, 63% of national public authorities are in favour of extending the period of export to six months or even longer. Extending the period of export until the end of a person's entitlement to unemployment benefits is slightly more preferred by national public authorities than extending the period of export to 6 months. This percentage of support is in line with what was found in the Deloitte survey.

Analysing the replies to the Deloitte survey country-by-country, extending the period of export until the end of a person's entitlement is the most preferred option by respondents from nine Member States (HU, IT, LV, MT, PL, RO, SK, SI, ES, UK). Representatives from these countries generally see a low risk of abuse and positive effects in terms of labour market mobility and labour market reintegration. Maintaining the status quo is the preferred option by respondents from national public authorities in 11 countries (AT, BE, CY, DK, EE, FI, FR, DE, LI, LU, NL and CH<sup>129</sup>).

#### Trade unions and social partners:

<sup>129</sup> It should be noted that the survey includes personal opinions of national administrations' representatives. These can by no means be considered as the official position of a Member State.

Only 22% of respondents to the public consultation will like to change the current export rules, whereas 78% of the respondents to the public consultation are in favour of keeping the current rules on export of unemployment benefits (preferred option).

#### Civil society/NGOs

78% of respondents in this group are in favour of changing the current rules on the export of unemployment benefits. Prolonging the period of the export to the end of a person's entitlement to unemployment benefit is the preferred option of NGOs/civil society (56%).

#### Individuals:

76% of individual respondents would like to change the current rules on the export of unemployment benefits. 59% of individual respondents would like to see an extension of the period of export until a person's entitlement to unemployment benefits.

### *5.3.7 Uneven application of current coordination rules by Member States*

Public authorities pointed out problems of application of the current coordination rules consistently via the different data gathering activities conducted for the study. 72.5% of the participating institutions selected in the Deloitte online survey "EU law is not uniformly understood and applied by Member States" as one of the three main problems regarding the coordination of unemployment benefits, making it the most-frequently noted problem. On top of the 44.4% of public authorities considering, for various reasons, that the coordination rules need to be changed, 19.4% of the respondents thought that, while the rules do not need to be changed, they should be better applied in practice. Thus, per countries, *whilst considering that the coordination rules do not need to be changed, representatives of public authorities from the Czech Republic, Denmark, Estonia, Malta, Portugal and Spain pointed out in the online survey that the rules should be better applied in practice. Meanwhile, authorities from Austria, Latvia, Lithuania, Slovakia and Switzerland stated that, whilst they do not need to be changed, the rules should be better explained.*

Results were similar in the EC public consultation. "National institutions/administrations do not apply EU law correctly" was the fourth most-frequently selected problem. 19% of the total amount of respondents from national administrations participating considered this as an important problem (in contrast, it was only selected by one social partner and one civil society organisation). On top of the 27% of respondents from national administrations (and 35% of social partners and trade unions, as well as 66% of civil society and non-governmental organisations) that considered that the rules should be changed, 20% of respondents from national administrations considered that, although they did not need to be changed, the coordination rules should be better applied in practice (this option was again only selected by one social partner and one civil society organisation).

Considering specific rules where an uneven application has been noticed, the rules of the aggregation of periods (art.61 Regulation (EC) No 883/2004) are a clear example.

A survey launched in the Administrative Commission in 2011 showed the widely divergent interpretations of art.61 by Member States, some of which were not in accordance with EU law.

These issues were confirmed in the European Report 2011 of the trESS network, and were also confirmed during the interviews conducted with involved public officials for this study.

Two aspects are particularly problematic. First, the consideration of periods of employment or self-employment, when the national legislation of the competent Member State makes the entitlement to benefits conditional on the completion of periods of insurance, and the periods of employment or self-employment are not regarded as periods conferring entitlement to unemployment benefits, is controversial. Second, the consideration of periods with regards to voluntary schemes.

Concerning the first problem, some institutions hold the view that they should not be obliged, by virtue of art.61, to take into account periods which would not qualify to generate entitlement to benefits under the legislation of the State under which these periods were completed (but would have been considered as a period of insurance under the national legislation of the competent Member State). Concerning the second problem, a similar problem arises. Only the national legislation of the competent Member State is considered (therefore, if the period of employment or self-employment completed abroad would have been considered as a period of insurance if it had been completed in the competent country, then it will be considered as such and will qualify for benefit entitlement); this even in cases where the unemployed worker did not insure himself voluntarily. In these cases, as with the first problem, some Member States consider that such period should not generate the right to unemployment benefits (and hence should not be aggregated) since it would have not done so in the country where it was completed.

An example of this type was brought up in Denmark: *“If Germans work in Denmark and if they chose not to become member of the unemployment fund, Germany needs to take into account the periods these people who have worked in Denmark but these people never contributed to the system. It should be clear that when people move to other MS, they should not have rights for which they have not contributed anything. Also Czech republic complained about it”*.

Another similar example was gathered in the Netherlands: *“Aggregation of period of insurance/employment problems with Germany and United Kingdom. Germany did not want to accept the period of employment of people in the Netherlands, as under German legislation this would not have led to entitlement to unemployment benefit. However, the problems are solved now with Germany. With the UK, there problem still persists”*.

The uneven application of art.64 concerning the extension of the period of export of unemployment benefits has also been documented, as discussed above.

Different national practices concerning cross-border communication between institutions of Member States were discussed during the country interviews with the public authorities. This concerns in the first place the use of different portable documents. As clearly pointed out by the Polish authorities, this includes the use of different documents that are used to confirm essentially the same information (e.g. U002/U017/E301). Member States use different documents (e.g., E- and U- documents for coordination unemployment benefits), paper-based or in electronic form, and exchange them differently (by postal mail or electronically). Secondly, it concerns the practices regarding the requests for specific information to fill out portable documents. During interviews, representatives in most Member States commented on how some countries require much more information than others do (for example France), which effectively delays procedures. Thirdly, as

brought up mainly by public officials from Spain and the United Kingdom, there are different practices with regard to the claims for reimbursement. According to them, certain countries were much more prone to ask for the reimbursement of unemployment benefits than others, particularly with regard to relatively unclear cases. In this sense, certain public officials felt a certain lack of “institutional loyalty”, whereby treatment and relations with other countries would not be reciprocal.

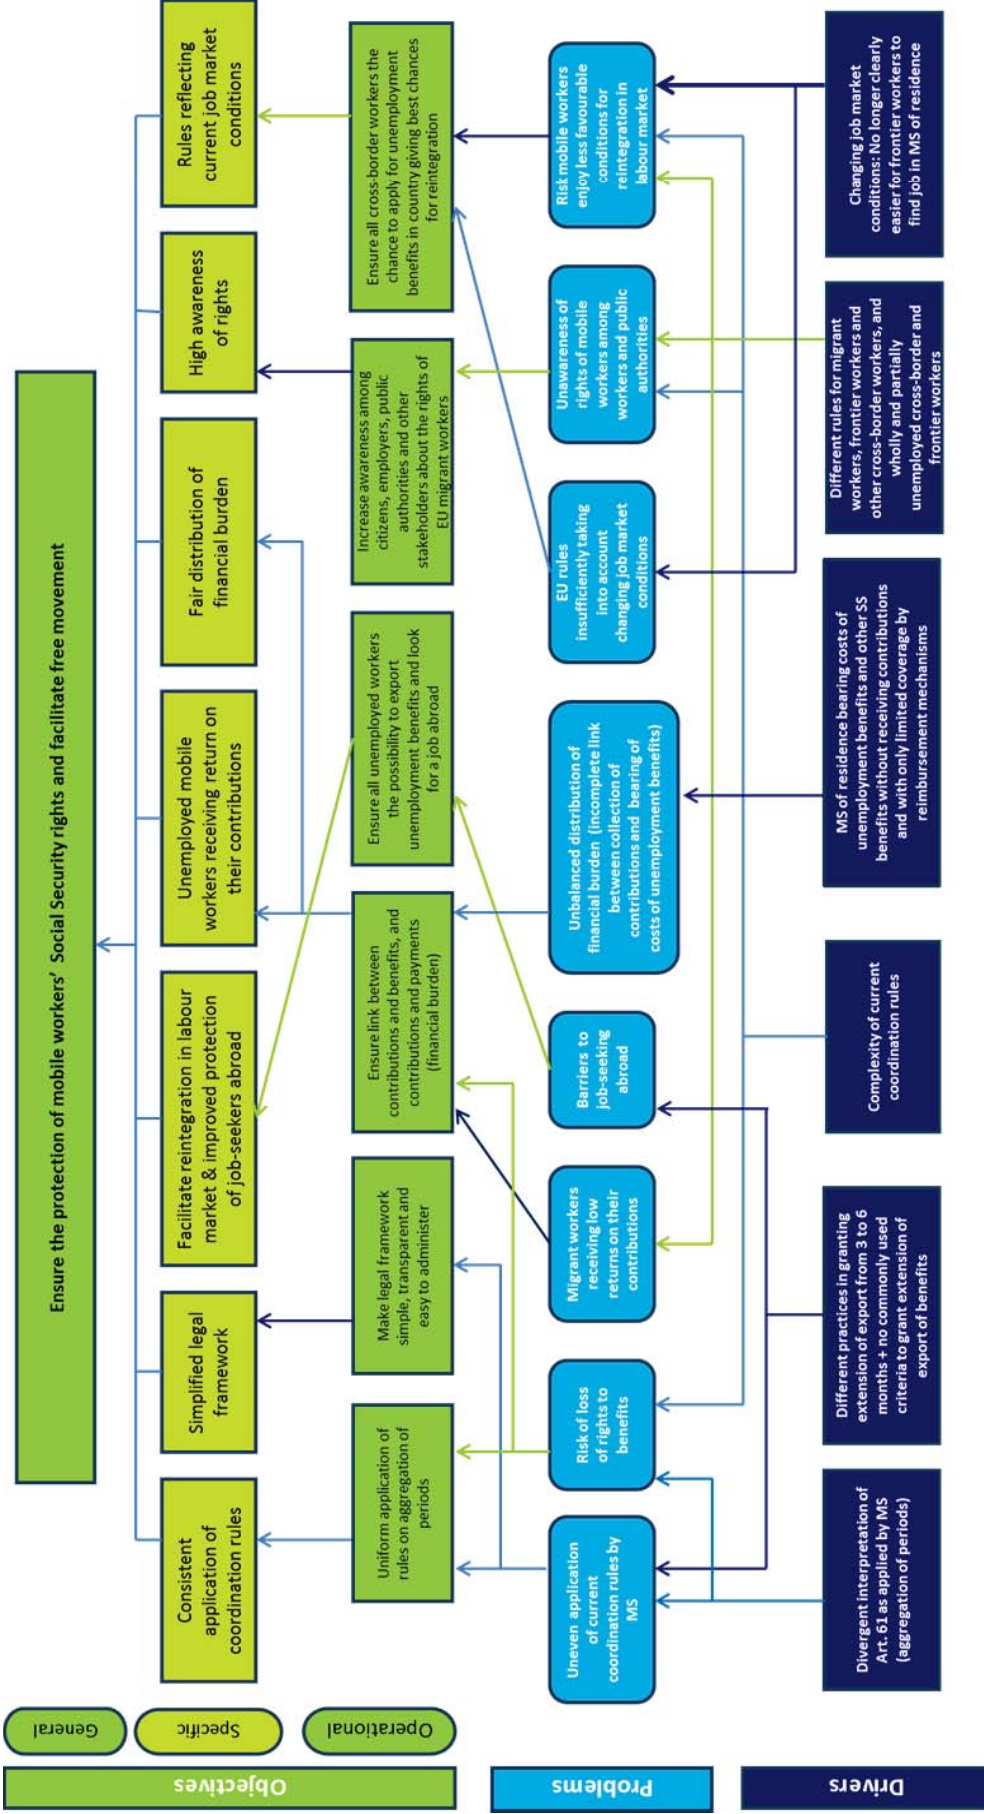

TrESS identified similar “practical problems” concerning the application of Article 61. As presented in the Think Tank Report 2012, sometimes wrong SEDs are used. In other occasions, the SEDs contain incorrect information or do not contain information on the nature of the employment, or the recipient cannot be identified. Even if the correct forms are used, the different approaches of Member States can lead to confusion as to the periods to be filled in on the PD U1 and the SEDs. Thus, while some institutions fill in all periods, others only include periods that qualify for benefit entitlement based on the argument that, otherwise, periods that cannot lead to an unemployment benefit in the State where the periods were complete have to be taken into account by the competent State which is to pay for the benefit. Moreover, as reported by TrESS, some institutions refuse to deliver the PD U1, while in practice institutions must often wait for months for the PD U1 or the SEDs.

### *5.3.8 Coordination of unemployment benefits: problem tree*

---

The following problem tree presents in a visual way the main problems presented by the current rules on the coordination of unemployment benefits. The tree is based on the information gathered via the different data collection tools and activities employed for this study. The problem tree relates the problems to their underlying drivers (which are depicted below the problems), and to the policy objectives, that are defined based on such problems (the objectives are depicted above them). The relationships between drivers and problems, and between problems and objectives, are pictures using arrows. Following the EC Impact Assessment methodology, a difference is made between general, specific and operational objectives. The relationships between the objectives at each of three levels are also presented visually by using arrows.

Figure 5 - Problem free coordination of unemployment benefits

## 6 Description of the policy objectives

A central question in this section is: *what should the EU rules for coordination of unemployment and long-term care benefits aim at?* The objectives that are set should reflect the identified problems, and should be structured according to the chain of problems (drivers). An objective tree was developed in which a hierarchy of objectives (operational, specific, and general) was defined according to a causal chain effect:

- **General** objectives: These refer generally to treaty and/or EU 2020 Strategy-based goals (and are therefore a link with the existing policy-setting).
- **Specific** objectives: Relate to the specific domain and the nature of the intervention considered. The specific objectives correspond to result indicators, and defining these is crucial, as they set out what the Commission wants to achieve with the intervention.
- **Operational** objectives: Concern deliverables or objectives of actions that the initiative is expected to achieve and are linked with the outputs of the intervention.

The objectives are to be coherent with the overall EU policy in the area, and should be SMART (Specific, Measurable, Achievable, Realistic and Time-Dependent) to the possible extent.

For both the coordination of long-term care benefits and unemployment benefits, the **general objective is to ensure the protection of mobile citizens' social security rights and to facilitate free movement**. By ensuring the rights of mobile citizens within the EU (plus Iceland, Liechtenstein, Norway and Switzerland), obstacles to free movement are removed. Actual mobility is not an objective *per se*, but creating an enabling and conducive environment for mobility is. All obstacles to free movement must be removed so that it is ensured. This general objective is in line with Articles 21, 45 and 48 of the TFEU, which constitute the basis for the coordination of social security schemes.

This general objective and the specific objectives set out are consistent with the horizontal policies of the European Union, including the Europe 2020 strategy, whose flagship initiative "An agenda for new skills and jobs" seeks inter alia to respond to the need to facilitate and promote intra-EU labour mobility. Removing the obstacles to mobility for European citizens is on the priorities of the European Commission, but it has been highlighted by it and other European institutions over the last few years that European citizens still face problems when moving across borders in the EU (see, among others, the European Year of Workers Mobility 2006, the European Parliament report on citizenship in 2009, the Monti report on the Single Market, President Barroso's political guidelines and the Commission Work Programme 2013). Labour mobility across Member States remains low, as emphasized in the 2012 Annual Growth Survey<sup>130</sup>. In line with this priority, the Commission issued a policy communication in April 2012 ("Employment package"), in which it identified the EU's biggest job potential areas and the most effective ways for Member States to create more jobs. Among other objectives, the employment package also aims to contribute to a genuine EU labour market. Boosting labour mobility as a means of boosting the EU's economic growth, alleviating social suffering among

---

<sup>130</sup> COM (2011) 815, Communication from the Commission, Annual Growth Survey 2012.

EU citizens and opening opportunities for their personal and professional development were also the aims pursued by Action 1 of the EU Citizenship report 2013 "EU citizens: your rights, your future", in which the Commission announced its intention, cited above, to propose a revision of the social security coordination regulation, looking in particular into extending the export of unemployment benefits for longer than the mandatory three months, to make it easier for citizens to look for a job in another EU country.

For both topics, while it might be complicated to define SMART operational objectives, there a number of indicators that can be used as proxies to measure the progress in achieving the objectives, such as the number of Court cases, the amount of complaints raised to the Commission, the number of infringement procedures opened against Member States and the results of surveys that can be launched *ad hoc* (including surveys to EU-funded networks and services that help EU citizens to resolve their doubts and problems when dealing with public institutions and EU rules, such as EURES advisors, the SOLVIT network or Europa Direct).

The order in which the objectives are presented does not reflect any particular level of importance.

The following **objectives have been identified at the specific and operational level for the coordination of long-term care benefits**. The specific objectives are outlined, and for each of them the operational objectives corresponding to it are listed and briefly discussed. Operational objectives might relate to several specific objectives. To the extent possible, the objectives intend to express the desired future state, towards which the policy options should contribute. The links of the objectives with the identified problems the current coordination rules present are also briefly introduced.

### ➤ **Improve protection of mobile citizens**

- Ensure EU rules do not leave any migrant citizen without protection: the current coordination rules leave a gap in protection. Citizens reliant on care moving from a competent country which only grants benefits in kind to a country (new country of residence) that grants only benefits in cash can be left without any protection. The coordination rules must aim to close this gap and guarantee the protection of all Member States' citizens.
- Make legal framework simple, transparent and easy to administer: beyond the gap in protection that can arise depending on the types of benefits granted in the countries involved in the mobility of the citizens reliant on care, the protection of mobile citizens can be hampered by other reasons. These include the uneven or incorrect application of the coordination rules. Failures to correctly and consistently identify the benefits provided under each national system that should be considered as LTC and hence coordinated, can also lead to losses of benefits (e.g. Member States considering certain LTC benefits as social assistance and not applying the coordination rules). Similarly, the coordination of LTC benefits under different social security branches in different Member States can also generate issues in terms of the protection of

citizens. Public administrations can face obstacles to apply the rules given the complexity of the legal framework. For these reasons, a simpler, more transparent and easy to administer legal framework would contribute to ensuring the protection of mobile citizens in the EU.

#### ➤ **Facilitate classification of LTC benefits under EU law**

- Common understanding of LTC benefits across Member States (common definition of LTC or common criteria to determine them): there is currently no common definition of LTC at EU level, nor a common set of criteria to determine which benefits provided under each national system should be considered LTC benefits and hence coordinated. The ECJ has filled some of this gap, but problems of classification persist. Regardless of the means employed, a common understating of what LTC is a pre-requisite to make a clear classification of LTC benefits under EU law possible.
- Make legal framework simple, transparent and easy to administer: a general simplification of the legal framework and accrued transparency would contribute to facilitate the classification of LTC benefits under EU law. No specific coordination rules exist for LTC, which must in turn be coordinated as sickness benefits. This results in a series of mismatches given the different characteristics of both types of benefits. In this particular case, the operational and specific objective could be seen as the two sides of the same coin. A simpler, more transparent and easier to administer legal framework would facilitate the classification of LTC benefits under EU law. At the same time, however, facilitating such classification would be in itself a major step towards simplifying the legal framework.

#### ➤ **Rules taking into account the specific characteristics of LTC benefits**

- Make legal framework simple, transparent and easy to administer: the complexity of the current coordination rules and the different problems derived from it stem in part from the lack of a specific coordination regime for LTC and the application instead of the rules for the coordination of sickness benefits. LTC benefits present however distinct characteristics. The application of the rules from the sickness hence fail to account for the specific characteristics of LTC benefits, giving place to certain shortcomings that should be overcome.

#### ➤ **Improve legal certainty & Stable regime of coordination of LTC benefits**

- Ensure EU rules do not leave any migrant citizen without protection: creating (or modifying existing ones) provisions ensuring that no citizen is left without protection regardless of his/her circumstances would in itself contribute to increase legal certainty. Cases of lack or total lack of protection would be prevented, and hence it would be expected that less cases and proceedings would be brought before the Court of Justice, which would bring some stability to the coordination regime.

- Make legal framework simple, transparent and easy to administer: a simpler, more transparent and easy to administer legal framework would enhance legal certainty and, as direct result, make the system of coordination of LTC benefits more stable.
- Limit individual complaints and proceedings before the Court of Justice: setting limiting the complaints and proceedings before the Court of Justice as an operational objective facilitates the measurability of improvements in terms of legal certainty and stability. The current instability of the system of coordination, manifested by the amount and relevance of the ECJ's rulings in the field, leads logically to the objective of limiting the amount of cases and procedures.

### ➤ **High awareness of migrant citizen's LTC rights**

- Make legal framework simple, transparent and easy to administer: as evidenced by the interviews conducted during the project, the results of the EC public consultation and Deloitte's online survey, and as also pointed out by trESS, the complexity and intricacies of the legal framework for the coordination of LTC benefits make it difficult for migrant citizens and public authorities to know with certainty the entitlements of migrant citizens to LTC rights. A simpler, clearer framework would make it easier to gain knowledge about LTC rights.
- Improve information regarding LTC in cross-border situations among citizens and public authorities: beyond the difficulties brought about by the complexity of the rules, a way to raise the awareness about the LTC rights of migrant citizens is directly tackling information and communication activities. While not all aspects of the coordination might be entirely clear even for those actively looking for information about it, the knowledge of the average citizens about LTC rights in case of mobility within the EU could be increased.

### ➤ **Fair distribution of the financial burden between Member States**

- Ensure there are no double payments: the current diversity of benefits provided in the MS that should be considered as LTC benefits for the purposes of the coordination, the actual coordination of the benefits under different social security schemes, the consideration of LTC as social assistance by some MS (which do not apply the coordination rules), combined with the lack of a definition of LTC or common criteria at EU level, results in difficulties to apply the provisions (Art.34) to avoid the overlapping of benefits. As a result, the risk of double payments persists. To guarantee a fair distribution of the financial burden, it must be ensured that the cost of providing LTC benefits is borne by the competent MS and that no double payments are done for the same risk. This, beyond the pure distributional aspects, can also lead to higher overall costs and affect negatively the sustainability of the system.

The following objectives have been identified at the **specific and operational level for the coordination of unemployment benefits**. As has been done for long-term care, the specific objectives are outlined, and for each of them the operational objectives corresponding to it are listed and briefly discussed. Operational objectives might relate to several specific objectives. To the extent possible, the objectives intend to express the desired future state, towards which the policy options should contribute. The links of the objectives with the identified problems the current coordination rules present are also briefly introduced.

#### ➤ **Consistent application of the coordination rules**

- Uniform application of rules on the aggregation of periods: a survey launched within the Administrative Commission in 2011, the findings of the trESS Think Tank Report 2012 and the results of the interviews with public authorities conducted for this project indicate that Member States apply the rules on aggregation of periods in widely different ways. As reported in the answers to the Administrative Commission survey, some would not be in accordance with EU law. Therefore, in order to ensure a consistent application of the coordination rules, the rules on the aggregation of periods must be applied uniformly.

#### ➤ **Simplified legal framework**

- Make legal framework simple, transparent and easier to administer: as part of the general effort to render the legal framework for the coordination of unemployment benefits less complex, a simpler, more transparent and easy to administer legal framework should be achieved. These objectives reflect in reality the same purpose, only the formulation varies to provide a more operational nuance, where proxies for output indicators can be found and hence progress towards achieving the goal monitored. The currently uneven application of the coordination rules, as well as the low level of awareness of mobile unemployed workers about their rights and the information and knowledge problems faced by public authorities justify the need to simplify the legal framework.

#### ➤ **Facilitate reintegration in the labour market & improved protection of job-seekers abroad**

- Ensure all unemployed workers the possibility to export their unemployment benefits and look for a job abroad: not all unemployed workers in the EU enjoy currently the same possibilities to export their unemployment benefits and look for a job abroad. The rules about the export of periods are applied unevenly by Member States, creating differences among unemployed workers. To maximise the possibilities for reintegration in the labour market and providing a fair and similar chance to unemployed workers across the Member States, the rules must ensure to all unemployed workers the possibility to export their unemployment benefits and look for a job abroad.

#### ➤ **Unemployed mobile workers receiving return on their contributions**

- Ensure link between contributions and benefits, and contributions and payments (financial burden): under the current coordination rules, wholly unemployed frontier workers might receive a low return on their contributions due to the fact that they receive their unemployment benefits from a country (their country of residence) other than the one in which they paid contributions (their country of last activity). The lack of a required minimum period of employment (or self-employment) to determine the country of last activity might also lead certain unemployed cross-border workers to receive benefits disproportionately lower with regard to their contributions. A similar effect might arise due to the fact that the unemployment benefits are calculated based only on the salary perceived during the last activity.<sup>131</sup>

### ➤ Fair distribution of the financial burden

- Ensure link between contributions and benefits, and contributions and payments (financial burden): the country of residence must currently bear the costs of the unemployment benefits of wholly unemployed frontier workers and certain cross-border workers other than frontier workers without having received any contribution from them. Although a reimbursement mechanism exists, it has a limited coverage. It does not cover all the costs of the unemployment benefits provided by the country of residence in any case (the period to be reimbursed is limited to three or five months), and the country of residence must also bear other costs such as those of sickness and family benefits. Ensuring the link between contributions and payment is necessary to provide for a fair distribution of the financial burden between Member States.

### ➤ High awareness of rights

- Increasing awareness among citizens, employers, public authorities and other stakeholders about the rights of EU migrant workers: the results of the EC public consultation and Deloitte's online survey point to a low level of awareness about the rights of unemployed mobile workers. The interviews conducted with public authorities in 14 Member States showed that it is also complicated for public officials, and not only potential beneficiaries of the benefits, to have a thorough and reliable knowledge of the rules. This was also pointed out by trESS. The complexity of the coordination rules, including the wide variety of cases contemplated in the legislation, contribute to render difficult higher degrees of awareness. In response to such situation, increasing the awareness of rights among citizens, employers, public authorities and other stakeholders about the rights of EU migrant workers is set as an objective.

### ➤ Rules reflecting current job market conditions

- Ensure all cross-border workers the chance to apply for unemployment benefits in the country giving them the best chances for reintegration: wholly unemployed frontier workers must now register and apply for unemployment benefits in their country of residence. While they might register as jobseekers

---

<sup>131</sup> It should be noted that in all the cases presented, the unemployed mobile workers could also end up in a winning situation.

in their country of last activity as a supplementary step, compliance with the requirements of the country of residence's public employment service has priority. These rules were created under the assumption that wholly unemployed frontier workers enjoy the best chance for reintegration into the labour market in their country of residence. Given the changing market conditions, this might however not always be the case anymore. Higher chances of reintegration might exist in their country of last activity.

## 7 Impact assessment of the policy options

### 7.1 Introduction

Multiple decision paths can be chosen by decision-makers to tackle effectively the existing problems and to address the challenges related to social security coordination. Decision makers could analyse all the different options, assess any combination of options, and approach the final solution step by step. Some of these options are of horizontal nature and could be taken irrespective of the way of coordination chosen; others are clearly separated paths of coordination. This makes it very complex to take a clear-cut decision.

In this chapter we present a description of each option. We would like to note that we have not examined all possible options, but a selection taking into account the work of trESS on this issue and the mandate of the Commission services for this study.

Furthermore, this chapter focuses on the assessment of the likely impacts of the policy options. All policy options have been assessed according to the same assessment criteria.

### 7.2 Impact assessment criteria

The following impact assessment criteria have been applied:

Table 38: Impact assessment criteria

<b>Coordination of long-term benefits + coordination of unemployment benefits</b>	<ul style="list-style-type: none"><li>• The impact (increase/reduction) on <b>social security coverage</b> of the insured persons who move within the EU, and the members of their families and survivors;</li><li>• The impact (increase/reduction) on <b>administrative burden</b> of each option, <b>transparency</b> and <b>complexity</b> of the rules</li><li>• Impact on <b>public budgets</b> of the Member States, Impact on <b>fair burden sharing</b> of the burden between Member States</li><li>• Impact on the risks of <b>misuse or abuse</b> of the EU rules;</li><li>• Possible impact on the EU <b>internal market</b>;</li><li>• Impact on the <b>fundamental rights of EU citizens, incl. gender equality</b></li><li>• Possible impact on the <b>EU budget</b>.</li></ul>
<b>Specific - coordination of long-term care benefits</b>	<ul style="list-style-type: none"><li>• Impact (increase/reduction) on social security coverage of the insured persons <b>dependent on care</b> who move within the EU</li><li>• Impact on correct and uniform application of the rules.</li></ul>
<b>Specific – coordination of unemployment</b>	<ul style="list-style-type: none"><li>• Impact on the social security coverage of migrants worker, particularly with regard to:</li></ul>

## benefits

- the conditions for **reintegration in the labour market** (less or more favourable)
- **return on the workers’ contributions**.
- Impact on the **intra-EU labour market mobility** (increase/reduction) (prolongation of the period of export).

## Impact on social security coverage of the insured persons

An important question is whether the **social security rights** of the person concerned are well protected<sup>132</sup>. This means that we have checked if all benefits which could be claimed without a cross-border situation can also be granted in a cross-border situation or if the person loses entitlements and thus could in the worst case be left without any entitlements although the Member States involved know such benefits.

Furthermore, concerning the coordination of unemployment benefits, we assessed all possible options on the **return** that workers receive on their **contributions** to the social security benefit system. Moreover, we evaluated the options with regard to their potential to create less or more **favourable conditions for reintegration in the labour market** of the unemployed. An important aspect that has been evaluated is the increase or decrease in services and assistance offered by public employment services to mobile jobseekers in the EU.

## Impact on administrative burden, transparency and complexity of the rules

We assessed the impact of each option on the likely administrative burden on national administrations and other institutions that are involved in handling cross-border cases. More specifically with regard to the following questions:

- Do new processes or new information flows between Member States have to be set up?
- Do national administrations or other institutions have to set up new implementing arrangements to put the coordination into practice?

### Disclaimer:

During the interview phase, it became clear that when discussing administrative burden on administrations, stakeholders (regardless of type) relate administrative burden issues to complexity of the rules and lack of transparency of the coordination rules, which lead to incorrect and non-uniform application of the rules. The complexity of the rules and transparency of the coordination rules is considered as a determining factor in the administrative burden that is imposed on national administrations. In our (qualitative) description of the impacts, it is difficult to discuss these three aspects (administrative burden, transparency and complexity) separately, because they are very much related to each other.

## Impact on public finance of the Member States

<sup>132</sup> Treaty on the functioning of the EU (TFEU), Art.48, FFTEU: “they shall make arrangements to secure for employed and selfemployed migrant workers and their dependants.”

First, we have assessed the impact on public finance of Member States, based on the impact on the social security coverage of the insured persons linked to each option. We have paid attention to **the financial impact for Member States** both at an aggregated level and at individual Member State level (where possible).

Second, we have assessed the impact of each option on the extent to which it enhances **fair sharing of the financial burden** between Member States. We would like to note that this is difficult to evaluate. Fair burden sharing between Member States is strongly depending on the system the Member States apply. Examples of unfair burden sharing:

- Member States which have to reimburse benefits which their national legislations do not know may see this as unfair.
- Member States with insurance-based schemes could be seen as burdened if they have to grant/reimburse benefits for persons which are not insured there and thus also do not pay any contributions towards these schemes of these Member States.

Examples of Member States which are not to be regarded as unfairly burdened:

- Member States which are obliged to grant all the benefits which they would have to grant already under national legislation (e.g. in residence based tax financed schemes for all residents, such as in Sweden) are not to be regarded as unfairly burdened.

### Impact on risk of abuse or misuse of rights

The options were evaluated based on their **risk of abuse or misuse of rights** by the citizens or workers, often referred in the general and more colloquial terms of “benefit tourism” or “social tourism”. One has to be very careful with the use of these concepts. Abuse is to be understood as “an artificial conduct entered into solely with the purpose of obtaining the right of free movement and residence *under Community law which, albeit formally observing of the conditions laid down by Community rules, does not comply with the purpose of those rules*”<sup>133</sup>.

### Potential impact on EU internal market

We have also assessed if the options better stimulate mobility of persons and intra-EU labour market mobility - both in the sense of geographic mobility (movement of workers between countries and regions) and job-to-job mobility (e.g. moving to another job) than the baseline scenario. We particularly paid attention to the removal of barriers to labour market mobility.

### Potential impact on EU budget expenditure

#### Impact on fundamental rights of citizen

The chosen option has to be compatible with the EU Charter of Fundamental Rights. The Commission “Impact Assessment guidelines” provide a full-list of fundamental rights in annex 8.1. Fundamental rights that are potentially affected by social security coordination rules are:

---

<sup>133</sup> EC, Communication on guidance for better transposition and application of Directive 2004/38/EC on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States, COM/2009/0313 final. Reference to judgments of the Court of Justice of the EU in: Cases C-110/99 Emsland-Stärke (para 52 et seq.) and C-212/97 Centros (para 25).

- Chapter II – Freedoms:
  - Freedom to choose an occupation and right to engage in work
  - Freedom to conduct a business
- Chapter III – Equality
  - Equality before the law
  - Non-discrimination
  - The rights of the child
  - The rights of the elderly
  - Integration of persons with disabilities
- Chapter IV – Solidarity
  - Family and professional life
  - Social security and social assistance
  - Health care
- Chapter V – Citizen's Rights
  - Right to good administration
  - Freedom of movement and of residence

**With regard to the impact of prolongation of the period of export**, several factors were specifically considered:

- The impact the **reintegration of people in the labour market**;
- **Risks of misuse or abuse of the EU rules**: we had to examine if this option favours situations where the persons concerned could easily influence and manipulate their situation in such a way that they receive more benefits than they would otherwise be entitled to. This is especially so if two Member States grant benefits or provide specific services and if it cannot be excluded that they do not know about the other Member States granting such benefits (the person concerned does not report the benefits received);
- **Intra-EU labour market mobility**;
- Social security coverage, particularly with regard to the **return on the workers' contributions**.

### 7.3 *Scoring indicators*

A scoring system was developed to allow judgments on 'performance' of an option with regard to the impact assessment criteria described above. The baseline scenario - a continuation of the current rules - served as the benchmark, as the decision maker needs to know if an option is better or worse than the situation we are confronted with today:

- A '+' indicates that an option is better than the baseline scenario with regard to of the criterion in question.
- A '-' indicates that an option is worse than the baseline scenario.
- We used a "+/-" when it was not clear which impact the option will have with regard to the criterion in question or in case evidence gives a mixed picture (both positive and negative impacts were identified).
- We use "0" for the identified impacts in the baseline scenario.

We have chosen a simple and straightforward scoring system in order not to complicate the assessment of the impacts. trESS made a similar consideration regarding the value system<sup>134135</sup>.

The different impact assessment criteria were not weighted.

---

<sup>134</sup> trESS, Legal impact assessment for the revision of Regulation 883/2004 with regard to the coordination of longterm care benefits, Analytical Study 2012: [http://www.trESS-network.org/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS\\_Analytical%20Study%202012.pdf](http://www.trESS-network.org/EUROPEAN%20RESOURCES/EUROPEANREPORT/trESS_Analytical%20Study%202012.pdf)

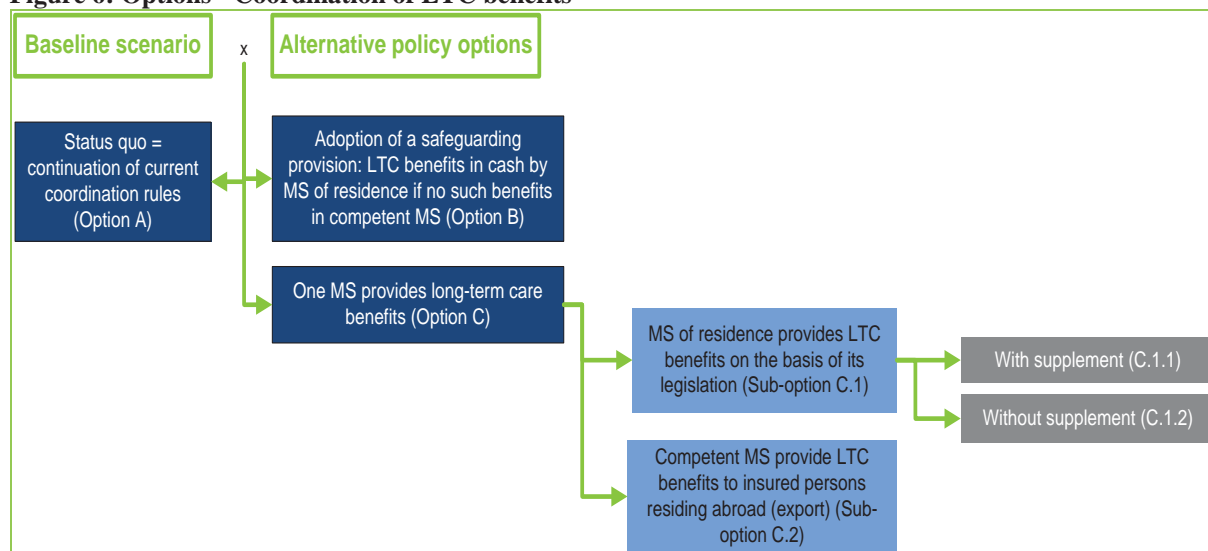

<sup>135</sup> TrESS admits that a “+/-“ system is a rough value system, which could be more elaborated. However, it refrained from adopting a more complex value system, because “it make it more difficult to evaluate all the different options in a systematic and coherent way”. Furthermore , trESS makes the following caveat: “It has to be said that these marks (‘+’, ‘-’ or ‘±’) were not easy to agree on. Our discussion of these marks always involved a very subjective element, as each author had a slightly different approach towards giving the marks.”

## 7.4 Coordination of long-term care benefits

### 7.4.1 Overview of possible options

The figure below presents an overview of the options that were assessed on their likely impacts for the coordination of the LTC benefits.

**Figure 6: Options - Coordination of LTC benefits**

### 7.4.2 Option A: Baseline scenario

The baseline scenario (**OPTION A**) implies no change of policy and a continuation of the current rules for coordination.

- Long-term care benefits *in kind* continue to be provided according to the legislation of the Member State of residence (if they exist) and reimbursed by the competent Member State (= where the person is insured);
- Long-term care benefits in cash (if they exist) continue to be provided by the competent Member State (= where the person is insured).

The baseline means to change nothing and keep the coordination rules as they stand today. This implies that outlined problems and challenges. The status quo is the benchmark for any other alternative option proposed.

### 7.4.3 Option B: Adoption of a safeguarding provision ensuring that a mobile person does not remain without any protection

Long-term care benefits *in cash* will be provided by the Member State of residence if the application of the rules under the Sickness Chapter would mean that a person does not receive any long-term care benefits. The amount of the benefits provided by Member State of residence would then be reimbursed by the competent Member State.

With this policy option, the safeguarding provision would ensure that all the mobile persons are protected: they would always be entitled to some LTC benefits. Whenever a person would not be entitled to any LTC benefits (neither in cash nor in kind) under the current system (meaning the

application of the Sickness Chapter's rules), the Member State of residence would provide benefits in cash in accordance with its legislation. The competent Member State would then reimburse to the Member State of residence the amount of the benefits provided.

This safeguarding option however does not guarantee that the level of protection for long-term care would not be reduced after the person's move.

**Attitude of consulted stakeholders:**

- Generally, public authorities perceived this option as rather theoretical. No such cases as those intended to be covered by the safeguarding provision were reported, conveying the impression that the existent gap in protection does not represent a sizeable problem.

This being said, the large majority of interviewed stakeholders (across the different Member States) national public authorities seemed receptive to the introduction of the provision, particularly in view of the negligible impacts that it would have. If the clause served to ensure the protection of a fringe group of migrant persons who might be left without protection, it would be welcome.

7.4.3.1 Impact on social security coverage of the insured persons who move within the EU, and the members of their families and survivors

---

Score: +

This option addresses the current problem of the gap in the protection of mobile persons, as it can overcome the complete loss of social security protection; for example if the competent Member State does not have any LTC benefits in cash (only benefits in kind) and the Member State of residence has only LTC benefits in cash. However, the option does not guarantee perfect social security coverage of mobile persons reliant on care and cannot ensure that the protection would remain at the same level as if the person remained in his/her competent Member State. Therefore, a differential supplement would have been needed.

One EU civil society representative made the remark that under this option, *“mobile persons – a small minority in the total population - would be put at a disproportional advantage over the non-mobile persons in that country. In case the competent country does not provide any long-term benefits at all, those people can receive cash benefits in the country of residence and would thus be better-off than non-mobile persons in the competent Member State (who would not be entitled to any benefits)”*.

7.4.3.2 Impact on administrative burden, transparency and complexity of the rules

---

This option is likely to increase the administrative burden compared to the baseline scenario, as it requires a complex and burdensome cooperation between national public authorities (worse than the baseline scenario). This would be particularly the case if the obligation of the Member State of residence to provide LTC benefits depends on the actual granting of LTC benefits by the competent Member States (and not on the question whether or not such benefits are included in the legislation of the competent Member States).

- Transparency: -

This option would be less clear than the status quo. Many questions could arise. It has to be clarified what exactly is meant by the condition that the competent MS does not grant LTC benefits in cash. Does this mean that no LTC benefits in cash are provided under the national legislation or does it also cover situations in which this legislation knows such benefits but the person concerned does not fulfil the conditions for entitlement (e.g. because the relevant degree of need of care or the relevant age are not reached – a question similar to the question concerning the existing text for taking into account of child raising periods under Article 44 of Regulation (EC) No 987/2009)? For the MS of residence this would give rise to many uncertainties. In relation to some MSs (which are competent for the persons concerned) LTC benefits in cash would have to be granted, whereas not in relation to others (in the same situation - depending on whether the competent MS grants such benefits or not).

➤ Complexity of the rules: -

This option does also not provide more simple rules compared to the baseline scenario. All situations have to be explained in detail under which in addition to the obligations of the competent Member State, the Member State of residence has to grant its LTC benefits in cash. Furthermore, for the MS of residence it could become very complex in case it also has benefits in kind. Which of these benefits should this MS grant by priority (both benefits will be reimbursed); could the competent MS refuse the reimbursement of the more expensive version? Options with reimbursement are usually more complex than without reimbursement.

It could also be questioned why this obligation only becomes applicable when the competent MS does not at all grant any LTC benefits in cash, but not if it grants an LTC benefit in cash which is lower than the benefit in the MS of residence.

➤ Administrative burden on public authorities: -

This option does not tackle any of the major problems in the baseline scenario which have an impact on administrative burden on public authorities (e.g. uneven application of coordination rules, problems of classification of LTC benefits under EU law and insufficiently specified reimbursement mechanisms).

It has to be considered that – as regards the administrative burden of granting benefits – the Member State of residence is expected to face an additional administrative burden compared to the baseline scenario.

Furthermore, when opting for a system of reimbursement for benefits in cash provided by the country of residence (which can be a sub-option), the administrative burden on both Member States is likely to increase even more.

According to a German civil servant, *“this option would lead to substantial, additional administrative burden. First, additional administrative steps are needed to ensure the implementation of the ‘safeguarding provision’. Based on this, the insured person needs to submit a request to receive the LTC benefits (enabled by the ‘safeguarding provision’). Following, the country of residence will need to request information about any LTC payments by the competent Member State. The competent Member State will then reply to this request by sharing information on the LTC benefits that were already paid to the person. As a next step, the Member State of residence will need to provide the long-term benefits in cash if the application of the Sickness Chapter would mean that the person does*

*not receive any long-term care benefits. Finally, in case of a reimbursement system, the country of residence will need to prepare and send a claim for reimbursement to the competent Member State”.*

Similar administrative burden problems can be expected as in the case of reimbursement between Member States for unemployment benefits to frontier workers (Article 65 (5) and (6) of Regulation (EC) No 883/2004). A national administration explained:

*“The reimbursement mechanisms are not properly applied by the institutions/bodies concerned. The terms of reimbursement are not applied. In some cases, Member States do not fully reimburse the costs incurred. This presents a major problem which could be aggravated by the introduction of this option.”*

One should however put these additional administrative costs into the right perspective, as option B will only need to be applied in a limited number of cases.

#### 7.4.3.3 Impact on public finance of the Member States

---

##### ➤ Impact on public finance of Member States: +/-

Under this option, the protection of the mobile persons would thus come first. Once it had been ensured, the issue of which Member State bears the cost, and the opportune reimbursement, would be resolved. National public authorities considered that although logically an increase in public expenditure can be expected, the impact on their budgets of this option would be negligible.

##### ➤ Fair burden sharing between Member States: -

A sub-option where the benefits provided are reimbursed could contribute to fair burden sharing. However, there is also a flip side of the coin. According to a legal assessment by the trESS network<sup>136</sup>, it could be said that it is an additional burden for the competent MS, which *“might deliberately make a decision to compensate the risk of LTC only by way of benefits in kind. This MS would thus also have to reimburse benefits in cash”*.

#### 7.4.3.4 Possible impact on the EU internal market

---

##### Score: +

With this policy option, the safeguarding provision would ensure that the mobile persons are better protected: they would not remain without any entitlements due to the coordination rules. In this manner, mobile persons would not see their mobility options restrained because of a lack of LTC coverage as an effect of their decision to move.

#### 7.4.3.5 Impact on the fundamental rights of EU citizens

---

##### Score: +

By contributing to eliminate gaps in protection and ensuring that mobile citizens reliant on care can receive a minimum level of care, this policy option has a positive impact on different fundamental

---

<sup>136</sup>JORENS, Y. (e.a.) Legal impact assessment for the revision of Regulation 883/2004 with regard to the coordination of long-term care benefits. Analytical study 2012, trESS

rights that it would to promote: non-discrimination (certain citizens would not suffer a total loss of benefits based on their country of origin), the rights of the elderly, the rights of the persons with disabilities, family and professional life and, in general, on the fundamental right to social security and social assistance.

By guaranteeing that mobile citizens would not be left without any protection, this policy option would also contribute positively to ensuring the right of freedom of movement and of residence. Thus, citizens would not see their mobility options based on a possible total loss of entitlements to long-term care benefits.

#### 7.4.3.6 Possible impact on the EU budget

---

Score: +/-

No impact on the EU budget could be identified.

#### 7.4.4 *Option C1: Member State of residence provides long-term care benefits on the basis of its legislation*

---

In Option C.1, the Member State of residence shall provide long-term care benefits on the basis of its legislation:

- with a supplement from the competent Member State if benefits in Member State of residence are at lower level (C.I.1)
- without a supplement from the competent Member State (C.I.2).

This policy option sets out clearly which Member State would provide LTC benefits. Contrary to the baseline scenario, where the distinction between benefits in cash and in kind is the starting point and an element of crucial importance (as it determines which Member State must provide the LTC benefits), this policy option would not make any distinction among the types of benefits. The starting point and critical element would be the Member State legally in charge of providing the LTC benefits (the Member State of residence or the competent Member State depending on the sub-option). This Member State would then provide all LCT benefits (be them in kind, in cash or mixed), with a system of reimbursement.

The competent Member State would always be responsible for the cost of the benefits.

In Option C1, the Member State of residence would provide the LTC benefits (again, regardless of their type) on the basis of its legislation, and the competent Member State would then reimburse them. Option C1 includes two sub-options itself: in the first one, the competent Member State would provide a supplement to the beneficiary in the event that the benefits in the Member State of residence were at a lower level (in this case -in line with the non-distinction amongst benefits in this policy option-, the comparison of the level of the amount of LTC benefits between the residence and the competent Member State would have to include all types of LTC benefits). In the second sub-option, there would be no compensation even if the benefits in the Member State of residence were lower than those in the competent Member State.

### Attitude of consulted stakeholders

National public authorities	<ul style="list-style-type: none"> <li>➤ According the EC public consultation replies, there is weak support among public authorities for both options. Option C.I.2 is slightly more popular (9%) than option C.I.1 (4%). Our public authorities' survey shows significantly higher support for option C.I.2 (22%).</li> </ul>
Trade unions and social partners	<p>In the public consultation:</p> <ul style="list-style-type: none"> <li>➤ Most popular option: 25% of the responding trade unions and social partners' representatives are in favour of the option where the Member State of residence provides LTC benefits in cash supplemented with a supplement by the Member State of insurance (option C.I.1).</li> <li>➤ 17% of trade unions and social partners' representatives would like that the Member State of residence provide the LTC benefits based on its own legislation without any supplement by the competent Member of State (C.I.2).</li> </ul>
Civil society/NGOs	<ul style="list-style-type: none"> <li>➤ 50% of the civil society representatives are in favour of C.I.2 (without a supplement by the competent Member State).</li> <li>➤ No respondent claimed to be in favour of C.I.1 (with a supplement by the competent Member State).</li> </ul>
Individual respondents	<ul style="list-style-type: none"> <li>➤ One fifth of individuals (25) that have responded to the public consultation are in favour of letting the Member State of residence pay for the LTC benefits based on its own national legislation (C.I.2 - second preferred option).</li> <li>➤ Only 7% of the individuals expressed a preference for C.I.1 (with a supplement by the competent Member State).</li> </ul>

#### 7.4.4.1 Impact on social security coverage of the insured persons who move within the EU, and the members of their families and survivors

##### Score C.I.1 and C.I.2: +

Both options would ensure that mobile persons are always protected at the same level as the persons who are insured in the Member State of their residence. C.I.1 option (with supplement) would also, address the problem of the gap in the protection of mobile persons. Both sub-options give entitlements to all the benefits which are provided for the residents of a Member State. This can in itself be seen as positive compared to the baseline scenario (which is why both sub-options received a positive scoring). In our public authorities' survey, national administrations highly scored both sub-options with regard to their impact on the social protection of insured people. Sub-option C.I.2 with no supplement received an average rating of 4.3 on a 1-to-6 scale; whereas the sub-option C.I.1 with supplements remarkably scored slightly lower (4.0).

Findings from the face-to-face interviews reveal that the sub-option, which includes a supplement by the competent Member State (C.I.1), is without any doubt seen as better than the baseline scenario and (in many cases) also than C.I.2 (without supplement). It seeks very effectively to avoid that rights are lost and the highest benefits are always safeguarded.

With regard to the sub-option without supplement by the competent Member State (C.I.2), interviewees expect that it will depend on the specific case whether there will be a positive or negative impact on social security coverage. Depending on the specificity of the long-term care benefits in the country of residence and its generosity, citizens will be better or worse off in terms of social security coverage.

With regard to this point, one trade union representative stated: *“There is a large discrepancy between the social systems between the Member States; the insured persons would be disadvantaged should no supplements be granted”*. It illustrates the overall opinion of the interviewees.

In addition, an Austrian national administration employee/representative mentioned, *“Austrian citizens (who have paid social security contributions in Austria) would be worse-off if they moved to a Member State with a lower level of LTC services or to a country that does not grant any LTC benefits at all.”*

#### 7.4.4.2 Impact on administrative costs and administrative burden

---

##### *C.I.1 - Supplement provided by the competent Member State*

###### Transparency: +

This sub-option would bring slightly clearer rules than the baseline scenario. The MSs involved would always know that they have to grant benefits (the MS of residence always provide the whole range of benefits; the competent Member State provides a top-up on these benefits in case its benefits are higher). Furthermore, the person concerned would know where to request the benefits and what legislation applies. The division of tasks between MSs would be clear and would not depend that much on peculiarities of the national legislation.

###### Complexity of the rules: -

In terms of complexity, this sub-option would open simultaneous entitlements under the legislations of more than one MS. This is perceived as more complex than the baseline scenario. The provision of supplements is always complex, as the legislator has to draft complex rules concerning priority, the benefits to be included into the calculation of the supplement (benefits in cash or also benefits in kind, what ‘amount’ of the benefits in kind etc.) and rules for procedures to settle these supplements.

###### Administrative burden on national administrations: -

See C.I.2

This a complex option from an administrative point of view, which is regarded as slightly worse than the baseline scenario according to the public authorities’ survey results (it receives 3.6 average rating on a 1-to-6 scale compared to a 3.5 average rating for the baseline scenario; a lower score means less expected administrative burden).

This option necessitates an extensive exchange of information between national public authorities concerned. Especially if also benefits in kind are included, it could lead to different supplements every month. It would necessitate a lot of new business flows and SEDs under the potential future EESSI.

The complexity and the administrative burden of supplement system is generally the main reason for the low support for this option among national public authorities.

#### *C.1.2. No supplement provided by the competent Member State*

##### Transparency and complexity of the rules: -

This sub-option would bring clarity, simplicity and legal certainty, by setting out clearly which Member State would provide LTC benefits. Contrary to the baseline scenario, where the distinction between benefits in cash and in kind is the starting point and an element of crucial importance (as it determines which Member State must provide the LTC benefits), this policy option would not make any distinction among the types of benefits. The starting point and critical element would be the Member State legally in charge of providing the LTC benefits. In this option, beneficiaries are able to know in advance which legislation will systematically apply to them depending on the MS where they will reside. There will be no doubts even if it is not clear under the relevant legislation whether a certain benefit is a benefit in cash or in kind.

It was gathered during the interviews with public authorities carried out in certain Member States that this option would help to circumvent to a certain extent the issues caused by the problems of classification of LTC benefits under EU Law. Without tackling the underlying problem, this policy option would help to bring certain clarity.

##### Administrative burden on national administrations: -

At first sight, the administrative burden on Member States' administration is expected to decrease, because of reduced complexity of the rules under this option (only one Member State provides the long-term care benefits and no distinction between benefits in kind and benefits in cash).

In Option C 1.2 all calculations for the in kind benefits remain the same. The in cash benefits are now however defined at the % of use and the level of spending of the country of residence. The particularities of our sources reveal that even more persons are using LTC in cash, but the average amount is much lower so that the total budget for in cash is reduced to € 192 million and the total becomes € 810 million (cf. 8.2.3). The administrative burden is even somewhat higher (more cases means more costs) and compared to a lower needed budgetary cost, the share of the administrative burden in the total budget is enlarged to 1.7%, highlighting the impact of probably estimated number of cases.

The provision of all types of LTC benefits by the Member State of residence would require setting up a procedure for the reimbursement of LTC benefits in cash. The current reimbursement procedure only covers benefits in kind. Based on our interviews with national administrations, it appears that setting a system for the settling of monetary amounts, however, would not entitle major problems, as no differentiation needs to be made between benefits in cash and kind.

#### 7.4.4.3 Impact on public finance of the Member States

---

##### ➤ Impact on public finance of Member States: +

For options C1, namely claims (as debtor and as creditor) based on LTC spending per capita of the **country of residence** (option C1), the budgetary impact of a change in the Regulation was estimated<sup>137</sup> (based on estimated number PD S1 forms and variables 'Health care spending in 2010 prices per person', 'Population (million)' and 'Long-term care spending in 2010 prices (in billion Euros)' in the Ageing Report). For both options, a distinction should be made between LTC benefits provided in kind and in cash.

This option, whereby the Member State of residence shall provide LTC benefits (in kind and in cash) on the basis of its legislation, implies a total expenditure of € 810.1 million or a decrease of 19% compared to the baseline scenario<sup>138</sup>. (Table 53 and Table 54).

In this option the expenditure on LTC benefits in kind shall be the same as in the baseline scenario, namely € 618.3 million. The LTC benefits in cash shall be provided on the basis of the legislation of the country of residence and no longer on this of the competent country.<sup>139</sup> This switch results in an expenditure on LTC benefits in cash of € 191.9 million or a decrease of 49% compared to the baseline scenario (Table 53 and Table 54).

On the level of Member States especially a positive impact (less spending) is observed for Italy (decrease of 49% of expenditure on LTC benefits), Austria (decrease of 47% of expenditure on LTC benefits), Denmark (decrease of 43% of expenditure on LTC benefits) and the Netherlands (decrease of 42% of expenditure on LTC benefits). Primarily, a negative impact (more spending) is observed for the Slovak Republic (increase of 106% of expenditure on LTC benefits), Romania (increase of 60% of expenditure on LTC benefits) and Bulgaria (increase of 51% of expenditure on LTC benefits). Countries in which we do not observe a crucial negative or positive impact are: Belgium (same expenditure as in the baseline scenario), Estonia (same expenditure as in the baseline scenario), Germany (decrease of 1% compared to the baseline scenario) and France (increase of 3% expenditure compared to the baseline scenario) (Table 54).

The changes are not always as what is expected since they are sensitive to the real levels of spending. For instance the shift of the reimburse mechanism to the basis of spending at the level of residence implied an increase for Luxembourg (as competent country) because they were 'less generous' (or less oriented) to in cash benefits.

---

<sup>137</sup> We calculated our estimates on average benefits for the total of the insured population. It is as the mobile citizen (workers, pensioners, their family members) is using this system of LTC as if they were nationals. This involves a 'potential' overestimation of the number of users of cross-border LTC benefits and the related expenditure due to fact some MS consider their LTC benefit as not exportable. At the same time these estimates assume a complete 'take-up' of rights by mobile citizens.

<sup>138</sup> We estimated for the baseline scenario (Option A) a total LTC cross-border expenditure of € 994.7 million of which € 376.4 million LTC benefits in cash paid to persons living in another country than the competent country based on the legislation of the competent country and € 618.3 million paid to creditor countries which provided LTC benefits in kind to insured persons living in another country than the competent country, according to the legislation of the country of residence.

<sup>139</sup> The 'real life' dimension of this option is illustrated by the growing discussion in the Netherlands that the 'in cash' LTC expenditures exported to other countries should not be adopted to the cost of living (or care) in those countries, as is the case when benefits in kind are used.

➤ Fair sharing of the burden between Member States: -

Reimbursement is a step towards burden sharing, but in this option, the negative aspects compared to the baseline scenario outweigh the positive impacts. As also the trESS Analytical report on LTC remarked:

*“It could be said that it is an additional financial burden for the competent Member State, which might deliberately make a decision to compensate the risk of LTC only by way of benefits in kind. Under this option, these Member States would thus also have to reimburse benefits in cash”.*

According to the results of our public authorities’ survey, this option also received the lowest average score with regard to its impact on fair burden sharing (3.39 on a 1-to-6 scale).

7.4.4.4 Risk of abuse or misuse of the EU rules

---

Score: -

This sub-option incorporates risks of misuse of benefits, as two Member State could be competent to grant benefits at the same time. Persons concerned could thus be tempted not to inform the competent MS of the receipt of benefits under the legislation of the Member State of residence (leading to double payments).

Furthermore, several national administrations in Member States with more generous LTC benefits warned that this option could lead to social tourism in the EU (Austria, Germany and the Netherlands). One German national administration representative stated:

*“This option may lead to an increase of inflow of persons from ‘poorer’ Member States seeking LTC benefits in our country (the standard of LTC benefits in our country is relatively high compared to other Member States). Indirectly, this could also result in an increased pressure on the (supply of) nursing staff, in case there is a high inflow of mobile persons seeking long-term care services as a result of this option.”*

This argument was repeated by an Austrian national administration representative:

*“In 2012, the Austrian Bund (federation) allocated EUR 2.6 billion for LTC; there were 430.000 recipients of benefits. The benefits ranged between EUR 154 - EUR 1655 per month. Approximately 5% of the Austrian population receives LTC benefits, which is relatively high compared to other EU countries. For instance, Germany has a lower share of population receiving LTC benefits. The threshold as of which people receive LTC benefits is relatively low in Austria. Under this option, a Romanian citizen, who has not paid any contributions into the Austrian social security system, would be entitled to receive LTC benefits from Austria. So, reimbursement between Member States is crucial”.*

7.4.4.5 Possible impact on the EU internal market

---

C.I.1 – No supplement provided by the competent Member State +/-

Should there be no supplement, the difference in the level of LTC benefits between the competent Member State and the Member State of residence would seem to be a factor in the decision of (potentially) mobile persons.

*C.1.2. Supplement provided by the competent Member State: +*

This option would prevent the situation where persons would not move due to the impossibility of receiving any LTC benefits in their new country of residence.

According to the public authorities' survey, national administrations believe that this option is one of two best options to stimulate free movement of persons within the EU (3.94 average score on a 1-to-6 scale), with a higher average score than the sub-option with supplement.

#### 7.4.4.6 Impact on the fundamental rights of EU citizens

---

Score: +

For both options by contributing to eliminate gaps in protection and ensuring that all mobile citizens reliant on care receive adequate levels of care, this policy option has a positive impact on different fundamental rights that it would promote: non-discrimination (citizens would be less likely to suffer loss of benefits based on their country of origin), the rights of the elderly, the rights of the persons with disabilities, family and professional life and, in general, on the fundamental right to social security and social assistance.

By removing obstacles to mobility linked to the potential lack or loss of rights to long-term care and increasing the transparency of the rules (mobile citizens should have more visibility on their entitlements with this policy option than they do with the current coordination rules), this policy option would also contribute positively to ensuring the right of freedom of movement and of residence.

**One civil society representative provided the following concrete examples about the impact of this option on fundamental rights:**

*Example 1:*

A couple lives in Portugal. The husband receives a low Portuguese pension and a high German pension, after having worked in both countries. Under the current rules, he is not entitled to German *Pflegegeld*. His wife only receives a German pension and is entitled to German *Pflegegeld* in Portugal (exported).

Under the alternative regime (country of residence provides all LTC benefits), this couple – in the same way as their Portuguese neighbours – would be entitled to all Portuguese LTC benefits in kind (*Sachleistung*) and Portuguese LTC benefits in cash (*Geldleistung*). If the couple would move back to Germany, both pensioners would be entitled to the German *Pflegegeld*. Equal treatment in the country of residence.

*Example 2:*

A couple lives in Germany. The husband receives a German pension and is entitled to German Pflegegeld. His wife receives a Belgian pension. Under the current rules, the wife is not entitled to the high German Pflegegeld but to the lower Flemish *Zorguitkering* (Flemish equivalent of Pflegegeld).

Under the alternative regime, both pensioners would be entitled to all German LTC benefits in cash and LTC benefits in kind, in the same way as their German neighbours.

*Example 3:*

A family lives in Germany. A husband starts working as a frontier worker in the Netherlands. His wife does not work and receives German *Pflegegeld* for care of their disabled son. Because the husband is going to work in the Netherlands, the whole family is insured for healthcare in the Netherlands. However, from the moment the husband goes working in the Netherlands, the family is only entitled to German LTC benefits in kind in the country of residence. Thus, the family loses its entitlement to LTC benefits in cash (German Pflegegeld). From the Netherlands, the family does not receive any LTC benefits in cash, because this is not existent in the Netherlands.

Under the alternative regime, the family will be entitled to all German LTC benefits, whether these benefits are in cash or benefits in kind. If the family moves to the Netherlands, the family would be entitled to all Dutch LTC benefits, as their Dutch neighbours.

#### 7.4.4.7 Possible impact on the EU budget

---

Score: +/-

No impact on the EU budget could be identified.

#### 7.4.5 Option C2: Competent Member State provides long-term care benefits to insured persons residing abroad (export)

---

In Option C.II, the competent Member State shall provide long-term care benefits to insured persons residing abroad (export). Where benefits are only available in the forms of services, the competent Member State will reimburse the services provided in the country of residence.

The competent Member State would provide LTC to insured persons residing abroad (that is, the mobile persons would export their benefits). In this policy option, the competent Member State would be “responsible” for all types of LTC benefits, including the benefits in kind (not “naturally” exportable as the benefits in cash). The following solution would be established: where the benefits were only available in the form of services, the competent Member State would reimburse the services provided in the Member State of residence.

This policy option sets out clearly which Member State would provide LTC benefits. Contrary to the baseline scenario, where the distinction between benefits in cash and in kind is the starting point and an element of crucial importance (as it determines which Member State must provide the LTC benefits), this policy option would not make any distinction among the types of benefits. The starting point and critical element would be the Member State legally in charge of providing the LTC benefits (the Member State of residence or the competent Member State depending on the sub-option). This Member State would then provide all LCT benefits (be them in kind, in cash or mixed), with a system of reimbursement.

Under this option, it should be considered and clarified, according to which legislation the person might be considered as dependent and what the level of the dependency is, given the diversity of national legislations. A communication channel would also have to be established between the Member States for Option C2, in order to avoid that the person concerned receives benefits from the competent Member State and services in the Member State of residence for the same purpose.

#### Attitude of consulted stakeholders

National public authorities	Public consultation results: ➤ 18% of the national public authorities think that persons should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he/she moves to another Member State (second preferred option). Our public authorities’ survey shows a preference of 28% for this statement.
Trade unions and social partners	➤ 33% of the responding trade unions and social partners’ representatives are in favour of this option (preferred option).
Civil	➤ 25% of the civil society representatives are in favour of this option

society/NGOs	(second preferred option).
Individual respondents	➤ 39% of the individuals (49) believe that persons should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he/she moves to another Member State (preferred option).

#### 7.4.5.1 Impact on social security coverage of the insured persons who move within the EU, and the members of their families and survivors

Score: +

In our survey of national administrations, this option is considered as better than the status quo with regard to its impact on the social protection of mobile citizens (receiving an average score of 3.83 on a 1 to 6 scale, compared a 2.83 score for the baseline scenario). We have also given this option a positive mark, as it allows mobile persons in need of LTC to be treated equally in the Member States where they are insured and not to have their care benefits reduced if they move to another Member State.

Under this option, several national administrations (in Germany and Austria) noted that it should however be considered and clarified, according to which legislation the person might be considered as dependent and what the level of the dependency is, given the diversity of national legislations.

#### 7.4.5.2 Impact on administrative costs and administrative burden

##### ➤ Transparency: +

In terms of transparency, this option is expected to have a positive impact compared to the baseline scenario. It is expected to decrease legal uncertainty because all LTC benefits will be provided on the basis of a single legislation: the one of the competent Member State.

##### ➤ Complexity of the EU rules: -

However, this will not reduce the complexity of the coordination rules, as always more than one Member State will be involved in the provision of LTC benefits. Indeed, it was considered by a large majority of the national administrations that this option would entail significant feasibility challenges, not in the least due to the need of huge communication and coordination between Member States. A comparison of the LTC benefits in kind available in both countries would be necessary, so as to provide in the Member State of residence benefits similar to those in the competent Member State. This calculation could be complex (e.g. due to differences in eligibility conditions across EU Member States) and to a large extent theoretical. For the benefits common in both countries, the current rules for the valuation of LTC benefits in kind would suffice. For those provided in the competent Member State but not existent in the Member State of residence, cash compensation should be provided.

##### ➤ Impact on administrative burden on national administrations: +

In option C 2 there is no change in the baseline scenario for the in cash benefits, but now the entitlements as well number of cases and the average spending for the in kind benefits is defined on the level of the competent country. Those systems are better developed in the competent states and we see the number of cases increasing to 58 thousand, and the total budget to € 900 million (cf. 8.1.2 and 8.1.3). For reason of this increased number of cases also the administrative burden for the in kind LTC increases to € 5.8 million (or 120 % of the baseline situation) while the relative share of the administrative cost to the total budgetary cost for in kind LTC declines to 0.6%.

### 7.4.5.3 Impact on public finance of the Member States

---

#### Impact on public finance of Member State: -

Option C2 whereby the competent Member State shall provide LTC benefits (in kind and in cash) on the basis of its legislation implies a total expenditure of € 1.3 billion or an increase of 28% compared to the baseline scenario. In this option the expenditure on LTC benefits in cash shall be the same as in the baseline scenario, namely € 376.4 million. LTC benefits in kind shall be provided on the basis of the legislation of the competent Member State and no longer on this of the country of residence. These results in an increase of expenditure on LTC benefits in kind to € 900.3 million or an increase of 46% compared to the baseline scenario (Table 53 and Table 54).

On the level of the Member States primarily a positive impact (less spending) of this option compared to the baseline scenario is observed for Bulgaria (decrease of 94% of expenditure on LTC benefits), Estonia (decrease of 89% of expenditure on LTC benefits), Romania (decrease of 88% of expenditure on LTC benefits), Poland (decrease of 86% of expenditure on LTC benefits) and Portugal (decrease of 72% of expenditure on LTC benefits). Mainly a negative budgetary impact (more spending) of the option compared to the baseline scenario is observed for Finland (increase of 255% of expenditure on LTC benefits), Sweden (increase of 254% of expenditure on LTC benefits) and the Netherlands (increase of 66% of expenditure on LTC benefits) (Table 54)..

Compared to the baseline scenario, the competent Member State could be in a better position to control or forecast LTC expenditure on mobile persons abroad, as these persons will receive benefits in kind that are seen as equivalent to the benefits in kind provided in the competent Member State. This is because the legislation of the competent Member State will have the most important role in the provision of the LTC benefits. Nevertheless, it should be noted this effect is likely to be limited. Significant disparities exist between EU Member States with regard to the monetary value that can be assigned to a specific LTC benefit in kind. For instance, home nursing (benefit in kind) exists both in Germany and Belgium (equivalent benefits), but the provision of this benefit in Germany could be more costly than in Belgium.

#### Fair burden sharing between Member States: +/-

In the public authorities' survey, this option received the highest average score of all options in terms of fairness. However, this results contrasts with our own survey results and interview findings, which suggest a negative impact in terms of fair burden sharing.

### 7.4.5.4 Risk of abuse or misuse of the EU rules

---

#### Score: "+/-"

This option does not entail a higher risk of fraud or abuse than the baseline scenario. Interviewees found it difficult to estimate the likely impact of this option in terms of fraud risk. One interviewee believed that this option might actually entail a lower risk of fraud than the baseline scenario, because of the increased communication between Member States that is required. This way it will be more difficult for mobile persons to claim LTC benefits in the country of residence without that the competent Member State is informed.

### 7.4.5.5 Possible impact on the EU internal market

---

#### Score: +

Together with option C.I.2, this option was seen by surveyed national administrations as the best option to stimulate mobility of people in the EU (receiving a 3.94 average rating on a 1 to 6 scale, compared to 2.94 for the baseline scenario). It allows mobile persons in need of LTC to be treated equally in the Member States where they are insured and not to have their care benefits reduced if

they move to another Member State. This element is regarded as a decisive factor in the decision of citizens to move to another Member State.

#### 7.4.5.6 Impact on the fundamental rights of EU citizens

---

Score: +

This option contributes to eliminate gaps in protection and ensuring that all mobile citizens reliant on care receive adequate levels of care and thus a positive impact on different fundamental rights that it would to promote: non-discrimination, the rights of the elderly, the rights of the persons with disabilities, family and professional life and, in general, on the fundamental right to social security and social assistance.

By removing obstacles to mobility linked to the potential lack or loss of rights to long-term care and increasing the transparency of the rules (mobile citizens should have more visibility on their entitlements with this policy option than they do with the current coordination rules), this policy option would also contribute positively to ensuring the right of freedom of movement and of residence.

#### 7.4.5.7 Possible impact on the EU budget

---

Score: +/-: No impact on the EU budget could be identified.

## 7.4.6 Overview of impact assessed

**Table 39: Coordination of LTC benefits: overview of the impacts assessed per option**

Impact assessment criteria	A. Status quo (BASELINE SCENARIO)	B. Adoption of a safeguarding provision ensuring that a mobile person does not lose his/her entitlement to LTC	C.1: MS of residence shall provide LTC benefits on the basis of its legislation		C.2: Competent MS shall provide LTC benefits to insured persons residing abroad (export)
			C.1.1: with supplement by competent MS	C.1.2: without supplement by competent MS	
Impact on <b>social security coverage</b> of mobile citizens, with regard to:	0	+	+	+	+
Impact on <b>admin. burden, transparency and complexity</b> of the rules					
o impact on transparency of the rules	0	-	+	+	+
o impact on complexity of rules	0	-	-	+	-
o impact on admin. burden on national admin.	0	-	-	-	+
Impact on <b>public finance</b> of MS, particularly with regard to:					
o impact on public finance	0	+/-	+	+ (-19%)	- (+28%)
o fair burden sharing between MS	0	-	-	-	+/-
<b>Risk of abuse/misuse</b> of rights	0	+	-	-	+/-
Impact on the <b>internal market</b>	0	+	+	+/-	+
Impact on <b>fundamental rights of EU citizens</b>	0	+	+	+	+
Impact on <b>EU budget</b>	0	+/-	+/-	+/-	+/-

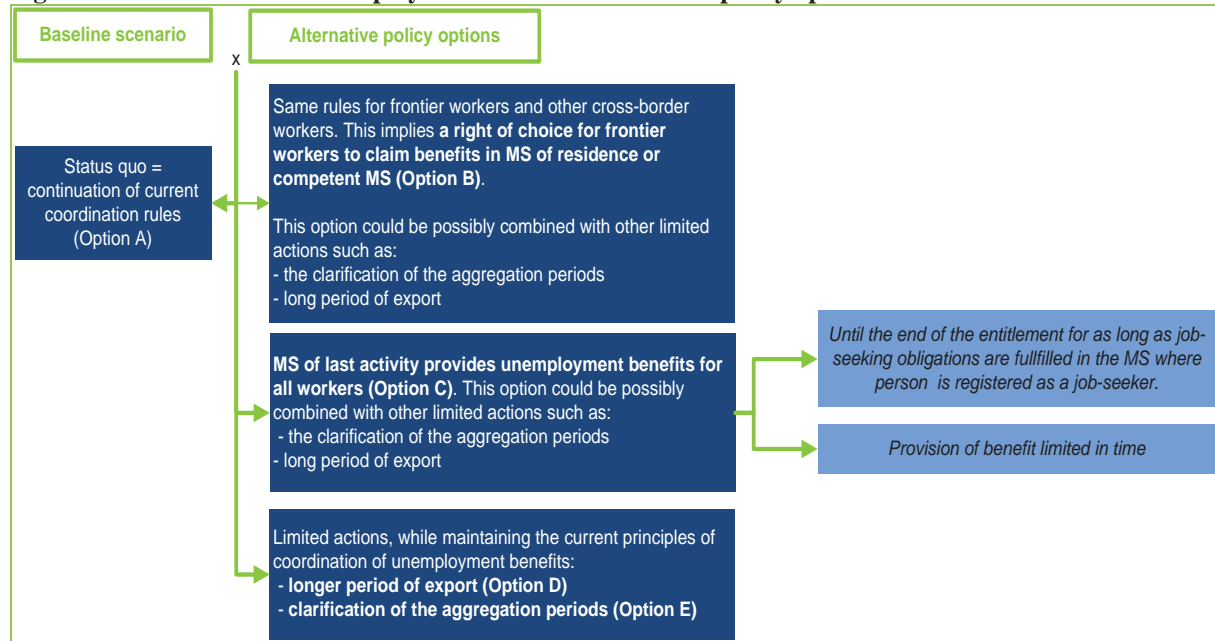

A “+” should be interpreted as a positive impact on the impact assessment criterion, whereas a “-” indicates a negative impact on the impact assessment criterion. Be aware that a positive impact on public finance of MS (+) actually reflects an expected decrease in public expenditure. Similarly, a “+” impact on administrative burden actually reflects an expected decrease in the administrative burden on administrations.

## 7.5 Coordination of unemployment benefits

### 7.5.1 Overview of possible options

The figure below presents the options that were considered in the impact assessment. Options D and E are of a horizontal nature and can be combined with options A, B and C.

**Figure 7: Coordination of unemployment benefits: considered policy options**

### 7.5.2 Option A: Baseline scenario

The baseline scenario (**OPTION A**) implies no change of policy and a continuation of the current rules for coordination. This means:

- Workers shall claim unemployment benefits in the country of last activity, if they have not resided during their activity in another Member State. Periods of insurance completed abroad, as well as other periods of employment/self-employment, are taken into account for establishing the right to the unemployment benefits (if the periods of employment/self-employment would also have been accounted for an entitlement to unemployment benefits in the competent Member State).
- Unemployed workers have a limited possibility of export of unemployment benefits for 3 months, with the possible extension to 6 months (when he/she looks for work in another Member State). It is the competent institution of the Member State paying the unemployment benefits that may extend this period to 6 months.
- Frontier workers (people who work in one country and live in another, and return home daily or at least once a week) who become wholly unemployed must apply for unemployment benefits in their country of residence. They can in addition register with the employment services in the country of last activity.
- The country of last activity will reimburse the institution of the place of residence the full amount of the benefits provided by the latter institution during the first three months (extensible to five months in certain circumstances).

- Cross-border workers, other than frontier workers, may apply for unemployment benefits and register with the employment service in either the country of last activity or the country of residence.

The baseline means to change nothing and keep the coordination rules as they stand today. This implies that outlined problems and challenges. The status quo is the benchmark for any other alternative option proposed.

### 7.5.3 Option B: Right of choice for frontier workers (B)

---

This option implies that frontier workers have the choice between applying for unemployment benefits and registering with the employment services either in the country of last activity or in the country of residence. In this system, frontier workers and cross-border workers, other than frontier workers, are put subject to the same rules.

This option would eliminate the obligation for frontier workers to apply for unemployment benefits in their country of residence. Since conditions might be more favourable for them in the country of last activity, they would have the possibility to apply for unemployment benefits there. The qualification conditions that apply, the value conferred to experience in that particular market, a higher demand for certain skills and expertise, or an overall labour market policy better suited to their needs are factors that could make it easier for unemployed workers to find a job in the country of their last activity (as compared to their country of residence).

It would not be the legislator who would make the choice for the workers. The workers themselves would ponder pros and cons and decide the Member State in which to apply for unemployment benefits (their country of residence or that of their last activity). The unemployed workers, it should be borne in mind, will have to comply with the job seeking requirements of the country they choose to receive the benefits from. Such requirements, together with policy support and labour market conditions, might vary across countries. Frontier-workers would, under this policy option, be subject to the same rules than the other cross-border workers, enjoying the right of choice that cross-border workers other than frontier workers enjoy in the baseline scenario.

This option implies that frontier workers have the choice between applying for unemployment benefits and registering with the employment services either in the country of last activity or in the country of residence. In this system, frontier workers and cross-border workers, other than frontier workers, are put subject to the same rules.

#### Attitude of consulted stakeholders

National public authorities	<ul style="list-style-type: none"> <li>➤ 51% of the national public authorities responding the public consultation preferred this option. However, the results of the Deloitte survey of national public authorities show a significantly lower support for this option (27%)<sup>140</sup>.</li> <li>➤ Analysing the replies to the Deloitte survey country-by-country, the right of choice for frontier workers seems the most preferred option in only 5 Member States (CZ, EE, SK, RO and UK).</li> </ul>
-----------------------------	---

<sup>140</sup> The differences between both percentages are due to the overrepresentation of the some Member States and the underrepresentation of other Member States in the respondent group of both surveys. In order to circumvent over/underrepresentation issues, we analysed the replies to both surveys country-by-country.

	<p>➤ The face-to-face interviews with national public authorities revealed that respondents in some Member States with generous social benefit systems strongly oppose this option (AT, DE, DK and SE).</p>
Trade unions and social partners	<p>➤ 31% of the social partners and trade unions responding the public consultation preferred this option (second preferred option).</p>
Civil society/NGOs	<p>➤ 78% of the civil society/NGOs responding the public consultation preferred this option (preferred option).</p>
Individual respondents	<p>➤ 49% of the national public authorities responding the public consultation preferred this option (the most preferred option of individual respondents).</p>

#### 7.5.3.1 Impact on social security coverage of the insured persons who move within the EU

In the current regime, an unemployed frontier worker might be better or worse off, depending on the characteristics of the unemployment benefits in the Member State of last activity and the Member State of residence (the conditions, heights and duration of the unemployment benefits). Under this policy option, it is generally believed by interviewees that the unemployed frontier worker will be better off, as he has a right of choice (although conditional). Experience with Miethe cases show that frontier workers will likely choose the most beneficial and generous system of both countries. According to the Deloitte survey, public authorities think that this option guarantees the best the protection of social security rights of all options (rated 2.79 on average on a 1-4 scale).

#### ➤ *Return on workers' contributions:*

Score: +

Several consulted civil society representatives and trade unions representatives believe that granting frontier workers a right of choice will have a positive impact in terms of non-discrimination and equality between workers. It gives frontier workers the possibility to be treated in the same way as their former work colleagues which live in the country of last employment. Within this regard, one EURES adviser who is active in a cross-border region stated:

*“Workers are always comparing themselves with their colleagues at the workplace and not with other workers from their country of residence. Imagine a person who lives in Belgium but who is working in the Netherlands, and a person who lives and works in the Netherlands. Both men work for the same company, Philips Lighting Company in Eindhoven, the Netherlands. One day, the company decided to make both of them redundant. Under the current rules, the Belgian frontier worker claims his unemployment benefit in Belgium and not in the Netherlands, although he paid workers' contributions for many years in the Netherlands. So, two former employees of the same company receive different unemployment benefits, both in terms of height as in terms of duration. Many Belgian frontier workers feel discriminated under the current rules”.*

Furthermore, the right of choice is considered as fairer and more equal than the baseline scenario by many civil society representatives, as it ensures frontier workers a better return on the workers' contributions which they have paid in the country of last activity before becoming unemployed. Granting a right of choice for frontier workers ensures that they are not deprived from the rights that frontier workers have built up in the country of last activity.

➤ *Conditions for reintegration in the labour market:*

Score: +/-

There is mixed evidence on whether this option would really make conditions for reintegration in the labour market less or more favourable for frontier workers, compared to the baseline scenario.

On the one hand, several interviewees – particularly NGO representatives and several EURES advisers - believe that unemployed people have a better chance of finding a job in the Member State of last activity. Often, these people have built up a network in the country of last activity and do know the labour market well. The Court of Justice has identified in its case-law<sup>141</sup> a category of frontier workers (so called 'atypical frontier workers') who have better prospects of finding another job in the State of last activity and could therefore apply for unemployment benefits.

However, it is questionable according to several Member States (Austria, Germany, Denmark and the Netherlands) if the employment services of the country providing unemployment benefits will be able to provide any direct (local) assistance to those unemployed persons who are residing in another Member State but claimed their unemployment benefit in the country of last activity. For example: national administrations in Germany and Austria raised doubts whether the country of last activity would have the necessary means/infrastructure/instruments to support unemployed people abroad in finding employment. Vice versa, they wonder if the elder unemployed people would have the required skills and instruments to seek a job from abroad. This was confirmed by our public authorities' survey results: in the majority of the Member States, national administrations think that physical presence is a requirement to find a job in another Member State (than the country of residence).

Furthermore, the experience of national public authorities and trade union representatives with Miethes cases<sup>142</sup> give us useful information about the motives of frontier workers to make use of the Miethes case law and thus to claim unemployment benefits in the country of last activity. According to three EURES advisers who are active in cross-border regions between Germany, the Netherlands and Belgium, of the hundreds of people who made use of the Miethes ruling to claim unemployment benefits in the country of last activity; very few used the argument of seeing better chances on the labour market in the country of last activity. The overwhelming majority of the people had based their choice on the height of the unemployment benefits and chose the most beneficial and generous system of both countries.

Finally, it should be noted that, under the current rules, frontier workers can already register as job-seekers in their country of last activity, so this option was not thought to bring much positive effects in terms of facilitation of the reintegration into the labour market.

---

<sup>141</sup> Case C-1/85 *Miethes*

<sup>142</sup> Case C-1/85 *Miethes*

There is a mixed picture with regard to the impact of this option with regard to the administrative burden that is expected to arise. All in all, from an administrative point of view, we believe that the negative impacts are likely to outweigh the positive impacts.

➤ *Transparency and complexity of the rules*

Score: -

On the one hand, many public authorities considered that this option will cause a significant increase in uncertainty among public administrations. Several public officials expressed the view that giving workers the right to choose between two national systems generally makes it more difficult and costly for them to be aware of the situation of the worker, as more communication efforts (which might not always work optimally) are needed. This statement is supported by the public authorities' survey results: public authorities in the Member States see by far this option as the most burdensome of all options from an administrative point of view.

One Austrian public servant also raised a legal concern with regard to the binding force of a 'right of choice': *"What does that mean in practice? Does the decision count once and for all when it is taken; or can the persons change their 'choice'? There is a need for legal certainty."*

➤ *Administrative burden on public authorities*

Score: +

Adopting a right of choice for frontier workers will reduce the number of reimbursements between Member States, as no reimbursement is needed between the MS for the frontier workers who have chosen to claim their unemployment benefit in the country of last activity.

Based on our simulations, we expect a reduction of the administrative burden to € 4.8 million in total, of which € 1.9 million for the country of residence or 27% of the total (cf. 8.1.3). Compared to the baseline cost this is a reduction to 59% of the baseline amount.

For the countries of last activity the direct cost of handling the unemployment benefit increases substantially, but the costs for handling a PD U1 and for the reimbursements is substantially reduced, also in the country of residence. The relative cost of the administrative cost to the total budgetary cost is 0.5 %.

Note: for cases of people who will make use of the possibility to claim unemployment benefit in the country of last activity, several Member States expect that the administrative burden related to "control" of the job seeker abroad (and the legitimacy of the unemployment benefit provided) could increase. The employment services will need to exchange information if the person has launched a request for unemployment benefits in that country to avoid double payments or to avoid that the person would receive no payment at all.

## ➤ *Impact on public finance of Member States:*

Score: -

### **Public expenditure on unemployment benefits**

For this exercise the estimated number of unemployed cross-border workers based on the LFS and the unemployment rates of the Ageing Report is multiplied by the annual unemployment benefit per unemployed person (in 2010 prices; projected in the 2012 Ageing Report). For each of the flows between Member States (in the different cells) the unemployment benefit of the country of last activity and the unemployment benefit of the country of residence was taken into consideration. The yearly expenditure assumes that the unemployed person did not find a job during the first year of unemployment.<sup>143</sup> For that reason, the percentual change between the different options is more useful. However, also the amount of the reimbursement claim should be taken into account.

A first alternative option involves that frontier workers will have the right to choose between the country of residence and the country of last activity (option B). As similar for the baseline scenario, we define 2 scenarios (equal distribution and rational choice).

The first scenario whereby 50% of the cross-border workers are returning involves a yearly expenditure of € 624.3 million (or an increase with 15.6% compared to the baseline scenario) of which € 476.7 million for frontier workers (Table 42 and Table 91). It implies a much higher expenditure by the country of last activity (62% of total expenditure) (Table 45).

The scenario where cross-border workers will make a rational decision implies the highest yearly expenditure. The expenditure will increase to € 891.6 million (what illustrates a higher level of protection (benefit)) - of which € 645.5 million related to the expenditure for frontier workers (Table 42 and Table 92). This increases the general expenditure with € 351.6 million or 65% compared to the baseline scenario whereby 50% of the other cross-border workers return to their country of residence.

There is a substantial shift of taking up the unemployment benefit in the country of last activity, and this is also illustrated by a substantial shift of direct payment of those benefits by the country of last activity. 73% of the expenditure would be paid by the country of last activity (Table 45). Their direct payment (again calculated on one year) increases to € 653 million (Table 44). On the other side, there is a reduction (calculated on 3 months) of their reimbursement (Table 46).

Please consider the caveats for the reliability limits for reason of a) the estimates of bilateral cross-border and frontier workers in the LFS b) the hypothesis to be made on as well average unemployment benefits, choice of either unemployment benefits in country of competence and country of residence c) the assumption the unemployed person did not find a job during the first year of unemployment and d) for a more detailed analysis on the level of MS also the reimbursement claims have to be taken into account.

### **Estimated impact on number of reimbursement claims**

---

<sup>143</sup> The reader has to take this assumption into account when reading the estimated budgetary impact. A more 'realistic' calculation of the yearly expenditure could be obtained by taking into consideration the average duration of the unemployment (which is an indicator in the LFS) and the specific national rules concerning the maximum length of the payment of the unemployment benefit.

The option whereby frontier workers also have the choice (option B) will decrease the reimbursement claims with 45% - for both scenarios (equal distinction and rational choice) compared to the baseline scenario a1 (Table 46). The actual reimbursement will be lower based on the maximum amount of unemployment benefits of the country of last activity (Table 100, Table 101 & Table 102).

➤ *Fair burden sharing between Member States:*

Score: +

In terms of fair burden sharing between Member States, a right of choice for frontier workers is seen as slightly better than the baseline scenario by about half of the national public authorities who responded to our public authorities' survey. While in the baseline scenario the State of residence has to bear the costs of unemployment and other social security benefits (such as sickness or family benefits) for unemployed frontier workers without having received any contribution from them, this option would shift some of these costs to the country of last activity – the reimbursement mechanism established by the current legal framework and the sharing of the burden of unemployment benefits do not fully address the issue.

7.5.3.4 Risk of abuse or misuse of the EU rules

---

Score: -

Many trade unions' representatives and national public authorities would not see it as a positive development that an unemployed frontier worker can choose to claim unemployment benefits under the best conditions: identified risks of misuse of rights by frontier workers under this option. Many of them referred to concrete practices of "social benefit tourism" in cases where frontier workers recalled on Miethe case law to claim unemployment benefits in the country of last activity: not because they saw better labour market chances, but because of the generosity of the unemployment benefit system. Some stakeholders saw this possibility as an incentive for 'social tourism', encouraging job-seekers to find employment in countries with a high standard of living and providing an advantage to them should they become unemployed and move/reside in a country with substantially lower costs of living.

In order to restrict such a "shopping" by frontier workers, a Dutch public authority representative proposed to make the right of choice for frontier workers conditional by a minimum 5 years of working in the country concerned.. For example, when a frontier worker who becomes unemployed, has been insured for minimum 5 years based on the legislation of the Member State of last activity, he could have the right to claim his unemployment benefit in the country of last activity as if he would have lived there.

7.5.3.5 Possible impact on the EU internal market

---

Score: +

The right of choice option is generally seen as the option which would best stimulate intra-EU labour market mobility. In the public authorities' survey, this option received the highest average score of all options with regard to its impact on intra-EU labour market mobility.

First, the option allows frontier workers to be treated in the same way as other cross-border workers. This possibility is generally perceived as the removal of a significant barrier to labour market mobility.

Second, frontier workers are better off under this option in terms of social protection, as they can choose under which unemployment benefit regime they would like to fall. Most of the frontier workers are likely to choose the most beneficial system in their view.

#### 7.5.3.6 Impact on the fundamental rights of EU citizens

---

Score: +

This option would bring frontier workers and other cross-border workers on equal footing. By providing frontier workers with the right of choice, they would enable them to select the system that, in their belief, grants them the best opportunity to reintegrate in the labour market –including that of other Member States-. In this sense, the adoption of this policy option would contribute positively to the freedom of movement.

#### 7.5.3.7 Possible impact on the EU budget

---

Score: +/-

No impact could be identified on the EU budget.

#### 7.5.4 Option C: Unemployment benefits for all workers to be provided by the country of the last activity regardless of the person's residence

Under a third option, the unemployed person should claim unemployment benefits and register with the employment services in the country of the last activity and could, in addition, also register with the employment services of another Member State. If the person decides to look for work in another Member State and registers with the employment services there, there could be a number of sub-options:

- *C.I: The provision of the unemployment benefits from the competent State would last until the end of the entitlement for as long as the person fulfils the job-seeking obligations in the Member State where he is registered as a job-seeker. Regular information shall be provided to the competent State by the public employment services of the Member State where the person looks for work. Additionally, EU Member States could agree on a minimum common set of job-seeking obligations to be monitored by the public employment services.*
- *C.II: The provision of the unemployment benefits would be limited.*

The unemployed person should register with the employment services in the country of the last activity and could also register with the employment services of another Member State. If the person decides to look for work in another Member State and registers with the employment services there, there could be a number of sub-options:

- C.I: The provision of the unemployment benefits from the competent State would last until the end of the entitlement for as long as the person fulfils the job-seeking obligations in the Member State where he is registered as a job-seeker.
- C.II: The provision of the unemployment benefits would be limited.

#### Attitude of consulted stakeholders

National public authorities	➤ 41% of the national public authorities responding the public consultation preferred this option (second preferred option of public authorities). The results of the Deloitte survey of national public authorities are in line with this percentage (43%) <sup>144</sup> , but in this survey option C is the preferred option among public authorities. Analysing the replies to the Deloitte survey country-by-country, option C was preferred by respondents from 11 Member States (CY, CZ, FI, FR, HU, IT, LV, MT, NL, PT, SI).
Trade unions and social partners	➤ 44% of the social partners and trade unions responding the public consultation preferred this option (preferred option of trade unions and social partners).
Civil society/NGOs	➤ 0% of the civil society/NGOs responding the public consultation preferred this option.
Individual	➤ 40% of the individual respondents preferred this option (second

<sup>144</sup> The differences between both percentages are due to the overrepresentation of the some Member States and the underrepresentation of other Member States in the respondent group of both surveys. In order to circumvent over/underrepresentation issues, we analysed the replies to both surveys country-by-country.

respondents	preferred option)
-------------	-------------------

#### 7.5.4.1 Impact on social security coverage of the insured persons who move within the EU

---

The Deloitte's public authorities' survey shows that this option is positively rated with regard to the impact on social security of coverage of persons moving within the EU (2.67 on a scale from 1 to 4), however less than the right of choice option (2.79). The option received the highest rating from public authorities in 8 Member States.

First of all, the probability of any worker being left without any unemployment benefits would diminish substantially, compared to the baseline scenario, as it would always be clear to which country request the unemployment benefits.

##### *Return on workers' contributions*

Score: +

Secondly, civil society representatives and trade unions representatives believe that this option enhances equality and non-discrimination, as it ensures that frontier workers are treated in the same way as their former work colleagues which live in the country of last activity. Furthermore, similar to those frontier workers who would make use of a right of choice to claim their unemployment benefits either in the country of last activity either in the country of residence (cf. option B), this option is considered as fairer than the baseline scenario as it ensures frontier workers a better return on the workers' contributions which they have paid in the country of last activity before becoming unemployed.

##### *Conditions for reintegration in the labour market*

Score: +/-

There is mixed evidence on whether this option would really make conditions for reintegration in the labour market less or more favourable for frontier workers, compared to the baseline scenario.

On the one hand, several interviewees believe that unemployed people have a better chance of finding a job in the Member State of last activity. The Court of Justice has identified in its case-law<sup>145</sup> a category of frontier workers (so called 'atypical frontier workers') who have better prospects of finding another job in the State of last activity and could therefore apply for unemployment benefits.

However, it is questionable according to several Member States if the employment services of the country providing unemployment benefits will be able to provide any direct (local) assistance to an unemployed person who is residing in another Member State. For example: national administrations in Germany and Austria raised doubts whether the country of last activity would have the necessary means/infrastructure/instruments to support unemployed people abroad in finding employment. Vice versa, they wonder if the older unemployed people would have the required skills and instruments to seek a job from abroad.

---

<sup>145</sup> Case C-1/85 *Miethé*

Finally, it should be noted that, under the current rules, frontier workers can already register as job-seekers in their country of last activity, so this option was not thought to bring much positive effects in terms of facilitation of the reintegration into the labour market.

There is a general concern that important fiscal technical problems may arise under this option, the tax on unemployment benefits is not aligned between countries.

#### 7.5.4.2 Impact on administrative costs and administrative burden

---

##### *Impact on transparency and complexity of the rules*

Score: +

This option is expected to bring more clarity and legal certainty for unemployed workers compared to the baseline scenario. By making the country of last activity always responsible for the provision of the unemployment benefits –regardless of the person’s residence- the complexity of the EU rules is likely to be reduced. Certain clarity and transparency would be gained, since the distinction between frontier workers and other cross-border workers would be eliminated.

##### *Administrative burden on public authorities*

Score: +/-

Since the distinction between frontier workers and other cross-border workers would be eliminated, there is no need for reimbursement between Member States anymore, which is expected to have a positive impact from an administrative point of view. Analysing the replies to the public authorities’ survey country-by-country, this option is ranked as the one that creates the least administrative burden.

In the option C the administrative burden is further reduced to 36% of the baseline scenario, or € 2.9 million (cf. 8.1.3). This burden is completely situated in the country of last activity, but under the present hypothesis of standard costs, this is not even more expensive because all cases of payment are threatened in the country of last activity, but there are no costs for exchange of a PD U1 or reimbursements to be made.

Note: public authorities considered that this option will also make it more difficult and costly for the country of last activity to follow-up the job seeking efforts and job status of beneficiaries of unemployment benefits who live in another Member State.

#### 7.5.4.3 Impact on public finance of the Member States and fair burden sharing

---

Many national public authorities see this option as a better alternative than the baseline scenario in terms of fair sharing of the financial burden between Member States. Nevertheless, for some countries, this option would have a significant negative impact on their public budget.

##### *Impact on public finance of Member States*

Score: -

For this exercise the estimated number of unemployed cross-border workers based on the LFS and the unemployment rates of the Ageing Report is multiplied by the annual unemployment benefit per unemployed person (in 2010 prices; projected in the 2012 Ageing Report). For each of the flows between Member States (in the different cells) the unemployment benefit of the country of last activity and the unemployment benefit of the country of residence was taken into consideration. The yearly expenditure assumes that the unemployed person did not find a job during the first year of unemployment.<sup>146</sup> For that reason, the percentual change between the different options is more useful.

The option whereby the country of last activity is paying the unemployment benefit (option C) leads to a yearly expenditure of € 770 million or an increase with 42.6% compared to the baseline scenario (Table 42 and **Error! Reference source not found.**). More specific for frontier workers this option would involve an expenditure of € 561.0 million or an increase in expenditure of 43%. All costs are fully paid by the country of last activity.

If the unemployment benefit would be provided by the country of last activity (Option C) no reimbursements would be claimed by the country of residence (Table 46).

This option is generally expected to lead to a decrease in public expenditure in some Member States, being outweighed by an increase of public expenditure in other Member States. This is certainly going to be the case for countries that are net residing countries versus countries that are net competent Member States. Further, we will see that the total expenditure will probably increase to the present situation, but less than would be the case with right of choice and most unemployed choose the Member State with the highest benefit.

#### ➤ *Fair burden sharing between Member States*

Score: +

Member States widely considered this option as positive in terms of providing a more equitable distribution of the financial burden between Member States. The effects are similar to those discussed for policy option B for the frontier workers deciding to apply for unemployment benefits in their country of last activity. In our public authorities' survey, this option is seen as the one that incorporates the fairest burden sharing between Member States (receiving an average rating of 3.19 on a 1 to 4 scale).

#### 7.5.4.4 Risk of abuse or misuse of the EU rules

---

Score: -

The prolongation of the unemployment benefits from the competent Member State for as long as the person fulfils the job-seeking obligations in the Member State where he is registered was thought to apply mainly to the country of residence of the cross-border worker. Otherwise, it would operate as a regular export of benefits. In this sense, those in the countries visited generally opposed to the

---

<sup>146</sup> The reader has to take this assumption into account when reading the estimated budgetary impact. A more 'realistic' calculation of the yearly expenditure could be obtained by taking into consideration the average duration of the unemployment (which is an indicator in the LFS) and the specific national rules concerning the maximum length of the payment of the unemployment benefit.

export of benefits for as long as the entitlement would be maintained in the competent Member State. The main reason alleged was the lack of control on the beneficiary.

The export of benefits in these situations lends itself easily to a certain abuse of misuse, whereby the benefits could be paid to a person not actively seeking a job. The aim of providing economic means to compensate for the lack of income until a new job is found would be lost in favour of other personal, vested interests. Clear issues of moral hazard were perceived. Countries with generous unemployment benefits and/or net inflow of cross-border workers (notably Luxembourg, but also Denmark, Germany, Austria and the Netherlands) raised these complaints whereas Romania, with a clear net outflow of workers, favoured the extension of the benefits for as long as the entitlement would last in the competent Member State. In Spain, an intermediate, flexible system such as the one currently provided for the Regulation was better valued.

While the policy option includes the provision of regular information to the competent Member State, which should in theory soothe the concerns expressed by some countries, the majority of the interviewees raised their doubts about the actual operability and success of such regular information provisions. The control of “national” job-seeker appears to be difficult. In this regard, the interviewees generally share the view that no particular control system should be put in place for cross-border workers exporting their benefits. In this sense, the freedom of movement should not be favoured over the equal treatment. Workers exporting their benefits would be subject to the same type of control (verifying that the worker is actually effectively looking for a job, including, when appropriate, attending courses and job interviews) that other local workers. In light of the expressed difficulties to control unemployed workers, the aforementioned provision of regular reports to the competent Member State would be difficult. The administrative costs would also be increased.

This is compounded by the fact that job-seeking demands less and less physical presence, and is carried out more online. This difficulties the control and the establishment of formal job-seeking requirement (e.g., a person might have been very active, submitting dozens of applications online, but there is not an easy manner to verify it).

Similarly, and while Member States shared their interest in controlling their job-seeker abroad, the agreement on a common set of job-seeking obligations was regarded as highly unfeasible. Conceptually, it was deemed positive, but serious doubts were raised about its feasibility.

This option would also make it difficult to react quickly to any non-compliance by the employment seeker with the job-seeking requirements in country of last employment. It would require a laborious administrative process in order to clarify any issues of non-compliance with the employment agencies of another Member State (and to proceed with sanctions, if needed). According to one public authority representative, the problem could be aggravated by language differences between the responsible bodies in the Member States concerned.

A standardised documentation system (taking all national legal sensitivities into account) which informs the country of residence about all criteria for imposing any sanctions against the employment seeker which are applicable in the country of last activity could be a solution, but the feasibility of setting up such a system was questioned by several Member States.

A public authority representative who opposed this option stated that this option could only work if the Member States agreed on a harmonised legal system and its interpretation.

A proposed alternative would be for the country of last activity to provide the job-seeker with a questionnaire to be filled in in the country where the person is looking for employment – this would result in an unacceptable level of administrative burden.

#### 7.5.4.5 Possible impact on the EU internal market

---

Score: +/-

Public authorities ranked this option as the option that is least stimulating intra-EU labour market mobility.

Should the unemployed workers decide to look for a job in another Member State and register with the employment services there, two sub-options are considered: maintain the unemployment benefits until the end of the entitlement or limit them.

While the provision by the competent Member State of the unemployment benefits until the end of the entitlement would be more in line with the support of labour mobility across EU countries (unemployed workers would be in a similar situation to look for a job in the competent country or in any other Member State), several national authorities (e.g. in the Netherlands, Denmark and Sweden) argued that the Member State in which the person registers as a job-seeker might not be equally ready to spend resources to help a person find a job in a different country, and might prefer to maintain the job-seeker under their own supervision. Hence, the authorities preferred second-sub option: limit the provision of unemployment benefits. Although, this sub-option would be more limiting in terms of promoting the labour mobility.

#### 7.5.4.6 Impact on the fundamental rights of EU citizens

---

Score: +

By making the country of last employment competent for the provision of unemployment benefits to all workers, it would guarantee a similar degree of return on their contributions to all migrant workers. As such, it would eliminate the current distinction between frontier workers and other cross-border workers and migrant workers. In the current situation, frontier workers might lose out on benefits due to their mobility decisions, receiving lower benefits than what their contributions in their country of last activity would have entitle them had they been resident there.

#### 7.5.4.7 Possible impact on the EU budget

---

Score: +/-

No impact on the EU budget could be identified.

### 7.5.5 *Option D: Prolongation of the minimum period of export from 3 months to 6 months*

---

Option D foresees a general prolongation of the period of export of unemployment benefits for persons who look for work in another than the competent Member State to minimum 6 months. The option could be combined with options A, B and C.II<sup>147</sup>.

This policy option would lift the period of export to a minimum of six months for *all* Member States. Whilst this option would still not harmonise the conditions across all countries (the export could last only up to the end of person's entitlements in the competent Member State; also, more generous provisions -that is, longer periods of entitlement- by any Member State would in principle still be allowed), it would elevate the minimum period of export to bring it to a level that would guarantee all unemployed workers a fair chance to find a job in a different country.

On a different note, while the Terms of Reference refer specifically to the possibility of combining Option D with Options A, B and C.II, the possibility of combining it with Option C.I is worth exploring. In this regard, Option D cannot be combined with Option C.I straight away. Both options deal with the duration of the period of export of unemployment benefits (while Option C.I also addresses the question of determining the country in charge of providing the unemployment benefits). Option C.I proposes that the period of export (that is, the provision of unemployment benefits by the competent Member State) shall last until the end of the entitlement –for as long as the person fulfils the job-seeking requirements in the Member State where he is registered as a job-seeker-. Option D, on its side, proposes to extend the period of export to a minimum of 6 months. The period of entitlement under the competent Member State rules can be inferior, equal to or higher than 6 months, therefore resulting in prolongation periods which could be in line or not with option D. Both options could be however easily combined by stating that the period of export of the unemployment benefits will be of 6 months unless the rules of the competent Member State provide for a longer period of entitlement, in which case the latter would be respected –in line with current art.64.3 of Regulation (EC) No 883/2004, which allows for more generous provisions in the competent Member State-. To add the Option C distinctive element, this new “hybrid” option should state that the unemployment benefits would be provided by the country of last activity regardless of the person’s residence. The export period shall be never longer than the entitlement period a person enjoys if she stays in the MS. E.g. if a country has unemployment benefit duration of 3 months, it should not be asked to provide benefits for 6 months for those who left the country.

**Attitude of consulted stakeholders**

<p>National public authorities</p>	<ul style="list-style-type: none"> <li>➤ 20% of the national public authorities responding the public consultation preferred this option (third preferred option of public authorities). Two options were more popular: the current export rules (period of export of three months, with a possible extension up to six months) and the one where one should be able to export the unemployment benefit until the end of the person's entitlement, according to the rules of the Member State which provides them.</li> <li>➤ The results of the Deloitte survey of national public authorities show a lower percentage of preference (13%), but it is also the third preferred option of public authorities. The majority of the public authorities’ opinions are distributed between two alternative, extreme options:</li> </ul>
------------------------------------	---

<sup>147</sup> Especially if combined with option C, it should be considered if option D should also not include the export until the end of the entitlement period.

	<p>prolonging the period of export until the end of the person's entitlement to unemployment benefits (39%) and maintaining the status quo (37%).</p> <p>Analysing the replies to the Deloitte survey country-by-country, this option was preferred by respondents from only 1 Member State (PT). In 11 Member States, a period of export of 3 months with a possible extension to 6 months remains the preferred option (baseline), whereas prolonging the period of export until the person's entitlement to unemployment is the dominant preference in 9 Member States.</p> <p>With regard to the public consultation, a prolongation of the period of export to minimum 6 months was most preferred by respondents from public authorities in 2 Member States (FR, HU).</p>
Trade unions and social partners	<p>➤ 0% of respondents on behalf of the social partners and trade unions responding the public consultation preferred this option (preferred option of trade unions and social partners).</p>
Civil society/NGOs	<p>➤ 22% of respondents from civil society/NGOs responding the public consultation preferred this option.</p>
Individual respondents	<p>➤ 40% of the individual respondents in the public consultation preferred this option (second preferred option after the export until the end of person's entitlement under the national rules)</p>

#### 7.5.5.1 Impact (increase/reduction) on social security coverage of the insured persons who move within the EU

##### ➤ *Impact on return on contributions*

##### Score +/-

Although longer export means that a person looking for job abroad does not have his rights reduced due to this effect, this option was paradoxically not perceived by the public authorities and other stakeholders interviewed as having a relevant impact on the return on workers' contributions.

However, it should be borne in mind that the return on contributions refers not only to the level but also duration of the benefits. Though the level of unemployment benefits would not change with this option, the duration of the benefit would not be limited due to the fact that the job seeker registers with employment services of another Member State.

Under the current rules (baseline scenario), unemployed people are able to export their unemployment benefits for a period of three months. The competent institution can then grant an extension for the export of benefits to up to six months. Upon expiry of the period of export (be it three or six months, or a period in between), the concerned worker must return to the competent Member State to continue perceiving the benefits (he/she shall lose all entitlement to benefits under the legislation of the competent Member State if he does not return there on or the expiry of the said period). Therefore, in order not to lose his entitlements upon expiry of the period of export; he must return to the competent country to continue perceiving unemployment benefits until the end of his entitlement. If he does not return with this period, the remaining entitlements are lost.

➤ Impact on the reintegration in the labour market of a person

Score: +

No consistent evidence was provided by the public authorities interviewed showing that longer periods of export of benefits correlate with better chances of finding a job<sup>148</sup>. Actually, the institutions participating in our survey ranked the prolongation of the period of export behind the current rules in terms of impact on the reintegration of unemployed people in the labour market. The current rules were the highest-ranked option. However, it was also ranked behind the option enabling the export of benefits until the end of the person's entitlement to unemployment benefits according to the rules of the Member State which provides them. These results seem contradictory in the sense that, in terms of facilitating the reintegration of unemployed workers in the labour market, the prolongation of the period of export to a minimum of six months is ranked both below an option that leads to shorter periods of export and below an option that leads to longer periods of export.

Considering the qualitative input gathered during the interviews, it nevertheless appears that the stay abroad while retaining entitlement to benefits facilitates job-seeking. While, once again, no hard figures were presented to back up the notion that the export of benefits, in general, leads to better employment prospects and, in particular, that staying abroad for longer increases the chances of finding employment, the public officials interviewed tended to side with the idea that physical presence in the country of job search (made possible by the opportunity to export the unemployment benefits) had, if any, certain positive effects. Thus, while a relevant amount of respondents considered that physical presence is not needed for job-seeking or that it depends on the situation, the most-selected option among public authorities in both the online survey and the public consultation was that physical presence is needed for job-seeking. The majority of trade unions and social partners also maintained the need for physical presence. Those defending the need for presence argued mainly that it is needed for job interviews, but also for "job placement and employment promotion by the Public Employment Service". The benefits of presence linked to availability for job interviews were also argued by many of the respondents choosing the "it depends" option.

Furthermore, increasing the minimum period of export would confer additional possibilities to mobile workers who do not currently enjoy them. As has been reported, several countries do not grant the prolongation of the export of unemployment benefits at all (the extension is rejected without real consideration of the individual circumstances of the case). Certain workers are thus deprived of the possibility to export their unemployment benefits for more than three months. The adoption of this policy option would grant all the workers in the EU (subject only to their concrete entitlements given their conditions and the rules of the Member State which provides their benefits) a similar possibility to export their unemployment benefits. In a context in which an important responsibility with regard to finding a new job and thus reintegrating in the labour market falls on the workers themselves (who, for example, must choose the country where they claim

---

<sup>148</sup> For instance, Spain carried out a study in 2008 comparing the duration of unemployment and probability of finding a job for unemployed workers remaining in the country and those exporting the benefits. The results showed that the latter were not more likely than the former to find a job. Similar results were reported in Luxembourg, although the very reduced amount of workers does not allow to draw representative conclusions. Similar effects were also reported in the UK.

unemployment benefits in the case of cross-border workers other than frontier workers), it seems that providing them with expanded possibilities to find a job anywhere in the EU is positive.

For this reason, it is considered that this policy option could have a positive impact in terms of the reintegration of unemployed workers in the labour market and thus on the social security coverage of these workers.

#### 7.5.5.2 Impact on administrative costs and administrative burden

---

##### ➤ Impact on transparency: +

In terms of transparency, the adoption of this option could have positive effects. It was gathered during the interviews conducted that the extension of the export of benefits is not granted as a general rule (for example, in the United Kingdom). Therefore, certain unemployed workers are in practice not granted the possibility to export their unemployment benefits for longer than three months without an individual examination of the circumstances of their case. In this sense, the rules are not entirely transparent, since national institutions might apply widely varying practices that cannot be known *a priori* by the unemployed workers. The adoption of this option would eliminate the uncertainty derived from the degree of flexibility granted to public institutions by the current coordination rules. While currently workers can count on a period of export of their unemployment benefits of three months (whilst not being certain of whether the export could be prolonged up to six months), this option would guarantee a period of export of six months not subject to individual (and not necessarily entirely transparent) decisions.

##### ➤ Impact on complexity of the rules: +/-

This option was not perceived by the public authorities interviewed as having a clear impact in terms of complexity of the rules. Aspects such as the distinction between frontier workers and other cross-border workers, wholly and partially unemployed frontier workers, or different national practices in terms of the aggregation of periods of insurance, employment and self-employment would not be affected by this option. Since those were mentioned as sources of complexity, the option would not have an impact.

##### ➤ Administrative burden on public authorities

Score: -

In terms of administrative costs and burdens brought about by the coordination of social security systems, this option would primarily have an impact in terms on the communication exchange between countries concerning the situation of the job-seekers exporting their benefits.

On one hand, certain workers who currently (under the baseline scenario) cannot export their unemployment benefits for longer than three months (given the reluctance of some Member States to grant the extension), could pass to indeed export their benefits for longer periods. On the other hand, lifting the minimum period of export to six months might also lead to longer periods of export by workers who are effectively entitled to six-month exports under the current rules (with the minimum set at six months, certain countries might grant the export for longer periods). In both

situations, the daily, regular control of the jobseeker would shift from the competent country (be it the country of residence or of last activity) to the country of export. In addition, certain communication should take place between the two countries concerned. While the implications are far from likely to apply regularly and homogeneously across all countries given the differences that exist in their way of operating, this communication is generally not a one-off effort, implying instead additional efforts the longer the period of export.

In cases of export of unemployment benefits, several countries (including Belgium, Estonia, Netherlands, Poland and Portugal) stated that the situation varies significantly depending on the country they deal with in each concrete case. For such reasons, it is expected that the adoption of this policy option would have a negative impact with regard to administrative costs and administrative burdens.

In addition, it must be noted that the export of unemployment benefits is widely linked, in the view of public authorities, to concerns about the possibility of accrued risks of abuse or misuse of rights. 52% of the organisations participating in Deloitte's survey indicated so, including 33% that considered that such risk would be particularly high if extending the minimum period of export to six months. Therefore, it seems likely that if such prolongation were to be adopted, it could come hand in hand with additional measures to soothe Member State's concern about the risk of abuse. While such measures are not considered in the scenarios evaluated by this study, it is worth, for the sake of comprehensiveness, to quickly analyse the potential implications of the adoption of such measures.

When asked about mitigation measures to reduce the risk of abuse, the Member States selected and/or proposed some of the following options:

- The guest Member State should feel more responsible for jobseekers who have exported their unemployment benefit from another Member State. Agreements should be made between Member States about the control and the provision of active assistance to jobseekers (HU, AT, CZ, IE, IT, LI, NL, PL, PT and SI).
- Several Member States would like to enhance the role of the "guest" Member State in providing information to the competent Member State about the chances of a person to find a job at short-term (BE, EE, CZ and FR).
- All jobseekers who have exported their unemployment benefits should be obliged to report about their job seeking activities to the competent Member State (CZ, DE, MT, LT and FR). Some countries are in favour of monthly reporting by the jobseeker to the competent institution (DE, MT and LT); other Member States say that a 3-monthly reporting would be sufficient (FR).

As clearly pointed out by the Danish authorities, and as can be perceived by considering the options proposed, many of the mitigation measures proposed would also increase the administrative burden and costs of Member States. Therefore, should this scenario play out, the negative impact on administrative burden and costs could be increased.

### 7.5.5.3 Impact on public finance of the Member States (and fair burden sharing)

---

- Impact on public finance of Member States

Score: +/-

The results of the data collection activities conducted suggest that this policy option would not have any significant impacts on the public finance of Member States, neither at individual or aggregate level. However, the 'success rate' of finding a job abroad could/will differ by country of residence which will have an impact on the period of unemployment and on the expenditure.

This policy option does not affect the duration and amount of unemployment benefits granted by each country, nor would it affect the national system from which the unemployed person would receive his/her benefits.

There could be differences in terms of "where" the unemployed person receives his/her benefits for a certain period of time, but not the level or amount of benefits received. This would still be determined by the competent institutions according to the individual circumstances of the case (inter alia, the periods of insurance, employment or self-employment completed by the unemployed person, and the salary perceived in the last professional activity). In particular, this option would not guarantee a minimum export of six months at any moment for any unemployed worker regardless of the circumstances. Should the concerned worker be entitled to continue perceiving unemployment benefits for a period shorter than six months (given his (remaining) entitlements according to the legislation of the competent Member State), the export of benefits would only last until the end of the entitlement (and not be prolonged until reaching the six months).

The possible impacts on the public finance of Member States could come via changes in administrative costs and via a possible impact on the period of unemployment (which affects directly the amount spent on unemployment benefits by the competent institution). As commented earlier, the impact on administrative burden and costs is not clear, whilst there is not clear evidence that exporting the unemployment benefits for longer than three months provides additional chances of finding a job. In light of this, no significant impacts on the budget Member States via these factors can be appreciated at this stage.

➤ *Impact on fair sharing of the financial burden*

Score: +/-

This policy option would not change the amount of unemployment benefits that must be provided by each Member State. When an unemployed person "exports" his or her benefits, the competent institutions continue to pay them. The unemployed person must register as a job-seeker in the "host" country (being then subject to the job-seeking requirements of the public employment service there), but continues to receive his/her benefits from the competent institution. In this sense, there is no shift at all in the sharing of the financial burden between Member States.

Still, Member States rated this option clearly below the current rules in terms of impact on fair sharing of financial burden between Member States in Deloitte's survey. This option received a score 2.43 (on a scale of 1 to 4), very similar to the possibility of extending the export until the end of the person's entitlement (2.42), but clearly below the score given to the current rules (2.72). The interviews conducted suggest that this lower rating could be linked to the costs taken on by the "host" country regarding job-seeking support and control activities with regard to the mobile

unemployed worker. Thus, the receiving countries would incur in additional costs for every incoming job-seeker (certain administrative costs linked to communication with the competent Member State would also come as a result). While each country could find itself in the “receiving” or “sending” situation, the differential impacts would depend directly on the net flow of “exporting” job-seekers experienced by each country.

#### 7.5.5.4 Risk of abuse or misuse of the EU rules

---

Score: -

This option was clearly identified by a large number of representatives from national administrations interviewed (including Luxembourg and the United Kingdom) as increasing the risk of misuse or abuse of the EU rules.

Such risks would, in this view, be aggravated by the extension of the period of export (the payment of unemployment benefits without the certainty that they are effectively trying to find a job would be prolonged, while additional workers might feel attracted to make use of the possibility of export without a clear focused aim of finding employment as soon as possible in the country of destination).

52% of all the respondents to the Deloitte online survey think that extending the period of export could lead to an increased risk of misuse or abuse of rights. Such risk would be higher, according to the respondents, the longer the allowed period of export. Thus, 79% of the respondents to the online survey for public authorities thought that the risk of misuse or abuse would increase if the unemployment were provided until the end of a person’s entitlement, according to the rules of the Member State that provides them; meanwhile, 33% of the respondents believed that the risk would increase in the minimum period of export was raised to six months.

These data show that the concern exists among public authorities.

The argument of the risk of abuse of rights is linked to the limitations of the control the competent Member State can exert on the jobseeker (whose unemployment benefits they are paying) whilst he/she is abroad exporting his/her benefits.

For such reasons, the impact that this option could have in terms on a higher risk of misuse or abuse appears, in comparison with the baseline scenario, negative.

However, it should be noted that the authorities interviewed were unable to attach figures on the misuse of rights. The cases of abuse related seemed rather anecdotal. Other interviewees also pointed out that, while the risk of misuse or abuse exists, the concerns over it should not lead to deprive the vast majority of workers who export their unemployment benefits legitimately. 45% of the participants in Deloitte’s survey did not think that the misuse or abuse of rights is a risk in cases of export of unemployment benefits.

#### 7.5.5.5 Possible impact on the EU internal market

---

Score: +

While in many cases reluctant to the extension (due to potential pitfalls such as the increase risk of misuse of the rights, as previously discussed), interviewees (regardless of their type) coincided in general in signalling that the extension of the period of export could have some favourable effects from the point of view of fostering cross-border mobility.

National administrations participating in the survey considered that this option would have a slightly more positive impact on labour market mobility than the current rules (on a scale of 1 to 4, it received a 2.54, compared to the 2.47 of the current rules). The highest-ranked option in this regard was the possibility to extend the export until the end of the person's entitlement. These results reveal that national administrations recognize that the possibility of exporting unemployment benefits, the more the longer it is, facilitates labour mobility to some degree. In comparison with the baseline scenario, the effects of an increase of the minimum period of export from three to six months seemed limited, but positive.

This question is also directly linked to the chances of reintegration in the labour market for unemployed people exporting their unemployment benefits, discussed before. As previously pointed out, there is no clear evidence that the chances of finding a job in the "host" country improve after three months, but public officials tended to agree that, if any, the effects of the export (and the extension) would be positive. Similarly, the possibility to export unemployment benefits for longer could facilitate not only the reintegration in the labour market but also the decision of unemployed workers to decide going to look for a job in the country. A guaranteed longer period of export in case employment is not found could help to soothe concerns of adaptation of some potentially migrant workers. The cultural and social "acclimation" to the host country would in principle be facilitated by the possibility to remain there for longer. More unemployed workers might then be willing to take their chances leaving their country of residence if a relatively long period of export, allowing them to fully adapt to the local conditions.

#### 7.5.5.6 Impact on the fundamental rights of EU citizens

---

Score: +

This policy option would in principle provide a direct positive impact in the freedom of movement and of residence. It could also help to eliminate some discrimination problems. As currently unemployed workers in certain countries do not enjoy the chance to extend the export of their unemployment benefits from three to six months, there are *de facto* differences across workers in different Member States, and what could be considered a certain discrimination. This would be solved with the adoption of this policy option. Most clearly, the impact of this option would be via its further facilitation of job-seeking abroad. By increasing the possibilities to look for a job abroad, the prolongation of the minimum period of export from three to six months would have a positive effect in favouring the freedom of movement and of residence.

#### 7.5.5.7 Possible impact on the EU budget

---

No impacts on the EU budget were identified

### 7.5.6 *Option E: Clarification of the provision on the aggregation of periods of insurance, employment and self-employment*

---

Option E implies a clarification of the provisions on the aggregation of periods of insurance, employment and self-employment. This policy option addresses directly the problem of the different practices in the application of rules on aggregation of periods (Article 61 of Regulation (EC) No 883/2004). For such reason, it could be combined with any of the previous options (as Options A, B and C address the first problem and Option D addresses the second problem). Several regulatory instruments are proposed (a Regulation, an interpretative decision of the Administrative Commission or guidelines).

Given that Member State's legislation often makes the acquisition, retention, recovery or duration of unemployment benefits conditional upon the completion of either periods of insurance, employment or self-employment, mobile unemployed persons would be penalised if it were not possible to take into account the periods completed under the legislation of a Member State other than that whose legislation applies. To prevent this problem, and facilitate cross-border mobility, Article 61 of Regulation (EC) No. 883 /2004 states that the periods of insurance, employment or self-employment completed under the legislation of any other Member State shall be taken into account and considered as though they were completed under the legislation it applies.<sup>149</sup>

However, as explained in the problem definition, there is significant diverge of opinions on the proper interpretation of the article and reported practices of some Member States not in accordance with EU law. Therefore, a clarification of the provision on the aggregation of periods of insurance, employment and self-employment which enshrined a unique, unmistakable interpretation, could serve as an effective tool to avoid different practices in the application of rules on aggregation of periods.

Periods of insurance, employment and self-employment completed abroad are taken into account for the acquisition, retention, recovery or duration of the rights to unemployment benefits.

When the legislation of the competent Member State makes the entitlement conditional upon the completion of either periods of insurance, employment or self-employment, the competent institution shall take into account **periods of insurance, employment or self-employment** completed under the legislation of any other Member State as though they were completed under the legislation it applies.

When the applicable legislation makes the entitlement to benefits conditional upon the completion of periods of insurance, **the periods of employment or self-employment** completed under the legislation of another Member State shall only be taken into account if such periods would have been considered to be periods of insurance had they been completed in accordance with the applicable legislation.

---

<sup>149</sup> In the particular case where the applicable legislation makes the right to unemployment benefits conditional on the completion of periods of insurance, the periods of employment or self-employment completed under the legislation of another Member State shall not be taken into account, with one exception: when these periods of employment or self-employment would have been considered to be periods of insurance had they been completed in accordance with the applicable legislation, they shall be considered as periods of insurance and therefore give right to unemployment benefits.

While respecting these coordination rules, Member States remain competent to determine the conditions for insurance under their social security system and the entitlement to benefits under that system.

**Attitude of consulted stakeholders:**

- The public consultation and the Deloitte online survey did not contain specific questions on the aggregation of periods of insurance, employment and self-employment. Concerns about the incorrect application and the lack of clarity of rules included the question of the aggregation of periods of insurance, employment and self-employment.
- The public authorities and other stakeholders consulted were not able to elaborate on the impacts of a clarification of the provisions on aggregation of periods without more details about the content of such clarifications. Member States interpret art.61 Regulation (EC) No.883/2004 in the light of their own national legislation and their particular circumstances. This results in different interpretations across Member States. While support for a clarification was provided in general terms during the interviews with public officials, they expressed the concern that it could lead to undesired changes in their own practice (imposing an interpretation of the rules that differs to the one they deem appropriate given their national legislation).

7.5.6.1 Impact (increase/reduction) on social security coverage of the insured persons who move within the EU

The impacts are analysed under the consideration that the clarification of the provisions would ensure a consistent interpretation and application of the rules across countries (without implying any change in the way that each Member State considers, under its own legislation, different periods as periods of or equivalent to periods of insurance, employment and self-employment). This consistent understanding and application of the rules would then reflect accurately the desire of the legislator regarding the rights granted to migrant workers and the responsibilities of each Member State involved. It is in accordance with this potential situation the clarification should bring about that the impacts of this options vis-à-vis the baseline scenario are assessed.

➤ Impact on return on contributions

Score: +

The clarification of the provisions on the aggregation of the periods of insurance, employment and self-employment would bring positive effects in terms of the return that migrant workers receive on their contributions. By guaranteeing a consistent application of the rules, the clarification would ensure that no periods that should have been considered for establishing the entitlement to unemployment rights are left aside due to an uneven application of the rules across Member States.

➤ Impact on the reintegration in the labour market of a person

Score: +

By ensuring that unemployed workers receive the level of unemployment benefits they are rightfully entitled to, and that no periods are unduly left aside for determining and calculating such environments, this policy option would have a positive impact on the reintegration of the labour market. In other words, the clarification of the provisions would help to ensure that the support the unemployed person receives, both income and non-income related (including the duration of such supporting measures), that he is rightfully entitled to and that the legislator intended to grant him. As the provisions on unemployment benefits are designed with the objective of providing the unemployed person with the best possible chances to find a job, a consistent application of the provisions on aggregation of periods would help to ensure that he/she receives exactly the support (considered optimal given the different factors the policy makers must consider and weigh) the legislator intended.

#### 7.5.6.2 Impact on administrative costs and administrative burden

---

##### ➤ Transparency and complexity of the rules

###### Score: +

The clarification should have a clearly positive impact in terms of transparency and provide as well a certain reduction in complexity of the rules.

Transparency and clarity are complicated when determining the rights an unemployed worker is entitled to when there must be an aggregation of periods of insurance, employment or self-employment completed abroad because of two factors: the diversity of national systems and the divergence in the interpretation of art.61.

The diversity of national systems would not have an impact in any way by the adoption of this policy option. Member States will continue to regard different periods (periods of employment, of self-employment, of maternity, of education, of sickness, etc.) in different manners (as periods of or equivalent to periods of insurance, employment of self-employment, or not). This will not be affected by clarifying the provisions on the aggregation of periods.

However, transparency and clarity will be improved by the adoption of a clarification by eliminating the complications introduced by the divergent interpretation and application of the rules. While it might still be to some extent complex for migrant workers to know the benefits they would be entitled to if/when becoming unemployed in different countries due to the importance that the different national systems have, this would not be compounded by an uneven application of the rules across Member States.

##### ➤ Administrative burden on public authorities

###### Score: +

The clarification is not expected to have significant effects on public authorities' administrative burden. The number of cases to deal with would not be altered by the clarification, while the majority of the administrative tasks related to the coordination of unemployment benefits would not be affected either (for instance, essentially the same tasks should be carried out regarding the export of unemployment benefits, and well as the reimbursement procedure –amounts might vary-). If any, the impact should be mildly positive, inasmuch as the clarification could bring about a certain decline

of communication exchanges between different Member States institutions over contested cases, as well as citizens' claims or complaints about a potentially incorrect application of the rules.

#### 7.5.6.3 Impact on public finance of the Member States and fair burden sharing

---

##### ➤ Impact on public finance of Member States

Score: + / -

The adoption of this policy option should not have relevant effects on the public finance of Member States. A clarification of the rules could imply that certain periods unduly left aside for the calculation of unemployment benefits in certain cases would now be taken into account (hence possibly increasing the amount and duration of benefits granted). However, it could also lead to discarding certain periods that are currently taken into account for establish the entitlement to benefits but that should not be considered. In absence of concrete evidence over how the practices of Member States and the amount and type of cases concerned in each of them, the overall impact on the public finance of Member States does not seem clear (in a positive or negative direction) *a priori*.

##### ➤ Impact on fair sharing of the financial burden

Score: +

The rules should improve the sharing of the financial burden between Member States by clearly and consistently making every country responsible for the provision and payment of exactly the amount of benefits they should be in charge of according to the coordination rules. Member State should not be negatively affected (or, on the contrary, profit) from an uneven application of the rules. The distribution of costs should reflect the balance intended by the legislator.

#### 7.5.6.4 Risk of abuse or misuse of the EU rules

---

Score: +/-

This policy option should not increase the risk of misuse or abuse of the EU rules decisively. A clarification of the periods of insurance would ensure a reflection of the possibilities and level of protection for workers desired when designing the coordination rules. Better visibility would exist on the benefits workers would be entitled to upon becoming unemployed depending on their country (or countries) of previous and last activity. It could be argued that this clearer view on their rights could be used to identify the cracks of the system and profit from possible unintended comparative advantages made possible by the system. However, it would also enable the workers to better plan and have a more accurate long-term view on their rights if moving and working in different countries. It would also allow public authorities to better identify possible loopholes or unintended consequences in the system (and counter them if necessary).

#### 7.5.6.5 Possible impact on the EU internal market

---

Score: +

A clarification of the provisions on the aggregation of periods of insurance, employment and self-employment would help to ensure that migrant workers would not lose their right to acquire, retain or recover their unemployment benefits, of that the duration of the same would not be shortened, as a result of exercising their right of free movement.

In this manner, this policy option would favour labour mobility. Workers would not refrain from moving abroad due to concerns about their entitlement to benefits if becoming unemployed. They would also not see their chances of finding a job –including jobs in other Member States- diminished due to an unduly reduction in their entitlements (stemming from a wrongful application of the

aggregation rules). By removing obstacles to labour mobility, this policy option would have a positive impact on the EU internal markets.

#### 7.5.6.6 Impact on the fundamental rights of EU citizens

---

Score: +

The uneven application of the rules on aggregation of periods of insurance, employment and self-employment effectively reduces the entitlements of certain unemployed workers. By ensuring a consistent interpretation and application of these rules, the differences among workers across countries would be removed (eliminating, in a sense, a form of discrimination), and would help to uphold the right to social security of the unemployed persons (their entitlements would not be unduly reduced). By guaranteeing unemployed workers the provision of the unemployment benefits they are rightfully entitled to, this policy option would also facilitate their job-seeking activities (including the possibility of finding a job in another country). In this sense, a certain positive effect could be appreciated in the freedom of movement and of residence.

#### 7.5.6.7 Possible impact on the EU budget

---

No impacts on the EU budget are expected as a result of the adoption of this policy option.

## 7.5.7 Overview of the impact assessed

This section provides an overview of the likely impacts for each of the options. It aims to show strengths and weaknesses of all options.

**Table 40: Coordination of unemployment benefits: overview of impact assessed per option**

	A. Status quo (baseline scenario)	B. Right of choice for frontier workers	C1. UB provided by country of last activity (until end of entitlement)	C2. UB provided by country of last activity (limited in time)	D. Prolongation of min. period of export from 3 to 6 months	E. Clarification of provision on aggregation of periods of insurance/employment/self-employment	
<b>Coordination of Unemployment benefits</b>	Impact on <b>social security coverage</b> of mobile citizens, particularly with regard to: <ul style="list-style-type: none"> <li>o return on workers' contributions</li> <li>o conditions for reintegration in labour market</li> </ul>	+	+	+	+/-	+	
	Impact on <b>administrative burden, transparency and complexity</b> of the rules <ul style="list-style-type: none"> <li>o transparency</li> <li>o complexity</li> <li>o administrative burden on national admin.</li> </ul>	-	+	+	+	+	
	Impact on <b>public finance</b> of MS and fair burden sharing: <ul style="list-style-type: none"> <li>o impact on budget of MS</li> <li>o fair share of financial burden between MS</li> </ul>	+	+	+	+	+/-	
	<b>Risk of misuse/abuse</b> of EU rules	-	-	-	-	+/-	
	Impact on <b>internal market and intra-EU labour market mobility</b>	+	+/-	+/-	+/-	+	+
	Impact on <b>fundamental rights of EU citizens</b>	+	+	+	+	+/-	+
	Possible impact on <b>EU budget</b>	+/-	+/-	+/-	+/-	+/-	+/-
		0	+	+	+	+	+
		0	+/-	+/-	+/-	+	+
		0	- (+65%)	- (42%)	- (42%)	+/-	+/-

A “+” should be interpreted as a positive impact on the impact assessment criterion, whereas a “-” indicates a negative impact on the impact assessment criterion. Be aware that a positive impact on public finance of MS (+) actually reflects an expected decrease in public expenditure. Similarly, a “+” impact on administrative burden actually reflects an expected decrease in the administrative burden on administrations.

## 8 Comparison of the options

In this chapter, we recollect the key findings of the previous chapter to provide a summary overview of all positive and negative impacts for the policy options that we analysed in detail in the previous chapter. The criteria used for the comparison of the options against the baseline scenario are:

- *Effectiveness* of the options in relation to the specific objectives (cf. Figure 4: Problem tree - coordination of LTC benefits and Figure 5 - Problem tree coordination of unemployment benefits)
- *Efficiency* of the options in achieving the operational objectives and the extent to which objectives can be achieved for a given level of resources/at least cost.
- *Coherence* of the different policy options.

In a first step, we focused on the performance of the options, with regard to their effectiveness with the defined policy objectives, efficiency and coherence with the overarching EU objectives.

We started by scoring the options on the basis of the effectiveness criteria and identifying which options score best on effectiveness i.e. meets the defined objectives best. All specific objectives were considered as equally important (no weighting mechanism was applied, as requested by the Commission services).

In a second step, we considered the efficiency of the various options, and looked at the costs that are associated with implementation of the policy options. In many cases this has pointed at trade-offs between effectiveness and efficiency that are relevant for the political choices.

Finally, for all options, we have considered all the relevant positive and negative impacts alongside each other, regardless of whether they could be expressed in qualitative, quantitative or monetary terms.

## 8.1 Coordination of unemployment benefits

### 8.1.1 Overview

The table below summarizes the expected impact of each option alongside each objective, based on the previous analysis. The notion of effectiveness refers to the Specific Objectives presented in the objective tree (cf. 5.3.8).

One should note that options D and E should be considered as horizontal options, which can be combined with options A, B and/or C.

**Table 41: Comparison of the effectiveness, efficiency and coherence of the options (baseline=1)**

	Option A: baseline scenario	Option B: Right of choice	Option C: UB provided by country of last activity	Option D: Prolongatio n period of export	Option E: Clarification of aggr. rules
<b>Specific objectives</b>					
1. Consistent application of coordination rules	1	1,5	1,5	1,5	1,5
2. Simplified legal framework	1	1,5	1,5	1	1
3. Facilitate reintegration in labour market & improved protection of job-seekers abroad	1	1	1	1,5	1,5
4. Unemployed mobile workers receiving return on their contributions	1	1,5	1,5	1	1,5
5. Fair distribution of financial burden	1	1,5	1,5	1	1,5
6. High awareness of rights	1	1,5	1,5	1,5	1,5
7. Rules reflecting current job market conditions	1	1,5	1,5	1,5	1
<b>Efficiency</b>					
Budgetary impact	1	0,5	0,5	1	1
Administrative burden	1	1,5	1,5	0,5	1,5
<b>Coherence</b>	1	1	1	1	1
<b>Total</b>	<b>10</b>	<b>13</b>	<b>13</b>	<b>11,5</b>	<b>13</b>

Legend: 1= no impact (e.g. baseline scenario); 1.5 = positive impact; 0.5 = negative impact. A "1.5" should be interpreted as a positive impact on the impact assessment criterion, whereas a "0.5" indicates a negative impact on the impact assessment criterion. Be aware that a positive impact on public finance of MS (+) actually reflects an expected decrease in public expenditure. Similarly, a "+" impact on administrative burden actually reflects an expected decrease in the administrative burden on administrations.

Option E (clarification of the rules of aggregation) is generally considered a good option, both in terms of effectiveness and efficiency. However, the positive impact of this option will largely depend on how the aggregation rules will exactly be clarified. All consulted parties are of course in favour of clear aggregation rules and see the benefits of such a clarification, but the question will be what the result will be. In terms of effectiveness, a clarification of the aggregation rules would create higher return on the contributions of migrant workers and enhance the consistent application of the rules. It would ensure that no periods that should have been considered for establishing the entitlement to unemployment rights are left aside. A clarification of the aggregation rules will however not simplify these rules and the diversity of national systems will be continued.

Options C and B are both evaluated as very effective options, capable to address the wider variety of problems that are faced with the coordination of unemployment benefits (Problem definition).

Option C has consistently positive impacts with regard to all specific objectives except for the objective of "facilitate" reintegration in labour market and improve protection of job-seekers abroad", for which it is not clear whether the option would have a positive or negative impact compared to the baseline scenario". Transparency will increase and complexity of the rules will be reduced, as it will also be the country of last activity that will be in charge. Furthermore, it is considered as fairer that the country

which receives contributions of workers also pays out the unemployment benefits. There is however an important disadvantage linked to the option: although option C is effective, it is expected to have a negative budgetary impact (an increase in expenditure of 43% - cf. 8.1.2) on the Member compared to the baseline scenario.

Also, option B is expected to produce a negative budgetary impact compared to the baseline scenario (and is also costlier than option C – cf. Table 42). However, option B is considered as very effective. Under option B, unemployed frontier workers are likely to be better off in terms of social protection, as he has a right of choice. It gives frontier workers the possibility to be treated in the same way as their former work colleagues which live in the country of last employment. It is also fairer, as it ensures frontier workers a better return on the workers' contributions which they have paid in the country of last activity before becoming unemployed. There is a substantial shift of the financial burden directly to the countries of last activity (cf. Table 45).

Option D (export of unemployment benefits for a period of minimum 6 months) is generally evaluated as better than the baseline scenario. There are indications that a prolongation of the period of export could facilitate the reintegration of unemployed in the labour market. Such a prolongation is also likely to stimulate intra-EU labour market mobility. From an administrative point of view, it could however generate higher administrative burden on public authorities, as unemployed abroad need to be followed up over a longer period than currently is the case. Option D can also make an end to the inconsistent application of the export rules by the different EU Member States.

Option A – a continuation of the status quo - is clearly the worst-case scenario in terms of effectiveness. All other options are expected to be more effective in tackling the current problems. However, the baseline scenario scores better than all other options (except option E) with regard to the efficiency criterion.

### *8.1.2 Budgetary impacts of the different options and likely reimbursement claims*

---

We aimed to make quantitative estimates of the likely budgetary impacts for the following options: option A (baseline scenario), option B (right of choice for frontier workers – cf. 7.5.3.3) and option C (unemployment benefits for all workers to be provided by the country of last activity – cf. 7.5.4.3)<sup>150</sup>. The section below compares the different options with regard to their likely budgetary impacts (identified in the previous chapter)<sup>151</sup>.

The baseline option A2 is the most realistic under the hypothesis that the unemployed free to choose, choose for the country of the highest benefit<sup>152</sup>. The total cost is estimated at 638 million euro.

---

<sup>150</sup> In order to estimate the budgetary impact of the baseline scenario, the estimated number of unemployed cross-border workers based on the LFS and the unemployment rates of the Ageing Report was multiplied by the annual unemployment benefit per unemployed person. For each of the flows between Member States (in the different cells) the unemployment benefit of the country of last activity and the unemployment benefit of the country of residence was taken into consideration. The total yearly expenditure is calculated based on the unemployment benefit per unemployed person in prices 2010 taken up in the 2012 Ageing Report as also the estimated unemployed cross-border workers. **This yearly expenditure assumes that the unemployed person did not find a job during the first year of unemployment.** A more 'realistic' calculation of the yearly expenditure could be obtained by taking into consideration the average duration of the unemployment

<sup>151</sup> Budgets are estimated as if the unemployed remain in that situation for a complete year. The reimbursement between countries of last activity and country of residence (if implied) is limited to 3 months.

<sup>152</sup> Please note that, because of the fact that unemployed frontier workers must claim unemployment benefits in the country of residence while unemployed other cross-border workers can choose to claim unemployment benefits in the country of last employment or in the country of residence, an assumption had to be made about how many of them return to the country of residence and how many stay in the country of last activity (assumption 1: 50% of the other unemployed cross-border workers return and 50% stay; assumption 2: cross-border workers make a rational decision and choose the Member States is paying the highest unemployment benefit. The fact that all cross-border workers are able to choose between the country of residence and the country of last activity involves important budgetary uncertainties as shown in our estimates. Differences in expenditure between the scenario where 50% of the cross-border workers are returning or where cross-border workers are making a rational decision on the basis of the amount of the unemployment benefit are striking. For all different scenarios, a breakdown between the expenditure by the country of residence (table) or the country of last activity (table) is made. We also refer to the cross-table in annex have a view on the bilateral expenditure between countries.

The option B2 confirms the qualitative assessment of the impact on the budget: it increases to 891 million euro. This is a substantial shift from the burden to the country of last activity, considered in the qualitative assessment as a fairer share of the burden.

A somewhat smaller increase of the total burden (to 768 million euro) is observed in option C (in contradiction with the qualitative assessment) putting the burden completely on the country of last activity. For the competent Member States this option is more expensive than option B2 where their burden via direct payment and reimbursement is only 704 million euro.

The difference (at the benefit of the unemployed) would be in option B2 at the expense of a higher fiscal burden for the country of residence because of that freedom of choice

**Table 42: Total estimated yearly expenditure unemployment benefits for unemployed cross-border workers (in € 000)**

	Total yearly paid expenditure in (000€)

Source: Estimate based on data LFS and 2012 Ageing Report

The unemployment benefits paid by the country of residence and the country of last activity do not completely reflect the burden sharing of unemployment benefits. Also the amounts of reimbursement should be taken into account. For that reason Table 42 concerning the estimated

<sup>154</sup> ibidem

<sup>155</sup> ibidem

<sup>156</sup> ibidem

yearly expenditure on unemployment benefits for unemployed cross-border workers should be read together with Table 46 dealing with the estimated reimbursement claims to assess who is sharing the burden of unemployment.

Claims can be made by the country of residence to the country of last activity for fully unemployed frontier workers but also for other cross-border workers who have decided to register with the competent institution in their country of residence. The country of last activity shall reimburse the unemployed benefits provided in the country of residence during the first three months or five months (when the unemployed person during the preceding 24 months, completed at least 12 months of (self)-employment in the country of last activity). In our estimates, we have supposed a claim of 3 months.

The baseline scenario A1 whereby frontier workers have to return to the country of residence and other cross-border workers can choose between the country of residence or the country of last activity involves a claim of € 108.8 million of which € 98.1 million for frontier workers when we assume that 50% of the other cross-border workers return to their country of residence. However, these claims are based on the unemployment benefits paid by the country of residence and not on the maximum payable amount by the country of last activity. It implies for this baseline scenario that the reimbursement will be 24% lower than the possible actual claim (see baseline scenario A1a). If other cross-border workers are making a rational decision on the basis of the amount of the unemployment benefit (baseline scenario A2a) the claim will decrease with 4% compared to the baseline scenario A1a whereby 50% of the other cross-border workers are returning to their country of residence.

The option whereby frontier workers also have the choice (option B) will decrease the reimbursement claims with 45% - for both scenarios (equal distinction and rational choice) compared to the baseline scenario a1. The actual reimbursement will be lower based on the maximum amount of unemployment benefits of the country of last activity (Table 100, Table 101 & Table 102).

If the unemployment benefit would be provided by the country of last activity (Option C) no reimbursements would be claimed by the country of residence.

**Table 46: Estimated reimbursement claims (scenario 3 months) for the baseline scenario and the different options and the impact of the maximum boundary, in € 000**

Source: Estimate based on data LFS and 2012 Ageing Report

In Table 47 we summarize the budgetary impact of the baseline scenario and options B and C. It is the total level of expenditure for unemployment benefits for some 73.7 thousand estimated unemployed cross-border workers of which 45.2 thousand frontier workers. We do not comment on the hypothesis that for those that can choose between the country of residence or the country of last activity to take up the unemployment benefit, 50% choose for the one or the other alternative, but we immediately look to the scenario that each group that can choose, will make a rational decision by choosing the place with the highest benefit. Total expenditures for unemployment are calculated for one year, implicitly assuming that all concerned persons stay unemployed for one year what is of course not the case. The reimbursement between country of residence and competent country of part of this unemployment benefit is calculated on 3 months. For the Baseline scenario A2 this results in a total budgetary cost of € 638 million, of which € 450 million for the country of residence and € 188 million in the country of last activity. All those amounts are calculated for a whole year. Of this total expenditure the country of last activity reimbursed € 105 million (calculated on 3 months) and € 82 million when taking into account limits in the reimbursement. Option B2 where all cross-borders have right to choose and will choose for the highest amount, the total expenditures increases to € 890 million, what illustrates a higher level of protection (benefit). There is a substantial shift of taking up the unemployment benefit in the country of last activity, and this is also illustrated by a substantial shift of direct payment of those benefits by the country of last activity. Their direct payment (again calculated on one year) increases to € 652 million. On the contrary there is a reduction (calculated on 3 months) of their reimbursement. In option C the unemployment benefit is completely taken up in the country of last activity, what reduces somewhat the total cost to € 768 million (in scenario B2 one could choose for a higher benefit in the country of residence), while the burden is completely situated in those countries of last activity. There is no reimbursement needed. Option F, not under scrutiny in this assessment, illustrates the impact when the unemployment is taken up in the country of residence, what implies a substantial reduction of the budgetary cost and an important reimbursement. Remarks that the reimbursement is always  $\frac{3}{12}$  of the amount spend in the country of residence. The budgetary results of those scenarios are determined by the difference in average benefit between country of residence and country of last activity, seemingly in most of the cases higher in the country of last activity. This is not unexpected since those differences in benefit reflect also differences in income that triggers cross-border mobility.

**Table 47: Summary estimated yearly expenditure on unemployment benefits and estimated reimbursement claims (in million €)**

	Total yearly expenditure by country of residence (millions €)		Total yearly expenditure by country of last activity (millions €)		Reimbursement from country of last activity to country of residence (3 months) (millions €)					
	Cross-border workers	Of which: frontier workers	Cross-border workers	Of which: frontier workers	(a) Reimbursement based on UB country of residence	(b) Actual reimbursement based on maximum amount country of last activity	(a) Reimbursement based on UB country of residence	(b) Actual reimbursement based on maximum amount country of last activity

### 8.1.3 *Administrative cost and burden of rules related to the aggregation of periods of insurance or (self-)employment*

---

In Table 48 we now calculate for the same group of 73.7 thousand unemployed cross-border workers the administrative implications. There are 45.2 thousand frontier workers and 28.5 other cross-border workers. In the baseline scenario only the latter are allowed to choose the country on taking up the unemployment benefit. 22.2 thousand of them choose the country of last activity in the hypothesis that they choose for the highest unemployment benefit. The rest of the other cross-border workers take the unemployment benefit in the country of residence, as is also the case for the frontier workers. The sum of those two groups is 51.4 thousand persons who take up their benefit in the country of residence. For this 51.4 thousand cross-border workers a reimbursement between the country of residence and the country of last activity needs to be organised. In option B2, where all cross-border workers can choose, and choose for the highest benefit, the number of persons taking up the benefit in the country of last activity increases to 55.2 thousand cross-border workers. The rest of this group, some 18.5 thousand persons, receives an unemployment benefit of the country of residence, at that level, but reimbursed by the competent state for three months. In scenario C all 73.7 thousand persons are paid in the country of last activity, and no reimbursement is claimed.

Again some **stylized estimates** can be made on the administrative burden. Only anecdotic information on the average cost of this administrative burden was available. Based on this information we suppose first of all that in the country where the unemployment benefit is paid, an average handling time of the cases of two hours, or € 40, is required. On top of that, when there is payment in the country of residence there is an administrative burden of some € 42.8 for the handling of a PD U1 in the country of residence and some € 20 (our hypothesis) in the country of last activity. On top of that there is in those cases in the country of residence and in the country of last activity a handling time for introducing a reimbursement claim and the settling of it. We suppose the same stylised estimate of € 20 in both countries. Multiplying this standard cost (in reality this cost can differ between the countries because of differences in organisation, productivity and wages) with the total number of cases provides us the total administrative cost in the country of residence and the country of last activity, for the payment of a benefit, including the control of the unemployed person, and the cost of reimbursement. In Table 49 those amounts are calculated, and compared with the total budgetary cost of the unemployment benefits. Remember that the total amount of benefits is estimated on a yearly basis, while reimbursement on 3 months. In the baseline scenario the total administrative burden is € 8.3 million of which € 5.2 million in the countries of residence. This is 64% of the total administrative cost and this is a very similar % of the 71% of the budgetary cost. The share of the total administrative burden in the total budgetary burden is some 1.3%. It could be compared with the average administrative cost in the unemployment insurance.

How does this burden shift in the two other options? In option B2, characterized by the way by a substantial increase of the total budgetary cost compared to the baseline scenario, the administrative burden is reduced to € 4.8 million in total, of which € 1.9 million for the country of residence or 27% of the total. Compared to the baseline cost this is a reduction to 59% of the baseline amount. This again is similar to the share of those countries in the total budgetary cost. For the countries of last activity the direct cost of handling the unemployment benefit increases substantially, but the costs for handling a PD U1 and for the reimbursements is substantially

reduced, by the way also in the country of residence. The relative cost of the administrative cost to the total budgetary cost is 0.5 %.

In the option C the administrative burden is further reduced to 36% of the baseline scenario, or € 2.9 million. This burden is completely situated in the country of last activity, but under the present hypothesis of standard costs, this is not even more expensive because all cases of payment are threatened in the country of last activity, but there are no costs for exchange of a PD U1 or reimbursements to be made. The total budgetary burden shifts however completely in the direction of the country of last activity.

We underline that those calculations risk to be speculative in the sense that first of all the number of cases is estimated, but also the behaviour of the unemployed, the spell of unemployment, the administrative burden, all are not controlled in those calculations or are defined as standard stylized estimates. For instance the use of a PD U1 is sometimes not taking into account for those specific cross-border situations, where in fact the unemployed is supposed to have worked only in the country of last activity. In the case that he worked in two countries, already a PD U1 might be needed for other reasons than the cross-border situation under consideration.

The different options illustrate that the option where the unemployed person can choose is the most expensive in terms of budgetary cost, what implies however higher levels of social protections, while the payment in country of last activity is the least expensive in administrative terms, but puts the burden completely on the country of last activity. The baseline scenario is relative limited in budgetary terms but seems to be the most expensive in administrative terms.

## 8.2 Coordination of LTC benefits

### 8.2.1 Overview

The table below summarizes the expected impact of each option alongside each objective, based on the previous analysis. The notion of effectiveness refers to the Specific Objectives presented in the objective tree (cf. Figure 4).

**Table 50: Comparison of the effectiveness of the options (baseline scenario = 1)**

	Option A: baseline	Option B: Safe- guarding provision	Option C1.1: MS of residence provides LTC benefits (with supplement)	Option C1.2: MS of residence provides LTC benefits (without supplement)	Option C2: Competent MS provides LTC benefits
<b>Specific objectives</b>					
1. Fair distribution of financial burden between MS	1	1	0,5	0,5	1,5
2. Rules taking into account the specific character of LTC benefits	1	1	1	1	1
3. Facilitating classification of LTC benefits under EU law	1	1	1	1	1
4. Improve legal certainty and stability of coordination regime	1	1,5	0,5	1,5	1,5
5. Improved protection of mobile citizens	1	1,5	1,5	1,5	1,5
6. High awareness of rights on side of mobile persons	1	0,5	1	1,5	1,5
<b>Efficiency</b>					
Budgetary impact	1	1	1,5	1,5	0,5
Administrative burden on administrations	1	0,5	0,5	0,5	1,5
<b>Coherence</b>	1	1	1	1	1
<b>Total</b>	<b>9</b>	<b>9</b>	<b>8,5</b>	<b>10</b>	<b>11</b>

Legend: 1= no impact (e.g. baseline scenario); 1.5 = positive impact; 0.5 = negative impact

Option C2 – the competent Member State provides the LTC benefits to mobile citizens abroad – is rated as the most effective option, most capable of tackling today's challenges of the coordination regime. It is expected to create a more stable and transparent coordination regime with a fairer distribution of the financial burden between Member States. However, it is considered as an option with also a likely negative budgetary impact (+28% compared to the baseline scenario).

Option C.1.2 generally comes out as a rather effective option. It is expected to generate a positive budgetary impact on the Member States (19% less costly than the baseline scenario) and to create a more stable and legally certain coordination regime, however with a relatively higher administrative burden (in relation to the number of cases and compared to the baseline scenario).

The main advantage of option B lies in the fact that it would ensure that all the mobile persons are protected: they would always be entitled to LTC benefits. However, the option is likely to create more administrative burden compared to the baseline scenario and would also less clear than the status quo.

Option A – a continuation of the status quo - is not seen as the worst-case scenario, despite the problems described earlier in this report. Option C1.1 which includes a supplement mechanism is expected to produce more negative impacts than the baseline scenario. Supplements require an

increased exchange of communication and more coordination between Member States. Furthermore, it does not guarantee a more stable and legally certain framework. Option C.1.1 however is expected to have a positive budgetary impact compared to the baseline scenario.

### *8.2.2 Budgetary impact of the different options*

---

Earlier in this report (cf. Table 24) , we have estimated the cross-border expenditure on health care and long-term care with a distinction between LTC benefits in cash and in kind for the baseline scenario.

The overall, current budget expenditure on LTC is estimated at € 994.7 million of which € 618.3 million (62% of total budget) is related to LTC benefits in kind and € 376.4 million (38% of total budget) is related to LTC benefits in cash (Table 24). Compared to total national expenditure of LTC, the share of the cross-border LTC expenditure is limited to 0.4% of total EU expenditure or 0.008% of total GDP of the EU-27.

Option C1 whereby the Member State of residence shall provide LTC benefits (in kind and in cash) on the basis of its legislation is expected to imply a total expenditure of € 810.1 million or a decrease of 19% compared to the baseline scenario (positive budgetary impact). In this option the expenditure on LTC benefits in kind shall be the same as in the baseline scenario, namely € 618.3 million. The LTC benefits in cash shall be provided on the basis of the legislation of the country of residence and no longer on this of the competent country.<sup>157</sup> This switch results in an expenditure on LTC benefits in cash of € 191.9 million or a decrease of 49% compared to the baseline scenario.

Option C2 whereby the competent Member State shall provide LTC benefits (in kind and in cash) on the basis of its legislation implies a total expenditure of € 1.3 billion or an increase of 28% compared to the baseline scenario (negative budgetary impact). In this option the expenditure on LTC benefits in cash shall be the same as in the baseline scenario, namely € 376.4 million. LTC benefits in kind shall be provided on the basis of the legislation of the competent Member State and no longer on this of the country of residence. The result is an increase of expenditure on LTC benefits in kind to € 900.3 million or an increase of 46% compared to the baseline scenario.

---

<sup>157</sup> The 'real life' dimension of this option is illustrated by the growing discussion in the Netherlands that the 'in cash' LTC expenditures exported to other countries should not be adopted to the cost of living (or care) in those countries, as is the case when benefits in kind are used.

**Table 51: Estimated number of cross-border users benefiting from LTC (in thousand) and budget (in million €), Option where competent country is providing LTC benefits**

### 8.2.3 *Administrative cost and burden of cross-border LTC in kind or in cash*

---

The number of cases is multiplied by some **standard stylized estimated** cost per case. Standard because we use for each country the same cost, stylized because round figures are used and estimated because we have only partial and anecdotic information for two countries, Belgium and Poland. Those parameters can however easily be changed in this kind of calculations when more solid information becomes available. Stylized is also the fact that we do not reproduce all administrative steps for this kind of benefits: the intake of the patient, the decision process to allocate a benefit, the administrative burden to pay a patient, to claim in needed the reimbursement, to verify the entitlements, to reimburse, or claim reimbursement of some of the administrative burden etc. Here we make the hypothesis that in the country of residence the administrative burden for the intake for a benefit in kind is € 60, as it is also € 60 for the benefit in cash. This intake is here to take place in the country of residence, although situations are thinkable that people were already entitled to this benefit before they moved (as a pensioner for instance) from the previous country of residence to a new one. In the case of a benefit in kind also in the competent state an additional cost needs to be made for the handling of this process. On top of that for the payment in kind, based on the level of the country of residence and organised in the country of residence, a reimbursement process is needed, here supposed at € 20 euro per case, triggering at the same time a similar cost in the competent country. Multiplying those standard costs with the number of cases results to an average administrative cost for the in kind cases of € 4.8 million, and € 3.6 million for the in cash cases. The % of this administrative cost to the total budgetary cost is some 0.8% for the in kind benefits, and 1.0% for the in cash benefits. The grand total is some 0.9 % of which the major part of the administrative burden is at the expense of the country of residence while the budgetary cost is completely to be paid or reimbursed by the competent country.

In Option C 1.2 all calculations for the in kind benefits remain the same. The in cash benefits are now however defined at the % of use and the level of spending of the country of residence. The particularities of our sources reveal that less persons (now some 41 thousand) are using LTC in cash, but the average amount is higher (those countries of residence have in most of the cases a less developed level of protection for this social risk of LTC) so that the total budget for in cash is reduced to € 192 million and the total becomes € 810 million. The administrative burden for LTC in cash is somewhat lower (or 91% of the baseline scenario) but compared to a lower needed budgetary cost, the share of the administrative burden in the total budget for LTC in cash is enlarged to 1.7%.

In option C 2 there is no change in the baseline scenario for the in cash benefits, but now the entitlements as well number of cases and the average spending for the in kind benefits is defined on the level of the competent country. Those systems are better developed in the competent states and we see the number of cases increasing to 58 thousand, and the total budget to € 900 million. For reason of this increased number of cases also the administrative burden for the in kind LTC increases to € 5.8 million (or 120 % of the baseline situation) while the relative share of the administrative cost to the total budgetary cost for in kind LTC declines to 0.6%. The total budgetary cost is in this option C2 some € 1.277 million, or the highest amount, illustrating higher levels of social protection, tailored at the size of the competent state. In those scenario's they also will have to pay it, either directly or via reimbursement.

**Table 55: Estimated administrative cost and burden baseline scenario and options where country of residence or competent country are providing LTC benefits**

## 9 Summary of the conclusions

### 9.1 Introduction

The objective of this study consisted in evaluating the social and economic impacts of a number of policy options in the light of a possible revision of the EU coordination rules in the area of free movements of workers and social security coordination. These rules concern in particular Article 21, 45 and 48 of the Treaty and Regulations (EC) N°s 883/2004 and 987/2009. The study focused specifically on the rules on the coordination of LTC benefits and unemployment benefits.

This preparatory study may lead to an impact assessment and thus aimed to produce transparent and reliable evidence for the European Commission, in order to help it to choose the appropriate policy option(s).

The data collection and data analysis was focused on a representative sample of 14 Member States. The selection of the countries was primarily based on relevant mobility patterns and a balanced coverage in terms of types of the social security systems, more notably in the area of unemployment and LTC benefits. The 14 countries retained were: Austria, Belgium, Denmark, Estonia, France, Germany, Luxemburg, Netherlands, Poland, Romania, Spain, Slovakia, Sweden and United Kingdom.

We used both secondary and primary data sourced during this study (both of them of a quantitative and qualitative nature). Concerning the secondary data sources used, we conducted an extensive review of relevant, available literature (particularly trESS reports), organised quantitative data collection of available administrative data in 14 Member States and requested additional data extractions from the LFS for EU-27. Also the use of ESSPROS, the Ageing Report 2012 (EC) and the Audit Board Report contributed to the quantifying the scope of the problem at stake and the impact of the reform. In terms of primary data, we organised an online survey targeting national administrations and executing bodies in the EU-27 and conducted face-to-face interviews with circa 120 different stakeholders, both at Member State level and EU level.

Also, an evaluation was made of the replies by a wide range of stakeholders to the EC public consultation.

Finally, we conducted a number of workshops, group interviews and phone interviews at Member State level in order to find specific data on the administrative burden imposed on national administrations by the current coordination rules.

## 9.2 Current situation

The table summarises our analysis with regard to the number of cross-border workers and pensioners in the EU-27 that are affected by the coordination rules, their main mobility patterns and their use of long-term care and unemployment benefits. The table below summarises the statistics that were described and discussed in detail.

**Table 56: Synoptic overview of the scope of the cross border use of unemployment benefits and LTC benefits under scrutiny\*\***

Indicator	Year	Unit	Amount	Type variable
<b>Coordination of unemployment benefits</b>				
<b>Cross-border workers within EU-27</b>	2010-2011	in thousand	1.032,0	stock
of which <b>frontier workers</b>	2010-2011	in thousand	701,0	stock

## 9.3 *Current problems*

### 9.3.1 *Coordination of LTC benefits*

---

According to our interview and survey findings, a general complexity of the EU Law regulation on the coordination of long-term care is widely regarded as root problem of the current system, which results in and is at the same elicited by a number of more specific problems. The most recurrent problems were the lack of awareness of their rights under EU law among migrant workers, the incorrect or uneven application of rules by national administration, ineffective cross-border communication between Member States' institutions and insufficient and incorrect information provided by national administrations to mobile citizens.

The root of the problem is perceived to be in the different manner in which the Member States recognise, consider and deal with LTC benefits. Four basic positions were identified: 1) specific, dedicated system of LTC; 2) LTC benefits considered as sickness benefits, 3) LTC as a complement to pensions and 4) LTC as social assistance. As a relatively recently identified new social risk, a huge risk of misunderstanding has been observed between stakeholders what LTC is, how it is insured and how it should be coordinated. This resulted also in a huge lack of statistics on precise coverage for LTC, so that we needed to make estimates of it based on several hypotheses. The hypothesis that the mobile worker or pensioner is entitled and is using LTC in the same way as nationals should be the implication of efficient coordination but can only anecdotally compared with the real use.

A large majority of the national administrations - evidence was found in all 14 Member States - consider the **lack of a common definition of LTC benefits** across Member States and/or of a precise list of benefits per country as the main obstacle to a smooth coordination of LTC benefits.

According to one third of the surveyed national administrations, the incorrect and uneven application of the EU rules is a major issue. Even within the group of national administrations who do not see a need to change the current coordination rules, 79% of them thought that the rules should be better explained or better applied in practice. It appears that the exchange of portable documents, the recognition of entitlement to LTC benefits in kind, and the claims for reimbursement significantly vary across countries. The administrative burden on national administrations is mainly attributed to these disparities across systems and the uncertainty faced by Member States and citizens.

Although most national administrations considered the risk of social tourism under the current rules to be rather low, concerns were raised which rather lied in the lack of operability of the system, the lack of transparency of Member States on the costs incurred into; and the reimbursements claims received or entitled to issue. The differences in the concept of LTC benefits and their treatment across Member States lead to a lack of operability of the reimbursement and mechanism of deduction for the avoidance of double payments set up by Article 34 of the Coordination Regulation.

In the lack of a comprehensive and coherent coordination regime well-suited to the particularities of LTC benefits, it is the CJEU which constantly has to make clarifications. The system can thus be

altered at any moment by a CJEU ruling. Legal uncertainty was identified as an issue. Similarly, the level of complexity of the regulatory framework and the rulings of the CJEU render the issue not easily accessible for all the concerned staff public authorities.

The complexity of the legal framework results in a highly uneven application of the coordination rules. This results in a non-transparent, uncertain system, where citizens are not able to determine beforehand their entitlements in each country. Our findings confirm the lack of upfront visibility mobile citizens have on their entitlements. This lack of knowledge apparently affects public authorities as well.

### 9.3.2 *Coordination of unemployment benefits*

---

The coordination rules were generally perceived as complex during the interviews conducted with public authorities and other stakeholders. Different elements contribute to the complexity and lack of transparency of EU coordination rules.

These include:

1. *The distinction between frontier workers and other cross-border workers and the determination of cross-border workers' country of residence*

While wholly unemployed frontier workers<sup>158</sup> must register and ask for unemployment benefits in their country of residence, other cross-border workers have the choice between their country of residence and the country of last activity. It was pointed out that the distinction between frontier workers and other cross-border workers is often rather complicated. In accordance with the views gathered, the determination of the country of residence remains difficult in practice, as it is subject to a high degree of interpretation. On one hand, this distinction might be confusing for the workers, who may not be aware of their own status. It might also be confusing for the public authorities.

2. *Rules on aggregation of periods of insurance, employment and self-employment*

A second element of complexity is provided by the rules on the aggregation of periods. The conditions to consider certain periods as periods of insurance, employment and self-employment vary across countries. Since the acquisition, retention, recovery or duration of unemployment benefits are linked to the different periods of each type completed, and the consideration of the same periods might vary across countries, this makes it complicated for mobile workers to know their rights. This is also the case for public authorities (therefore, workers cannot always solve their doubts by asking to the administration). In particular, our findings pointed towards particular issues with the periods of self-employment.

3. *Provisions on the export of unemployment benefits: minimum period of export of three months with a possible extension to six months (discretionary decision of the competent institution)*

---

<sup>158</sup> Regulation 883/2004 also establishes a distinction between wholly unemployed frontier workers and partially or intermittently unemployed frontier workers (art.65.1-2 Regulation (EC) No. 883/2004). Wholly unemployed frontier workers must register and apply for unemployment benefits in their country of residence, while partially or intermittently unemployed frontier workers must register in their country of last activity.

A third element contributing to the lack of transparency is the regime for the exportation of unemployment benefits. The regulation foresees a minimum period of export of three months, with a possible extension to six months. However, there are not fixed criteria for the concession or refusal of the extension. The decision lies on the competent institution, which applies its own set of criteria or, in some cases, has no pre-defined criteria at all. This reduces, in practice, the transparency for the workers, who cannot know in advance the likely duration of their export period, which might in turn affect their mobility decision. In addition, some countries do not grant the export at all.

#### *4. Reimbursement of unemployment benefits between Member States*

Even though they do not impact EU citizens directly, the rules on reimbursement also add to overall complexity of the system and represent a source of administrative burden for Member States. Several claims were raised during the interviews pertaining the inefficiency and burdensome character of the reimbursement mechanism.

- 5. Communication between institutions of Member States:* Communication between institutions of Member States is clearly perceived as an area with substantial margin for improvement.

### **EU rules not sufficiently taking into account changing job market conditions**

The rule mandating frontier workers to claim unemployment benefits in their country of residence is based on the assumption that they enjoy the most favourable conditions for seeking employment in their country of residence. Due to changing job market conditions, however, such assumption is nowadays questionable. Instead, they could have better chances of finding a job in their country of last activity. However, it was also noted during the interviews that it is not possible to generalise. Each case is different. The most relevant factors to determine the chances of finding a job are the educational background, qualifications and experience of the job-seeker as well and the conditions of the job market in the area concerned. Demand for specific skills and the economic conditions of a specific area are paramount (as evidenced particularly in times of economic crisis, where unemployment rates vary strikingly across countries and regions). Therefore, it is difficult to determine, on a general basis, whether frontier workers enjoy a better chance of finding a job in their country of residence or in their country of last activity.

### **Unfair sharing of financial burden**

The Member State of residence must bear the costs of the unemployment benefits of frontier workers, even though it has not received any contribution from them. Furthermore, it also has to bear other social protection costs related to the unemployed worker and his family. In general terms, it was agreed that to provide for a fair sharing of burden, the country receiving contributions should be in charge of paying out the unemployment benefits.

It must be noted, however, that a reimbursement mechanism exists. As long as the unemployment spell of the concerned worker lasts for longer than the period of reimbursement, the current coordination rules impose an unfair burden on the Member State of residence.

### Lack of return on contributions for migrant workers

Wholly unemployed frontier workers must currently claim unemployment benefits in their Member State of residence. These workers, however, paid contributions to Social Security, covering the contingency of unemployment, in their country of activity. Therefore, frontier workers receive unemployment benefits based on a different system than that to which they contributed. This leads to situations in which certain wholly unemployed frontier workers lose out on benefits, and receive unemployment benefits below what their contribution should have enabled them to.

### Potential loss of rights to benefits

The shortcomings of communication between the institutions of Member States can cause a certain loss of rights to workers by unnecessarily depriving them temporarily of their rights. The slow or ineffective communication can affect the unemployed people insofar as they can lead to delays in the processing of documents. Since the payment of unemployment benefits depends upon the completion of the administrative procedures, unemployed workers are directly affected by issues in cross-border communication between institutions. Issues were reported in several Member States.

### Uneven application of current coordination rules by Member States

Public authorities pointed problems of application of the current coordination rules consistently via the different data gathering activities conducted for the study. Considering specific rules where an uneven application has been noticed, the rules of the aggregation of periods (art.61 Regulation (EC) No 883/2004) are a clear example. Furthermore, the uneven application of art.64 concerning the extension of the period of export of unemployment benefits has also been documented.

Different national practices concerning cross-border communication between institutions of Member States were discussed during the country interviews. This concerns in the first place the use of different portable documents. Secondly, it concerns the practices regarding the requests for specific information to fill out portable documents. Thirdly, there are different practices with regard to the claims for reimbursement.

## 9.4 Policy objectives

The objectives express the desired future state, towards which the policy options should contribute. The objectives that were defined are linked to the problem identified in the previous section. For the coordination of LTC and unemployment benefits, the following objectives have been identified at each level:

Level of objective	Coordination of LTC benefits	Coordination of unemployment benefits
General objectives	<ul style="list-style-type: none"><li>➤ Free movement of workers</li><li>➤ Protection of EU citizens rights (including social security rights)</li></ul>	<ul style="list-style-type: none"><li>➤ Free movement of workers</li><li>➤ Protection of EU citizens rights (including social security rights)</li></ul>
Specific	<ul style="list-style-type: none"><li>➤ Fair distribution of the financial burden between Member States</li></ul>	<ul style="list-style-type: none"><li>➤ Facilitation of job-seeking abroad</li><li>➤ Fair distribution of financial burden</li></ul>

Level of objective	Coordination of LTC benefits	Coordination of unemployment benefits
<b>objectives</b>	<ul style="list-style-type: none"> <li>➤ Stable coordination rules</li> <li>➤ Good awareness (by citizens and public authorities) of rights</li> <li>➤ Allow a clear classification of long-term care benefits under EU Law</li> </ul>	<ul style="list-style-type: none"> <li>among Member States</li> <li>➤ Good awareness (by citizens and public authorities) of rights and obligations</li> </ul>
<b>Operational objectives</b>	<ul style="list-style-type: none"> <li>➤ Only one Member State can be the competent Member State</li> <li>➤ Simplified EU legal framework</li> <li>➤ Uniform application of the rules by the Member States</li> <li>➤ Rules reflecting the particularities of long-term care benefits, and in particular their similarities with sickness benefits</li> </ul>	<ul style="list-style-type: none"> <li>➤ Uniform application of EU rules by the Member States</li> <li>➤ Unemployed mobile workers receiving adequate return on their contributions</li> <li>➤ Rules reflecting the particularities and employment possibilities of frontier workers</li> <li>➤ Stronger links between the collection of contributions and the provision of unemployment benefits</li> <li>➤ Simplified EU legal framework</li> </ul>

## 9.5 Impact assessment of the options

### 9.5.1 Coordination of LTC benefits

#### **OPTION A: baseline scenario - continuation of the current rules**

The baseline scenario implies no change of policy and a continuation of the current rules for coordination. Long-term care benefits *in kind* continue to be provided according to the legislation of the Member State of residence (if they exist) and reimbursed by the competent Member State (= where the person is insured). Long-term care benefits in cash (if they exist) continue to be provided by the competent Member State (= where the person is insured).

About half of the surveyed national administrations (52%) preferred to continue with the current coordination rules. A large part of this group of respondents however think that the rules should be better explained or better applied in practice. However, according to many civil society representatives and social partners, a continuation of the status quo will not solve the problem that a person reliant on care may be left without any protection in specific cases.

A continuation of the current coordination rules will not solve the problems that were outlined in the previous section.

#### **OPTION B: Adoption of a safeguarding provision ensuring that a mobile person does remain without any protection**

With this policy option, the safeguarding provision would ensure that all the mobile persons are protected: they would always be entitled to LTC benefits. Whenever a person would not be entitled

to any LTC benefits under the current system (meaning the application of the Sickness Chapter's rules), the Member State of residence would provide benefits in cash.

Most public authorities perceived this option as rather theoretical. No such cases as those intended to be covered by the safeguarding provision were reported, conveying the impression that the existent gap in protection does not represent a sizeable problem. This being said, the large majority of the national public authorities seemed receptive to the introduction of the provision, particularly in view of the negligible impacts that it would have.

Option B is likely to increase the administrative burden compared to the baseline scenario, as it requires a complex and potentially burdensome cooperation between national public authorities. This would be particularly the case if the obligation of the Member State of residence to provide LTC benefits depends on the actual granting of LTC benefits by the competent Member States (and not on the question whether or not such benefits are included in the legislation of the competent Member States). This option would also be less clear than the status quo. Many questions could arise. It does also not reduce complexity of the coordination rules compared to the baseline scenario, as all situations would need to be explained in detail under which in addition to the obligations of the competent Member State, the Member State of residence has to grant its LTC benefits in cash.

In terms of financial impact, a large majority of the national public authorities considered that although logically an increase in public expenditure can be expected, the impact on their budgets of this option would be negligible.

#### **OPTION C1: Member State of residence provides long-term care benefits on the basis of its legislation**

In option C 1, the Member State of residence would provide the LTC benefits (regardless of their type) on the basis of its legislation, and the competent Member State would reimburse all LTC benefits provided by the country of residence. Option C1 includes two sub-options itself: in the first one, the competent Member State would provide **a supplement to the beneficiary** in the event that the benefits in the Member State of residence were at a lower level (C1.1). In the second sub-option, there would be **no supplement** even if the benefits in the Member State of residence were lower than those in the competent Member State (C.I.2).

Both options would ensure that mobile persons are always protected. Both sub-options give entitlements to all the benefits which are provided for the residents of a Member State. In terms of social protection, the sub-option with a supplement by the competent Member State (C.I.1) is without any doubt seen as better than the baseline scenario and (in many cases) also than C.I.2 (without supplement).

In terms of complexity of the rules, option C.I.1 option would open simultaneous entitlements under the legislations of more than one MS. This is perceived as more complex than the baseline scenario. The provision of supplements is always complex, as the legislator has to draft complex rules concerning priority, the benefits to be included into the calculation of the supplement and rules for procedures to settle these supplements. The option also requires an extensive exchange of information between national public authorities concerned. The complexity and the administrative burden of supplement system is generally the main reason for the low support for this option among national public authorities. Option C.I.2 (no supplement provided by the competent Member State) is

likely to increase transparency and reduce complexity of the rules as it sets out clearly which Member State would provide LTC benefits. However, we expect a relative increase of the administrative burden.

Our estimation for the option without the supplement indicates an increase in total expenditure on LTC benefits. When there is a supplement paid, the level of expenditure probably comes in the neighbour of scenario C2.

### **OPTION C2: Competent Member State provides LTC benefits to insured persons residing abroad**

In Option C2, the competent Member State would provide LTC to insured persons residing abroad (that is, the mobile persons would export their benefits). As, in this policy option, the competent Member State would be “responsible” for all types of LTC benefits, including the benefits in kind (not “naturally” exportable as the benefits in cash). The following solution would be established: where the benefits in kind were only available in the form of services, the competent Member State would reimburse the services provided by the country of residence. This option allows mobile persons in need of LTC to be treated equally in the Member States where they are insured and not to have their care benefits reduced if they move to another Member State.

18% of the national public authorities that have responded to the public consultation are in favour of this option (second preferred option), compared to 33% of the responding social partners, 25% of the NGOs and 39% of the individuals (preferred option).

In terms of transparency, this option is expected to increase legal uncertainty because all LTC benefits will be provided on the basis of a single legislation: the one of the competent Member State. However, this does not mean that the coordination rules will be simplified, as always more than one Member State will be involved in the provision of LTC benefits. A large majority of the national administrations see significant feasibility challenges linked to this option, not in the least due to the need of communication and coordination between Member States. A comparison of the LTC benefits in kind available in both countries would be necessary, so as to provide in the Member State of residence benefits similar to those in the competent Member State. This calculation could be complex (e.g. due to differences in eligibility conditions across EU Member States) and to a large extent theoretical. That is also why findings from the face-to-face interviews reveal that this option is considered as more burdensome for national administrations than the status quo.

It is expected that this will increase also the total expenditure on LTC benefits, and especially in those countries where the level of protection is high. Our estimates reveal an increase of the total budget from 994 million EUR for the baseline scenario to 1,277 million in option C2.

### **Summary of the likely impacts**

The table below summarizes the expected impact of each option alongside each objective, based on the analysis before.

**Table 57: Comparison of the effectiveness of the options (baseline scenario = 1)**

	<b>Option A: baseline</b>	<b>Option B: Safe- guarding provision</b>	<b>Option C1.1: MS of residence provides LTC benefits (with supplement)</b>	<b>Option C1.2: MS of residence provides LTC benefits (without supplement)</b>	<b>Option C2: Competent MS provides LTC benefits</b>
<b>Specific objectives</b>					
1. Fair distribution of financial burden between MS	1	1	0,5	0,5	1,5

2. Rules taking into account the specific character of LTC benefits	1	1	1	1	1
3. Facilitating classification of LTC benefits under EU law	1	1	1	1	1
4. Improve legal certainty and stability of coordination regime	1	1,5	0,5	1,5	1,5
5. Improved protection of mobile citizens	1	1,5	1,5	1,5	1,5
6. High awareness of rights on side of mobile persons	1	0,5	1	1,5	1,5
<b>Efficiency</b>					
Budgetary impact	1	1	1,5	1,5	0,5
Administrative burden on administrations	1	0,5	0,5	0,5	1,5
<b>Coherence</b>	1	1	1	1	1
<b>Total</b>	<b>9</b>	<b>9</b>	<b>8,5</b>	<b>10</b>	<b>11</b>

Legend: 1= no impact (e.g. baseline scenario); 1.5 = positive impact; 0.5 = negative impact

Option C2 – the competent Member State provides the LTC benefits to mobile citizens abroad – is rated as the most effective option, most capable of tackling today’s challenges of the coordination regime. However, it is considered as an option with a likely negative budgetary impact (+28% compared to the baseline scenario).

Option C.1.2 generally comes out as an effective option. It is expected to generate a positive budgetary impact on the Member States (19% less costly than the baseline scenario) and to create a more stable and legally certain coordination regime, however with a somewhat higher relative administrative burden, compared to the baseline scenario.

The main advantage of option B lies in the fact that it would ensure that all the mobile persons are protected: they would always be entitled to LTC benefits.

Option A – a continuation of the status quo - is not seen as the worst-case scenario, despite the problems described earlier in this report.

### 9.5.2 Coordination of unemployment benefits

#### **OPTION A: baseline scenario – continuation of the current coordination rules**

Option A implies a continuation of the current coordination rules. This means that workers continue to claim unemployment benefits in the country of last activity, if they have not resided during their activity in another Member State. Periods of insurance completed abroad, as well as other periods of employment/self-employment, are taken into account for establishing the right to the unemployment benefits. Furthermore, unemployed workers have a limited possibility of export of unemployment benefits for three months, with the possible extension to six months (when he/she looks for work in another Member State). Frontier workers who become wholly unemployed must apply for unemployment benefits in their country of residence. They can in addition register with the employment services in the country of last activity. The country of last activity will reimburse the institution of the place of residence the full amount of the benefits provided by the latter institution during the first three months (extensible to five months in certain circumstances). Cross-border

workers, other than frontier workers, may apply for unemployment benefits and register with the employment service either in the country of last activity or in the country of residence.

According to the public consultation findings, half of the national public authorities and social partners see no need to change the current rules. About one third of these respondents think that although the rules should not be changed, but that there is a need to better explain the rules. One third of national public authorities are explicitly in favour of changing the rules. Only 11% of NGOs that responded to the public consultation sees no need to change the current rules.

A continuation of the current coordination rules will not solve the problems that were outlined in the previous section on current problems.

### **OPTION B: Right of choice for frontier workers**

This option implies that frontier workers have the choice between applying for unemployment benefits and registering with the employment services either in the country of last activity or in the country of residence. In this system, frontier workers and cross-border workers, other than frontier workers, are put subject to the same rules.

Half of the national public authorities and individuals responding the public consultation preferred this option (results of the Deloitte survey of national public authorities show a significantly lower support for this option (27%)), compared to 31% of the social partners and 78% of the surveyed NGOs.

Under this policy option, unemployed frontier worker are likely to be better off in terms of social protection, as he has a right of choice (although conditional). Experience with Miethe cases show that frontier workers will likely choose the most beneficial and generous system of both countries. In general, stakeholders think that this option guarantees the best the protection of social security rights of all options. It gives frontier workers the possibility to be treated in the same way as their former work colleagues which live in the country of last employment. Furthermore, the right of choice is considered as fairer, as it ensures frontier workers a better return on the workers' contributions which they have paid in the country of last activity before becoming unemployed. There is mixed evidence on whether this option would really make conditions for reintegration in the labour market less or more favourable for frontier workers, compared to the baseline scenario.

From an administrative point of view, adopting a right of choice for frontier workers will reduce the number of reimbursements between Member States and will eventually reduce the administrative burden on Member States' administrations (as confirmed by our simulations), but for cases of people who will make use of the possibility to claim unemployment benefit in the country of last activity, several Member States expect that the administrative burden related to "control" of the job seeker abroad (and the legitimacy of the unemployment benefit provided) could increase.

In terms of impact on public finance of the Member State, it can be expected that the overall, aggregated cost of providing unemployment benefits in the EU would increase compared to the baseline scenario (an estimate is to be found in Table 42. This is because all cross-border workers (including frontier-workers) are likely to choose the Member State with the more advantageous system for them. In terms of fair burden sharing between Member States, a right of choice for frontier workers is seen as slightly better than the baseline scenario. There is even a substantial shift of the financial burden directly to the countries of last activity, but there remains also a burden in the

country of last activity when benefits are higher. The right of choice option is generally seen as the option which would best stimulate intra-EU labour market mobility.

### **OPTION C: Unemployment benefits for all workers to be provided by the country of the last activity regardless of the person's residence**

The unemployed person should register with the employment services in the country of the last activity and could also register with the employment services of another Member State. If the person decides to look for work in another Member State and registers with the employment services there, there could be a number of sub-options:

- C.I: The provision of the unemployment benefits from the competent State would last **until the end of the entitlement** for as long as the person fulfils the job-seeking obligations in the Member State where he is registered as a job-seeker.
- C.II: The provision of the unemployment benefits would be **limited**.

40% of individuals, 41% of the national public authorities and 44% of social partners responding the public consultation preferred this option.

In terms of social security coverage, the probability of any worker being left without any unemployment benefits would diminish substantially, compared to the baseline scenario, as it would always be clear to which country request the unemployment benefits (which also increases awareness of rights). Furthermore, this option enhances equality and non-discrimination, as it ensures that frontier workers are treated in the same way as their former work colleagues which live in the country of last activity. This option is also considered as fairer than the baseline scenario as it ensures frontier workers a better return on the workers' contributions.

There is no need for reimbursement between Member States anymore, which is expected to have a positive impact from an administrative point of view. However, on the other hand, public authorities considered that this option will also make it more difficult and costly for the country of last activity to follow-up the job seeking efforts and job status of beneficiaries of unemployment benefits who live in another Member State.

Many national public authorities see this option as a better alternative than the baseline scenario in terms of fair sharing of the financial burden between Member States. Nevertheless, for some countries with many incoming frontier workers, this option would have a significant negative impact on their public budget. The total budgetary cost for the country of last activity will increase, according to our simulations. Those simulations could however not take into account any hypothesis on the spell of entitlement, except that one year of unemployment is used as a standard cost.

In Table 42, also an alternative hypothesis F has been calculated, namely the unemployment benefit provided by the country of residence for all, placing a high burden on those countries, with exception of the standard reimbursement of 3 months.

### **OPTION D: Prolongation of the period of export from three months to minimum six months (D)**

Option D foresees a general prolongation of the period of export of unemployment benefits for persons who look for work in another than the competent Member State to minimum six months.

20% of the national public authorities responding the public consultation preferred this option (third preferred option of public authorities). Analysing the replies to the Deloitte survey country-by-country, option D seems the most preferred option in only one Member State. Two options are more popular: a period of export of 3 months with a possible extension to 6 months remains the preferred option, and prolonging the period of export until the person's entitlement to unemployment.

Considering the qualitative input gathered during the interviews, it appears that the stay abroad provides certain benefits to facilitate job-seeking. While, once again, no hard figures were presented to back up the notion that the export of benefits, in general, leads to better employment prospects and, in particular, that staying abroad for longer increases the chances of finding employment, the public officials interviewed tended to side with the idea that physical presence in the country of job search (made possible by the opportunity to export the unemployment benefits) had, if any, certain positive effects.

In terms of transparency, the adoption of this option could have positive effects. The adoption of this option would eliminate the uncertainty derived from the degree of flexibility granted to public institutions by the current coordination rules.

In terms of administrative burden, this option would primarily have an impact in terms on the communication exchange between countries concerning the situation of the job-seekers exporting their benefits. While the implications are far from likely to apply regularly and homogeneously across all countries given the differences that exist in their way of operating, this communication is generally not a one-off effort, implying instead additional efforts the longer the period of export. For such reasons, it is expected that the adoption of this policy option would have a negative impact with regard to administrative costs and administrative burdens.

While in many cases reluctant to the extension (due to potential pitfalls such as the increase risk of misuse of the rights, as previously discussed), the interviewees coincided for the most in signalling that the extension of the period of export could have some favourable effects from the point of view of fostering cross-border mobility.

#### **OPTION E: Clarification of the provision on the aggregation of periods of insurance, employment and self-employment**

Periods of insurance, employment and self-employment completed abroad are taken into account for the acquisition, retention, recovery or duration of the rights to unemployment benefits. When the legislation of the competent Member State makes the entitlement conditional upon the completion of either periods of insurance, employment or self-employment, the competent institution shall take into account periods of insurance, employment or self-employment completed under the legislation of any other Member State as though they were completed under the legislation it applies.

When the applicable legislation makes the entitlement to benefits conditional upon the completion of periods of insurance, the periods of employment or self-employment completed on the completed under the legislation of another Member State shall only be taken into account if such periods would have been considered to be periods of insurance had they been completed in accordance with the applicable legislation.

While respecting these coordination rules, Member States remain competent to determine the conditions for insurance under their social security system and the entitlement to benefits under that system. Our findings point at the diversity in national systems, but also divergences in the interpretation of art.61 of Regulation (EC) No.883/2004. One possibility to tackle this problem would be to clarify the provisions on the aggregation of periods. The impacts are analysed under the consideration that the clarification of the provisions would ensure a consistent interpretation and application of the rules across countries (without implying any change in the way that each Member State considers, under its own legislation, different periods as periods of or equivalent to periods of insurance, employment and self-employment).

The clarification would bring positive effects in terms of the return that migrant workers receive on their contributions. By guaranteeing a consistent application of the rules, the clarification would ensure that no periods that should have been considered for establishing the entitlement to unemployment rights are left aside due to an uneven application of the rules across Member States.

By ensuring that unemployed workers receive the level of unemployment benefits they are rightfully entitled to, and that no periods are unduly left aside for determining and calculating such environments, this policy option would have a positive impact on the reintegration of the labour market. Impact on administrative costs and administrative burden

The clarification should have a clearly positive impact in terms of transparency and provide as well a certain reduction in complexity of the rules. The diversity of national systems would not be impacted in any way by the adoption of this policy option. Member States will continue to regard different periods (periods of employment, of self-employment, of maternity, of education, of sickness, etc.) in different manners (as periods of or equivalent to periods of insurance, employment of self-employment, or not). However, transparency and clarity will be improved by the adoption of a clarification by eliminating the complications introduced by the divergent interpretation and application of the rules.

## Summary of the likely impacts

The table below summarizes the expected impacts of each option alongside each objective, based on the analysis in the section before.

**Table 58: Comparison of the effectiveness, efficiency and coherence of the options (baseline=1)**

	Option A: baseline scenario	Option B: Right of choice	Option C: UB provided by country of last activity	Option D: Prolongatio n period of export	Option E: Clarification of aggr. rules
<b>Specific objectives</b>					
1. Consistent application of coordination rules	1	1,5	1,5	1,5	1,5
2. Simplified legal framework	1	1,5	1,5	1	1
3. Facilitate reintegration in labour market & improved protection of job-seekers abroad	1	1	1	1,5	1,5
4. Unemployed mobile workers receiving return on their contributions	1	1,5	1,5	1	1,5
5. Fair distribution of financial burden	1	1,5	1,5	1	1,5
6. High awareness of rights	1	1,5	1,5	1,5	1,5
7. Rules reflecting current job market conditions	1	1,5	1,5	1,5	1
<b>Efficiency</b>					
Budgetary impact	1	0,5	0,5	1	1
Administrative burden	1	1,5	1,5	0,5	1,5
<b>Coherence</b>	1	1	1	1	1
<b>Total</b>	<b>10</b>	<b>13</b>	<b>13</b>	<b>11,5</b>	<b>13</b>

Legend: 1= no impact (e.g. baseline scenario); 1.5 = positive impact; 0.5 = negative impact

Option E (clarification of the rules of aggregation) is generally considered as a good option, both in terms of effectiveness and efficiency. However, the positive impact of this option will largely depend on how the aggregation rules will exactly be clarified. A clarification of the aggregation rules will however not simplify these rules and the diversity of national systems will be continued.

Options B and C appear as the option that is most effective, best capable to address the wider variety of problems that are faced with the coordination of unemployment benefits (Problem definition).

Option C has consistently positive impacts with regard to almost all specific objectives. However, it is expected to have a negative budgetary impact (an increase in expenditure of 43% - cf. 8.1.2) on the Member compared to the baseline scenario.

Like option C, option B is expected to produce a negative budgetary impact compared to the baseline scenario (and is also costlier than option C – cf. Table 42). However, option B is considered as very effective (better off in terms of social protection, better return on the workers' contributions). There is a substantial shift of the financial burden directly to the countries of last activity (cf. Table 45).

Option D (export of unemployment benefits for a period of minimum 6 months) is generally evaluated as better than the baseline scenario. There are indications that a prolongation of the period of export could facilitate the reintegration of unemployed in the labour market. From an administrative point of view, it could however generate higher administrative burden on public authorities, as unemployed abroad need to be followed up over a longer period than currently is the case.

Option A – a continuation of the status quo - is clearly the worst-case scenario in terms of effectiveness. All other options are expected to be more effective in tackling the current problems. However, the baseline scenario scores better than all other options (except option E) with regard to the efficiency criterion.

\*\* Luxembourg: source: Le gouvernement du Grand-duché de Luxembourg - Les activités de l'agence le développement de l'emploi en 2012

\*\*\* Austria: AMS, answer to questionnaire Deloitte

\*\*\*\* the Netherlands: based on sample of received forms (Gak Nederland bv, 'Import en export van uitkeringen', 2001)

\*\*\*\*\* Sweden: Detail by country on related to number of issued U2 forms and not E303 forms. More detailed information on the profile of the jobseeker is available (source: 'AF: Vilka personer söker arbete i Europa med svensk arbetslöshetsersättning?'). Between 1 May 2010 and 31 August 2011 381 E303/U2 forms were issued to unemployed persons living in Sweden. 87.4% of them (333 jobseekers) actual went abroad to look for a job. Jobseekers are mainly aged between 30 - 39 (44% of total number of jobseekers). More unemployed women (58%) than men (42%) went looking for a job abroad. 46% of the unemployed persons with an U2 form who are not born in Sweden are seeking a job in their country of birth.

\*\*\*\*\* Sweden: Evolution of number of requested and issued E303/U2 forms (2000-2012)

\*\*\*\*\* the Netherlands: based on (UWV, 'Kwantitatieve informatie 2011')

## 10.6 List of national experts for the statistical data collection

**Table 121: Statistical data collection: list of national experts**

Name	Institution	Country
Jozef Pacolet Frederic De Wispelaere	HIVA – KU Leuven	Belgium
Frederic De Wispelaere	HIVA – KU Leuven	France
Norman Wagner	Social Policy Unit in the Chamber of Labour	Austria
Roland Eisen Hans-Christian Mager Jürgen Faik	Johann Wolfgang Goethe Universität Frankfurt am Main	Germany
Jan Edling	Flexicurity	Sweden
Franz Clément	Centre d'Etudes de Population, de Pauvreté et de Politiques Socio-Economiques	Luxemburg
Frederic De Wispelaere	HIVA – KU Leuven	The Netherlands
Eigil Boll Hansen	KORA, Danish Institute for Local and Regional Government Research	Denmark
Raphael Wittenberg	London School of Economics and Political Science	United Kingdom
Gregorio Rodríguez Cabrero	University of Alcalá	Spain
Dorota Kawiorska	Krakow University of Economics	Poland
Catalin Ghinararu	National Research Institute for Labour and Social Protection Romani	Romania
Jüri Kore	Tartu University	Estonia
Marek Radvansky	Institute of Economic Research (EU SAV)	Slovakia

## 10.9 Analysis of online survey of national administrations and social security institutions

### 10.9.1 Coordination of unemployment benefits

---

#### Introduction

This annex contains an analysis of the online survey of national administrations and social security institutions that was set up and launched by Deloitte. In order to expand the scope of our analysis to all EU and EEA countries, we launched a web-based survey among the responsible national public authorities and other key actors with regard to both topics. The Commission sent an invitation to the members of the Administrative Commission for the Coordination of Social Security systems in December 2012. After several reminders and prolongation of the deadlines, we finally closed the survey on the 28 February 2013.

We would like to note that the analysis of the survey cannot be considered as a stand-alone document, like the public consultation analysis. We have primarily used the survey findings to support statements and other findings in our main report. The aim of this annex is to provide the reader with some more background about the attitudes of consulted parties.

#### Profile of respondents

We received 73 complete answers (and 42 incomplete answers) to the online survey that was sent to the national administrations and social security institutions in all EU Member States and EFTA/EEA countries. We received no answers from the following countries: Liechtenstein, Bulgaria, Greece, Iceland and Norway. For several countries, only 1 answer was received for each topic. This is mainly due to the fact that the national administrations and social security institutions aimed to coordinate their answers. 16.4% of the respondents were Portuguese, 13.7% were German and 8.2% were Romanian. In order to circumvent the problem of some Member States being overrepresented in the results and other countries being underrepresented, a country-by-country analysis of the replies was made for many questions (where relevant).

**Table 127: Profile of respondent – unemployment benefits survey - by MS**

United Kingdom	1,4%	1
<b>answered question</b>		<b>73</b>

61% of the respondents are national institutions, 26% are regional organisations and the remaining 12% are local authorities. Almost 18% of the respondents are organisations situated in cross-border regions.

66% of the respondents are dealing with individual claims for unemployment benefits. Almost all of them (98%) have to contact other Member States to confirm the workers' employment or insurance record.

➤ *With which countries do you mostly exchange information (top-3) – cf. table below*

## Opinions on the competent Member State for the provision of unemployment benefits

43% of all respondents think that the competent Member State should be the one in which the person last worked and paid social security contribution, even a person lives in another Member State. About 27% of the respondents favour a right of choice for workers to claim their unemployment benefits either in the country of last activity either the country of residence. About the 25% say that the country of residence should be the competent Member State, even if a person last worked and paid social contributions in another Member State.

Applying a country-by-country analysis, the results are slightly different with regard to the 2<sup>nd</sup> and 3<sup>rd</sup> preferred option.

In 11 countries (CY, CZ, FI, FR, HU, IT, LV, MT, NL, PT, SI), the most popular option among public authorities remains that unemployment benefits should be provided by the Member State in which the person last worked and paid social security contributions, even if he/she lived in another Member State. In several of these countries, there is also strong support for the option where workers would have a right of choice with regard to where to claim their unemployment benefits. Reasons why respondents say to favour this option are: it would make an end to the reimbursement of unemployment benefits between Member States and it is fairer that the Member State which receives the social security contributions is also competent to provide the unemployment benefits. However, several respondents warn that this option entails risks of abuse/fraud. The country of residence may lack an incentive to check the legitimacy of the benefits provided by the competent country and to follow-up the unemployed person during the job-seeking process.

In 9 countries (AT, BE, DK, DE, IE, LU, ES, SE, CH), most public authorities are in favour of the Member State in which the person lived being the competent Member State, even if he/she last worked and paid social security contributions in another Member State. These countries are also generally against a thorough revision of the coordination rules.

In 5 countries (CZ, EE, RO, SK, UK), the most popular option is that a person should be allowed to choose to claim the benefit either in the Member State of last employment or in the Member State where the person lived (if these Member States are different).

*Likely impact of these options - from 4 (=best/highest impact) to 1 (=least ensuring):*

**Table 129: Opinions on likely impacts of the options - unemployment benefits**

Options	Impact on labour market mobility	Impact on social protection	Impact on fair sharing of financial burden between MS	Impact on administrative burden and costs
a) Member State in which the person last worked and paid social security contributions, even if he/she lived in another Member State.	2,57	2,67	<u>3,19</u>	2,49
b) Member State in which the person lived, even if he/she last worked and paid social security contributions in another Member State	2,61	2,53	2,29	2,36
c) Person should be allowed to choose to claim the benefit either in the Member	<u>2,75</u>	<u>2,79</u>	2,28	<u>2,58</u>

State of last employment or in the  
Member State where the person has lived  
(if these Member States are different).

## Export of unemployment benefits

Almost 45% of all respondents are in favour of giving the possibility of “exporting unemployment benefits” (going to another country to look for a job while continuing to receive the unemployment benefits from the competent institution) until the end of the person’s entitlement to unemployment benefits, according to the rules of the Member State which provides them. 34% of all respondents would like to maintain the current period of export of 3 months with a possible extension of the export of unemployment benefits to 6 months. About 12% would like to extend the period of export in the entire EU to at least six months.

Analysing the replies on a country-by-country basis, the results look differently. The current rule of a three-month period of export with a possible extension to 6 months is the most chosen option among public authorities in 11 countries (AT, BE, CY, DK, EE, FI, FR, DE, LI, LU, NL, CH). In 9 countries (HU, IT, LV, MT, PL, RO, SK, SI, ES, UK), exporting the unemployment benefit until the end of the person's entitlement to unemployment benefits, according to the rules of the Member State which provides them, is the most preferred option. Only in one Member State (PT), public authorities favour a general period of export of minimum 6 months.

*Likely impact of the options - from 4 (=best/highest impact) to 1 (=least ensuring)*

**Table 130: Opinions on impacts of options (export of unemployment benefits) - unemployment benefits**

Options	Impact on labour market mobility	Impact on reintegration of unemployed people in the labour market	Impact on fair sharing of financial burden between MS
a) Three months, with a possible extension up to six months	2,47	2,64	2,72
b) At least six months prolongation	2,54	2,46	2,43
c) Until the end of the person's entitlement to unemployment benefits, according to the rules of the Member State which provides them	2,72	2,57	2,42
d) Other solution	2,26	2,33	2,43

52% of all respondents think that the export of unemployment benefits could lead to increased risk of misuse or abuse of rights. This is also the opinion of most public authorities in 15 Member States. 79% of this group of respondents think that the risk of misuse or abuse of rights is particularly high when the unemployment benefits would be provided until the end of a persons’ entitlement to unemployment benefits, according to the rule of the Member State which provides them. 33% of the respondents also believe that there would be an increased risk of abuse if the period of export would be generally extended to minimum 6 months.

45% of the respondents do not think that misuse or abuse of rights is a risk in cases of export of unemployment benefits. This is also the most dominant position among public authorities in 8 countries.

Public authorities who believe that the export of unemployment benefits could lead to increased risk of misuse of rights, propose the following mitigation measures to reduce this risk:

- The guest Member State should feel more responsible for jobseekers who have exported their unemployment benefit from another Member State. Agreements should be made between Member States about the control and the provision of active

assistance to jobseekers (HU, AT, CZ, IE, IT, LI, NL, PL, PT and SI). However, more control of jobseekers by the guest Member State will also increase the administrative burden and costs on Member States (DK).

- Some Member States say that the keeping the period of export generally limited to maximum 3 months will limit the risk of abuse and misuse of rights. Extension may be possible, if there is a high probability that the jobseeker will find work at short term (AT, BE, IE). Several Member States would like to enhance the role of the "guest" Member State in providing information to the competent Member State about the chances of a person to find a job at short-term, so that the competent Member State can take a well-argued decision about extending the period of export in a specific case (BE, EE, CZ and FR).
  - All jobseekers who have exported their unemployment benefits should be obliged to report about their job seeking activities to the competent Member State (CZ, DE, MT, LT and FR). Some countries are in favour of monthly reporting by the jobseeker to the competent institution (DE, MT and LT); other Member States say that a 3-monthly reporting would be sufficient (FR).
  - One respondent suggests making language courses compulsory in the "guest" country, as language is often the most important barrier to integration in the labour market. Also reducing the height of unemployment benefit over time could provide an incentive to jobseekers abroad to actively apply for a job.
  - In the long-run, it should be possible to introduce an EU-Job pass for every EU citizen which contains his/her social data. Every public employment service should be able to access these data, based on a single European social database (DE, NL).

When people are exporting their unemployment benefit abroad, 40% of the organisations that deal with claims for exportation of unemployment benefits say that they receive information about the status of these job-seekers from the country of residence, but only on request. About 19% automatically receives information from country of residence. About 10% of the respondents say that this information is not needed. The majority of these respondents cannot say if these job-seekers (who exported their unemployment benefit) had found a job.

Under the current rules, Member States have the possibility to extend the period of export of unemployment benefits from 3 months to 6 months. The table below gives an insight about for how long the authorisation for export is given in the countries (TABLE INCOMPLETE – no data for all countries):

## Need for physical presence for job-seeking

➤ The majority (52%) of the public authorities think that, in order to actively look for a job, it is necessary for the unemployed person to be physically present in the Member State in which she/he is searching for a job. This is the most common point of view in 12 countries (AT, CY, DE, DK, EE, FI, LT, LV, PL, PT, SI and UK). These respondents consider unemployment benefits different from other social security benefits, because of the particular "availability" element which is linked to receiving an unemployment benefit. Unemployed people must be available to the labour market of the country of residence every single day. If a person resides abroad, it is difficult for the public authorities of the country of residence to check the criteria of entitlement for receiving an unemployment benefit.

Almost 17% of all respondents do not consider physical presence necessary (most common point of view in 3 countries: MT, SK and CH). They argue that ICT tools have made it possible to find a job, without having to be physically present in the country of the potential employer.

Finally, 30 % stated that it depends on the stage in the application, the skills and background of a person whether physical presence is necessary to actively look for a job (most common point of view in 8 countries: BE, CZ, FR, IE, LU, NL, ES and SE). The respondents say that the early stage of a job application procedure (e.g. identifying vacancies, first contact, phone interview) with employers abroad does not require physical presence of the jobseeker, whereas further stages of the application procedure probably require physical presence of the jobseekers. Furthermore, the need for physical presence also depends on the required skills and background of jobseekers. In some countries, employers are so desperately looking for engineer or technicians that they do not expect from candidates to be physically present in their country.

➤ Under the current EU rules, an unemployed person can register with the employment services in the Member State paying the unemployment benefits and, in addition, in the Member State where the person lives (if this is a different Member State). A person 'exporting' his/her unemployment benefit to another Member State must register, for that period, with the employment services of that Member State. Almost 42% of all surveyed public authorities would like to maintain the current rules. 36% of respondents would like to revise the current rules, so that a person could register with the employment services anywhere in the EU, regardless of where the person has lived or worked, with a possibility to register in more than one Member State. Only 16% say that a person should be able to register with the employment services anywhere in the EU, but only in one Member State.

➤ Likely impact of these options - from 4 (=highest impact) to 1 (=least/least ensuring):

**Table 132: Opinions on the need for physical presence while job seeking**

Options	Impact on labour market mobility	Impact on reintegration of unemployed persons in the labour market	Impact on administrative burden and costs
a) Anywhere in the EU, regardless of where the person has lived or worked, but only in one Member State at a time	2,36	2,25	2,18
b) Anywhere in the EU, regardless of where the person has lived or worked, with a possibility to register in more than one Member State	2,58	2,56	2,64

c) As it is under the current EU rules	2,76	2,81	2,63
d) Other solution	2,29	2,39	2,18

## Communication between Member States

Only 10% thinks that the communication with other Member States in dealing with individual claims for unemployment benefits is effective and smooth. About 25% of the respondents describe the communication as ineffective and slow. The majority of the respondents think that there is room for improvement but that in general, communication works well.

Many respondents say that there is a long waiting time before documents (particularly U2 forms and the confirmation of periods of insurance) are sent back in the exchange with a number of Member States. There is anecdotal evidence that it regularly takes two-three months when a request for information is being replied by another Member State and exceptionally, even up to one or two years. The following countries are regularly mentioned as problematic in terms of processing time, bureaucratic behaviour and communication: France, Italy, Spain and United Kingdom.

The long processing time of a case is seen as very problematic for claimants of unemployment benefits, because as long as a Member State does not have the required information about a claimant, it is not able to make a decision about the unemployment benefit.

Some Member States also ask for more information than it is usually the case (for example, the reason for termination of employment). This creates additional burden and requires more time from public authorities. There are also no clear instructions how the U2 forms or other portable documents and SED forms have to be filled in, what information goes under what section, etc. The specialists, dealing with these forms, should receive better training and better instructions. A good practice is the Austrian national authorities who have elaborated in detail how the rules should be interpreted and which information should be filled in per form. Some requests (for example the confirmation of periods of insurance/employment requires) also require much background information of a person, which causes delays in a case.

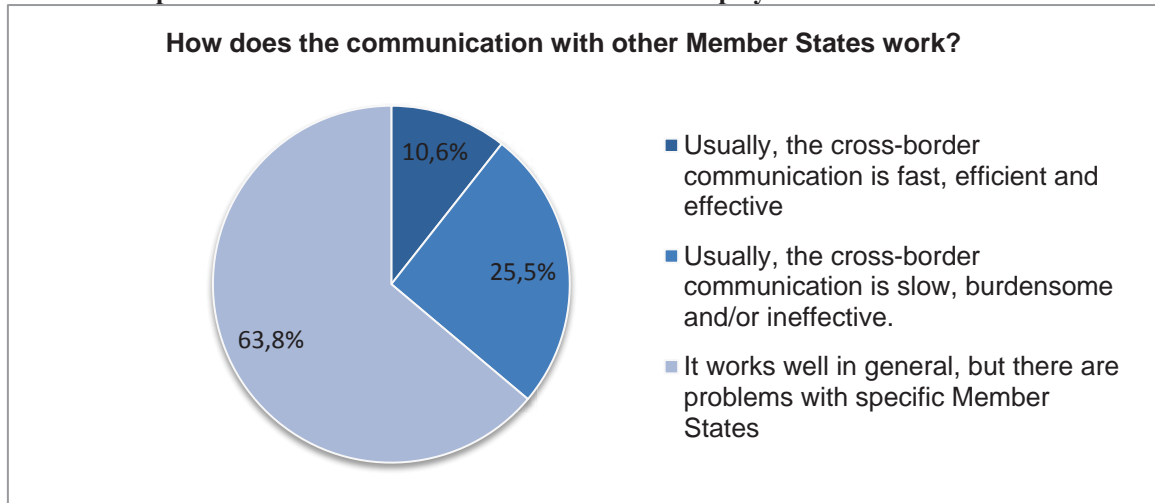

Furthermore, the regulation was designed for electronic exchange but almost all Member States are still working in paper format. Several respondents expect that the introduction of the ESSI system can partly solve existing communication problems.

Some public authorities say that the names and addresses of competent institutions are often not correct or not updated in Master Directory (EESSI).

Exceptionally, there are problems with public authorities reporting in their own language instead of English.

**Table 133: Opinions on communication with other MS – unemployment benefits**

## Opinions on need to reform

- Almost 45% of the surveyed public authorities think that current EU rules of coordination need to be changed. 14% of them find it difficult to say if there is a need to revise the current rules. About 10% of the respondents do not say any reason to change, clarify or better apply the EU rules. Respondents' answers differ from country to country. The table below gives an overview of the most given answer per country:

**Table 134: Opinions on need to reform coordination rules - unemployment benefits**

Based on your administration's experience, you conclude that EU rules on coordination of unemployment benefits?					
Member State	<i>Difficult to say</i>	<i>Do neither need to be changed, nor better explained and are correctly applied in practice.</i>	<i>Do not need to be changed, but should be better applied in practice</i>	<i>Do not need to be changed, but should be better explained</i>	<i>Need to be changed</i>

- For the group of respondents who see a need to change the rules:
  - 72% of them think that the current rules are not uniformly understood and applied by the Member States. A recurrent concern is the reimbursement procedure between Member States which are not sufficiently detailed and

clear. In some cases, Member States let national legislation interfere with the EU coordination rules during reimbursement procedures.

- About 60% of public authorities said that migrant workers are not sufficiently aware of their rights and informed about the rules. Those respondents say that migrant workers are unaware which institution could support them. As the regulation is quite unspecific (for example, how long do you need to work in a foreign country to be entitled for unemployment benefit) each country adds its own rules which make it difficult for jobseekers.
- 47% stated that the communication between Member States is burdensome and ineffective.
- Almost 40% see a problem in the administrative burden that is imposed on public authorities by the current rules. In addition the calculation of the reimbursement amount for cases where no entitlement exists in the Member State of last employment is not only difficult but administratively cumbersome. Last but not least the time lag between the payment of unemployment and the time of reimbursement has proven to be another administrative burden.
- About 20% think that the current EU rules are too complicated.
- 10% mention the inadequate social protection of citizens as a concern.
- Legal uncertainty associated with the current rules is not a problem (0%).
- Furthermore, some respondents say that the current rules, particularly Article 65 of the Regulation, does not allow for the fairest sharing of the financial burden as it requires Member States to reimburse regardless of the insurance/employment period.

#### Opinions on administrative burden

- Regarding the administrative burden related to handling cross-border cases, respondents particularly describe the following processes are burdensome (high workload):
  - Handling requests for information from another country about employment or self-employment periods of a claimant
  - Carrying out checks and informing the competent institutions
  - Implement measures to facilitating job-seeking abroad.

## 10.9.2 Coordination of LTC benefits

---

### Profile of respondents

We received 22 complete to the online LTC survey that was sent to the national administrations and social security institutions in all EU Member States and EFTA/EEA countries. We received no answers from the following countries: Belgium, Bulgaria, Cyprus, Denmark, Finland, France, Greece, Hungary, Iceland, Ireland, Liechtenstein, Norway, Portugal, Romania, Switzerland and United Kingdom. **It should be noted that this makes the exported data not fully representative and only useful to a limited extent.**

**Table 135: Profile of respondent – LTC benefits survey - by MS**

Answer Options	Response Percentage	Response Count
Austria	9,1%	2
Belgium	0,0%	0
Bulgaria	0,0%	0
Cyprus	0,0%	0
Czech Republic	4,5%	1
Denmark	0,0%	0
Estonia	4,5%	1
Finland	0,0%	0
France	0,0%	0
Germany	9,1%	2
Greece	0,0%	0
Hungary	0,0%	0
Iceland	0,0%	0
Ireland	0,0%	0
Italy	9,1%	2
Latvia	4,5%	1
Liechtenstein	0,0%	0
Lithuania	9,1%	2
Luxembourg	9,1%	2
Malta	4,5%	1
Netherlands	4,5%	1
Norway	0,0%	0
Poland	4,5%	1
Portugal	0,0%	0
Romania	0,0%	0
Slovakia	9,1%	2
Slovenia	4,5%	1
Spain	9,1%	2
Sweden	4,5%	1
Switzerland	0,0%	0
United Kingdom	0,0%	0

73% of the respondents are national institutions, 14% are regional organisations and the remaining 14% are local authorities. Half of the respondents are organisations situated in cross-border regions.

56% of the respondents are dealing with individual claims for unemployment benefits; all of them have to contact other Member States to confirm the workers' employment or insurance record.

### Opinions on the competent Member State for the provision of LTC benefits

Keeping the status quo is only the 4<sup>th</sup> preferred option among national administrations. 17% (3 replies) of the national administrations and social security institutions would like to keep the current coordination rules for long-term care benefits. About 28% (5 replies) of the respondents believe that people should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he moves to another Member State.

**Table 136: options on competent MS for provision of LTC benefits**

Options	Response Percent	Response Count
a) Should continue receiving benefits as it is today – and depending on the Member State's legislation the person might end up in a win or in a lose situation.	16,7%	3
b) Should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he/she moves to another Member State.	27,8%	5
c) Should be treated equally in the Member State where he/she lives and receive the care benefits there (including the cash benefits), in accordance with national legislation.	22,2%	4
d) Should receive care benefits in cash from the Member State of insurance, supplemented by the Member State of residence in case of more advantageous conditions (top-up).	22,2%	4
e) Should receive care benefits in cash from the Member State of residence, supplemented by the Member State of insurance in case of more advantageous conditions (top-up).	0,0%	0
f) Other (please describe briefly)	11,1%	2
<i>answered question</i>		<b>18</b>
<i>skipped question</i>		<b>4</b>

The options where a person in need of care is treated equally in the Member State where he is insured (option b) or where he/she lives (option c) are considered by national administrations as the best ones to stimulate free movement of persons. The current coordination rules are seen as the **worst** option to stimulate mobility of persons.

In terms of social security coverage, national administrations have a preference for option c), where a person in need of care is treated equally in the Member State where he/she lives and receives LTC benefits there in accordance with national legislation. Also the option where a person receives care benefits in cash from the Member State of residence, supplemented by the Member State of insurance in case of more advantageous conditions (top-up).

Making the competent Member State fully responsible for the provision of the LTC benefits is seen as the best option to ensure a fair share of the financial burden between Member States (option b)).

On a 1 to 5 scale (1=negative impact; 5=positive impact)

**Table 137: Opinions on impacts of the different LTC options**

Options	Free movement of persons	Best protection of social rights	Fairest sharing of financial burden	Admin. burden & costs
a) A person in need of care should continue receiving benefits as it is today, and depending on the Member State's legislation the person might end up in a win or in a lose situation.	2,94	2,83	3,66	3,50
b) A person in need of care should be treated equally in the Member State where he/she is insured and should not have his/her care benefits reduced if he/she moves to another Member State.	3,94	3,83	4,06	3,50
c) A person in need of care should be treated equally in the Member State where he/she lives and receive the care benefits there (including the cash benefits), in accordance with national legislation.	3,94	4,28	3,5	3,61
d) A person in need of care should receive care benefits in cash from the Member State of insurance, supplemented by the Member State of residence in case of more advantageous conditions (top-up)	3,61	3,44	3,83	3,33
e) A person in need of care should receive care benefits in cash from the Member State of residence, supplemented by the Member State of insurance in case of more advantageous conditions (top-up).	3,89	4,00	3,39	3,61
f) Other solution	2,67	2,61	2,61	3,44

Almost half of the national administrations have the opinion that all costs for LTC benefits should be borne by the competent Member States (where the migrant person is insured). About one third prefers a system where those costs are shared between the Member State of residence and the competent Member State. The latter option however is seen as the most burdensome in terms of administration.

**Table 138: Opinions on fair burden sharing of the financial burden between Member States**

Regarding the distribution of costs between Member States :

Answer Options	Response Percent	Response Count
a) All costs for care benefits provided to an insured person should be borne by the Member State in which the migrant person is insured for healthcare or long-term care.	44,4%	8

b) Each Member State should bear its own expenses for benefits provided to a migrant person under its own legislation, without any reimbursement between them.	16,7%	3
c) The Member State of residence and the Member State of insurance should share the costs for the care benefits provided to a migrant person.	33,3%	6
d) Other solution (please describe briefly)	5,6%	1
<i>answered question</i>		18
<i>skipped question</i>		4

	Fairest sharing of financial burden	Admin. burden and costs
a) All costs for care benefits provided to an insured person should be borne by the Member State in which the migrant person is insured for healthcare or long-term care.	2,83	2,50
b) Each Member State should bear its own expenses for benefits provided to a migrant person under its own legislation, without any reimbursement between them.	2,33	1,94
c) The Member State of residence and the Member State of insurance should share the costs for the care benefits provided to a migrant person.	2,61	2,89
d) Other solution	2,22	2,67

About 40% of the national administrations who are in contact with administrations in other Member States think that the communication works well in general, but that they are problems with specific Member States. One third says that cross-border communication is fast, efficient and effective; another 30% finds the communication slow, burdensome and ineffective.

**Table 139: Opinion on functioning of communication between MS - LTC**

How does the communication with other Member States work?		
<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>
Usually, the cross-border communication is fast, efficient and effective	30,0%	3
Usually, the cross-border communication is slow, burdensome and/or ineffective (please specify briefly)	30,0%	3
It works well in general, but there are problems with specific Member States (please specify briefly)	40,0%	4

Half of the national administrations that are dealing with claims for LTC benefits provision (10) think that the current rules need to be changed. 40% of national administrations do not want to see the rules changed.

**Table 140: Opinions on the need to reform the current LTC coordination rules**

Based on your administration's experience, would you conclude that EU rules on coordination of long-term care benefits:		
<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>

Do neither need to be changed, nor better explained and are correctly applied in practice.	20,0%	2
Do not need to be changed, but should be better clarified and explained (please specify briefly).	20,0%	2
Do not need to be changed, but should be better applied in practice (please specify briefly).	0,0%	0
Need to be changed (please specify briefly).	50,0%	5
Difficult to say (please specify briefly).	10,0%	1
	<i>answered question</i>	10
	<i>skipped question</i>	12

The main problems with the current coordination rules are the fact that there is no common understanding and incorrect application of the coordination rules, the complexity of the coordination rules, the fact that the rules do not take into account new mix-types of LTC benefits.

**Table 141: Main problem regarding application of LTC coordination rules**

**What are the main problems you have noticed regarding the application of EU law in the area of long-term care benefits? (choose max. three options)**

<i>Answer Options</i>	<i>Response Percent</i>	<i>Response Count</i>
Migrant citizens are not sufficiently aware about their rights under EU law (please specify briefly).	16,7%	1
EU law is not uniformly understood and applied by Member States (please specify briefly).	100,0%	6
The cross-border communication between institutions of Member States is too slow and/or ineffective (please specify briefly).	33,3%	2
Migrant citizens are abusing the possibilities offered by EU law (please specify briefly).	0,0%	0
EU rules are too complicated (please specify briefly).	33,3%	2
EU rules face legal uncertainty and are unstable (under influence of ECJ rulings) (please specify briefly).	16,7%	1
EU rules create significant administrative costs and burdens for national administrations (please specify briefly).	16,7%	1
EU rules do not take into account new mixed-types of benefits, which are blurring the distinction between benefits in kind and cash (please specify briefly).	33,3%	2
EU rules do not provide for the effective protection of social rights of migrant citizens (please specify briefly).	16,7%	1
Other (please specify briefly). (Please specify)	0,0%	0

ANNEX VI: FRESSCO REPORT: EXPORT OF FAMILY BENEFITS .....	2
TABLE OF CONTENTS .....	5
EXECUTIVE SUMMARY .....	16
GENERAL REMARKS .....	20
1.1 Notions used throughout the text.....	20
1.2 Mapping.....	23
CURRENT SITUATION AND PROBLEMS .....	25
1.3 Legal background – coordination of family benefits under today’s coordination rules .....	25
1.3.1 The coordination embedded in the general principles of the TFEU .....	25
1.3.2 Specific rules on coordination of family benefits.....	27
1.4 Legal problems .....	29
1.5 Administrative problems .....	32
1.5.1 Results from the mapping exercise.....	32
1.5.2 Short conclusions on the administrative problems .....	36
1.6 Political problems .....	37
1.6.1 General remarks.....	37
1.6.2 Results from the mapping exercise.....	37
HORIZONTAL OPTIONS WHICH ARE RELEVANT FOR ALL OPTIONS EXAMINED WITH REGARD TO EXPORT .....	39
1.7 The same coordination for all family benefits?.....	40
1.7.1 General remarks concerning the variety of benefits .....	40
1.7.2 Results from the mapping exercise.....	40
1.7.3 Benefits with the predominant aim to meet family expenses; questions of definition .....	46

1.7.4	Benefits which are employment-related .....	48
1.7.5	Benefits which have the function of special non-contributory cash benefits .....	54
1.7.6	Advances of maintenance payments and childbirth and adoption allowances .....	55
1.7.7	Special new rules for benefits in kind .....	55
1.7.8	Clustering of benefits for the purpose of calculating the differential supplement .....	56
1.8	Who is a member of the family at the side of the ‘grown-ups’? .....	57
1.9	Also the child could open an entitlement under Regulation (EC) No 883/2004 .....	58
1.10	Problems with the place of residence of a child .....	60
HORIZONTAL PRINCIPLES WHICH ARE RELEVANT FOR THE OPTIONS CONCERNING EXPORT OF FAMILY BENEFITS .....		62
1.11	What does ‘adjustment’ mean for the options concerning the export of family benefits? .....	62
1.11.1	Why adjust family benefits? .....	62
1.11.2	Which elements could be the base to determine the factor of adjustment? .....	62
1.11.3	Would adjustment be possible from an administrative and technical point of view? .....	65
1.12	How to treat persons in a contributory scheme or in an employment-related scheme who are not in such a situation in the relevant Member State .....	66
1.12.1	Benefits which are contribution-based but open entitlement to all residents .....	66
1.12.2	Benefits which are provided only for insured persons .....	67
WHICH OPTIONS COULD BE ENVISAGED CONCERNING THE EXPORT OF FAMILY BENEFITS? .....		70

1.13	Option 1 – Status quo .....	74
1.13.1	Legal background and general remarks about Regulation (EC) No 883/2004 .....	74
1.13.2	Rules in the event of no overlap of entitlements .....	74
1.13.3	Rules in the event of overlap .....	76
1.13.4	Advantages and constraints of the status quo .....	77
1.14	Option 2 – Adjustment of the amount of family benefits to the living standards in the Member State of residence of the child(ren) .....	80
1.14.1	Sub-option 2a – adjustment of the amount (no limits) .....	82
1.14.2	Sub-option 2b – adjustment of the amount (no limits) and reimbursement .....	89
1.14.3	Sub-option 2c – adjustment of the amount (limit national amount) .....	94
1.15	Option 3 – reversed competence of the Member State of residence before the Member State of employment .....	97
1.15.1	Sub-option 3a – reversed competence of the Member State of residence before the Member State(s) of employment, no adjustment, no reimbursement .....	100
1.15.2	Sub-option 3b – reversed competence of the Member State of residence before the Member State of employment + reimbursement .....	106
1.15.3	Sub-option 3c – reversed competence of the Member State of residence before the Member State of employment + adjustment .....	110
	CONCLUSIONS .....	114
	ANNEX 1 – OVERVIEW OF THE EFFECTS OF THE DIFFERENT OPTIONS .....	116
	ANNEX 2 – ELEMENTS FOR ANALYSING THE LEGAL POSSIBILITIES TO ADJUST THE AMOUNT OF FAMILY BENEFITS TO THE LIVING COSTS .....	122

Results from the mapping exercise.....	122
Would such adjustments be possible from our point of view?.....	126
Introductory remarks .....	126
Would it be legally possible to adjust family benefits to the costs of living? .....	127
Neutrality principle.....	127
General assimilation of facts principle .....	130
Equality of treatment principle .....	130
Exportability of the acquired rights principle.....	132
Some final additional remarks .....	134

------	----------------------------	-----

## Executive summary

The coordination of family benefits has become an issue of political interest in some Member States. It is argued that an unlimited export of these benefits granted to migrant workers whose children reside outside the Member State which has to grant benefits may not meet the policy aims behind these benefits. Therefore, the FreSsco team has been mandated to look into different options which could be a remedy for these political concerns.

The options we have chosen (based on the mandate and some also added by us) to evaluate their impact (always compared to the status quo) are the following ones:

- **Option 1:** Keeping the status quo.
- **Option 2:** Introducing an adjustment mechanism (which deviates from today's unlimited amounts of family benefits for children living outside the Member State concerned and adjusts the amount due to the different cost of living in the Member State of residence compared to the Member State which has to grant the benefit). As 'adjustment' is not a clear notion and as we had an extended exchange of ideas concerning the questions how such adjustments could work, what will be the outcome, and what legal obstacles could exist which hinder such adjustments, we have also elaborated on these questions in more detail. We have analysed the following three different sub-options:
  - **Sub-option 2a:** full upwards and downwards adjustment of the amounts.
  - **Sub-option 2b:** full upwards and downwards adjustment of the amounts but reimbursement of the amount of any upwards adjustments by the Member State of residence.
  - **Sub-option 2c:** only downwards adjustment.
- **Option 3:** reversing the order of priority, and always making the Member State of residence of the children the State competent by priority.

- **Sub-option 3a:** reversing only the order of priority without additional measures.
- **Sub-option 3b:** reversing the order of priority, and reimbursement by the Member State with primary competence under today's coordination of the amount it would have to grant today.
- **Sub-option 3c:** reversing the order of priority, and adjusting the amount of the Member State which has secondary competence to an amount according to the level of costs of living in the Member State of residence (when calculating a differential supplement).

For our evaluation of these six new options the following factors were considered:

- **Clarification:** where clarity and transparency are an issue.
- **Simplification:** is the solution simple or rather complex?
- **Protection of rights:** for this evaluation benchmark it is important whether the persons concerned are well protected, whether they lose rights but also how safe and quick the procedures are which have to be followed to get a benefit.
- **Administrative burden and implementation arrangements:** here the burden for administrations is scrutinised.
- **No risk of fraud and error:** options should also not be construed in such a way that the persons concerned try to achieve better results (e.g. higher benefits) by simulating facts which do not correspond to reality.
- **Potential financial implications:** behind this point the main question is hidden, as it seems that divergent points of view of Member States have been the incentive for this report; therefore, we refrained from really giving marks on this factor, but we only show the possible impact the option will have and leave it to the decision-makers to draw the conclusions from this;

The discussion within our small group of experts already showed how difficult it would be to achieve a solution to which everyone can agree (we quickly saw

that on some points we did not agree and, thus, this also had to be reflected in this report).

To help the reader more easily identify our conclusions concerning the different factors in relation to each option we used a system of marks where (+) means better than, (-) worse than and (≈) means nearly the same as the status quo, while (?) indicates that we give the results of our analysis whereas it will be a decision for the political decision-maker to make, as we cannot.

The following table presents the results of our evaluation.

	Clarification	Simplification	Rights	Admin. burden	Fraud	Financial implications
Option 2a	-	-	?	-	≈	?
Option 2b	-	-	?	-	≈	?
Option 2c	-	-	-	-	≈	?
Option 3a	+	?	+	+	+	?
Option 3b	+	-	+	-	+	≈
Option 3c	-	-	?	-	+	?

The analysis also showed that export is not the only problem. Thus, if a revision of the family benefits chapter is envisaged also all other problems and shortcomings existing today should be examined. If possible also additional options could be achieved at the same time with the provision of the export principle. From our point of view the problems which arise due to some of the horizontal problems are much more important and, maybe, should be solved

with more energy of the legislature and urgency than the export question. We identified several issues, especially the following ones: the need for better definitions, a special coordination for child-raising benefits for persons in gainful employment (exclusive granting by the Member State which is competent for the person concerned) but also a clear rule on the question how many ‘baskets of benefits’ have to be made for the calculation of the differential supplement. Some of these horizontal issues are so interlinked with our main topic of export of family benefits that we had to recommend to take them also on board for the planned revision. As an example we want to mention that we have all been convinced that, even if an adjustment of family benefits is decided to be an interesting option, this cannot apply to contributory benefits (when only the payment of contributions opens entitlement to benefits) or to those with an income replacement function (e.g. some child-raising benefits).

Thus, our conclusion is that the examination of possibilities for a revision of the family benefits coordination rules is a valuable exercise which could improve the status quo. It should not be restricted only to the export question, but should also contain additional elements. Looking at the marks we have given to the different options it is clearly Sub-option 3a which seems to be the most suitable one for further analysis. Of course, also this option would be optimised by adding a special coordination e.g. for child-raising benefits. But it should never be forgotten that also this option would have negative aspects like e.g. a shift of the burden between the Member States, which has to be reflected upon when the political decision is taken.

## General remarks

### *1.1 Notions used throughout the text*

To ease the reading of the text some notions used throughout the text have to be defined:

**‘Regulation (EEC) No 1408/71’** means Regulation (EEC) No 1408/71 of the Council of 14 June 1971 on the application of social security schemes to employed persons and their families moving within the Community, as amended;

**‘Regulation (EEC) No 574/72’** means Regulation (EEC) No 574/72 of the Council of 21 March 1972 fixing the procedures for implementing Regulation (EEC) No 1408/71 on the application of social security schemes to employed persons and their families moving within the Community, as amended;

**‘Regulation (EC) No 883/2004’** means Regulation (EC) No 883/2004 of the European Parliament and the Council of 24 April 2004 on the coordination of social security systems, as amended;

**‘Regulation (EC) No 987/2009’** means Regulation (EC) No 987/2009 of the European Parliament and of the Council of 16 September 2009 laying down the procedure for implementing Regulation (EC) No 883/2004 on the coordination of social security systems, as amended;

**‘Regulation (EU) No 492/2011’** means Regulation (EU) No 492/2011 of the European Parliament and of the Council of 5 April 2011 on the freedom of movement for workers within the Union;

**‘CJEU’** means the Court of Justice of the European Union; rulings which dealt with Regulation (EEC) No 1408/71 are also mentioned in relation to Regulation (EC) No 883/2004 if from our point of view these rulings are still valid under the new Regulation (the relevant material content did not change);

**‘family benefit’** means benefits in kind and in cash intended to meet family expenses (definition of Article 1(u)(i) of Regulation (EEC) No 1408/71 and Article 1(z) of Regulation (EC) No 883/2004);

**‘family allowance’** means periodical cash benefits granted exclusively by reference to the number and, where appropriate, the age of the members of the family (definition of Article 1(u)(ii) of Regulation (EEC) No 1408/71);<sup>1</sup>

**‘member of the family’** means – in accordance with Article 1(i) of Regulation (EC) No 883/2004 – any person defined or recognised as a member of the family or as a member of the household by the legislation under which benefits are provided; thus, it is a question of definition under the legislation which applies in the concrete case; if this legislation makes it necessary that the person concerned lives in the same household as the insured person or the pensioner, this condition has to be regarded as satisfied if the person in question is mainly dependent on the insured person or pensioner;

**‘export’** is from a legal point of view misleading; in principle Regulation (EC) No 883/2004 obliges to grant the family benefits also for the children residing in another Member State; therefore, it depends mainly on the legislation of the Member State which has to grant the benefits to whom the benefits have to be granted; if they have to be granted directly to the children this indeed usually means export; if they have to be granted to one of the parents this is not export, but it is assumed that the person receiving the money spends it in favour of the children concerned; if this is not the case, Article 68a of Regulation (EC) No 883/2004 safeguards that the benefit is transferred to the person who really maintains the children; this is only a clarification for the reader; we do not intend to change anything in this respect under our options and decided to use the word ‘export’ in a broader sense for all situations in which the children reside outside the Member State concerned;

---

<sup>1</sup> In MISSOC tables family allowances can usually be found under the heading ‘Classic child benefits’.

‘**Member State with primary competence**’ means the Member State which has to grant its family benefits by priority (this Member State has to grant the full amount of the benefit under the legislation it applies). We will use this term throughout this report, also if we propose changing the rules of priority (for further details under today’s coordination please read chapter 3.1.2).

‘**Member State with secondary competence**’ means the Member State which only has to top up the family benefit of the Member State with primary competence in the event that the family benefits of this Member State with secondary competence are higher (differential supplement – see below).

‘**differential supplement**’ means the topping up of the family benefit of the Member State which has been declared primarily competent by the Member State which is secondarily competent to reach the amount of benefits in the latter Member State (which is only necessary if the latter amount is higher than the first one – today provided under Article 68(2) of Regulation (EC) No 883/2004);

The **different States** to which Regulation (EC) No 883/2004 applies have at certain points been abbreviated in the following way: Austria (**AT**); Belgium (**BE**); Bulgaria (**BG**); Switzerland (**CH**); Cyprus (**CY**); the Czech Republic (**CZ**); Germany (**DE**); Denmark (**DK**); Estonia (**EE**); Greece (**EL**); Spain (**ES**); Finland (**FI**); Liechtenstein (**FL**); France (**FR**); Hungary (**HU**); Croatia (**HR**); Ireland (**IE**); Iceland (**IS**); Italy (**IT**); Lithuania (**LT**); Latvia (**LV**); Luxemburg (**LU**); Malta (**MT**); the Netherlands (**NL**); Norway (**NO**); Poland (**PL**); Portugal (**PT**), Romania (**RO**); Slovenia (**SI**); Sweden (**SE**); Slovakia (**SK**) and the United Kingdom (**UK**).

A **bibliography**, including selected literature on the coordination of family benefits for further reading, is attached as **Annex 3**.

## 1.2 Mapping

We also want to already refer to the **mapping** which had to be done especially to reflect the specific impact of the proposed amendments (options) in the different Member States, but, also to map the current situation and the problems encountered. For this purpose questionnaires were sent to **FreSsco national experts**. The countries were chosen according to substantive and geographic criteria. Care was taken to select countries that provide family benefits as income replacement benefits and those with no link to employment and paying of social security contributions, those with very diverse family benefits and those with more simple ones, countries from continental Europe, Eastern Europe and a Scandinavian country. Hence, the questionnaire was sent to (and the replies were received from) **Austria, Belgium, Bulgaria, the Czech Republic, Croatia, Luxembourg, Poland, Slovenia** and **Sweden**. It has to be mentioned also that the selected Member States have very different levels of cost of living standards. Starting with the Member State with the highest level,<sup>2</sup> **Sweden** is No 2, **Luxembourg** No 4, **Belgium** No 8, **Austria** No 10, **Slovenia** No 16, **the Czech Republic** No 22, **Croatia** No 23, **Poland** No 26 and **Bulgaria** No 28. Due to the very restricted time schedule for all three think tank reports (next to the present one also on special non-contributory cash benefits and unemployment benefits), all three questionnaires could not be sent to the same national experts (candidate countries for the analysis of family benefits could also be **DE, UK** or **FR**), since this would clearly be overburdening for them. The results of the replies received have been incorporated into the report wherever best fitted. These parts are clearly distinguished in separate chapters.

Whenever we refer in this report to the special situation in one Member State, this is as a rule the outcome of the replies to the questionnaire (thus, the opinion of the FreSsco experts) and not of other (e.g. official) sources.

---

## Current situation and problems

### 1.3 *Legal background – coordination of family benefits under today’s coordination rules*

#### 1.3.1 *The coordination embedded in the general principles of the TFEU*

The substantive rules currently in force to coordinate family benefits in the EU are stipulated by Regulation (EC) No 883/2004, more precisely in its **Title III, Chapter 8**. Understandably the preamble of the said Regulation as well as Title I, which sets out general provisions, and Title II, which fixes the main principles for the determination of the applicable legislation, are extremely important, as well as implementation Regulation (EC) No 987/2009.

To better understand the idea of the coordination rules, it is useful to note that Regulation (EC) No 883/2004 was enacted under **the legal base of Articles 48 and 352 TFEU**. The former one obliges the EU institutions to adopt measures to secure the rights of migrant workers and their dependants in the field of social security, which are necessary to provide freedom of movement to workers. In other words one of the aims of the Regulation is “*to contribute to the establishment of the greatest possible freedom of movement for migrant workers*”, which is one of four fundamental freedoms of the EU, along with free movement of capital, goods and services.

It has to be mentioned that compared to the previous coordination Regulations, the current one is broader as it applies to all nationals of a Member State, stateless persons and refugees residing in a Member State who are or have been subject to the legislation of one or more Member States, as well as to the members of their families and to their survivors (Recital No 7; Article 2). Thus, it does not only cover economically active persons and their families, but everyone who has had some contact with the social security of several Member States. For persons who cannot be regarded as being active, the

Regulation was adopted following the procedure in Article 352 TFEU. The broader personal scope is logical, taking into account the general trend to expand also the rights of non-active EU citizens (especially under the fundamental right to free movement for all Union citizens under Article 18 TFEU).

The Court of Justice of the European Union (CJEU) has consistently held that Article 48 TFEU provides for the coordination, not for the harmonisation, of the legislation of the Member States. The aim of coordination is to adjust social security schemes in relation to each other in order to regulate transnational questions, with the objective of protecting the social security position of migrants (or any other eligible persons according to the Regulation), by guaranteeing that persons do not lose their social security rights due to migration. At the same time the coordination rules have a neutral character, which means that in principle situations have to be accepted where, due to the change of applicable social security legislation, the migrant person may find him or herself in a less favourable situation deriving from the substantive law of the Member State where the person migrated to (as, for example, the substantive law, applicable according to coordination rules, provides for lower amounts of benefits). However, the situation could also be in favour of the migrant.

Before going more into detail of Regulation (EC) No 883/2004 it is also important to mention **Article 18 TFEU**, according to which, within the scope of application of the Treaties, any discrimination on grounds of nationality must be prohibited and Article 45 TFEU, which, in the context of free movement of workers prohibits any discrimination on grounds of the migrant worker's nationality.

The aim of all coordination rules, is, as previously said, to guarantee that a person, due to free movement, is not losing his or her social security rights. Looking at the preamble of the Regulation, especially recitals No 1, 7, 8, 13, and 17, and taking into account the legal base from the TFEU, it could be said

that the Regulation concentrates on securing the social security rights of all EU citizens who have used their right to free movement and their family members, and not especially of economically active persons. But, arguments could also be found which support the idea that the Regulation still gives priority to economically active persons and their families, especially concerning family benefits, (see also recitals No 8 and 17 of the preamble) as the previous Regulations did. This question of the personal scope is important in defining whether the aim is to particularly guarantee the equal treatment of migrant workers and their rights in the Member State of activity or whether the aim is more general – to secure the social security rights of all persons who have used their right to move freely on whatever ground or have been in contact with that right through family members.

### *1.3.2 Specific rules on coordination of family benefits*

This part gives a short description of the main principles of coordination of family benefits. To guarantee persons' rights (also to family benefits), in **Title I** the Regulation provides for generally applicable principles, e.g. specific rules for aggregation of insurance etc, periods in different Member States, the assimilation of facts, the waiving of residence rules. The Regulation also enacts a general rule which should prevent overlapping of benefits (Article 10 and specific rules in Title III). All these general principles are well-known to the reader and seem unnecessary to be repeated at this occasion.

**Title II** of the Regulation determines which legislation is applicable to a person. As a general rule, the person covered by the Regulation should be subjected to the legislation of a single Member State (Article 11(1)). Article 11(3) defines the general rules of applicable legislation: as in previous Regulations, the Member State in which the person concerned pursues his or her activity as an employed or self-employed person should be the (one and only) competent Member State in social security matters (see recital No 17

and Article 11(3)(a)) and that State should also apply the general principles mentioned above; in particular it should treat the person equally with its nationals (Articles 4 and 5). At the same time there are more and more rules in the Regulation which derogate from this general principle of competence of the Member State of gainful activity and which complement these rules, and also which regulate competence situations where a person is not economically active, but is still covered by the Regulation. This determination of the applicable legislation is of utmost importance for the coordination of family benefits as – on the one hand – only a Member State which is competent for one of the members of the family (including the one competent for a child) has the obligation to grant benefits under Regulation (EC) No 883/2004<sup>3</sup> and – on the other hand – every competent Member State is obliged to open entitlement to its family benefits for all family members, irrespective of whether they reside in the same or in another Member State (Article 67 of Regulation (EC) No 883/2004).

Without any additional rules this could lead to overcompensation if all Member States competent have to grant the full amount of their family benefits. Therefore, **Title III, Chapter 8** of Regulation (EC) No 883/2004 provides for priority rules which set up a hierarchy of competent Member States (especially Article 68). Only the Member State which has primary competence has to grant the full amount of its family benefits and any other competent Member States only have to grant a top-up in the event that the family benefits under the legislation of these Member States are higher than those of the Member State with primary competence. In a nutshell, this hierarchy could be described as follows: competence of a Member State due to work has priority over the competence of a Member State granting a pension,<sup>4</sup>

---

<sup>3</sup> To keep this part simple we do not want to refer to the specific solutions developed by the CJEU under the general principles of the TFEU in relation to Member States not competent for any member of the family which provide for entitlements under national legislation alone – e.g. the judgment in *Hudzinski and Wawrzyniak*, C-611/10 and C-612/10, EU:C:2012:339.

<sup>4</sup> The case of pensioners is special as it is not the Member State competent for the pensioner under Title II of Regulation (EC) No 883/2004 (which would be, based on Article 11(3)(e), the Member State of residence) but the Member State which

which has priority over competence due to mere residence. The Regulation also contains special provisions for those cases in which more than one Member State at the same step of hierarchy is involved (e.g. two different Member States in which the parents exercise a gainful activity and thus are subject to the legislation of both Member States due to Article 11(3)(a) of Regulation (EC) No 883/2004). In these cases the residence of the child gives priority. Should no result be obtained thanks to this rule either (e.g. the child resides outside the two Member States in which the parents exercise a gainful activity) there are additional rules which determine the Member State which has to grant its family benefits by priority. As these are very rare cases we do not want to go into the details of these rules.

#### 1.4 Legal problems

The rules on family benefits under Regulation (EC) No 883/2004 are one of today's most complex and disputed fields of coordination. Among the problems of a legal nature especially the following have to be mentioned:

- **Various and diverging types of family benefits in cash:** Taking into account the rulings of the CJEU, not only the traditional family allowances have to be regarded as family benefits. This includes also a bouquet of other benefits which do not have a lot of common elements, but, which have a general aim, which is (at least in part) the intention to meet family expenses: child-raising benefits which are usually meant to help the concrete person taking care of the child and which, therefore, replace income which cannot be received during the child-raising period;<sup>5</sup> tax benefits which are granted as a tax bonus;<sup>6</sup> an aid for child

---

grants the pension; thus, the Regulation adds Member States which have to grant family benefits to those which are competent under its Title II.

<sup>5</sup> E.g. the judgment in *Hoever and Zachow*, C-245/94 and C-312/94, EU:C:1996:379; the judgment in *Kuusijärvi*, C-275/96, EU:C:1998:279; the judgment in *Weide*, C-153/03, EU:C:2005:428; the judgment in *Dodl and Oberhollenzer*, C-543/03, EU:C:2005:364; and most recently the judgment in *Wiering*, C-347/12, EU:C:2014:300.

<sup>6</sup> Judgment in *Lachheb*, C-177/12, EU:C:2013:689, concerning the aspects of tax benefits which are at the same time social security benefits; see B. Spiegel (ed.), K. Daxkobler, G. Strban & A.P. van der Mei, 'Analytical report 2014: The relationship between social security coordination and taxation law', FreSsco, European Commission, January 2015.

care at home if the public kindergartens are not used;<sup>7</sup> but also advances of maintenance payments<sup>8</sup> and childbirth and adoption allowances<sup>9</sup> (this last group had to be explicitly excluded from the definition of family benefit to safeguard that Regulation (EC) No 883/2004 does not apply to them – Article 1 (z)). This variety of benefits makes it difficult to know exactly which benefits have to be coordinated and which fall outside the material scope of the Regulation.

- **A transition from work-related concepts towards the inclusion of anybody covered by a social security scheme:** While Regulation (EC) No 883/2004 switched from covering (in principle) only gainfully active persons and their dependents (as has been the case with Regulation (EEC) No 1408/71) towards covering all persons subject to any social security scheme (Article 2), the coordination rules for family benefits still follow the old logic by giving priority to the situation of the gainfully active persons. This could cause some tension with the rights which every EU citizen derives from European citizenship (which rights have priority: those as a European citizen as an own right or those derived from another gainfully active person?). Without going further into that issue we recommend that this is an aspect which could also be further taken into account when thinking about concrete reforms of the coordination of these benefits.
- **The calculation of the differential supplement:** When the Member State which is not competent by priority has to top up the benefits of the Member State competent by priority many questions arise. The question if this top up has to be made for the total of all family benefits together or only per benefit category has been decided under Regulation (EEC) No 1408/71 by the CJEU in favour of the second option.<sup>10</sup> Although some doubt may arise whether this also applies for the application of Regulation (EC) No 883/2004, there are convincing arguments in that direction.<sup>11</sup> Another issue which is still not decided

---

<sup>7</sup> Judgment in *Maaheimo*, C-333/00, EU:C:2002:641.

<sup>8</sup> Judgment in *Offermanns*, C-85/99, EU:C:2001:166, judgment in *Humer*, C-255/99, EU:C:2002:73, and judgment in *Effing*, C-302/02, EU:C:2005:36.

<sup>9</sup> If Luxemburg had not excluded this benefit explicitly it would have been covered by Regulation (EEC) No 1408/71; judgment in *Leclere and Deaconescu*, C-43/99, EU:C:2001:303.

<sup>10</sup> Judgment in *Wiering* EU:C:2014:300.

<sup>11</sup> See also Y. Jorens & J. De Coninck, 'Reply to an ad hoc request for comparative analysis of national legislations. Family Benefits – Consequences of the Wiering judgment in C-347/12', FreSsco, European Commission, December 2014, 132 p.

is whether this calculation has to be made per family or per child (which could also lead to totally different results, the latter one giving entitlement to higher benefits than the first one).

- **An unclear situation concerning benefits in kind:** The notion of family benefits also covers all benefits in kind. Despite that, Regulation (EC) No 883/2004 does not provide for clear rules (as are e.g. provided in the field of sickness benefits in kind<sup>12</sup>) on which Member State has to grant these benefits. Although concrete rulings of the CJEU are still missing,<sup>13</sup> it cannot be excluded that these benefits have to follow the general rules of coordination of family benefits including the obligation to grant them also for children residing outside the Member State concerned. Of course it is very difficult to imagine the export of e.g. free school books, free school milk or free travel from home to school to other Member States, but, would it not be possible that the CJEU, once asked, deducts from these rules an obligation to reimburse the expenses incurred outside the competent Member State?<sup>14</sup>
- **Which persons have to be regarded as members of the family:** Under the traditional family concept the question which persons can open entitlement to family benefits was not so difficult to answer (the parents and the children). Modern family situations have altered this dramatically. Today it is in some situations very complicated to decide which persons might be involved. The CJEU had to respect these new situations and declared also persons outside the actual family as persons who might open entitlement to family benefits, e.g. a divorced parent.<sup>15</sup> As a result, much more individuals could be concerned when

---

<sup>12</sup> There is a whole Chapter 1 under Title III of Regulation (EC) No 883/2004 which deals with the various aspects of the granting of sickness benefits in kind. Most important is that there is no export of these benefits but an obligation of the Member State where the concrete treatment is effected to grant these benefits at the expense of the competent Member State.

<sup>13</sup> In the judgment in *Commission v Austria*, C-75/11, EU:C:2012:605, the CJEU did not have to answer the question whether the Austrian reduced costs for public transport have to be regarded as family benefits in kind under Regulation (EEC) No 1408/71.

<sup>14</sup> Following e.g. the reimbursement obligation developed by the CJEU in the cases on 'patient-mobility'; but of course, the cases we are confronted with are usually not cases on the freedom to provide services under Article 56 et seq TFEU. As this is not the main subject of this report we do not examine this question more in depth; for our purpose it is most important to mention it as a problem.

<sup>15</sup> Judgment in *Slanina*, C-363/08, EU:C:2009:732; this ruling is understood in Austria as extending the notion of member of the family beyond the definition of Article 1(i) as also children who have not been dependent on the insured person came within the notion of member of the family .

calculating the amounts of family benefits. The definition of family member under Article 1(i) of Regulation (EC) No 883/2004 should be analysed if it really gives enough clarity concerning all persons who could fall under the notion of ‘family member’. Another issue is also if today’s definition covers in a sufficiently broad way all new forms of family which are recognised only under the legislation of some Member States (e.g. homosexual marriages).<sup>16</sup>

## **1.5 Administrative problems**

### **1.5.1 Results from the mapping exercise**

The **FreSsco national experts’** replies to the questionnaire showed some details concerning administrative difficulties. Certain administrative problems were reported by the majority of FreSsco national experts, arguing that the coordination regime for family benefits does not function perfectly in practice. Causes might lie for instance in the difficulty of comparing distinctive family benefits, not only due to diversity in the nature of these benefits, but also due to diversity of eligibility conditions for claiming them (e.g. in **LU**).

It seems that in **Austria** the principle that **the whole family must be considered** for the entitlement to family benefits leads to major administrative efforts for the competent institutions. They are obliged to identify all relevant facts regarding the mother, the father and the child. Also **Poland** reported problems regarding the classification of benefits and of a family (e.g. the legal situation of a step-parent). Similarly in **Bulgaria**, the reference to persons who have to be specified in part A of the E400 family benefit confirmation form creates certain difficulties. The form requires referral to a (former) spouse or other person/persons whose entitlement to family benefits in the country of residence of those family members should be verified. This allows referral of economically inactive persons (pensioners and even deceased relatives) and in

---

<sup>16</sup> See also Y. Jorens, B. Spiegel, J.-C. Fillon & G. Strban Think Tank report 2013, ‘Key challenges for the social security coordination Regulations in the perspective of 2010’, Chapter 5.

that manner, to designate the other Member State as primarily competent (based on occupation). Moreover, in Bulgaria a large number of portable documents and certificates providing data only for family allowances for children in Bulgaria is being issued to individuals (by the Social Assistance Directorate at the Ministry of Labour and Social Policy). These do not provide information for occupation and activity in Bulgaria, and thus they cannot serve to determine the competent institution under the social security coordination rules.

All that may result in **rather long procedures**. Lengthy procedures were reported not only by **Austria**, but also by **Croatia** and **Slovenia**. In the latter it appears that the reason lies especially in complicated matters of coordination of family benefits and the important increase of coordination issues since Croatia's accession to the Union. In addition, only few experts are dealing with the coordination of family benefits, which may result in administrative decisions being issued only after a year from claiming the benefits (with an even longer tendency in the future). Moreover, certain procedures, like the one for the recovery of benefits, are as a rule not even instigated. Interestingly, in order to prevent fraud and abuse of family benefits, it is reported that **the Czech Republic** is currently starting negotiations with Slovakian partners on a possible future anti-fraud bilateral agreement. However, this procedure is only in a very beginning stage and no details on the future content of such an agreement are known yet.

So far, problems encountered and reported by the **Croatian** authorities relate also to **cooperation with the competent institutions of other Member States**. It seems that the main problem consists in obtaining the answer from another Member State, particularly where there is primary competence in another Member State on the basis of receipt of pension. The procedure is often long, without a reply from the Member State with primary competence. This results in the temporary granting of benefits by the Member State with secondary competence (i.e. **HR**), which could potentially lead to lengthy and

complicated reimbursement procedures. Another problem in communication arises with the forwarding of applications for family benefits, which are deemed submitted in all Member States if they are submitted in one Member State (which is then liable to forward it, if the facts of the case so require). Practice shows that applications are either not forwarded at all, or are forwarded without response from the other Member State.

Administrative problems in the cross-border exchange of data were also reported by **Belgium** and **Bulgaria**. In **Bulgaria** it seems that the series **E400 forms** and the SEDs of the F-series are exchanged on paper by regular post. As a result, the information flow lingers and a risk of losing documents always exists. Introduction of upcoming electronic exchange should accelerate and facilitate the process of data exchange.

Reportedly, in **Sweden** there are problems concerning the **coordination of income-replacing parental benefits** (see 4.1.4 below).

Another problem was reported by **Austria** in relation to family benefits. Entitlement to family benefits often **effects inclusion into social insurance**, like health or pension insurance. This can cause problems if the person concerned is already insured because of the prolongation of employment, e.g. during maternity leave. In this case the question arises which Member State is competent to provide social insurance coverage? This is also due to the fact that the material scope of Decision F1 of the Administrative Commission for the Coordination of Social Security Systems<sup>17</sup> is not clear enough regarding the applicable legislation.

Despite all the problems mentioned above, not many **national court cases** dealing with social security coordination of family benefits were reported. None or very few (non-recent) cases were reported by **Belgium, Bulgaria, the**

---

<sup>17</sup> Administrative Commission for the Coordination of Social Security Systems, Decision F1 of 12 June 2009 concerning the interpretation of Article 68 of Regulation (EC) No 883/2004 of the European Parliament and of the Council relating to priority rules in the event of overlapping of family benefits, OJ C 106, 24.04.2010, p. 11-12.

**Czech Republic, Hungary, Luxembourg** (apart from two famous cases, i.e. *Lachheb*<sup>18</sup> and *Wiering*<sup>19</sup> – introducing insecurity for the **Luxembourg** institution CNPF<sup>20</sup>) and **Slovenia**.

It is in **Austria** that several court cases were reported. In 2014 and 2015 (until end March) Austrian higher courts had to decide 23 cases regarding the coordination of family allowance (*Familienbeihilfe*) and two cases regarding the coordination of childcare cash benefits (*Kinderbetreuungsgeld*) under Regulation (EC) No 883/2004 (or Regulation (EEC) No 1408/71, respectively).

In **Sweden** (apart from the *Kuusijärvi*<sup>21</sup> case, also mentioned below) courts had to deal with the question of the duration of export of residence-based family benefits, such as child allowance.<sup>22</sup> Sweden also reported a specific problem with regard to the case law on the deduction of days to be made when parental benefits have been paid out in other Member States.<sup>23</sup> The negative consequences for families with one frontier worker were also acknowledged in the Swedish media.

---

<sup>18</sup> Judgment in *Lachheb* EU:C:2013:689.

<sup>19</sup> Judgment in *Wiering* EU:C:2014:300.

<sup>20</sup> Caisse nationale des prestations familiales.

<sup>21</sup> Judgment in *Kuusijärvi* EU:C:1998:279.

<sup>22</sup> Reportedly, one case concerned a woman who had left Sweden for France. As long as she was a student there with Swedish study allowance, she was entitled to continued payments of child allowance. However, when her studies came to an end, the Social Insurance Agency claimed that she was no longer covered by Swedish legislation. The Administrative Court of Appeal found that the woman, due to a leave of absence from her Swedish employer, could not be regarded as having ceased all occupational activity in Sweden (compare with the *Kuusijärvi* case). The Social Insurance Agency appealed and claimed that the woman was no longer covered by any risk according to Swedish social security legislation, since a person during leave of absence is not covered by the Swedish work-based social security legislation (compare with the *Dodl/Oberhollenzer* cases). The case was not granted leave to appeal in the Supreme Administrative Court.

<sup>23</sup> According to national legislation, Sweden is entitled to deduct days from the total of 480 Swedish days of benefits. However, to establish how many days have been taken out in another Member State may be problematic. The full Swedish parental benefit equals seven days of benefits a week. The Swedish Social Insurance Agency has taken the stance that, when transforming weeks taken out into days, a foreign week equals seven days, regardless of how many actual days the person has been granted in the other Member State during that week. In a situation where the mother worked in Denmark, for example, and had started the parental leave, the Swedish deduction led to situations where there were no days left for the father, working in Sweden, when he wanted to draw his parental benefit.

Several (administrative) court cases were also reported by **Poland** concerning overlapping of family benefits and the determination of the applicable legislation. Polish courts are of the opinion that the subject of comparison should be only the total amount of the benefit(s) granted, rather than the particular amounts of each type of benefits granted,<sup>24</sup> which seems to be in opposition to the CJEU judgment in *Wiering*.<sup>25</sup>

#### 1.5.2 *Short conclusions on the administrative problems*

As shown by the mapping exercise, many technical and administrative problems occur in today's application of Title III, Chapter 8 of Regulation (EC) No 883/2004 (beside the legal problems). It is not the subject of this report to deal with all the different problems; only those relevant to export will be analysed if needed. Nevertheless, from our point of view especially the following problems can be summed up (some of them stemming from the FreSsco national experts, some added from our experiences and knowledge):

- problems identifying the Member State competent by priority;
- problems calculating the differential amount by the other Member States;
- very lengthy procedures which lead to situations in which the families concerned have to wait long before any benefit is paid;
- problems calculating provisional benefits;
- problems recovering overpayments.

## **1.6 Political problems**

### **1.6.1 General remarks**

On top of the legal and administrative problems, in recent years the coordination of family benefits also became the focus of political attention. Anecdotally, some stakeholders' main concern and point of criticism is that the family benefits which have to be granted for children residing outside the competent Member State have to be exported without any limitation, irrespective of the (economic) situation in these children's Member State of residence. Member States with relatively high amounts of family benefits could argue that this unlimited export is not fair, as it provides (in relation to the economic situation) much more money than the local families (without cross-border movement) get. Main purpose of the mandate for this report (which clearly mentions these concerns) is to look into various options for the export of family benefits which could solve the political problems. But, already at that occasion it has to be stressed that our group did not see today's situation of unrestricted export of family benefits in such a dramatic way; in public discussion only very few Member States raised this issue.

As any option which is different from the status quo will not be measured in relation to its impact on these political problems alone, but, also in relation to the legal and administrative problems described, we will also refer to them and have a look if these problems could also be solved or at least diminished. The option which could best solve all three categories of problems would be the preferred one.

### **1.6.2 Results from the mapping exercise**

Despite all the problems mentioned and also the rationale behind our mandate, hardly any **political debate** on coordination of family benefits was reported by the **FreSsco national experts**. It is considered that the coordination

Regulations are a technical matter, giving rise to debates only between experts (e.g. CNPF in LU). For example, the *Wiering* case law<sup>26</sup> is of great importance for **Luxembourg**, but it seems too hard to explain it in detail to the public. Some public debate on family benefits was reported by **Slovenia** (following the adoption of the new family benefits act) and **Bulgaria** (on very low family benefits and their entitlement for the Roma population), but none on the coordination of family benefits. No public debate on coordination was also reported by **Belgium, Bulgaria, the Czech Republic and Slovenia**.

Conversely, there was some public debate in **Poland** on transfer of family benefits from other Member States, especially from the United Kingdom to Poland. This started when David Cameron, British Prime Minister, stated that he would try to renegotiate the UK's membership of the European Union to allow it to withhold child benefits for children living in other EU countries.<sup>27</sup> This became an international affair, and Polish foreign minister Radek Sikorski, talking about reciprocity, wrote on his official site: "*If Britain gets our taxpayers, shouldn't it also pay their benefits? Why should Polish taxpayers subsidise British taxpayers' children?*"<sup>28</sup> It has to be noted that in the United Kingdom child benefit claims under Regulation (EC) No 883/2004 in respect of children living in Poland are constantly decreasing.<sup>29</sup>

---

<sup>26</sup> Judgment in *Wiering* EU:C:2014:300.

<sup>27</sup> David Cameron said: "*It's a situation that I inherited ... I think it will take time because we either have to change it by getting agreement from other European countries – and there are other European countries who, like me, think it's wrong that someone from PL who comes here, who works hard, and I am absolutely all in favour of that, but I don't think we should be paying child benefit to their family back at home in Poland.*" R. Mason, 'Cameron to push for cap on European migrants in UK negotiations with EU', *The Guardian*, 5 January 2014, available at <http://www.theguardian.com/uk-news/2014/jan/05/cameron-cap-european-migrants-uk-negotiations-eu> (last accessed 17 March 2015).

<sup>28</sup> B. Waterfield, 'Poland attacks David Cameron plan to ban Polish and EU migrants from claiming child benefit', *The Telegraph*, 6 January 2014, available at <http://www.telegraph.co.uk/news/worldnews/europe/poland/10553020/Poland-attacks-David-Cameron-plan-to-ban-Polish-and-EU-migrants-from-claiming-child-benefit.html> (last accessed 17 March 2015). He argued that Polish people contributed about double the amount to the British economy than they withdrew in benefits. According to statistics, migrants from the Central and Eastern European Member States are much less likely to claim benefits than British nationals. The majority claim child benefits. In the long run the United Kingdom is receiving the fiscal contribution of migrants' work, without paying for the education and training that enables them to work.

<sup>29</sup> According to statistics, in 2009 there were 22,885 claims for 37,941 children in Poland. In 2013 there were 13,174 claims for 22,093 children of migrants from Poland. R. McInnes, 'Statistics on migrants and benefits', available at <http://www.parliament.uk/briefing-papers/SN06955/statistics-on-migrants-and-benefits> (last accessed 31 March 2015).

## **Horizontal options which are relevant for all options examined with regard to export**

Before going into the concrete options concerning the export of benefits, we want to mention some horizontal issues which emerge when problems in relation to the coordination are mentioned and, therefore, also have relevance for these options. We recommend also including these aspects in any attempt to change the existing system, as they could have significance for the impact assessment of the different options. After our examination of the different options we are convinced that these horizontal questions cannot be left aside by the policy-makers who have to take a decision on which option on export of benefits to follow.

Nevertheless, these additional options are not a must for the new coordination concerning export. They could help to avoid some additional problems, but, any export option would also perfectly work without them (maybe, with different pros and cons as a result of the impact assessment – which can be of great importance for the decision-makers). As this was not explicitly requested we have also abstained from making a detailed impact assessment of these additional options. Whenever important we will refer to them during the impact assessment of the export options. Taking into account the very restricted time available for any reform of the export provisions it would not be realistic to expect that all these additional options will be taken on board at this next occasion. Maybe, these ideas could be further discussed for a more profound revision of the coordination of family benefits in future.

## **1.7 The same coordination for all family benefits?**

### **1.7.1 General remarks concerning the variety of benefits**

Of course export today concerns all family benefits in the same way (letting aside the advances of maintenance payments and special childbirth and adoption allowances which are included in Annex I of Regulation (EC) No 883/2004). Nevertheless, it should be examined if the same coordination for all family benefits is really the perfect solution.

From a historical point of view (when Regulation (EEC) No 1408/71 was drafted) **family allowances** have been the main benefits provided for by the legislation of the Member States. Later on, the bouquet of family benefits as described above expanded and covered more and more different types of benefits. If export is considered the problem which stimulated this search for new options, we have to examine first if all the different groups of family benefits cause the same problems.

### **1.7.2 Results from the mapping exercise**

The diversity of political aims behind the different family benefits of the Member States also became very clear from the replies of the **FreSsco national experts**:

In general, the aim of social security systems is to provide income security in cases of lost (or reduced) income and in cases of additional costs (through a process of broader or narrower social solidarity). More precisely, the **primary goal** of family benefits may be deduced from the *actes préparatoires* (legislative material for the adoption of a new act). As a rule, it is to cover (part of) additional costs a family has due to maintenance and education of a child or more children.

For instance, in **Austria** in the *preparatory documents*<sup>30</sup> for the adoption of the Families' Burden Compensation Act (*Familienlastenausgleichsgesetz/FLAG*)<sup>31</sup> regulating family allowance (*Familienbeihilfe*), it is mentioned that the social policy aim of the Families' Burden Compensation Act is to support families with children when the costs of maintenance and education of children impair the standard of living, especially if a family has more than one child. It has been ascertained that compensating the additional financial burden of families for housing, clothing and nutrition is crucial for the existence of the whole **Austrian** society. This compensation is to be conducted between those who carry that burden – also for the good of the whole society – and those who do not carry such burden and therefore benefit from the fact that others do.

In **Slovenia** the social policy aim of the parental care and family benefits scheme is expressed in the preparatory materials for the new ZSDP-1 (*Zakon o starševskem varstvu in družinskih prejemkih*, Parental Care and Family Benefits Act).<sup>32</sup> It is emphasised that family benefits are a link of the entire uniform family policy, which is exercised also via other policy areas. The ZSDP-1 is based on the social nature of the Slovenian state and the fact that the state cannot ignore the basic societal cell – the family.

The primary goal of family allowances to offset the costs of a family for raising children is reported also by every other Member State (covered by our questionnaire), i.e. **Belgium, the Czech Republic, Poland, Luxembourg** (where family allowances are a personal right of the child),<sup>33</sup> **Sweden** (where family allowances should somewhat even out the differences between families

---

<sup>30</sup> RV 549 BlgNR 21.GP, 11.

<sup>31</sup> Federal Gazette Number 376/1967, latest version Number 53/2014

<sup>32</sup> Government of the RS, legislative proposal for the ZSDP-1, EVA 2013-2611-0042, 10.10.2013

<sup>33</sup> Reportedly, since the beginning of the 21st Century, LU has adopted a new approach regarding welfare of children, based on the United Nations Convention on the rights of the child. Through reforms in fiscal matters – the abolition of income tax classes taking into account the presence of children in a household and the creation of a "child bonus" (2007) – and family benefits – the creation of a childcare voucher (2009), the abolition of family allowances for young people over 18 and the creation of a financial aid for young people in higher education (2010), the government recognised the child as an individual.

with children and those without) and **Bulgaria** (benefits should support parents to raise a child in the family environment).

However, there are also **ancillary (secondary) aims**, like guaranteeing equal treatment of children (**BE**), or maximising the best interests of the child, increasing birth rates and nativity (**HR**), providing more gender equality, enabling workers with family responsibilities to balance between professional and family life (**SI**), or combating the decline in birth rates (**AT**). It is also important to note that family benefits should prevent or even alleviate poverty of children and their families (**BE, BG**). In **Bulgaria** it is discussed that instead of targeting poor people (especially Roma), family benefits should follow children in educational establishments, being dedicated to education and better health care to increase children's potential for future employment and social inclusion. Some initial conceptualisations have, however, become obsolete (e.g. family benefits as a wage supplement for workers with families in **BE**).

Taking all these primary and secondary aims into account, family benefits are **shaped quite distinctively** across Member States. Some amounts may depend on the number of children (e.g. in **SE**) and their age (e.g. in **AT, CZ, SI** for child benefits). Some may be income-related and some provided as a lump sum (e.g. in **LU**). Some may be income-tested or means-tested (**HR**, child allowance in **CZ**, guaranteed child benefit in **BE**, child benefit in **SI**, family allowances and supplements in **PL**). For some (permanent) residence may be required (e.g. in **AT, SI**). There may be special benefits (e.g. partial payment for lost income and childcare supplement in **SI**) or certain supplements for children with disabilities (e.g. in **BE, BG, PL**). Supplements may include additional amounts of certain family benefits for single parents (e.g. in **BE** where it is income-tested, **SI**) or for long-term unemployed, sick or incapacitated parents or those receiving an old-age or survivor's pension (e.g. the **BE** professional scheme), supplements for heating or electricity support (in **BG**), or within the housing benefit (in **SE**).

It should be emphasised that presenting all different features of all family benefits in all Member States is not the central focus of the present report. For this we refer to the annexes (country sheets) of the FreSsco report on the *Wiering* judgment<sup>34</sup> and the MISSOC comparative tables on family benefits.

However, it might be pertinent also for the present analysis whether the **amounts of family benefits (and their adjustment)** are linked to the (minimum or average) wage or social assistance or living costs in the Member State they are being provided. Linking family benefits to different factors might influence the possibility (or criteria) for their adjustment when exporting them to another Member State.

The amounts of some family benefits are not directly linked to any of the abovementioned factors. For instance, in **Austria**, there is no defined percentage of living costs or average income which should be covered by the benefit. The amount is not directly related to minimum income or the social assistance amount. However, family allowance is not deducted when calculating social assistance (*Bedarfsorientierte Mindestsicherung*) in comparison to e.g. cash childcare benefits. This is due to the fact that the latter are qualified as ‘income’, which reduces the amount of social assistance accordingly. In contrast, the amount of social assistance even increases (plus 18%) if the claimant has to care for a child receiving family allowance.

In **Belgium**, in neither scheme (i.e. the professional and residual one) is there a defined percentage of the average income or living costs that should be covered by the benefit. In principle, the amount is not tied to the minimum income or to amounts of social assistance. However, the guaranteed child benefit is granted only to persons who receive social assistance or have a low income (hence, an indirect link to social assistance does exist), and certain supplements are income-tested.

---

<sup>34</sup> Y. Jorens & J. De Coninck, ‘Reply to an ad hoc request for comparative analysis of national legislations. Family Benefits – Consequences of the *Wiering* judgment in C-347/12’, FreSsco, European Commission, December 2014, 132 p.

In **Bulgaria**, the amounts of family benefits are fixed annually by the State Budget Act for the respective year, which means they may differ from one year to another. Each family benefit or allowance type is a fixed sum and is not rate-related with living costs or average monthly or annual income. However, this does not apply to income-related family allowances.

In **the Czech Republic**, the amount of family allowances is not related to minimum income (reportedly, it used to be, but is not anymore), or to social assistance amounts. Interestingly, for Czech parental allowance, it is up to the parent who claims this benefit to choose how long he or she wants to stay at home with the child. The shorter the period, the higher the amount per month (within certain limits).

In **Croatia** benefits depend on monthly income per member of the household as put in relation to the State Budget Base of HRK 3,326 (€436) (the same base applied since 2002). Three income groups are eligible to receive the allowance: households who earn below 50% of the State Budget Base, those who earn below 33.66% of that base and those who earn below 16.33%. Those whose income exceeds 50% of this amount are not entitled. There are also additional supplements. The amount of the child allowance therefore depends directly on the amount of the State Budget Base, which is determined and laid down each year, by the Act on the Implementation of the State Budget for the current year.

Also in **Luxembourg**, the effective costs of the presence of a child in a household have never been calculated. A universalist vision prevails, which means that all children have equal rights, that they have a right to family allowances of the same (lump sum) amount. It is not related to living costs, average income, minimum income or social assistant amounts.

This is similar to **Sweden**, where child allowances and special supplements within housing benefits are not related to the minimum income/social assistance. Still, there appear to be discussions in Sweden from time to time on

whether child allowance should instead depend on the income level of the family. It is argued that in this case the costs for administrating the benefit would increase.

Also in **Poland** family benefits are not defined as a percentage of living costs, average remuneration or social assistance.

However, in **Slovenia** there seems to be a certain link to the minimum wage, e.g. parental allowance used to be determined as 55% of the minimum wage (and according to the new ZSDP-1 it is just set as a corresponding amount, no longer mentioning minimum wage as such). Also partial payments for lost income used to be equalled with (a proportional part or the entire) minimum wage (now the nominal amount is set, which corresponds to the minimum wage as it was set in the first half of 2010). Some benefits are targeted to those below 64 % of the average wage per family member (child benefit and large family supplement)

The most evident link to (former) income (wage) exists in income replacement child-raising schemes, e.g. the **Austrian** income replacement scheme of the cash childcare benefits (*Kinderbetreuungsgeld*), or parental benefits in **Sweden**.

Some family benefits do have a link with the cost of living in the country, which is evident from the **adjustment** (indexation) rules. Some family benefits are adjusted by the rate of inflation (e.g. in **AT**),<sup>35</sup> some by the evolution in living costs (e.g. in **BE** or **SI**). It may also be that family benefit amounts are fixed amounts, which are, e.g. in **Luxembourg**, no longer adjusted to the evolution of living costs.

---

<sup>35</sup> In Austria, for the years 2016-2017 the amount of the family allowance will be increased by 1.9 %. The same applies for the year 2018. That approximately corresponds to the calculated rate of inflation.

### *1.7.3 Benefits with the predominant aim to meet family expenses; questions of definition*

If the political decision behind a family benefit is (besides other policy aims like e.g. the promotion of families or the encouragement to have (more) children) to cover the additional expenses which are caused by the obligation to maintain children (e.g. additional or special nutrition, nappies, prams, school books etc.) it is arguable that this decision is usually only based on the situation in the Member State concerned. The costs of these goods there are the decisive factor. In an ideal transparent world national politics set a percentage of these additional costs which has to be covered by the family benefit. If this decision says e.g. that 20% of these additional costs has to be the amount of the family benefit, this decision is outbalanced if the children need these goods in another Member State where they live and this amount covers e.g. 100% or only 5% of these goods there. In these cases a political problem might arise. On the contrary, our mapping exercise (see 4.1.2 above) showed that national legislatures usually did not refer to a specific percentage of the living costs when a new family benefit was introduced, even if it is also provided for that these benefits have to be adjusted in correspondence to the development of the costs of living in the Member State concerned. Important is also that it seems that no Member State has adjusted its family benefits to different costs of living inside the relevant territory.

For these benefits which include at least the classic family allowances, options could be considered which strive for a better way of achieving the political aims behind the benefit. These benefits will be the main focus of detailed options concerning the export of family benefits. Of course these options could also cover all other family benefits if no decision is taken to split the coordination for the different types of family benefits, but, we should never forget that especially these general benefits gave rise to the main problems with today's export obligations.

Past FreSsco work unveiled the complexity of the notion of family benefits especially if benefits are concerned which are at the same time social tax benefits (benefits granted under tax law which have the clear purpose to cover at least a part of the additional costs due to having children to maintain).<sup>36</sup> The perception from a national point of view of what constitutes a family benefit covered by Regulation (EC) No 883/2004 and which benefits fall outside its scope are very often more influenced by national systematics than European approaches (which should only look into the policy aim of a measure to establish the material scope of the Regulation). This situation has been aggravated by new types of benefits added by the CJEU which are not so evidently covered by the existing definition of family benefits as they cover also other purposes (e.g. helping the person taking care of a child to reconcile work and family life as is very often the case with child-raising benefits).

Therefore, it could be good to start any work on new ways of coordination with a new definition of a family benefit. This would be recommendable even if no specific coordination is provided for specific benefits which are income-related (see 4.1.4 below). Such a new definition should draw a clear borderline in relation to social tax benefits which still remain outside the scope of coordination under the Regulation (if there are any) and should also cover all the other benefits (if no specific new coordination is provided for them).

#### **Proposal for an additional horizontal Option No 1**

The definition of family benefits should be adapted to avoid today's questions of interpretation and to draw a clear borderline in relation to benefits which should remain outside the coordination.

---

<sup>36</sup> B. Spiegel, K. Daxkobler, G. Strban & A.P. van der Mei, 'Analytical report 2014: The relationship between social security coordination and taxation law', FreSsco, European Commission, January 2015.

#### 1.7.4 *Benefits which are employment-related*

##### 1.7.4.1 Which benefits are special because they are employment-related?

Opposed to the classic family benefits there are benefits with quite different political aims. They want to replace income of the person who actually takes care of a child and for that reason interrupts or at least reduces a gainful activity. This is most evident if the amount of the benefit has a clear income replacement function, which means it is calculated as a percentage of the former earnings. But also benefits which have a lump sum nature could be added under this category as long as they are granted to persons exercising a gainful activity. It could be assumed that under today's coordination these benefits give rise to some problems and it is not safeguarded that all Member States apply Regulation (EC) No 883/2004 in the same way.

##### 1.7.4.2 Results from the mapping exercise

The above has also been confirmed by the replies from the **FreSsco national experts**. They especially report the following points:

Problems were reported with the coordination of family benefits in relation to **Sweden**, in particular as regards the **parental benefit**. When Sweden joined the EU it was considered that the parental benefit – which is related to the income of the individual parent – was to be regarded as a maternity benefit. However, the CJEU classified the parental benefit as a family benefit in the *Kuusijärvi* case.<sup>37</sup> Reportedly, there have been many cases in national courts regarding parents moving during parental leave and the issue of their right to continued payments of benefits. The issue of non-actives moving to Sweden and claiming parental benefits has also come up in the courts. The Supreme Administrative Court referred such a case to the CJEU (*Bergström*).<sup>38</sup> In general, it is argued that the coordination of family benefits has been one of

---

<sup>37</sup> Judgment in *Kuusijärvi* EU:C:1998:279.

<sup>38</sup> Judgment in *Bergström*, C-257/10, EU:C:2011:839.

the main problematic issues when it comes to applying Regulation (EEC) No 1408/71 and (EC) No 883/2004 in Sweden.

There have also been some cases concerning the overlapping of benefits in Sweden. As mentioned, parental benefits compensate income loss, whereas 'normal' family benefits are related to costs in general for having a family. Since some other Member States do not classify their parental benefits as family benefits, Sweden has often been obliged to pay supplements for families residing in another State, while one of the parents is working in Sweden. The Swedish Social Insurance Agency issued two reports on this issue, one in 2004 and one in 2006, to look into the cost for Sweden.

Also, the individual worker could be negatively affected by the fact that flat-rate benefits were put in the same benefit basket as the income-related parental benefit. The following example came up in the case law: a worker in Sweden whose family and working husband were in Denmark was taking out a few days of parental benefit a month (reportedly, in Sweden this is a common way of reducing working hours when having small children, since parental benefits may be spread out over several years; also when the child is sick parental benefits can be taken out). Denmark is then primarily responsible for family benefits. The Danish child allowance is higher than the Swedish one. When calculating the supplement for Sweden to pay out in this situation, the Swedish parental benefit was regarded as a family benefit, meaning that the few days of parental benefit 'disappeared' in relation to the higher Danish amount, despite covering income loss for the worker and not general costs for the family.

The problems related to overlapping of benefits have led to a special solution in the 2012 Nordic Convention (a multilateral convention based on Regulation (EC) No 883/2004 between **SE, DK, NO, FI and IS**), meaning that when calculating differential supplements for family benefits in accordance with Article 68(2) of the Regulation, benefits intended to compensate income loss for parents are not to be included.

As of September 2011, **Sweden** reportedly has taken the view that the parental benefit is to be regarded as a maternity/paternity benefit. This means that the Social Insurance Agency from this date on no longer includes parental benefits when calculating differential supplements (i.e. the same solution as in the Nordic Convention). The re-classification of parental benefits is, however, questionable. From our point of view it is difficult to justify such a fundamental change in interpretation taking into account that the general principles of coordination and the definition of family benefits did not change when Regulation (EC) No 883/2004 was adopted.

The fact that the parental benefit could be exported to family members in other Member States with no individual income in Sweden – which was one of the consequences of the classification in *Kuusijärvi*<sup>39</sup> – has been considered quite odd. One problem that could occur was on which level the benefits had to be granted – the income level of the spouse working in Sweden or the basic level granted in Sweden to non-actives.

The above example shows the diversity of family benefits in general and specific features of employment-related benefits in particular.

#### 1.7.4.3 Proposal for a new way of coordination

From our point of view the negative consequences of coordinating a family benefit with an income replacement function can be best shown by way of an example:

***Example:***

*Member States A and B know a child-raising benefit for the person who interrupts the gainful activity and takes care of the child for one year after birth. The amount of the child-raising benefit is in Member State A 60% of the previous earnings; in Member State B it is 80%. In addition, Member State A*

---

<sup>39</sup> Judgment in *Kuusijärvi* EU:C:1998:279.

*knows a lump-sum benefit (fixed amount) for persons who were not gainfully active before they started taking care of a child.*

*In a family which resides in Member State A the father works in Member State A while the mother works as a frontier worker in Member State B. The mother draws child-raising leave after maternity leave and stays with the child at home.*

*Under today's coordination<sup>40</sup> Member State A has primary competence. Will it grant the child-raising benefit under its legislation by compensating 60% of the income of the mother (who has been subject to the legislation of Member State B and not of Member State A)?<sup>41</sup> In this case Member State B (secondarily competent) will have to grant a differential amount of 20% to reach the 80% provided under its legislation. Or will it, maybe, only grant the lump-sum amount for non-active persons in that Member State and will Member State B grant a differential supplement to reach the 80% provided under its legislation?*

From the point of view of the persons concerned this solution is not understood. In principle they would expect that the legislation of the Member State where they exercise their work has to grant these benefits. This is especially the case if there is no clear-cut borderline between the duration of the maternity (paternity) benefit which has to be coordinated under Title III, Chapter 1 of Regulation (EC) No 883/2004 and, thus, be granted from Member State B in our example, and the following child-raising benefit (sometimes the benefits even have the same amount).

To avoid problems of coordination of these types of family benefits it should be considered to draft a specific coordination which is not connected to the coordination of the remaining family benefits. One way could be to state explicitly that for these benefits the same coordination as for maternity or equivalent paternity benefits (Title III, Chapter 1 of the Regulation) should

---

<sup>40</sup> Let us assume we apply the *Wiering* judgment and coordinate all child-raising benefits in one basket.

<sup>41</sup> From the judgment in *Bergström* EU:C:2011:839, it could be assumed that under Regulation (EC) No 883/2004 such an obligation exists.

apply, as seems to be the practice already in some Member States. Thus, only the situation of the person concerned would be relevant and not the one of other members of the family. It has to be admitted that such a radical change of today's coordination which is also a consequence of the clear rulings by the CJEU was not shared by all members of our group. Another way, more in line with the existing coordination, could be to provide under Title III, Chapter 8 of the Regulation specific rules for this kind of family benefits which strengthen the *lex loci laboris* principle of the person who wants to claim the benefit. To avoid overcompensation, only one parent should be entitled to claim such benefits for the family wherever the children reside. Should this recommendation (which is not the focus of this report and, therefore, will also not be elaborated in full detail) be chosen, all options which we will examine in relation to the export of benefits have to be read in such a sense that they do not cover these special child-raising benefits.

For this option we recommend that also the following elements should be further examined:

- **Definition:** It could be said that 'child-raising benefits linked to a gainful activity' are those which are provided under national legislation for persons who are in a gainful activity and who interrupt or reduce this activity with the (sole) purpose to raise a child.
- **Problems with benefits which have both functions, i.e. benefits for all residents + benefits for the gainfully active:** As an example the Austrian child-raising benefit could be mentioned, which consists in various lump sum options for all residents and an income replacement option for gainfully active persons. It has to be decided if only the income replacement option has to be coordinated under the new way of coordination or any of these options if the person is in a gainful employment (we favour the second alternative because this would give any person in gainful employment the option he or she also has under national legislation).

- But, it also has to be taken into account that this approach could **take away rights which exist under today’s coordination**. If we imagine in our example that Member State B does not have any such child-raising benefits, whereas Member State A does, there would be no entitlement. We think this is a consequence which has to be accepted, as it goes without saying that in this situation also e.g. cash sickness benefits would not have to be granted by Member State A if there is no entitlement to such benefits under the legislation of Member State B. Thus, this solution would correspond to coordination usually provided under the individualised approach towards benefits.
- Another issue which should be clarified in that context: for the coordination it should not matter if a family benefit is **financed by tax or contributions or if it is provided for all residents or only the gainfully active population**. Always the same coordination rules should apply with – in principle – the same results. Of course, entitlement in contribution-based systems could be seen as problematic when no contribution has been paid into the scheme of that Member State. This is an issue which is further discussed under 5.2 below.
- In this context we have noticed that under today’s coordination the **text of Article 68 of Regulation (EC) No 883/2004** is not as clear as it should be. The words “*rights available on the basis of an activity as an employed or self-employed person*” seem to mean that the person concerned is subject to the legislation of the Member State in question due to the exercise of an activity as an employed or self-employed person under Title II of the Regulation.<sup>42</sup> Yet, it could also mean that the scheme concerned is based on an activity as an employed or self-employed person (excluding residence-based schemes). If a reform of these provisions of the Regulation is undertaken, also this possibility of misunderstandings (which leads to totally different results of coordination) should be removed. Our discussion showed that also the last sentence of Article 68(2) is not clear and could be made more explicit.

---

<sup>42</sup> Recital 35 of Regulation (EC) No 883/2004 is a strong indicator for that interpretation.

### **Proposal for an additional horizontal Option No 2**

We recommend to further analyse the coordination of child-raising benefits for gainfully active persons and to look for ways of coordination which could take better care of the peculiarities of these benefits compared to classic family benefits like e.g. family allowances.

### **Proposal for an additional horizontal Option No 3**

We recommend some clarification in Article 68 on the meaning of “*rights available on the basis of an activity as an employed or self-employed person*”.

#### *1.7.5 Benefits which have the function of special non-contributory cash benefits*

Up until now Annex X of Regulation (EC) No 883/2004 does not contain any benefits which are related to family benefits. If export is a problem for some Member States because the benefit is strictly limited to the special needs of the local population, it could be examined whether an entry of these rare groups of benefits (if they exist at all) into that annex is possible already under today’s criteria for special non-contributory cash benefits.<sup>43</sup> Or, it could be examined whether a revision of the criteria contained in Article 70(2) of the Regulation is advisable to cover also these family benefits. Thus, all the options discussed in relation to the export of benefits would not apply to these benefits, which could also ease the discussion. But, as this is a very radical and far-reaching approach which could have effect for other benefits, this recommendation is not supported by all members of our group.

---

<sup>43</sup> This is a decision the EU legislature will have to take when such requests for inclusion of new benefits into Annex X of the Regulation are forwarded by a Member State; the moment a benefit is not special but a general social security benefit it can never be listed in that Annex (see also the judgment in *Hosse*, C-286/03, EU:C:2006:125).

#### **Proposal for an additional horizontal Option No 4**

We recommend an examination of the list of Annex X of Regulation (EC) No 883/2004 especially to cover also some family benefits which show the relevant elements.

#### *1.7.6 Advances of maintenance payments and childbirth and adoption allowances*

This is only to mention the problems with the existing exclusion of these benefits from the coordination under Regulation (EC) No 883/2004 the moment they are listed in Annex I. As we know, excluding benefits for which the CJEU decided that they are family benefits of the Regulation does not exclude that the TFEU or even Regulation (EU) No 492/2011 applies to these benefits.<sup>44</sup> When new ways of coordination of family benefits are considered also the special situation of these benefits should not be forgotten.

#### *1.7.7 Special new rules for benefits in kind*

As already said, the exact coordination of family benefits in kind is not clear under the existing coordination. A reform of this part of Regulation (EC) No 883/2004 should also be used to insert the necessary clarifications. From our point of view various options are at our disposal:

- The definition for family benefits could be changed and the application of the Regulation restricted to benefits in cash. This would not mean that benefits in kind would no longer fall under EU law, but all the other relevant instruments, like e.g. Article 45 TFEU or Regulation (EU) No 492/2011 would apply.<sup>45</sup>
- If also family benefits in kind should remain covered by some provisions of Regulation (EC) No 883/2004 it has to be noted that under today's definition of

<sup>44</sup> Judgment in *Hartmann*, C-212/05, EU:C:2007:437.

<sup>45</sup> Judgment in *Commission v Austria* EU:C:2012:605.

benefits in kind (Article 1(va)) no reference is made to family benefits, which could be regarded as disturbing and should be clarified.

- It could be provided that family benefits in kind always have to be provided only by the children's Member State of residence (no export, but, of course aggregation of periods if needed and equal treatment); this is what seems to be today's practice by many Member States but without a clear legal basis.
- This last option could be complemented by a reimbursement provision (as today provided under the Regulation for sickness benefits in kind), thus making the provision quite complex, not changing anything for the beneficiaries concerned and – as not all Member States share the same concept of family benefits in kind – burdening some Member States with costs of family benefits much higher than under today's coordination.

#### **Proposal for an additional horizontal Option No 5**

A clearer rule concerning family benefits in kind should be introduced.

#### *1.7.8 Clustering of benefits for the purpose of calculating the differential supplement*

Of course, the consequences of the *Wiering* judgment are far from clear<sup>46</sup> and Member States are not sure about the importance of this judgment in all the different situations. Therefore, it is strongly recommended that the legislature intervenes and clearly defines the different baskets within which the comparison of benefits has to be made to calculate the differential supplements or if all the benefits should be taken together. This would be especially important if no special coordination for child-raising benefits is provided for

---

<sup>46</sup> See also the FreSsco report by Y. Jorens & J. De Coninck, 'Reply to an ad hoc request for comparative analysis of national legislations. Family Benefits – Consequences of the *Wiering* judgment in C-347/12', FreSsco, European Commission, December 2014, 132 p.

(see 4.1.4). Our analysis of the different options will not deal with this issue; the reader has to imagine how complex the situation would become if the method of coordination were to be applied to different baskets by some Member States but only to one basket by others if a common approach could not be achieved.

This clarification would not only concern the calculation of the differential supplement but also other aspects like e.g. the obligation to reimburse half of the amount of the benefit(s) of the basket(s) concerned, granted under **Article 58 of Regulation (EC) No 987/2009**. In this context we have to mention that *per se* Article 58 of this Regulation is a provision which could also create a lot of problems. It is not always easy to identify the Member State with the “*highest level of benefits*”. How do you compare a lump sum benefit with a benefit paid every month during years? What is more important, that the benefit lasts longer or the amount granted? What happens when the family benefits are very different? We think that the problems identified up until now with the calculation of the differential amount apply also to the reimbursement under Article 58.

#### **Proposal for an additional horizontal Option No 6**

A clear decision should be made if and, as the case may be, how many baskets of different types of family benefits have to be made for the calculation of the differential supplement and the reimbursement.

### **1.8 Who is a member of the family at the side of the ‘grown-ups’?**

As already shown many problems arise with regard to the question who is a member of the family, especially concerning the persons who could open

entitlements. To avoid these problems and safeguard a more synchronised application of the family benefit coordination between different Member States, we recommend a more detailed definition than today's. However, the legislature could even go further and decide – under a common European definition – e.g. whether the biological parent always has the stronger ties to a child and is thus entitled to open family benefits, even if the child already lives in a new family and e.g. the mother's new partner maintains the child. Or, should it be *vice versa*: always the partners in whose household the children (irrespective of the biological father or mother) really live and are maintained. Maybe there are also other possibilities to clarify the situation. This would deviate from today's principle under which it is always the task of national legislation to define which person has to be regarded as family member (letting aside the condition of the shared household<sup>47</sup>). This far-reaching approach was not supported by all of us.

**Proposal for an additional horizontal Option No 7**

It could be useful to specify or at least clarify who is a member of the family for the purpose of the coordination of family benefits.

**1.9 Also the child could open an entitlement under Regulation (EC) No 883/2004**

If we combine the new elements of Regulation (EC) No 883/2004 (the personal scope is no longer restricted to active persons and their members of the family but covers all persons who are or have been subject to the legislation of a Member State – Article 2) with the clarifications made by the

---

<sup>47</sup> Supplemented by the position of the CJEU e.g. in the judgment in *Slanina* EU:C:2009:732; which at least from the Austrian point of view added European elements to that national definition.

CJEU under Regulation (EEC) No 1408/71 (it does not matter which family member opens entitlements under national legislation; in a cross-border situation all members of the family have to be treated as if they resided in the Member State concerned<sup>48</sup>) it could be discussed if children should always be (also) entitled or open entitlements (also) to family benefits under the legislation of their Member State of residence.<sup>49</sup> Thus, in a situation where a family resides in Member State A and the father works in Member State B while the mother works in Member State C this family opens entitlement to family benefits under the legislation of all three Member States. Therefore, already in a *Bosmann* scenario<sup>50</sup> (no entitlement to benefits in the Netherlands where the mother works and entitlement under national German legislation where the family, and thus also the child, lives) would Regulation (EC) No 883/2004 open entitlement to German family benefits.<sup>51</sup> As discussions within our team showed that this question is not that clear and that the effects of *Bosmann* under the Regulation seem to need further examination as well, the child's situation with regard to entitlement to family benefits in the Member State of residence if the parents exercise their gainful activities in another Member State could be fixed in a clearer way than today.

#### **Proposal for an additional horizontal Option No 8**

It should be clarified that also every child is covered by Regulation (EC) No 883/2004 as a non-active person and, thus, can open entitlement to family benefits in its own situation in the Member State of residence.

<sup>48</sup> E.g. the judgment in *Dodl and Oberhollenzer* EU:C:2005:364.

<sup>49</sup> As they are subject to that legislation as inactive persons under Article 11(3)(e) of Regulation (EC) No 883/2004.

<sup>50</sup> Judgment in *Bosmann*, C-352/06, EU:C:2008:290.

<sup>51</sup> But, of course, this would neither solve situations as examined by the CJEU in *Hudzinski and Wawrzyniak* EU:C:2012:339, as in this case Germany was not competent under Regulation (EC) No 883/2004 for any member of the family (also the children resided outside Germany).

### 1.10 Problems with the place of residence of a child

Problems can also arise with the determination of the Member State of residence for the purpose of applying the adjustment (if we opt for this solution).<sup>52</sup>

It is not always easy to determine where a child resides in accordance with the Regulations. Verifying this can be more difficult, for example, if he or she does not attend school or, on the contrary, attends a boarding school. As is well known, the Member State of residence is where a person habitually resides<sup>53</sup> or where the centre of his or her interests is located, and there is only one for the sake of coordination.<sup>54</sup> Following the precedent case law,<sup>55</sup> Article 11 of Regulation (EC) No 987/2009 provides for a non-exhaustive list of criteria based on relevant facts that should be used, with no clear order of precedence, in order to identify the residence (the centre of interests) in the event of disagreements between national institutions. As established by the CJEU, said criteria can also be considered relevant in case of disputes between an institution and the competent Member State.<sup>56</sup>

The criteria do not suit children much. On the one hand, the Article mentions the **duration and continuity of the presence**, this presence being independent from the administrative residence terms established in Directive 2004/38/EC.<sup>57</sup> Regarding this criterion it is reasonable to wonder whether social security

---

<sup>52</sup> See for instance the judgment in *Maaheimo* EU:C:2002:641. Ms Maaheimo was a Finnish national, as were her husband and her children. Having obtained parental leave, she cared for her children at home. From 8 January 1998 she received the home child care allowance. During the period from 1 May 1998 to 30 April 1999, her husband worked in Germany as a posted employee. From 10 July 1998 to 31 March 1999 Ms Maaheimo and her children stayed with her husband in Germany. She claimed that her permanent domicile remained in Helsinki. During that period the whole family was subject to Finnish social security legislation. Finnish administration stopped paying this family benefit from 10 August 1998 on the ground that the children were not actually resident in Finland.

<sup>53</sup> Article 1(j) of Regulation (EC) No 883/2004. Article 1(k), in turn, defines “*stay*” as temporary residence which does not necessarily mean of short duration (See the judgment in *I*, C-255/13, EU:C:2014:1291)

<sup>54</sup> Judgment in *Wencel*, C-589/10, EU:C:2013:303, paragraph 49.

<sup>55</sup> Mainly the judgment in *Swaddling*, C-90/97, EU:C:1999:96.

<sup>56</sup> See the judgment in *I* EU:C:2014:1291, paragraph 54.

<sup>57</sup> Reiterated by the CJEU in the judgment in *I* EU:C:2014:1291.

systems can easily gather the relevant information involved and check the duration and frequency of stays, especially inside the Schengen Area.

Article 11 of Regulation (EC) No 987/2009 also refers to different factors regarding the **person's situation**. The first factor is linked with the *working status* that in the case of minors would often be out of the question. Secondly it refers to the *family status and family ties*. Thirdly, with regard to *students* the Regulation specifically establishes that "*the source of their income*" has to be taken into account (in our scenario this income would normally be the salary of the parent working in a Member State which under today's coordination is one of the Member States competent to grant family benefits). The last factors are *housing situation* and *tax residence*. This last criterion does not apply to non-active descendants either.

If the criteria mentioned are not definitive, the **person's intention**, specifically the reason to move in the first place, should be considered. It does not seem that the minor's intention could be relevant to determine their residence.

In sum, if the adjustment mechanisms were implemented, ad-hoc criteria should be provided to determine the children's Member State of residence.

#### **Proposal for an additional horizontal Option No 9**

It could be useful to also envisage a revision of Article 11 of Regulation (EC) No 987/2009 concerning the determination of the place where a child resides.

## **Horizontal principles which are relevant for the options concerning export of family benefits**

### ***1.11 What does ‘adjustment’ mean for the options concerning the export of family benefits?***

As some options focus on the adjustment of family benefits to the living standards in the children’s Member State of residence we have decided to dedicate a special horizontal chapter to this issue and to not include it in the description of these options only.

#### ***1.11.1 Why adjust family benefits?***

Already the definition of family benefits states that the main purpose of the benefit is to meet family expenses. As shown in chapter 4.1.3 these expenses can differ from one Member State to another. Thus, it could be argued that the social policy aim behind these benefits is no longer achieved. Adjusting the benefits to the level of the child’s Member State of residence seems to avoid an imbalance and to safeguard that the social policy aim of the benefit is still achieved. This method would affect only the Member States which are competent to grant family benefits where the child does not reside.

#### ***1.11.2 Which elements could be the base to determine the factor of adjustment?***

First of all we want to mention that the legal analysis of whether such adjustments are **possible from a legal point of view** is a tricky issue which merits a study on its own. Nevertheless, we have also spent some time on this question. Interesting details which could help the decision-maker in this respect can be found in **Annex 2**.

The following elements could be used to set such adjustment. There are various figures which demonstrate economic differences between Member

States, e.g. gross domestic product per capita, average income or the price of living costs. Therefore, if the adjustment of social security benefits is discussed it is relevant which social policy aim is pursued with the benefit. If its purpose is to cover the costs of persons rendering services (e.g. in case of some long-term care benefits) it would be advisable to link it to the relations of average income between two Member States. If the purchase of goods and services is more the centre of the social policy decision, then e.g. the comparative price levels calculated by Eurostat<sup>58</sup> could be a valid tool, as the different price levels in the Member States for specific goods are the base for the calculation of these factors. Of course it could be argued that the basket of goods taken for these general statistics is not specifically the one which children need, and it should be a more focussed basket of goods to calculate these factors (e.g. child nutrition, additional living expenses for households with more than two household members, nappies, prams, furniture for children and juveniles, school costs and school equipment etc). However, it would be quite complicated to get reliable data for such specific baskets and it could be assumed<sup>59</sup> that such data are not regularly updated. Therefore, we recommend relying on general data which are published and reliable, unless more specific data with the same quality exist.

The following table contains figures taken from Eurostat to demonstrate the functioning of these data. In the following paragraphs we will give some examples and explanations to better understand how these figures could be used.

Country	Factor	Country	Factor	Country	Factor
---------	--------	---------	--------	---------	--------

<sup>58</sup> <http://ec.europa.eu/eurostat/tgm/table.do?tab=table&init=1&language=en&pcode=tec00120&plugin=1> (last accessed 25 March 2015).

<sup>59</sup> As it was not our task to examine the available data sets, we restricted our work to those elements which were really necessary to better understand and evaluate the export options.

<b>EU-28</b>	100.00	<b>ES</b>	93.50	<b>NL</b>	111.10
<b>BE</b>	110.80	<b>FR</b>	109.80	<b>AT</b>	107.20
<b>BG</b>	49.00	<b>HR</b>	67.50	<b>PL</b>	55.80
<b>CZ</b>	68.70	<b>IT</b>	103.20	<b>PT</b>	81.30
<b>DK</b>	139.40	<b>CY</b>	91.40	<b>RO</b>	54.00
<b>DE</b>	102.30	<b>LV</b>	71.20	<b>SI</b>	83.10
<b>EE</b>	78.10	<b>LT</b>	63.50	<b>SK</b>	69.40
<b>IE</b>	120.00	<b>LU</b>	121.40	<b>FI</b>	123.10
<b>EL</b>	89.20	<b>HU</b>	59.70	<b>SE</b>	131.60
<b>ES</b>	93.50	<b>MT</b>	82.50	<b>UK</b>	114.60

These figures have to be understood in such a way that they always refer to the average of the EU-28 (therefore, the factor for this average is 100.00). Thus, to adjust an amount from one Member State to the level of another Member State the factors for both countries are relevant. If we assume that e.g. Denmark has a family benefit of €100<sup>60</sup> and the child resides in Bulgaria, then the calculation would be: €100 : 139.40 x 49.00 = €35.15. This has as a consequence that the same amount of family benefits of different Member States in the end differs if the children reside in the same Member State. So, if also the Czech Republic has a family benefit of €100 and the child resides in Bulgaria, this would lead to: €100 : 68.70 x 49.00 = €71.32. This is also

<sup>60</sup> We have deliberately not taken the actual figures of family benefits of the Member States chosen, but only fictitious amounts to better demonstrate the effects of adjustment. The reader can easily adapt these calculations to real live figures.

logical as the difference in living costs between Denmark and Bulgaria is higher than the one between the Czech Republic and Bulgaria. The €100 family benefit in the Czech Republic has a much higher value of purchasing power in that country than in Denmark. Therefore, also when exported for a child in Bulgaria it must have a higher value than the benefit of Denmark.

Of course this calculation method also works in the opposite sense. If we assume that Bulgaria has family benefits of €20 and the child resides in Denmark this would lead to:  $€20 : 49.00 \times 139.40 = €56.90$  and if the child resides in the Czech Republic:  $€20 : 49.00 \times 68.70 = €28.00$ . This adjustment would not only oblige Member States with comparatively low costs of living (e.g. those with an index below 100.00, thus below the average) to adjust their benefits by raising the national amounts, but in principle all Member States with the exception of the only one Member State with the highest index (DK); also the second one (SE) would have to raise its family benefit of an assumed €100 for a child resident in Denmark in the following way:  $€100 : 131.60 \times 139.40 = €105.90$ .

An important final issue to mention: these adjustments do not really reflect on the level of family benefits under the legislation of the child's Member State of residence. Depending on the social policy decisions of this Member State they could be higher or lower than the adjusted benefits of the exporting Member State. Thus, also an option which includes adjustments could, on the one side, safeguard much higher amounts than the local level and could, on the other side, be supplemented also by the obligation to grant differential supplements.

### *1.11.3 Would adjustment be possible from an administrative and technical point of view?*

Of course, such an adjustment cannot react to all developments of living costs in the Member States concerned. Some clear rules within which periodicity

such adjustments have to be revised are necessary. It would be strongly recommended, if such an option is chosen, to refer to already existing, well-known and without any doubt usable tables. The ones for the application of the EU Staff Regulations (which contain rules for adjustment of wages and also some social benefits for EU civil servants residing outside Belgium and Luxemburg – see also Annex 2) could e.g. be a good starting point,<sup>61</sup> as these are also published in the OJ, as there is always a clear indication for which period they have to be used etc.

### ***1.12 How to treat persons in a contributory scheme or in an employment-related scheme who are not in such a situation in the relevant Member State***

Another important question is how the Member State of residence has to provide benefits when no gainful activity is exercised there. No problems should exist in relation to residence-based benefits which are granted on a lump sum base to all residents. But, how is the situation in relation to other types of benefits which are more or less employment-related?

#### ***1.12.1 Benefits which are contribution-based but open entitlement to all residents***

These benefits should also create no problems. If such benefits are financed from contributions e.g. from the employer, but any resident (including families without any gainful activities) is entitled to benefits (as e.g. in AT) already under national law entitlements are given. Thus, the Member State of residence will grant entitlement also if the only gainfully active parent works in another Member State.

---

<sup>61</sup> Regulation No 31 (EEC), 11 (EAEC), laying down the Staff Regulations of Officials and the Conditions of Employment of Other Servants of the European Economic Community and the European Atomic Energy Community (OJ 45, 14.6.1962, p. 1385, as amended); the last publication can be found for the period beginning with 1.7.2014 in OJ C 444, 12.12.2014, p. 10. For more details see Annex 2. Something which would have to be further analysed is e.g. the question whether or not the special indexes for special cities which are provided under the Staff Regulations (Bonn, Karlsruhe, Munich, Varese and Cultham) should be maintained for family benefits also under Regulation (EC) No 883/2004.

## 1.12.2 Benefits which are provided only for insured persons

### 1.12.2.1 General remarks

More problematic are benefits which are contribution-related or employment-related and for which entitlement is granted only to those persons who are insured or in the relevant employment. Does Regulation (EC) No 883/2004 open entitlement to such benefits if a gainful activity is only exercised in another Member State?

If the Regulation provides for competence of the Member State of residence, the existing rulings of the CJEU seem to speak in favour of this solution. From the *Bergström* judgment<sup>62</sup> it could be deduced that the ban on discrimination and, of course, also the assimilation of facts under Article 5 of the Regulation obliges the Member State of residence to take into account also employment (and the income received from such employment) in another Member State as such employment in the child's Member State of residence.<sup>63</sup> As the situation of the whole family always has to be treated as if it were in the Member State of residence of the child,<sup>64</sup> it should also not matter that the person exercising such an employment is subject to the legislation of another Member State. Nevertheless, it has to be assumed that this is not always applied in a consistent way in all Member States. To avoid problems it could be interesting to exclude benefits which are employment-related like child-raising benefits from the general coordination and provide for the competence of only the Member State which is competent for the person taking care of the child (see 4.1.4).

---

<sup>62</sup> Judgment in *Bergström* EU:C:2011:278.

<sup>63</sup> For family benefits there is no specific rule concerning the calculation of benefits which would allow a deviation from these principles as can be found e.g. in Article 21 of the Regulation for sickness or maternity benefits, which allows to take into account only income received in the relevant Member State and, thus, excludes the obligation to grant benefits with an income replacement function in cases in which no such income was received in that State.

<sup>64</sup> To be deduced from the judgment in *Dodl and Oberhollenzer* EU:C:2005:364.

Finally, it has to be mentioned that also if there is a condition of a special duration of periods of insurance to be entitled to a benefit, the Regulation could help, as the aggregation principle is applicable to family benefits (Article 6 of the Regulation).

#### 1.12.2.2 Results from the mapping exercise

Also the replies from **FreSsco national experts** show that benefits with an income replacement function are not always coordinated in a way as it might be necessary from e.g. the *Bergström* ruling.

For instance, in **Austria** entitlement to the income replacement scheme requires (among others) that the person concerned has been employed for a minimum period of six months before childbirth. Section 24(2) of the Child Care Cash Benefit Code (*Kinderbetreuungsgeldgesetz*) clarifies that ‘employment’ means “employment that is subject to Austrian social security insurance”. Thus, a person who resides in Austria but is working in another Member State and is therefore subject to the social security scheme of that Member State, is not entitled to income replacing cash childcare benefits in Austria, although Austria is competent to grant family benefits e.g. because the other parent works there. Austria would not take the income replacement scheme as the basis for the calculation of the differential amount, but exclusively the lump sum scheme (of the cash childcare benefits).<sup>65</sup> Similarly in **Belgium**, in order to qualify under the ‘professional’ scheme, work has to be carried out in Belgium.

Reportedly in **Sweden** the parental benefit was the only family benefit with an income replacement function. The Social Insurance Agency no longer

---

<sup>65</sup> Almost all Austrian family benefits are based on residence and not on employment. That applies especially to family allowance (*Familienbeihilfe*) as well as to cash childcare benefits (*Kinderbetreuungsgeld*). As regards the latter, however, the Austrian Child Care Cash Benefit Code (*Kinderbetreuungsgeldgesetz*) provides for two different schemes: a lump sum scheme and an income replacement scheme. Therefore, at least for the income replacement scheme employment is of relevance.

considers it a family benefit (but a maternity benefit) and therefore it is not included when calculating the differential amount for family benefits.

In many Member States family benefits do not have an income replacement function. For those who have such function it could be assumed that they are sometimes coordinated under the maternity/paternity chapter of Regulation (EC) No 883/2004. An example could be the maternity benefit in **the Czech Republic**, or the maternity, paternity and parental benefits in **Slovenia**. **Bulgaria** stressed that family allowances differ from benefits under the Social Security Code and do not depend on personal contributions. Also in **Luxembourg** family benefits are only residence-based (and, therefore, no problems in that respect were reported).

## Which options could be envisaged concerning the export of family benefits?

Before starting the analysis of the different concrete options dealing with the export of family benefits we have to make some general remarks:

For all options we have used **one standard example** to safeguard a better comparison of the effects of the different options. This standard example will be supplemented, if needed, by other examples to better demonstrate all different aspects of the option.

### **Standard example:**

We assume the following situation:

**Member State A:** amount of family benefits: €100; in case of adjustments due to different costs of living in Member State B: €80

**Member State B:** amount of family benefits: €50; in case of adjustment due to different costs of living in Member State A: €63 (exactly €62.5, which has been rounded up for easier reading)

This standard example is used in two different scenarios:

**Scenario 1:** cases where work is exercised only in Member State A while the residence of the family is in Member State B

**Scenario 2:** cases where work is exercised only in Member State B while the residence of the family is in Member State A

The numerical results of the different options, when applied to this standard example, have been made visible in graphs which form **Annex 1** of this report.

The options will be examined by ways of an **impact assessment**, which was made by using the following parameters.<sup>66</sup>

The different aspects analysed for each of these options were the following:

- **Clarification:** Here we looked into the question whether the option is clear, easy to understand and transparent. From our point of view, the most important question with regard to clarification is whether persons concerned know in advance and without problems what their rights (and obligations) are. Naturally the option should be clear for institutions as well. However, as institutions would be involved in any case, also in complex legal situations, this does not have that great a weight.
- **Simplification:** For this second aspect, we examined whether the solution is simple or complex. It was sometimes difficult to distinguish between this aspect and the first one, but also between this one and the administrative burden. Therefore, these three aspects have to be seen as related to each other. It also has to be mentioned that any new way of coordination – as simple as it might seem if used for the first time – would also cause problems during a period of transition from the existing coordination towards the new coordination. We have, however, no longer mentioned this in our analysis of the different options. So even if the transition might be complex, non-transparent and arduous for the institutions we have not changed our evaluation if the option itself – looked at in an abstract way – has to be regarded as positive compared to the status quo.
- **Protection of rights:** A very important issue is whether the rights of the person concerned are well protected. This means we had to check if really all benefits which can be claimed can be granted, or if the family loses entitlements. In addition, the question how easily and how quickly the persons can get the benefits which are necessary to cover the costs related to having a family also plays a role. This evaluation was not clear in cases where political decisions need to be taken. Therefore, we abstained from evaluating, e.g. in case of

---

<sup>66</sup> We want to refer also to Y. Jorens, B. Spiegel, J.-C. Fillon & G. Strban, trESS Analytic Study 2012, 'Legal impact assessment for the revision of Regulation 883/2004 with regard to the coordination of long-term care benefits', which contains the same criteria for the impact assessment. We have, therefore, included the same description for the criteria into this report whenever possible and added a new one concerning the impact on migration.

adjustments, if this is better or worse concerning the protection of rights. Of course in case of downwards adjustments a person might lose benefits which he or she is entitled to today. The political question which we did not answer under this point is whether it is necessary to always maintain the status quo (only higher benefits can be considered a plus with regard to protection of rights) or if also a solution is good with regard to the protection of rights if less benefits are awarded which, however, better meet the social policy decisions of the Member State granting the benefit.

An issue which could also be discussed when talking about protection of rights is what the impact could be on the national system of a Member State as a whole (also in situations without cross-border elements). It could be argued that if a group of Member States has to grant, under one of our options, more or higher family benefits than under the status quo this could lead to the decision of the national legislature to reduce all family benefits to achieve the same result with regard to the costs of the system as before. If this were true, on the other hand, the group of Member States which have to grant in less cases or lower benefits could spend the money saved on increasing all family benefits and thus all persons receiving family benefits from these Member States could profit. As we have estimated that no option would result in such a significant impact on the budget of the national family benefits financing mechanisms, we will not mention this aspect in the context of the different options. Still, this could be an element which should not be forgotten when the political decision is taken.

- **Administrative burden and implementation arrangements:** Here we deal with the institutions. Is it easy to administer the option without large additional processes or do we have to set up new processes? Does it need additional flows of information and does information have to be exchanged regularly? Will institutions have to set up new implementing arrangements to put the coordination into practice? The mere fact that e.g. under EESSI new SEDs or flows will become necessary does in itself not mean that an option adds to the administrative burden, because this will be a standard situation in the future if we change the existing ways of coordination.

- **No risk of fraud or abuse:** It also has to be examined if the option favours situations where the persons concerned could easily influence and manipulate their situation in such a way that they receive more benefits than they would otherwise be entitled to. We will also examine if the necessary checks are easy or not.
- **Potential financial implications:** This point as well is not easy to answer and evaluate. First, it was not the task of this report to go into data and analyse what exactly the additional amounts would be which Member States would have to pay or what the amounts would be which Member States would save under the various options compared to the status quo. Therefore, we will only outline whether groups of Member States would have to pay more or less from a general point of view. But, this does in itself not give a clue for the evaluation of the different options. Is a solution which is more costly (for some Member States) better or worse than the status quo? Taking this question into account, we have decided to extend the examination of the financial impact also to the question whether an option leads to a fairer distribution of costs compared to the status quo.

However, also the burden-sharing between the Member States involved is an issue which is very difficult to evaluate. The ‘fair burden-sharing’ between Member States largely depends on the system the Member States apply. As the political concerns of some Member States that they have to pay too high amounts of family benefits for children residing outside their countries were the main reason for the whole exercise, a shifting of burdens seems to be a solution for that problem. Therefore, it will remain a political decision which transfer of burdens makes the system more balanced and from a political point of view more acceptable for the large majority of the Member States. We will present the pros and cons for the different groups of Member States concerned, but abstain from giving recommendations, as this will be something for which a political decision is necessary.

The results of our examination of the various aspects of the impact assessment have to be seen as the comparison with the status quo (therefore, the status quo, which remains an option, is neutral in that respect):

- (+) means better than the status quo;
- (-) means worse than the status quo;
- (≈) means (nearly) the same as the status quo;
- (?) means the decision has to be taken by the policy-makers.

### ***1.13 Option 1 – Status quo***

#### *1.13.1 Legal background and general remarks about Regulation (EC) No 883/2004*

To better understand any new option it is always necessary, first, to recall the existing rules applicable to family benefits. With regard to the existing coordination rules for family benefits we want to refer to 3 above. In this context we only want to recall some elements which are necessary for our evaluation of this option.

#### *1.13.2 Rules in the event of no overlap of entitlements*

The specific rules for family benefits do not change the general rules to determine the applicable legislation. This is still to be decided in accordance with Title II of Regulation (EC) No 883/2004, which means that the Member State of employment or any other competent State according to Title II (the only exception are pensioners, as for these it might be another Member State than the one competent under Title II, if this other Member State grants a pension) should pay family benefits, which is also the case in situations where the family members of eligible persons reside in another country (see Title II and Article 67). In the following examples we will focus on active persons,

their partners and their children and not deal with the specific situation of pensioners, as in practice they are not so significant.

Family benefits are intended to meet family expenses. In this respect the sole situation of the employed person is not the only relevant one (which is the case mostly with e.g. unemployment benefits). The situation of the family, especially of dependent children, is also relevant (see also 4.3 above). Despite the latter fact, the Member State of employment or any other Member State competent according to Title II is responsible to pay the family benefits at its rate even when the children are residing in another Member State (in case of overlap of benefits, see below). This means that the situation of the family of migrant workers (or other eligible persons) could be more advantageous compared to other families in the children's State of residence. If we consider that the aim of the Regulation is first and foremost to guarantee the equal treatment of migrant and domestic workers working in one country, and not so much to achieve the material equality of families, the provisions are rational. A strong argument to defend the status quo, especially in cases where the competent Member State is the State of employment, is that the person has also paid taxes and contributions there. Of course, paying e.g. tax is not such a strong argument if we think about situations in which tax has to be paid in a Member State other than the one which is competent under Title II of the Regulation.<sup>67</sup> Or would this mean that the Member State collecting the taxes and not the one competent under Title II has to grant tax-financed benefits? This would be a totally new way of coordination which should be carefully examined.

---

<sup>67</sup> See for such cases B. Spiegel, K. Daxkobler, G. Strban & A.P. van der Mei, 'Analytical report 2014: The relationship between social security coordination and taxation law', FreSso, European Commission, January 2015.

### 1.13.3 Rules in the event of overlap

As family benefits are granted mainly on behalf of dependent children, there are a great deal of cases in which family benefits overlap, for example as often both parents are eligible for benefits for the same child, but also the child itself could open entitlement to benefits in its Member State of residence. Article 68 of Regulation (EC) No 883/2004 tries to solve these questions.

The priority rules applicable depend on whether benefits are paid on a different basis – employment or residence – or on the same basis (see also 3.1.2 above; concerning possible problems of interpretation of that principle see also 4.1.4.3 above). In the first case Article 68(1)(a) of the Regulation is the applicable rule; in the latter case Article 68(1)(b). In both cases also Article 68(2) is relevant, as the Member State which does not have primary competence according to Article 68(1) may have to pay a differential supplement.

#### **Standard example:**

**Scenario 1:** Member State A (primary competence) grants €100, Member State B (secondary competence) does not grant a differential supplement

**Scenario 2:** Member State B (primary competence) grants €50, Member State A (secondary competence) grants as a differential supplement €50

#### **Additional example to highlight the effects of the status quo:**

*The family (mother, father, child) resides in Member State A, the father works in Member State A, the mother works as a frontier worker in Member State B; the amount of family benefits for a child is €120 in Member State A and €200 in Member State B.*

*Member State A (primary competence) has to grant €120; Member State B (secondary competence) grants a differential supplement of €80.*

#### *1.13.4 Advantages and constraints of the status quo*

For legal, administrative and political problems related to today's Regulation (EC) No 883/2004 with regard to export of family benefits and more general problems of coordination of family benefits see chapter 3 above.

Below, the pros and cons of the current system of coordination of family benefits are shortly presented. Reference is also made to chapters 3 and 4. In this chapter we will not give +/-/~/? marks, as the status quo is the situation against which the other solutions are evaluated, and it is hard and subjective to construct any ideal solution against which the status quo could itself be evaluated.

- **Clarification:** The current Regulation is more or less clear for the migrant workers. They usually get the family benefits in their Member State of employment at the rate of that State, despite their family residing in another Member State (this is a clear case when the other parent is non-active; less clear when both parents work, are posted etc – e.g. in cases where the priority of the States should be determined). The current option poses problems, but some of them are more general in nature. They arise more from the diverging nature of potential family benefits (what benefits exactly are family benefits that should be exported according to Articles 67 to 68) and from the question whether or not the benefits should be divided into baskets, for example to decide whether there is overlap to calculate the differential supplement– see also 4.1 above. Therefore, taking all these elements together, it could be said that today's coordination is not as clear as it could be.
- **Simplification:** If there is overlap of benefits, the current Regulation is not very simple. See also chapter 3 for existing problems and chapter 4 on our proposals for horizontal solutions.

- **Protection of rights:** Currently the Regulation is built around the migrant worker/ person, not around the children. This is logical, as the background of the Regulation is the necessity and aim to protect migrant workers (see also 3.1.1 above under which TFEU Articles the Regulation is adopted). In principle the Regulation aims to guarantee that the migrant worker (as, still, often the State of employment is competent) is treated the same way as all other workers in that country – he or she receives the same benefits also for his or her children, despite the economic situation in the Member State where they reside. There is also an economic logic behind it, as the worker usually pays taxes and contributions in the State of employment. The question whether the current Regulation sufficiently protects the rights of children is not easy to answer. It depends among other things on whether the children are living in a country with higher living costs or not; whether they have the rights to some residence-based family benefits in the country of residence; and how family benefits in kind are treated in the Member States concerned. A negative aspect for children in the current system is that it may take quite a long time before the institutions involved may take the necessary decisions and they receive the full amount of benefits, especially in cases where the priority rules are not easy to decide.

In chapter 3.3 the question was analysed whether the current system is unfair to children, in the context that children whose parents are migrant workers may, in the context of unlimited export, get higher benefits than other children in the Member State where they reside. This could be a question of reverse discrimination of the children. At the same time, the discrimination could be justified with objective reasons (no comparable situations etc).

Another point where we have doubts if today's coordination sufficiently protects the rights of the persons concerned are child-raising benefits for employed persons (e.g. also with an income replacement function). This is an issue we have already dealt with under chapter 4.1.4.

- **Administrative burden and implementation arrangements:** As analysed in chapters 3.1 and 3.2, the current system entails administrative difficulties. At the same time, the system has been in operation for years and the routines are

usually in place in the Member States. The difficulties in implementation do not lie in the fact that the benefits are not adjusted to the living standard of other Member States. They are caused by the existing general rules of the Regulation (e.g. Articles 10 and 68) and the interpretation given to them by the CJEU – which benefits should be considered as family benefits, how to calculate the differential supplement etc. See also chapter 4 for horizontal solutions.

- **No risk of fraud and abuse:** Every regulation runs the risk of being outsmarted. In the context of export of benefits it could happen in relation to children's eligibility to benefits, as the competent State cannot always easily and quickly verify the eligibility of children in another country. When the benefits are high in the children's country of residence, the family may first try to quickly get the benefits there, by denying the working activity of one parent in another Member State. In contrary cases it might be desirable to 'create' a gainful activity (e.g. a 'mini-job' or an activity which exists only on paper) in a Member State with high family benefits to receive these benefits for children living in another Member State (with not so high amounts of benefits). Also the concrete residence of children could be an issue when attempts are made to manipulate the entitlement to higher benefits. Therefore, it could be said that today's coordination is not very fraud-proof.
- **Potential financial implications:** Today's financial implications should be known to Member States. Is today's system fair with regard to the sharing of the burden between Member States? This is the main political question to be answered. It could be said that only if the Member State receiving contributions (and taxes) grants its full range of benefits this solution is fair. Others argue that when paying benefits which have the clear aim of covering additional costs of children and these costs differ between Member States, only e.g. an adjustment of amounts can lead to fair results. Therefore, we abstain from answering the question whether today's coordination of family benefits is fair.

#### ***1.14 Option 2 – Adjustment of the amount of family benefits to the living standards in the Member State of residence of the child(ren)***

**A general description of all sub-options summarised in this Option 2:** Option 2 consists in maintaining the current principles, i.e. the so-called ‘status quo’ described in chapter 6.1, but adding a new rule affecting the calculation of the amount of the family benefits. This new rule would consist of the adjustment of the amount of the family benefit granted by each Member State to the living standards in the Member State where the child or children reside.<sup>68</sup> The adjustment procedures and its logic were described above in chapter 5.1.

It should be outlined that this adjustment would be linked to the different economic situation (cost of living) in the Member State involved and would not be affected by the level of protection in the said Member State, i.e. the amount of the family benefits. The living standard is expected to go hand in hand with the level of social protection, but this is not necessarily always the case.

The **top-up obligation** (differential supplement) envisaged in Article 68(2) of Regulation (EC) No 883/2004 would still exist under this option. The difference would be that the Member State of residence of the children (if it is the Member State with secondary competence) may have to pay a differential supplement if the amount of the family benefit in said Member State exceeds the **adjusted family benefit** paid by the Member State that is primarily competent. That supplement would logically be limited to the sum exceeded. Taking into account the different levels of family benefits it could be assumed that such a top-up obligation would not occur very often.

As in the ‘status quo’, the Member State of employment would still be the one with primary competence.<sup>69</sup> Being the Member State of employment, i.e. the

---

<sup>68</sup> Hereinafter the chapter will refer to children in general, although the same would apply if there was a single child.

<sup>69</sup> Regarding the determination of the legislation applicable to the entitlement of family benefits, the general rules established in Title II of Regulation (EC) No 883/2004 would be applicable. Regarding active persons, *lex loci laboris* is the

State receiving the contributions and the majority of the taxes paid by the migrant workers, it could be said that a certain economic logic is maintained. The adjustment procedure, however, may disrupt this logic as the analysis of the burden-sharing will show.

Once dealing with the idea of adjusting the amount of the family benefits to the living standards of the children's Member State of residence, several possibilities arise and will therefore be analysed. The first possibility would be the **upwards and downwards adjustment (Sub-option 2a)**. Simply put, under this sub-option, if the children reside in a less expensive Member State, the benefit would be adjusted downwards, while if they reside in a more expensive Member State, the benefit would be adjusted upwards. Logically the Member State having to pay such adjusted benefits may not have a problem paying a smaller benefit, but may oppose the idea of paying a higher benefit than the one received by the children residing in its territory.

The second **Sub-option 2b**, a possible solution to this latter situation, would be the **reimbursement of the upwards adjustment by the children's Member State of residence** (this sub-option was not included in our mandate but added by us to show also some alternatives). Under this sub-option the family benefits would be adjusted upwards and downwards as described in the previous paragraph. However, the competent Member State of employment (outside the Member State of residence of the children) would be reimbursed by the children's Member State of residence, which would cover the difference between the original benefit and the one that was adjusted (upwards). The problem could be that said reimbursement may be linked to a benefit that is not envisaged by the social security legislation of the Member State where the children reside. Said Member State may again oppose the idea of paying part of a benefit that is not covered by its social security system.

---

competence rule except e.g. in the case of posted workers (among others). In Title III, Chapter 8 there are no specific conflict rules; there are only priority rules in the event of overlapping. In Option 2 the status quo is kept unchanged.

Finally, the third sub-option would be **adjusting only downwards (Sub-option 2c)**. Under this sub-option, if the children reside in a comparatively less expensive Member State, the benefit paid by another Member State would be adjusted downwards, but if they reside in a more expensive Member State, they would receive the same family benefits as those residing in the Member State which has to grant these benefits.

Finally, an issue which will be very important for any new option is whether the **legal base of the TFEU** will allow this solution (**legal compatibility**) or whether it is endangered if it is contrary to one of the principles enshrined in the TFEU. Analysing this question for the adjustment of benefits would merit a study on its own and was also not covered by the mandate of our report. Nevertheless, we have made some preliminary remarks also on that aspect in Annex 2 of this report.

Something has to be recalled in this context: we think that any rule on adjustments cannot be applied also to benefits with an income replacement function. Therefore, all three sub-options would necessitate special rules (specific coordination – see 4.1.4 above – or at least exemption from the adjustment) for this category of benefits and, thus, should apply only to **traditional family benefits like family allowances**. When the adjustment mechanism is also applied to family benefits with an income replacement function (when the benefit is e.g. calculated as a specific percentage of previous earnings) we tend to give a (-) to all three sub-options with regard to “protection of rights”, as rights acquired due to a gainful activity would be endangered. This would without any doubt also be contrary to the fundamental principles of the TFEU.

#### *1.14.1 Sub-option 2a – adjustment of the amount (no limits)*

**A short description of this sub-option:** This option would consist in maintaining the current rules of Regulation (EC) No 883/2004, but **adjusting**

**upwards and downwards** the amount of the family benefit granted by any Member State for children residing in another Member State to the living standards in that Member State of residence of the children.

To put it simply, under this option, if the children reside in a comparatively less expensive Member State, the benefit would be adjusted downwards, while if they reside in a more expensive Member State, the benefit would be adjusted upwards.

**Standard example:**

**Scenario 1:** Member State A (primary competence) grants €80: Member State B (secondary competence) does not grant any differential supplement

**Scenario 2:** Member State B (primary competence) grants €63: Member State A (secondary competence) grants a differential supplement of €37

The upwards adjustment could have no effect for the children concerned in practice if the benefit has to be topped up by a differential supplement of the Member State of residence of the children and if said supplement exceeded the amount of the adjustment already under the status quo. In such a case this option would result in a mere modification of the sharing of the burden between Member States in favour of the Member State of residence.

However, if the children's Member State of residence did not top up the benefit, the upwards adjustment would always result in an effective increment of the amount received by children residing in a Member State with a higher factor of adjustment.

**Additional examples to highlight the effects of this option:**

*Example 1*

*The father works in Member State C, the mother and 2 children reside in Member State D, and the mother does not work. The amount of a certain family benefit for 2 children is €200 in Member State C. There is no top-up (as the benefit in Member State D would amount to only €180). The factor of adjustment is 100 in Member State C to 120 in Member State D.*

*Member State C (primary competence) grants €240: Member State D (secondary competence) does not grant any differential supplement.*

*[Status quo: Member State C (primary competence) grants €200: Member State D (secondary competence) does not grant any differential supplement.]*

#### *Example 2*

*However, any adjustment of course also works in case of employment in two different Member States of the parents.*

*The father works in Member State C, the mother and 2 children reside in Member State D, and the mother works there. The amount of a certain family benefit for 2 children is €200 in Member State C. The amount of the family benefits in Member State D is €180). The factor of adjustment is 100 in Member State C to 120 in Member State D.*

*Member State D (primary competence) grants €180: Member State C (secondary competence) grants a differential supplement of €60 (the adjusted family benefits amount to €240).*

*[Status quo: Member State D (primary competence) grants €180: Member State C (secondary competence) grants a differential supplement of €20.]*

### **Evaluation of the option**

#### **(-) Clarification**

This option is less clear or easy to understand than the status quo as far as it does not simplify the current procedures and involves an additional adjustment procedure. Thus, it requires an additional factor of adjustment that is not self-explanatory and therefore requires additional clarification. Furthermore, migrant workers would be less aware of their rights, as the amount of the family benefit received would suffer variations depending on various factors, such as macro-economic criteria or the country of residence of the children and it would be different from the one received by the sedentary workers around him or her.

#### **(-) Simplification**

This option is more complex to apply as far as it imposes additional obligations for migrant workers, such as the obligation to state and eventually prove the Member State of residence of the children. Possible changes in the Member State of residence of the children would result in additional administrative obligations for the migrant worker and in changes in the amount of the benefit granted by one and the same Member State.

#### **(?) Protection of rights**

The evaluation of how the protection of rights varies under this option is not easy and depends on the point of view envisaged. First of all the 'value' of this option largely depends on political points of view. If it is decided that an unrestricted export cannot be justified (and is not necessary from a legal point of view) then this option is best adapted to protect the rights, as children always receive the benefit which corresponds to their economic circumstances. If the decision is taken that the national amount of the competent Member State is a right which has been acquired by the migrant worker, then this option cannot protect these rights.

The **beneficiaries** whose children are residing in a Member State with a **higher factor of adjustment** would see how their rights are better protected as they may receive a higher benefit to cover their family expenses. On the

other hand, the beneficiaries whose children are residing in a Member State with a **lower factor of adjustment** would see how the amount of their benefits is reduced. The processing times between the claim being filed and the benefit being received could be increased due to the verification of the residence, which might be more important, as it is decisive for the amount to be paid, in which Member State the children reside (which is not that important under the status quo from the point of view of the Member State of primary competence, as always the same amount is at stake, irrespective of whether the children reside e.g. in this or in any other Member State – of course, only if the first Member State stays the one with primary competence also after any transfer of residence of the children).

From the perspective of the States, the **Member State with primary competence** could have the perception that they are protecting the rights of their beneficiaries as a whole in a more balanced way, as each of them would receive an amount that covers a similar percentage of the related costs. A problem could arise, however, when States receive active migrants from Member States with a higher factor of adjustment, as they would have to allocate a higher share of their social budget to cover the benefits of children residing abroad, which could result in a diminished overall protection. Nevertheless, it is true that this is not expected to be a very common situation.

From the point of view of the **Member State of residence** of the children, the perception would vary depending on whether it is a State with a high or a low factor of adjustment. In the first case, children would receive higher benefits from the Member State with primary competence, so they would be better protected. In the second case, children would receive lower benefits from the Member State with primary competence, they will be less protected and the State of residence may have to allocate additional funds to protect these children, for example topping up the benefits with a differential supplement to guarantee the level of protection which this Member State wants to grant to all children residing on its territory.

Therefore, it is difficult to determine whether this option provides a better or worse protection of the rights of beneficiaries as a whole. It is for the policy-maker to determine this in the light of the level of protection which each of the groups mentioned currently has.

**(-) Administrative burden and implementation arrangements**

This option would result in a certain increase of the administrative burden. It is true that the implementation of the option would require some preliminary work, especially to establish the factors of adjustment, determining how the residence of the children needs to be proven and to include the additional adjustments in the national procedures, taking into account there will be 32 adjustment indexes. The running cases would also need further administrative processes as e.g. the updating of the adjustment factors has to be made on a regular basis (even if national amounts do not change).

As to the prevention of fraud, linked with the determination of the children's Member State of residence, a certain increment of the administrative burden may also be supposed, but, this is expected to be minor.

**(≈) No risk of fraud or abuse**

Under this option, families could be tempted to declare that their children live in a Member State with a higher factor of adjustment (or even in the Member State with primary competence), as far as the amount of the benefits would depend on the children's place of residence. For the Member State with primary competence, the children's place of residence is usually more difficult to determine than e.g. the place of work, as has been stated above (see 4.4), so the risk of abuse could increase. Nevertheless, a change of residence from a Member State with low factors of adjustment to States with high factors may not be very usual in practice; changes in a child's residence without any previous link to that Member State are not easy to explain and, therefore, administrations should have some remedies to prove the contrary (e.g. if a family resides in **PL** and the father works in **DE**, it would not be very

plausible if the children claim that they have moved to **DK**). However, it could encourage looking for constructions under which the child would be deemed residing in the Member State with primary competence and thus entitled to the full amount of the family benefit. Under today's coordination this is not an issue as the amount is always the same, irrespective of whether the children reside in the Member State with primary competence or anywhere else.

On the other hand, this option does not prevent or diminish the current risk of abuse, as it does not provide any additional instruments preventing the fraudulent overlapping accumulation of benefits.

#### **(?) potential financial implications**

This option shifts the burden from the Member States with a higher factor of adjustment, i.e. those where income and costs are higher, to Member States with lower factors of adjustment. This is made worse due to the effect of the differential supplement.

If the Member State of residence (in case it is the Member State with secondary competence) has a lower factor of adjustment, the benefit paid by the Member State of primary competence would be adjusted downwards. Consequently, the top-up obligation for the Member State of residence could emerge, if its benefits are higher than the downwards adjusted benefits from the Member State with primary competence (which is not very likely to occur). On the other hand, if the Member State of residence has a higher factor of adjustment, probably a less common situation, the benefit paid by the Member State with primary competence would be adjusted upwards. Thus, if the Member State of residence tops up the benefit, the amount of the supplement would be reduced in a proportional way.

Taking into account that migration usually heads from Member States with lower living standards to those with higher standards, this option would probably shift the burden from the latter to the former. This could result in a

certain disruption of the economic logic that assigns the obligation to pay the family benefits to the Member State receiving the contributions and taxes.

In sum, it is difficult to determine whether this modification of the burden-sharing is fairer or not and what the exact financial impact for every Member State would be. This should thus be decided by the policy-makers in the light of a broader analysis of the economic relationships between Member States.

#### *1.14.2 Sub-option 2b – adjustment of the amount (no limits) and reimbursement*

**A short description of this sub-option:** This option would consist in maintaining the current rules of Regulation (EC) No 883/2004 and adjusting upwards and downwards the amount of the family benefit granted by any other Member State to the living standards in the Member State of residence of the children, as in Sub-option 2a. Additionally, under this option the Member State of residence would **reimburse the upwards adjustment** to the other Member State(s), which might be (a) Member State(s) with primary or secondary competence.

In plain words, under this option, if the children reside in a less expensive Member State, the benefit would be adjusted downwards. If the children reside in a more expensive Member State, the benefit would be adjusted upwards. The difference between the national amount of the family benefit and the adjusted amount will be paid by the other Member State, but will be reimbursed to this State by the Member State of residence of the children.

**Standard example:**

**Scenario 1:** Member State A (primary competence) grants €80; Member State B (secondary competence) does not grant any differential supplement

**Scenario 2:** Member State B (primary competence) grants €63; Member State A (secondary

competence) grants a differential supplement of €37 and reimburses €13 to Member State B

The reimbursement of the adjustment could seem to have a certain parallelism with the payment of a differential supplement (top-up) by the Member State of residence of the children (if it is the one with secondary competence – envisaged in Article 68(2) of the Regulation) although they work differently. The adjustment and reimbursement results from the existence of a different economic situation (cost of living) in each Member State. The differential supplement, in turn, derives from a difference in the level of protection in each Member State, i.e. the Member State of residence of the children may have to top up the family benefit if the amount of the family benefit in said Member State is higher than the amount of the benefit in any Member State with primary competence, irrespective of the cost of living in each Member State.

**Additional example to highlight the effects of this option:**

*Example 1*

*The father works in Member State C, the mother and 2 children reside in Member State D, and the mother does not work. The amount of a certain family benefit for 2 children is €200 in Member State C. There is no top-up (as the benefit in Member State D would amount only to €180). The factor of adjustment is 100 in Member State C to 120 in Member State D.*

*Member State C (primary competence) grants €240: Member State D (secondary competence) does not grant any differential supplement but reimburses €40 to Member State C.*

*[Status quo: Member State C (primary competence) grants €200: Member State D (secondary competence) does not grant any differential supplement.]*

### *Example 2*

*The father works in Member State C, the mother and 2 children reside in Member State D, and the mother works there. The amount of a certain family benefit for 2 children is €200 in Member State C. The amount of the family benefits in Member State D is €180). The factor of adjustment is 100 in Member State C to 120 in Member State D.*

*Member State D (primary competence) grants €180; Member State C (secondary competence) grants a differential supplement of €60 (adjusted amount of the benefit: €240); Member State D reimburses €40 to Member State C.*

*Status quo: Member State D (primary competence) grants €180; Member State C (secondary competence) grants a differential supplement of €20.*

### **Evaluation of the option**

#### **(-) Clarification**

As with Sub-option 2a, and for the same reasons, this option is less clear or easy to understand than the status quo as far as it does not simplify the current procedures and involves an additional adjustment procedure.

#### **(-) Simplification**

As with Sub-option 2a, and for the same reasons, this option is more complex to apply. As for the reimbursement, it does not affect the beneficiaries, but only the institutions of the Member States involved.

#### **(?) Protection of rights**

As with Sub-option 2a, the evaluation of how the protection of rights varies under this option is not simple and depends on the point of view envisaged. For the **beneficiaries**, the situation is identical to the one described under Sub-

option 2a. Those with children residing in a Member State with a higher factor of adjustment could see their benefit increased, while those with children residing in a Member State with a lower factor of adjustment could see their benefit reduced.

So again it is difficult to determine whether this option offers a better or worse protection of the rights of beneficiaries as a whole. This is for the policy-makers to determine in the light of the level of protection which each of the groups mentioned currently has.

#### **(-) Administrative burden and implementation arrangements**

This option would result in a significant increment of the administrative burden, as far as it involves reimbursement of the upwards adjustment of the family benefits and adjustments. As reimbursement of healthcare costs has shown, said procedures require a significant exchange of information, involve constant delays,<sup>70</sup> and result in an additional administrative burden. It is true that the existing reimbursement procedures for healthcare benefits in kind could be applied, but that may not be the case depending on the internal organisation of the national administrations. Of course, also for family benefits reimbursement is not totally new (cf Article 58 of Regulation (EC) No 987/2009), but, the existing reimbursement provision concerns only few cases, while this reimbursement would cover much more cases. Consequently, this option is even more complex than Sub-option 2a from an administrative point of view.

#### **(≈) No risk of fraud or abuse**

As with Sub-option 2a, and for similar reasons, under this option the risk of abuse would increase although to a lesser extent. It is true that when the benefit is adjusted upwards, the Member State of residences would have to reimburse the difference and would therefore have an active role verifying the place of residence of the children. However, such verification would probably be less exhaustive when the benefit is adjusted downwards (the same as under Sub-option 2a).

As for the current risk of abuse, when the benefit is adjusted upwards the Member State of residence is expected to receive updated information regarding the benefits received by children residing in their territory (requests for reimbursement). As a result, the risk

---

<sup>70</sup> See e.g. Decision S9 of 20 June 2013 concerning refund procedures for the implementation of Articles 35 and 41 of Regulation 883/2004, OJ C 279, 27.09.2013, p. 8.

of fraudulent accumulation of benefits would decrease. However, when the benefits are adjusted downwards such prevention mechanism would not exist (therefore, also in this respect, in cases of downwards adjustments, the same as under Sub-option 2a).

### **(?) potential financial implications**

This option shifts the burden between Member States due to the effect of the differential supplement, but it does it in a less predictable way. As with Sub-option 2a, if the Member State of residence has a lower factor of adjustment, the benefit paid by any Member State competent which is not the Member State of residence of the children would be adjusted downwards; thus the top-up obligation for the Member State of residence might emerge.

If the Member State of residence **tops up the benefit** (as a Member State with secondary competence), it will pay a lower supplement as in the status quo, as the supplement would be reduced by the same amount, as the reimbursement will have to be paid in addition. So, in principle, the Member State of residence would end up paying the same amount as under the status quo (part of it as reimbursement, part of it as top-up). But, if the Member State of residence **does not top up the benefit**, it will result in a higher burden for the said Member State (as it has to grant reimbursement irrespective of any differential supplements). Furthermore, the Member State of residence will be in a situation where it is obliged to pay part of a benefit that is not envisaged by its social security system. That would be, on the one hand, an imposition of the Regulations difficult to justify in the light of the mere coordination of social security systems. However, this could, on the other hand, also be found under today's coordination of e.g. sickness benefits, where the competent Member State also has to reimburse benefits in kind which are granted in another Member State and which are not provided under its legislation.

In any case, like Sub-option 2a, this option would bring a financial relief for the Member State with a higher factor of adjustment (as they could downgrade their family benefits for children living in Member States with lower factors of adjustment, while Member States with lower factors of adjustment would not see any change in their situation in cases where they have to grant benefits for children residing in Member States with higher factors of adjustment. However, they could be affected by the obligation to grant higher differential amounts (which is not very likely). This could result in a certain disruption of the economic logic that assigns the obligation to pay the family benefits to the Member State receiving the contributions and taxes.

In sum, it is difficult to determine whether this modification of the burden-sharing is fairer or not. Thus, this should be decided by the policy-makers in the light of a broader analysis of existing figures and economic relationships between Member States.

#### *1.14.3 Sub-option 2c – adjustment of the amount (limit national amount)*

**A short description of this sub-option:** This option would consist in maintaining the current rules of Regulation (EC) No 883/2004 and in **adjusting** the amount of the family benefit granted by any Member State other than the Member State of residence of the children to the living standards in the Member State of residence of the children, but **limited to the amount** provided by the social security system of the Member State having to grant the benefits. So, in practice, adjustment would only work **downwards** but not upwards.

Simply put, under this option, if the children reside in a less expensive Member State, the benefit would be adjusted downwards, while if the children reside in a more expensive Member State, the benefit would not be adjusted.

**Standard example:**

**Scenario 1:** Member State A (primary competence) grants €80: Member State B (secondary competence) does not grant any differential supplement

**Scenario 2:** Member State B (primary competence) grants €50: Member State A (secondary competence) grants a differential supplement of €50

If the benefit is topped up by the Member State of residence of the children, the supplement could neutralise the negative impact of the adjustment.

However, if the Member State of residence of the children does not top up the benefit, this option would generate unbalanced results: it only reduces the amount received by children living in Member States with lower factors of adjustment without increasing the amount received by children living in Member States with a higher factor of adjustment.

**Additional examples to highlight the effects of this option:**

*Example 1:*

*The father works in Member State C, the mother and 2 children reside in Member State D, and the mother does not work. The amount of a certain family benefit for 2 children is €200 in Member State C; and €200 in Member State D. The factor of adjustment is 100 in Member State C to 120 in Member State D.*

*Member State C (primary competence) grants €200 (no upwards adjustment); Member State D (secondary competence) does not grant any differential supplement.*

*[Status quo: Member State C grants €200; Member State D does not grant any differential supplement.]*

*Example 2:*

*The father works in Member State E, the mother and a child reside in Member State F, and the mother does not work. The amount of a certain family benefit for one child is €100 in Member State E and €85 in Member State F. The factor of adjustment is 100 in Member State E to 80 in Member State F.*

*Member State E (primary competence) grants €80; Member State F (secondary competence) grants a differential supplement of €5.*

*[Status quo: Member State E grants €100; Member State F does not grant any differential supplement.]*

## **Evaluation of the option**

### **(-) Clarification**

As with Sub-option 2a, and for the same reasons, this option is less clear or easy to understand than the status quo as far as it does not simplify the current procedures and involves an additional adjustment procedure. In addition, it distinguishes between two groups of Member States – those with comparatively higher factors of adjustment (they can decrease their family benefits) and those with lower factors of adjustment (they can grant their national amounts). As this is not fixed and depends on every bilateral relation (for every Member State there is a different borderline in relation to which Member States the national amount has to be granted and where the downwards adjustment has to start; this borderline could also change with the time) it is even more unclear than Sub-option 2a.

### **(-) Simplification**

As with Sub-option 2a, and for the same reasons, this option is more complex to apply as far as it imposes additional obligations for migrant workers such as the obligation to state and eventually prove the Member State of residence of the children.

### **(-) Protection of rights**

This option provides a worse protection of the rights of a certain group of beneficiaries, i.e. those residing in Member States with a lower factor of adjustment, while it does not improve the protection of the rights of beneficiaries residing in Member States with a higher factor of adjustment.

In sum, this is an asymmetrical solution that lacks consistency. The amount of the family benefits should be adjusted to the living standard always or never.

### **(-) Administrative burden and implementation arrangements**

As with Sub-option 2a, and for the same reasons, this option would result in a certain increment of the administrative burden, due to the inclusion of the adjustment step in the national procedures and the need for additional prevention of fraud.

**(≈) No risk of fraud or abuse**

Comparable to Sub-option 2a, and for the same reasons, under this option the risk of abuse would increase. Of course, this option would no longer be an incentive to move the children to a Member State with a higher factor of adjustment, but it could still be an incentive to move from Member States with lower factors of adjustment to the Member State which is competent to grant the benefits. Therefore, this option does not prevent or diminish the current risk of abuse, as it does not provide any additional instruments preventing the fraudulent accumulation of benefits.

**(?) Potential financial implications**

This option could shift (again) the burden from Member States with a higher factor of adjustment to Member States with a lower factor of adjustment, in a similar way as with Sub-option 2a. Of course, this option differs from Sub-option 2a, as it takes away the obligation of Member States with lower factors of adjustment to make an upwards adjustment if the children reside in a Member State with higher adjustment factors.

If the Member State of residence has a lower factor of adjustment, the benefit paid by any other Member State would be adjusted downwards. The top-up obligation for the Member State of residence (if this is the Member State with secondary competence) is thus more likely to emerge. Consequently, today's situation would be distorted as it shifts some obligations from Member States with higher levels of costs of living towards Member States with lower levels.

***1.15 Option 3 – reversed competence of the Member State of residence before the Member State of employment***

**General description of all sub-options summarised in this Option 3:** The child's Member State of residence always has competence by priority. Any other Member State involved could only be competent at a secondary level. Thus, these other Member States would only have to grant differential supplements (as Member States with secondary competence) if their family benefits are higher than those of the Member State of residence of the child.

Again various sub-options are possible. First **Sub-option 3a**: the differential supplements would have to be granted based on the unreduced national amount in the same way as differential supplements are calculated today. This is the main difference with **Sub-option 3c** (which was not contained in the mandate, but added by us for the sake of completeness), where only adjusted amounts will be taken as the base for the calculation of the differential supplement. In between sits again **Sub-option 3b** (which has also been added by us), according to which no adjustment takes place, but, the benefits provided by the Member State of residence have to be reimbursed by any Member State with primary competence under today's coordination to safeguard the same burden-sharing between Member States as today. Of course there is also room for a **fourth sub-option** (adjustment + reimbursement). However, we have refrained from a detailed description of this sub-option as it seems to be too complex. Nevertheless, the other pros and cons for this additional fourth sub-option are comparable to the ones described in Sub-options 3a to 3c.

These options would mean a total change of today's cascade of competences of Article 68(1)(a) of Regulation (EC) No 883/2004 to determine the Member State with primary and secondary competence, as no longer 'gainful activity' but 'residence of the child' would be on top, followed by 'gainful activity' and 'receipt of a pension'. 'Residence' of any other person than the child as a last resort is not necessary from our point of view as it should not be the intention of this option to change today's Article 68(2), last sentence of the Regulation, under which a member of the family other than a child (e.g. a father) only residing in another Member State without being gainfully active there or receiving a pension cannot open entitlement to a differential supplement.<sup>71</sup>

To avoid any misunderstandings: this option only works properly if it is clear that the Member State(s) where the parents exercise a gainful activity pay their

---

<sup>71</sup> Concerning the necessity to clarify this sentence see also **Error! Reference source not found.**

supplements (which could reach 100% of their national amounts in cases in which the Member State of residence of the child cannot grant any benefit under its legislation) also if the national legislation of these Member States of activity are residence-based schemes. Additional provisions to safeguard such a common understanding would be advisable to avoid disadvantages for the persons concerned.

One issue which is very important with this option is whether or not **some of the horizontal options** are also taken on board. This concerns especially the question whether benefits which are employment-related are also covered by this option (also for these benefits it is always the child's Member State of residence which has to grant benefits with primary competence), or whether a special coordination is provided which would make this option easier to accept (our recommended option for these benefits can be found in 4.1.4 above). Also the additional clarifications we have made under chapter 5.2 above, e.g. concerning contribution-based benefits, are especially relevant for that option. Therefore, the impact assessment could show a different outcome depending on these horizontal decisions.

For these Options a special and separated coordination of family benefits with income replacement function (see under 4.1.4 above) could be advisable. This could safeguard that those family benefits which are clearly linked to a gainful activity of one parent exercised outside the Member State of residence of the children would still have to be granted by that Member State and not by the Member State of residence.

Concerning the legal framework (especially the **legal compatibility with the TFEU**) it has to be said that this solution should safeguard exactly the same amount for the beneficiaries. As today's solution never has been challenged by the CJEU it could be assumed that also this option would not raise any problems from the perspective of the total amount of the benefits granted. Of course it would shift the competences, thus it might happen that a person would lose immediate entitlement to high benefits by today's Member State

with primary competence e.g. where one parent works and have to start with comparatively low benefits from the Member State of residence of the children. But, we do not think that this could endanger the compliance with the TFEU as the same is valid also today if the Member State of residence of the children is the one with primary competence because one parent works there and a differential supplement has to be paid by another Member (e.g. where the other parent works). There are already measures provided to grant the differential supplement as quickly as possible. In case these measures are not yet sufficient it would be up to the Community legislator to look for further improvements.

*1.15.1 Sub-option 3a – reversed competence of the Member State of residence before the Member State(s) of employment, no adjustment, no reimbursement*

**A short description of this sub-option:** This sub-option declares the children's Member State of residence as the one with primary competence and any other Member States (e.g. those where the parents work) only competent to grant differential supplements as Member States with secondary competence, if the family benefits under that legislation are higher. The amounts of the family benefits taken into consideration are not adjusted.

**Standard example:**

**Scenario 1:** Member State B (primary competent) grants €50; Member State A (secondary competent) grants a differential supplement of €50

**Scenario 2:** Member State A (primary competent) grants €100, no differential supplement by Member State B (secondary competent)

**Additional examples to highlight the effects of this option:**

*Example 1:*

*The family (mother, father, 2 children) resides in Member State A, the mother does not work, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B.*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.*

*[Status quo: Member State B (primary competence) has to grant its €300 immediately; no differential supplement by Member State A (secondary competence).]*

*Example 2:*

*The family (mother, father, 2 children) resides in Member State A, the mother works in Member State A, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B.*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.*

*[Status quo: The same – Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.]*

*Example 3:*

*[This might be considered a not very realistic example; nevertheless, we want to mention it.] The family (mother, father, 2 children) resides in Member State C, the mother works as a frontier worker in Member State D, the father works as a*

*seasonal worker in Member State E; the amount of family benefits for 2 children is €150 in Member State C, €300 in Member State D and €200 in Member State E.*

*Member State C (primary competence) has to grant its €150 immediately; Member State D (secondary competence) grants a differential supplement of €150, €75 being reimbursed to Member State D by Member State E (tertiary<sup>72</sup> competence).<sup>73</sup>*

*[Status quo: Member State D (primary competence) has to grant its €300 immediately, €150 being reimbursed by Member State E (secondary competence); no differential supplement by Member State C (tertiary competence).]*

#### **Evaluation of the option:**

##### **(+) Clarification**

As the Member State which is competent by priority is always the Member State of residence of the children, it is clear which Member State has to start granting its benefits. In case of residence-based family benefits this is the clearest situation possible, as all children entitled to benefits under national legislation will get these benefits under Regulation (EC) No 883/2004 as well. Many disputes which today's coordination could cause (if Member States do not agree on which Member State is the primarily competent one) could be avoided. Nevertheless, this option is not the optimum with regard to clarity as we still have more than one Member State which could be competent to grant benefits (which includes differential supplements). From this perspective, the competence of only one Member State to grant its family benefits could be regarded as the clearest option.

---

<sup>72</sup> As also today there is a hierarchy between Member States which are competent due to the same element (more activities, more pensions), we think there are already today more than two competent Member States at stake; therefore, in this example we call Member State E the Member State with tertiary competence.

<sup>73</sup> If we keep Article 58 of Regulation (EC) No 987/2009 and extend it also to these cases.

Anyhow, the advantages concerning clarity are very important. The Member State of residence of the children becomes the anchor for family benefits. Irrespective of where the parents work and how often they switch their workplace, the Member State of residence of the children always stays the one with primary competence and the children will continuously receive the same benefits. Only the differential supplement can change whenever a new activity is started by one parent in a new Member State.

#### **(?) Simplification**

On the one hand this option could be regarded as simpler, as always the same Member State is the competent one, irrespective of the fact whether the parents work and in which Member State they work (it is always the same Member State which is the one with primary competence). This could lead to a (+). On the other hand, this option is as complex as the status quo, as differential supplements are still provided. The reverse order of priority does not change the overall systematic. So, from an abstract point of view this option could be regarded as neutral compared to the status quo. But, in practice this option could lead to much more cases with differential supplements than today (if we assume that in general the family benefits in Member States to which workers migrate are higher than in the Member State of residence of the children). From this perspective we would have to evaluate it with a (-). Thus, a (?) seems to be a fair value for this option.

#### **(+) Protection of rights**

This option is much better than the status quo, as it will safeguard that all children immediately receive the benefits which are provided for children under the legislation of the Member State where they reside. It could be assumed that, consequently, families do not have to wait any longer for the final settlements of conflicts or rely on payment of provisional amounts of benefits.<sup>74</sup> Thus, the policy aims of the Member State of residence on how

---

<sup>74</sup> Article 60(4) of Regulation (EC) No 987/2009.

much money a family should receive which resides in its territory is fully achieved. In addition, higher amounts of benefits in other Member States (especially those where one or both parents work) are also not lost, as there would be a differential supplement from these Member States. The best results concerning the protection of rights would be achieved if employment-related benefits (e.g. child-raising benefits with an income replacement function) remain within the competence of the Member State which is competent for the person taking care of the child. If this was not the case and all family benefits were covered in the same way by this new coordination, we think that many positive elements which this option really has, would be taken away again.

Another important issue is that, when the Member State of residence always has to grant its benefits with primary competence, this takes away today's obligation of this Member State to grant provisional benefits in the event of dispute of competences (Article 60(4) of Regulation (EC) No 987/2009). Thus, as benefits are granted immediately, this definitively adds to legal certainty and the protection of the persons concerned. It also safeguards that not so many cases of recovery of overpayments will occur (which is often the case today when the final competence differs from the provisional competence and thus overpayments have to be recovered (Article 6(5) and Title IV, Chapter III of Regulation (EC) No 987/2009).

Finally, in this context it has to be mentioned that, as family benefits in the Member State of residence could usually be assumed as being lower than those in a parent's Member State of work, this option could result in much more differential supplements than today. For these cases the procedures will take longer until they get the final amount of family benefits they are entitled to. This diminishes the (+).

#### **(+) Administrative burden and implementation arrangements**

No new administrative procedures have to be created, as the existing ones will work in the same way as today (sometimes only by exchanging the Member

States' roles). However, the length of procedures will be considerably shortened and provisional competences and all the administrative problems related to this (including the recovery of overpayments) could be largely avoided. Institutions of the child's place of residence can treat all applications in the same way irrespective of the parents' place of work. Again, the fewer cases of overpayment and recovery of overpayments (see under protection of rights) have to be mentioned. The possible increase of cases in which differential supplements have to be paid is something which could add negative aspects to this option.

**(+) No risk of fraud or abuse**

The Member State of residence will check the family in the same way as any other family resident there. Usually checking and evaluating the situation is easier in the same Member State than abroad and also if all residents are subject to the same checking procedures. Problems of the status quo, where sometimes a work of a parent in another Member State has been dissimulated to immediately get the benefits from the Member State of residence would no longer be an issue, as the Member State of residence is the competent one in all cases.

**(?) Potential financial implications**

This option shifts the burden in cases of only one working parent abroad (in principle only in these cases) from the Member State of work to the Member State of residence. It is difficult to decide whether this is fairer or not – this remains a political decision balancing the pros and cons mentioned below (this might also depend on the schemes involved). In case of a residence-based scheme in the Member State of residence this could be regarded as fairer, as already without the Regulation all residents would be entitled to the benefits. This would change if the Member State of residence has a contributory scheme and, thus, has to grant also benefits for persons not contributing to the scheme (if we assume that this is the consequence of this option, which has to

be clarified anyhow – see also 4.1.4 and 5.2 above<sup>75</sup>). Member States of residence could see too much burden on their shoulders (they will have to grant more family benefits than today) taking into account that a parent works and pays tax and/or contributions in another Member State, while this other Member State only has to grant a differential supplement. Therefore, we have to stress that, compared to the status quo, this solution will lead to savings of the Member State of gainful activity at the cost of the children’s Member States of residence. From the point of view of the Member States of employment this could be seen the other way around (the higher family benefits are only planned for the children resident on their territory and, therefore, it is only fair that they do not have to export the whole amount but only have to grant a differential supplement).

It could be assumed that this option is more valued by the Member States of work of migrant workers than those where the family resides (Member States from which the migrant worker came). Maybe the remaining unrestricted export obligation (which can result in sometimes considerable differential supplements by these Member States of work) could be an argument which convinces also these Member States of residence?

#### *1.15.2 Sub-option 3b – reversed competence of the Member State of residence before the Member State of employment + reimbursement*

**A short description of this sub-option:** This sub-option is very similar to Sub-option 3a (therefore, unless otherwise stated the remarks under Sub-option 3a apply to this sub-option as well). It declares again the children’s Member State of residence as the one with primary competence and any other

---

<sup>75</sup> This shows, again, how many questions have to be solved before a reform of the family benefit coordination chapter can be regarded as finished in a satisfactory way. We want to recall the following issue: if the Member State of residence has a contributory family benefits scheme (only active persons who contribute are entitled to benefits), does the competence of this Member State mean that also a person gainfully active in another Member State and, thus, not contributing to that scheme can open entitlement to such benefits if the children reside there or is this not the case? In the latter case this would not change today’s situation in which the Member State outside the Member State of residence of the children where the parent works has to grant its family benefits. And, it could be said that also this new coordination does not safeguard that the Member State of residence of the children grants all the benefits which it would have to in purely internal situations. Member States with only residence-based schemes could say that such an outcome has to be regarded as not balanced.

Member State (e.g. those where the parents work) only competent to grant differential supplements (secondary competence), if the family benefits under that legislation are higher. The amounts of the family benefits taken into consideration are not adjusted. The only difference is that the Member State which would have primary competence under today's coordination would have to reimburse the Member State of residence with an amount which corresponds to its obligation today. Thus, this option would combine the advantages for the persons concerned (immediate entitlement to the benefits provided under the legislation of the Member State of residence) with the well-known burden-sharing of today's coordination.

**Standard example:**

**Scenario 1:** Member State B (primary competence) grants €50; Member State A (secondary competence) grants a differential supplement of €50 and reimburses the €50 granted by Member State B

**Scenario 2:** Member State A (primary competence) grants €100, no differential supplement by Member State B (secondary competence), but, reimbursement to Member State A of €50

**Additional examples to highlight the effects of this option:**

*Example 1:*

*The family (mother, father, 2 children) resides in Member State A, the mother does not work, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B.*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150 and reimburses €150 to Member State A.*

*[Status quo: Member State B (primary competence) has to grant its €300 immediately; no differential supplement by Member State A (secondary competence)].*

*Example 2:*

*The family (mother, father, 2 children) resides in Member State A, the mother works in Member State A, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B.*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.*

*[Status quo: The same – Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.]*

*Example 3:*

*[This might be seen as a not very realistic example; nevertheless, we want to mention it.] The family (mother, father, 2 children) resides in Member State C, the mother works as a frontier worker in Member State D, and the father works as a seasonal worker in Member State E; the amount of family benefits for 2 children is €150 in Member State C, €300 in Member State D and €200 in Member State E.*

*Member State C (primary competence) has to grant its €150 immediately; Member State D (secondary competence) grants a differential supplement of €150 and reimburses the €150 to Member State C, €150 being reimbursed to Member State D by Member State E (tertiary competence).<sup>76</sup>*

---

<sup>76</sup> If we keep Article 58 of (EC) No Regulation 987/2009 and extend it to these cases.

*[Status quo: Member State D (primary competence) has to grant its €300 immediately, €150 being reimbursed by Member State E (secondary competence); no differential supplement by Member State C (tertiary competence)].*

**Evaluation of the option:**

**(+) Clarification**

For the persons concerned the same advantages as under Sub-option 3a apply. Nevertheless, for the institutions it is less clear, as additional reimbursement is included. This is an issue which we have not dealt with under clarification, but under administrative burden.

**(-) Simplification**

This option is more complex as the reimbursement is added to the obligation to grant differential supplements.

**(+) Protection of rights**

For the persons concerned this option is as positive as Sub-option 3a.

**(-) Administrative burden and implementation arrangements**

As an obligation of reimbursement is added, this sub-option is more complex than the status quo. The points mentioned in relation to Sub-option 2b apply to this sub-option as well.

**(+) No risk of fraud or abuse**

The same arguments as under Sub-option 3a apply, but, it might be assumed that this sub-option is even more fraud-proof than Sub-option 3a, as also the Member State of employment which has to reimburse will check the case (even if no differential supplement has to be paid).

**(≈) potential financial implications**

For this option we can clearly indicate the effects on fair burden-sharing, as it will lead to exactly the same results as the status quo.

*1.15.3 Sub-option 3c – reversed competence of the Member State of residence before the Member State of employment + adjustment*

**A short description of this sub-option:** This sub-option is, again, very similar to Sub-option 3a (therefore, unless otherwise stated the remarks under Sub-option 3a apply also to this sub-option). It declares again the children's Member State of residence as the one with primary competence and any other Member State (e.g. those where the parents work) only competent to grant differential supplements, if the family benefits under that legislation are higher. Different from Sub-option 3a the amounts of the family benefits taken into consideration have to be adjusted. Reimbursement, as contained in Sub-option 3b, is not part of this sub-option, as it would make it even more complex.

**Standard example:**

**Scenario 1:** Member State B (primary competence) grants €50; Member State A (secondary competence) grants a differential supplement of €30

**Scenario 2:** Member State A (primary competence) grants €100, no differential supplement by Member State B (secondary competence)

**Additional examples to highlight the effects of this option:**

*Example 1:*

*The family (mother, father, 2 children) resides in Member State A, the mother does not work, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B; due to adjustment this amount would be reduced to €200 (the factor of adjustment is 100 in Member State A to 150 in Member State B).*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €50.*

*[Status quo: Member State B (primary competence) has to grant its €300 immediately; no differential supplement by Member State A (secondary competence)].*

*Example 2:*

*The family (mother, father, 2 children) resides in Member State A, the mother works in Member State A, and the father works as a frontier worker in Member State B; the amount of family benefits for 2 children is €150 in Member State A and €300 in Member State B; due to adjustment this amount would be reduced to €200 (the factor of adjustment is 100 in Member State A to 150 in Member State B).*

*Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €50.*

*[Status quo: Member State A (primary competence) has to grant its €150 immediately; Member State B (secondary competence) grants a differential supplement of €150.]*

*Example 3:*

*[This might be considered a not very realistic example; nevertheless, we want to mention it.] The family (mother, father, 2 children) resides in Member State C, the mother works as a frontier worker in Member State D, and the father works as a seasonal worker in Member State E; the amount of family benefits for 2 children is €150 in Member State C, €300 in Member State D; due to adjustment this amount would be reduced to €200; and €200 in Member State E; due to adjustment this amount would be reduced to €120 (the factor of adjustment is 100 in Member State C to 150 in Member State D and 166 in Member State E).*

*Member State C (primary competence) has to grant its €150 immediately; Member State D (secondary competence) grants a differential supplement of €50, €25 being reimbursed to Member State D by Member State E (tertiary competence).<sup>77</sup>*

*[Status quo: Member State D (primary competence) has to grant immediately its €300, €150 being reimbursed by Member State E (secondary competence); no differential supplement by Member State C (tertiary competence)].*

#### **Evaluation of the option:**

##### **(-) Clarification**

It would be easier for the persons concerned, as they would in all cases be entitled to the family benefits of the Member State of residence. Compared to Sub-options 3a and 3b, this sub-option would not be so clear, as adjustments have to be made. This sub-option is close to Sub-option 2a. As the disadvantages seem to be stronger than the advantages it could be said that this option is worse than the status quo.

##### **(-) Simplification**

Adding adjustments to the coordination always makes it more complex.

##### **(?) Protection of rights**

Again, as an adjustment is involved, this is a question of political decision. The arguments mentioned e.g. under Sub-option 2a also apply to this sub-option.

##### **(-) Administrative burden and implementation arrangements**

As an obligation of adjustment is added, this sub-option is more complex than the status quo. The points mentioned in relation to Sub-option 2a apply to this sub-option as well.

##### **(+) No risk of fraud or abuse**

---

<sup>77</sup> If we keep Article 58 of (EC) No Regulation 987/2009 and extend it also to these cases.

The same arguments as under Sub-option 3a apply.

**(?) Potential financial implications**

Here, again, we are confronted with a necessary political decision. This sub-option could be seen by some Member States as one of the best, as the Member State of residence has to grant all its benefits by priority, and if another Member State has to grant differential supplements these supplements can be adjusted to the costs of living in the Member State of residence. But, Member States which are in favour of an unrestricted export of all family benefits as it happens today will oppose this sub-option, maybe even violently, as it does not only give the Member State of residence primary competence, but might also reduce benefits exported into these Member States. From this perspective, this option appears much worse than Sub-option 3a.

## Conclusions

Having analysed the existing coordination of family benefits and possible options to modify the current system we came to the following conclusions.

1. The existing coordination of family benefits is complex, covers a great variety of different types of benefits and has become the subject of political debate in recent times.
2. If the existing coordination is perceived as not being fair, this is a political statement. Therefore, also the search for a 'fairer' distribution of the burden depends on a political decision we cannot make. Nevertheless, from our experts' point of view some recommendations can be made irrespective of the political decision to be taken.
3. A re-examination of the existing coordination rules is advisable.
4. Export (understood as a Member State's obligation to grant family benefits also to the children residing in another Member State) is the main focus of the debate. Nevertheless, also other elements should not be forgotten. Some of these horizontal questions and problems could be regarded as more important and more burning issues than export.
5. Therefore, when discussing a reform of the coordination of family benefits we propose also clarifications ancillary to the export issue, like e.g. new or improved definitions, but also a special coordination for benefits which show a strong link to gainful activities, e.g. child-raising benefits for persons in employment. Only if these issues are solved in a satisfactory way, the options proposed for export could be a realistic alternative to the status quo.
6. Mapping has shown – at the level of FreSsco national experts – some support and advancement of legal arguments in favour of adjusting family benefits to the living costs of the country where the children reside, especially from some higher income Member States. Conversely, some lower income Member States were advancing arguments against such adjustment. It could be assumed that this will also be the official position of the Member States concerned.

Whichever solution will be further discussed, its pros and cons should be well evaluated and an EU-wide socially just solution should be adopted.

7. If there is really a political will to change the existing mechanism of export of family benefits, we think that the option which only reverses the competences from the Member State of employment towards the child's Member State of residence is a solution much easier to achieve and would also not take away any benefits granted today. Under this option, families would immediately receive the family benefits of the Member State of residence of the child (thus it can be assumed that from the perspective of the persons concerned it can be an improvement compared to the status quo). But, we have to note that this option cannot be presented as the only positive one. As it shifts the burden of the benefits from the Member State receiving the contributions and normally the taxes to the Member State of residence of the children, the fairness of this option can be disputed. It would most probably also result in more differential supplements than today and thus add administrative burden for the institutions. Anyhow, if an option is further examined to modify the existing coordination, we recommend analysing this option, as it contains the most positive elements of the options examined compared to the status quo.

## Annex 1 – Overview of the effects of the different options

### Option 1 (status quo)

### Option 2a (adjustment of the amounts, no limits)

### Option 2b (adjustment and reimbursement of difference)

[As the decision towards the person concerned must show the whole suspended amount, the amount of the reimbursement has to be added to the total amount to show the real effects for the Member State of residence.]

**Option 2c (adjustment + limit national amount)**

**Option 3a (reverse competence, no adjustment, no reimbursement)**

### Option 3b (reverse competence + reimbursement)

[As the decision towards the person concerned must show the whole suspended amount, the amount of the reimbursement has to be added to the total amount to show the real effects for the Member State of work.]

### Option 3c (reverse competence + adjustment)

## Annex 2 – Elements for analysing the legal possibilities to adjust the amount of family benefits to the living costs

Although the examination of a legal base for any adjustment (see 5.1 and Option 2) was not an explicit part of the mandate for this report, we have, nevertheless, collected some ideas, elements and background information to feed this examination.

### *Results from the mapping exercise*

First, it was interesting to explore how such adjustments would have to be regarded from a national perspective.

From the replies of the **FreSsco national experts** it seems that the introduction of a new coordination rule, stating that family benefits have to be adjusted according to the living costs of the Member State where the children reside, is not completely unambiguous from the viewpoint of **national law**. The main concern is the principle of equality, but it also depends on what is being compared (who is taken as a reference group, and who as comparative group).

Such new coordination rule might be in line with the **constitutional values** of some Member States. Reportedly, Article 7 of the **Austrian** Federal Constitution (*Bundesverfassungsgesetz*, B-VG) imposes equal treatment on the legislature. This means that not only persons in the same situation must be treated equally, but also that distinctive situations must be treated differently. Such a different situation may also be effectuated by different living costs in respect to family benefits which are aimed at compensating the financial burden of childcare. Thus, such a new principle would be in line with Article 7 B-VG, provided that the different living costs can be determined effectively.

A similar estimate is made for e.g. **Polish, Swedish, Luxembourg** and **Belgian** constitutions. It seems that the **Polish** constitution entails only general principles. Also in **Sweden**, there are no constitutional principles to prevent the adjustment of family benefits. For **Luxembourg** it is argued that, a priori, there would be no conflict with constitutional or general principles of Luxembourg law, since family benefits are already considered as personal rights of the children. Moreover, the adjustment of family benefits to the living standard in another Member State is also unlikely to raise constitutional issues in **Belgium**. Certain traces of a benefit adjustment approach can already be found in bilateral agreements of Belgium with Turkey, Morocco and Tunisia, in which specific, lower amounts are exported instead of the normal sums that would be due in Belgium. However, one may wonder whether it would exceed the tasks of coordination, especially where it results in the amount of the Belgian benefit being raised above the level that would be due in Belgium.

The argument of equal treatment may also go in another direction, arguing that adjusting family benefits might be against the equality principle. For instance, if **the Czech Republic** would have to pay a higher or lower amount of family benefits to children abroad only on the ground e.g. that the parents moved with the child to another Member State, this might breach the equality of children living in the Czech Republic and abroad, if the Czech Republic would remain the competent State. Obstacles for adjusting family benefits and possible breach of the equality principle were also advanced by e.g. the **Bulgarian** expert, arguing that adjustment might be against the Bulgarian Constitution and also Article 4 of Regulation (EC) No 883/2004 itself. In the **Slovenian** constitution unequal treatment based on any personal circumstance (which might include the place of residence of children) is as a rule prohibited, unless it could be proven that formally unequal treatment and positive measures are required to guarantee substantive (material) equality (although reducing family benefits might be difficult to perceive as a positive measure).

For the **legislative acts**, it is argued that national law would either have to be modified (since no adjustment is provided for, e.g. in **AT**; there is also no parallel to it in **BE, HR** or **SI** law), or the (accordingly modified) coordination Regulation would have to be directly applicable. However, in some Member States there seem to be specific conditions. For instance in **Luxembourg**, the *Caisse nationale des prestations familiales* (CNPf) would be in favour of such reform under one precise condition: the coordination Regulation has to be changed in accordance with the coordination provisions regarding unemployment benefits. For example, a Polish institution would pay family benefits according to the living costs in Poland to the children of a parent working in Luxembourg and the CNPF would have to pay the differential amount. In this case, the CNPF might agree with this change, if the costs could be reimbursed by the CNPF to the Polish institution in other words, if it would not have to pay the differential amount directly to the parent/child residing in Poland. The financial channels would have to be changed from the

parent/child to the institution (these suggestions are very similar to the ones we have further elaborated under Options 2 and 3).

What appears equally important as pure national law is the **purpose** (the philosophy) of family benefits in the Member States (which are ‘behind’ legal rules). It is argued that the adjustment of family benefits according to the living costs of the individual family is quite odd from a **Swedish** point of view, since family benefits according to national legislation are flat-rate and only vary with the number of children. A similar argument was advanced e.g. by **Slovenia**, where certain family benefits are (indirectly) linked to the minimum or average wage in the country. Adjusting them according to the living costs in another Member State might distort this balance. Also in **Poland** there is no criterion of the cost of living to determine family benefits.

The **Croatian** Act on Child Allowance would have to be amended accordingly, but such an amendment could be contrary to the national situation. The calculation of the State Budget Base (see 4.1.2) would also have to follow the costs of living and be adjusted accordingly. Although the living costs have increased in Croatia in the last decade, the State Budget Base, which is the base for calculation of many other benefits (not only within the family benefits system) has not been changed since 2002. The latest available Household Income Survey of 2011, published by the Croatian Bureau of Statistics, for example shows a dramatic increase in the percentage of households which have a lower income than the living costs (70% of households, in comparison with 40% of households in the previous year). However, there are no plans to recalculate and adjust the amount of the State Budget Base. An obligation to perform adjustments at European level could result in pressure also for the purely national cases.

This is even more the case with income-related family benefits. It is argued that adjustment of family benefits, whether an increase or a decrease, would sit uneasily with the contributory nature of the ‘professional’ benefit in **Belgium**, since it would loosen the nexus between the amount of the benefit received

and the amount of the contributions paid (for this reasoning we also refer to 5.2.).

From this point of view the current coordination regime is perceived as socially just, since it is in the first place established to enable economic mobility within the EU. In a Member State with primary competence, (unadjusted) contributions and taxes are paid, from which also family benefits are being financed. In addition, it is argued that living costs may also be distinct within one Member State (e.g. in the capital city, compared to other towns and rural areas), but this has no influence on the level of family benefits. The same principle might be applied also Union-wide.

This leads us to another interesting aspect. Imagine a Member State has already today in its **national legislation a rule which stipulates such adjustments** (e.g. higher family benefits in the big cities or in regions with higher living costs than in the rest of the country). Would this Member State be entitled to apply this national rule already today (under the current wording of Regulation (EC) No 883/2004) and reduce or increase its family benefits for children residing in another Member State, or would it be obliged to grant the amount of the region where the migrant worker actually works on its territory also for children resident in another Member State? The existing court rulings are not at all clear. While the EFTA Court seems to favour the first approach,<sup>78</sup> the Court of Justice of the European Union (CJEU) seems to support the latter one.<sup>79</sup> This is also an aspect which would merit further examination.

*Would such adjustments be possible from our point of view?*

#### *Introductory remarks*

First of all, we have to mention that we all considered it very important that this analysis was done and that all the pros and cons were very carefully

---

<sup>78</sup> Case E-3/05, *EFTA Surveillance Authority v The Kingdom of Norway* (concerning the Finnmark supplement).

<sup>79</sup> Judgment in *Gouvernement de la Communauté française and Gouvernement Wallon*, C-212/06, EU:C:2008:178 (concerning the Flemish care insurance).

examined. We have to admit that we do not see this question completely in the same way. While some of us were convinced that an adjustment of family benefits would be in contradiction to the fundamental principles of the TFEU, others thought that it could be justified and thus not be that problematic. The following part has to be read bearing these divergent opinions of the authors in mind.

*Would it be legally possible to adjust family benefits to the costs of living?*

It should be examined if such adjustments (which lead to reduced or increased amounts of benefits depending on the Member States involved) are in conformity with the general principles of the TFEU (e.g. equal treatment of migrant workers under Article 45, the export obligation under Article 48, but also the core principles of coordination enshrined in Regulation (EC) No 883/2004 itself, e.g. neutrality, assimilation of facts, equal treatment and exportability). Of course, this is a question which has to be examined very carefully and does not lie within our mandate. Nevertheless, if the TFEU does not allow such measures under any circumstances this would – without any doubt – also influence the impact assessment.

Any modification of the Regulations which goes for an adjustment of family benefits requires a careful review. The following considerations could be taken into account when analysing them as far as the adjustment procedures could affect the coordination especially concerning the **neutrality principle**, the general **assimilation of facts** principle, the **equality of treatment** principle and the principle **of exportability** of the acquired rights.

*Neutrality principle*

As is well-known, the TFEU provides for the coordination, not the harmonisation, of the legislation of the Member States, with regard to differences between the Member States' social security systems and, consequently, between the rights of persons working in the different Member States. It follows that those substantive and procedural differences between the

Member States' social security systems, and hence between the rights of the persons working in the Member States, are unaffected by the Treaty.<sup>80</sup>

The coordination Regulation, with regard to family benefits, has so far identified the applicable social security legislation and granted migrants the right to obtain a certain benefit as established in said national social security legislation. Under the scenarios envisaged here, the Regulation would go a step further by introducing an adjustment of the amount of the benefit established by the national legislation. Even if the substance of the national legislation remains unchanged, its result would be distorted.

As the CJEU has said, the objective of the free movement of workers within the EU is facilitated if conditions of employment (including social security rules), are as similar as possible in the various Member States. However, this objective is imperilled and made more difficult to realise if unnecessary differences in the social security rules are introduced by the Regulations. According to the Treaty, the EU legislature must refrain from adding to the disparities which already stem from the absence of harmonisation of national legislations (due to the famous *Pinna* case).<sup>81</sup> It would be important to determine whether or not the adjustment procedures constitute such an unnecessary disparity. However, of course *Pinna* concerned a situation in which all Member States applied one coordination, while France was allowed, pursuant to the Regulation, to apply a different coordination. Therefore, it has to be examined if the *Pinna* obstacle would also apply to a rule under which all Member States have to adjust their benefits in the same way.

The Regulation's **conflict rules** have an indirect effect, as they only determine the national legislation applicable.<sup>82</sup> Under this law, the protection of the

<sup>80</sup> Judgment in *Lenoir*, C-313/86, EU:C:1988:452, paragraph 13 and judgment in *Hervein and Lorthiois*, C-393/99 and C-394/99, EU:C:2002:182, paragraph 51.

<sup>81</sup> Judgment in *Pinna v Caisse d'allocations familiales de la Savoie*, C-41/84, EU:C:1986:1, paragraph 21.

<sup>82</sup> Judgment in *Hervein and Lorthiois* EU:C:2002:182, paragraph 53.

migrant (*lex loci laboris* in our case) can be more or less advantageous to the interests of the migrant.

Under the applicable law, the Regulations guarantee, on the one hand, that the migrant is **treated equally** with the nationals assured under this legislation (we will return to this point later on), and on the other hand, that he or she does **not lose any of the nationals' benefits** that he or she has been entitled to if the Regulations had not been applied. This is the so-called *Petroni* principle, establishing that the Regulations cannot freely limit benefits received in the light of the national legislation alone.<sup>83</sup> In fact, according to Articles 45 and 48 TFEU, which constitute the basis of the coordination, “*limitation may be imposed on migrant workers to balance the social security advantages which they derive from the Community regulations and which they could not obtain without them*”, but the Regulations may not withdraw or reduce the social security advantages that derive from the legislation of a single Member State.<sup>84</sup>

Therefore, it could be said that the adjustment procedure could only be applied if the right to the family benefit was opened by the Regulations only (no entitlement under national law alone), i.e. by applying the aggregation of periods or the assimilation of facts mechanisms (e.g. concerning the residence of the child) envisaged by the Regulations. If the right was recognised by mere application of the national social security legislation, the entitlement would be considered autonomous from and intangible for the Regulations. This important limitation for the EU legislature, defending the intangibility of autonomous ‘national benefits’, is a hermeneutical principle applied repeatedly by the CJEU since 1975 in the *Petroni* case.

---

<sup>83</sup> Judgment in *Petroni*, C-24/75, EU:C:1975:129. On the application of this principle on the differential supplement of family benefits, see the judgment in *Dammer*, C-168/88, not available, paragraph 21. The same principle is also followed in the judgment in *Bosmann* EU:C:2008:290, paragraph 30, for letting a Member State which lacks competence retain (under some conditions) the possibility of granting family benefits (voluntarily?) if there are specific and particularly close connecting factors between the territory of that State and the situation at issue. This possibility disappears when there are not enough connecting factors (see the judgment in *B.*, C-394/13, EU:C:2014:2199).

<sup>84</sup> Judgment in *Jerzak*, C-279/82, EU:C:1983:228, paragraphs 11 and 12.

### *General assimilation of facts principle*

This principle envisaged under Article 5(b) of Regulation (EC) No 883/2004 should also be considered. Children living in a different Member State have to be treated as if they were residing in the competent Member State with regard to the acquisition of the right to a benefit and the calculation of the amount of the benefit. There is even a specific and a partly reiterative ad-hoc rule regarding family benefits under Article 67 of the Regulation.<sup>85</sup>

Establishing an adjustment procedure for the calculation of the amount of the benefit of the children living abroad could be in contradiction with the assimilation principle. In fact, the adjustment would result in an unequal treatment of a certain group of migrants, i.e. those leaving their children in their home Member State. But, of course, the whole Article 5 of the Regulation is under the condition “*unless otherwise provided in the Regulation*”, and thus, the EU legislature could in theory deviate from these principles. This unequal treatment of children depending on their place of residence could be considered an indirect discrimination unless there would be a reasonable and objective justification for this measure and a reasonable proportionality between the means employed and that legitimate aim which is sought to be realised.

### *Equality of treatment principle*

Finally, the principle of **equal treatment** could be affected especially when considering downwards adjustment. Under such circumstances, the migrant worker would not enjoy the same benefits as the sedentary workers, something that may contravene Article 4 of Regulation (EC) No 883/2004. Furthermore, the level of protection will depend on the living standards of the Member State where his or her children live. With regard to family benefits, there would be

---

<sup>85</sup> The aim of this rule, envisaged in the precedent Regulation, was to prevent Member States from making entitlement to, and the amount of, family benefits dependent on residence of the worker's family members in the Member State providing the benefits, so that EU workers are not deterred from exercising their right to freedom of movement (see, in particular, the judgment in *Merino García v Bundesanstalt für Arbeit*, C-266/95, EU:C:1997:292, paragraph 28).

no equality of treatment between migrant workers and domestic workers. From this point of view, it can be argued that the employed person concerned would be impeded in his or her right to free movement.

From another perspective it could be argued that, if the purpose of the family benefit is to meet family expenses, children are protected to the level established by the competent Member State's social security system as far as a similar rate of their family expenses is being covered. Following this argument, the principle of equal treatment would be broken in our Sub-option 2c only when the upwards adjustment is not applied. But even if we admit that under the current Regulation there is a certain overprotection of children living abroad compared to children living in the competent Member State, this would not be breaking the equality principle, as the Regulations may provide a more favourable treatment of migrant workers compared to sedentary workers, as stated by the CJEU.<sup>86</sup>

The adjustment procedure under this option could remind one of the *Pinna I* case. Although the situation was slightly similar (a worker insured in France whose children were residing in another Member State received a different benefit from the workers whose children were residing in France), the provision included in the Regulation was fairly different. It established that, as the competent Member State, France could pay the family benefits granted by the Member State of residences of the children instead of the family benefits they granted to children residing in France. The CJEU considered this provision illegal because it gave rise to an indirect discrimination on grounds of nationality, as the unjustified provision denied the right to obtain French family benefits to a group of workers that consisted mainly of migrants. The

---

<sup>86</sup> Judgment in *Movrin*, C-73/99, EU:C:2000:369, paragraph 51: “That consequence would result not from the interpretation of Community law but from the system at present in force, which, in the absence of a common social security scheme, is based on a simple coordination of national legislative systems which have not been harmonised (see, in particular, Case 27/71 *Keller v Caisse Régionale d'Assurance Vieillesse des Travailleurs Salariés de Strasbourg* [1971] ECR 885, paragraph 13, and Case 22/77 *Fonds National de Retraite des Ouvriers Mineurs v Mura* [1977] ECR I699, paragraph 10)”.

CJEU stated that the right to freedom of movement was at stake if the migrant worker received less than the national workers just because his or her spouse and children remained in the Member State of origin.

Unlike *Pinna I*, our Option 2 proposes the adjustment of the family benefits provided by the competent Member State to the living standards of the Member State of residence of the children, not the substitution of those benefits for the ones provided by the Member State of residence of the children. It could be argued that all children entitled to benefits in a certain Member State will receive a benefit covering the same rate of their protected needs, irrespective of their place of residence, at least under the first Sub-options 2a and 2b analysed. For Sub-option 2c this argument could not be used.

Finally, the references to the first recital of Regulation (EC) No 883/2004<sup>87</sup> by the CJEU<sup>88</sup> should be taken into account. The CJEU stated that migrant workers leave their countries to **improve their living standard**; not to maintain it.

#### *Exportability of the acquired rights principle*

As is well-known, Article 48 TFEU on the minimum content of the coordination Regulations mentions only two principles: aggregation and exportability of the acquired rights. Article 7 of Regulation (EC) No 883/2004 developing the exportability principle establishes that “*Unless otherwise provided for by this Regulation, **cash benefits payable under the legislation of one or more Member States or under this Regulation shall not be subject to any reduction, amendment, suspension, withdrawal or confiscation on account of the fact that the beneficiary or the members of his/her family reside***”

---

<sup>87</sup> “The rules for coordination of national social security systems fall within the framework of free movement of persons and should contribute towards **improving their standard of living and conditions of employment**”.

<sup>88</sup> See e.g. the judgment in *Hudzinski and Wawrzyniak* EU:C:2012:339, paragraph 47; and the judgment in *Bosmann* EU:C:2008:290, paragraph 30.

*in a Member State other than that in which the institution responsible for providing benefits is situated.”*

Even if family benefits are, in this case, not subjected to a real exportation, and exceptions to this exportation principle have been accepted in relation to other types of benefits, this provision should also be considered when determining the viability of adjusting the family benefits on the basis of the fact that the members of the family reside in another Member State.

From our point of view it goes without saying that any benefits which are based on contributions where the amount of the benefit also reflects the duration of the payment and the amount of these contributions (classic example: pensions) have to be exported without any restriction. If benefits are lump sums or specific amounts to cover special needs inside the Member State concerned, the CJEU has already accepted export restrictions for special non-contributory cash benefits (no export at all).<sup>89</sup> Would it be the same if we introduced an export restriction for family benefits (by adjusting them to the local living costs)? Of course, these benefits cannot be considered as being ‘special’. Consequently, the arguments which speak in favour of non-export of special non-contributory cash benefits as a rule cannot be used in relation to non-contributory family benefits. So, other arguments must be used to justify such a deviation from today’s principles. Anyhow, such a solution would only be justifiable in relation to benefits which are not income-related like e.g. the child-raising benefits with an income replacement function (see 4.1.4). **Therefore, from our point of view any adjustment option would need a special coordination for these benefits to stay in conformity with the TFEU.**

Finally, the **case law of the Strasbourg ECHR** on benefits considered as *private property* could merit mentioning (e.g. case 9134/06, *Efe against Austria*, which seems to indicate that the ECHR allows different treatment

---

<sup>89</sup> Judgment in *Snares*, C-20/96, EU:C:1997:518.

concerning the amount of family benefits for children inside and outside a State, but, of course, taking into account the much more developed principles in the EU we are convinced that this cannot be transposed 1:1 also in the EU; thus, also this judgment cannot be used as an argument to justify the adjustment approach under the Regulation).

*Some final additional remarks*

We have also found some additional hints which we would like to mention:

- In one case, Advocate General Kokott already pleaded for an adjustment of a benefit by taking into account the different living costs to avoid results which are embarrassing from the exporting Member State's point of view.<sup>90</sup>
- Just for consideration of the decision-makers we also would like to mention the way the remuneration of EU civil servants is adjusted in case of service outside Belgium and Luxemburg. Due to the EU Staff Regulations<sup>91</sup> also in these cases an adjustment to the different living costs has to be made (Article 64 of the Staff Regulations – of course, this concerns only the salary<sup>92</sup>). The same adjustment seems to be applicable also to the family allowances paid under the Staff Regulations (Article 67(4)<sup>93</sup>). The relevant tables are published on a yearly basis in the Official Journal.<sup>94</sup> These indexes slightly differ from the Eurostat indexes mentioned in chapter 5.1 as not the EU-28 are the factor 100 from which all calculations have to start, but the situation in Belgium and Luxemburg. Therefore, the figures indicated for the different Member States cannot be the same as the ones from Eurostat. As such an adjustment has already been done

---

<sup>90</sup> Opinion of the Advocate General in *Hosse*, C-286/03, EU:C:2005:621, paragraph 109.

<sup>91</sup> Regulation No 31 (EEC), 11 (EAEC), laying down the Staff Regulations of Officials and the Conditions of Employment of Other Servants of the European Economic Community and the European Atomic Energy Community (OJ 45, 14.6.1962, p. 1385, as amended).

<sup>92</sup> It seems to be a common feature of many remuneration systems that they adjust at least some parts of the salary to local costs; this could be found e.g. also for diplomats or other civil servants, but also for employees of private employers who post them abroad. It seems that the general non-discrimination principle which, of course, covers also the remuneration does not create any problems in this respect.

<sup>93</sup> But we have to be careful! Interestingly this adjustment only applies if the allowance is directly paid to a person other than the official to whom the custody of the child is entrusted.

<sup>94</sup> For the period beginning with 1.7.2014: OJ C 444, 12.12.2014, p. 10.

for decades for EU civil servants,<sup>95</sup> this seems to be, from our point of view, an interesting model which could also be used if the decision is taken to make an adjustment also of family benefits granted under Regulation (EC) No 883/2004. Of course, it should be further examined if these rules for EU civil servants can give any answer concerning a valid legal base to introduce such measures for migrant workers between Member States.

Taking into account all these different aspects we think that, after this short examination which really did not go into depth, it seems that such an adjustment should be further analysed.

---

<sup>95</sup> Taking into account the mandate of this report we have not further examined whether this scheme for EU civil servants has already been disputed or even analysed by the CJEU.

## **Executive summary**

On the agenda of this report are reform proposals in the area of Chapter 6 of Regulation (EC) No 883/2004, which coordinates unemployment benefits. The focus is on the principle of aggregation and the calculation of unemployment benefits as they are laid down in Article 61 and Article 62 of Regulation (EC) No 883/2004. Should these provisions be preserved in their present state (Option 1)? Or are changes desired or necessary as envisaged in the presentations of Option 2 and Option 3? To be able to assess these Options, an analysis must be carried out.

Together with the principle of export of benefits, the principle of aggregation forms the backbone of the system of coordination of social security, which was enacted in 1958 in Article 51 of the EEC Treaty and which is now to be found in Article 48 TFEU. The principle of aggregation was conceived as a remedy to what is usually called the principle of territoriality, which is a characteristic of nearly all social security systems of the Member States. These systems show a clear tendency toward making entitlement to benefits dependent on territorial requirements. As a result, a benefit is very often granted on condition that the claimant has completed periods of insurance or employment in the territory of the granting Member State, periods completed elsewhere not being taken into account. The principle of aggregation helps to overcome this restriction and renders periods completed in another Member State equivalent. They are not equal, but of equal value in terms of relevance for entitlement to benefits.

Through this mechanism the principle of aggregation makes an important contribution to the freedom of movement of persons. With a view to Article 48 TFEU (and its precursor provisions) the Court of Justice of the European Union (CJEU) considers the purpose of the aggregation principle to ensure

that exercising the right to freedom of movement, conferred by the Treaty, does not deprive a worker of social security advantages to which he or she would have been entitled if he or she had spent his or her working life in only one Member State. Otherwise, this might discourage EU workers from exercising the right to freedom of movement and would therefore constitute an obstacle to that freedom.

From the beginning, Regulation (EEC) No 3/58, and later on, Regulation (EEC) No 1408/71 implemented the principle of aggregation through numerous provisions in different chapters. Regulation (EC) No 883/2004 did away with this approach and formed the principle and its essence in the general rule in Article 6 of Regulation (EC) No 883/2004. With Decision H6 of the Administrative Commission the principle of aggregation additionally gained in substance and precision giving good guidance to its application. Article 6 of Regulation (EC) No 883/2004, however, leaves room for derogating provisions (“unless otherwise provided for”). Article 61(1) of Regulation 883/2004 is in line with the exceptional clause in its Article 6. It does not abrogate the principle, but modifies it. It restricts unconditional application of the principle to periods of insurance, whereas periods of (self-)employment are not taken into account unless they would have been considered periods of insurance, had they been completed in accordance with the applicable legislation. A further restriction is laid down in Article 61(2) of Regulation (EC) No 883/2004. The relevant periods must have been completed most recently in accordance with the legislation on which the claimant bases his or her claim. This exception does not apply to persons in terms of Article 65(5)(a) of Regulation (EC) No 883/2004.

The reason for the divergent application of the aggregation principle required by Article 61(1) of Regulation (EC) No 883/2004 (and which was also required by Regulation (EEC) No 3/58 and Regulation 1408/71) is usually seen in the diversity of the unemployment benefit schemes available in the Member States. Some of them are based on periods of insurance for

entitlement, others prefer periods of employment to become entitled to unemployment benefits.

Whereas Article 61 of Regulation (EC) No 883/2004 gives guidance on the application of the aggregation principle when the competent institution has to ascertain whether there is a right to an unemployment benefit, Article 62 deals with the quantitative dimension of the benefit, the level of the benefit. Unemployment cash benefits are overwhelmingly income-related in the Member States' legislations. They are intended to replace income lost through unemployment. As a result the level of the benefit is a statutorily fixed portion of the preceding income. This line of thought is in tune with the view held consistently by the CJEU, who associates a benefit with the risk of unemployment if it is to replace a salary lost as a result of unemployment and is therefore intended for the upkeep of the unemployed worker.

Most Member States calculate the benefit on the basis of income earned during shorter or longer periods of reference preceding the unemployment. Coordination law has to give an answer to this question in cases in which income preceding the occurrence of unemployment was earned in different Member States. The answer given in Article 62(1) of Regulation (EC) No 883/2004 opts for the exclusive account of salary or professional income received by the person concerned in respect of his or her last activity as an employed or self-employed person under this legislation. The CJEU interpreted Article 62(1) of Regulation (EC) No 883/2004, and the preceding provision in Article 68(1) of Regulation (EC) No 1408/71, to the effect that the previous wage or salary which normally constitutes the basis of calculation is the wage or salary received in the last employment of the worker. In this way mobility of workers is not impeded.

Article 62(2) of Regulation (EC) No 883/2004 takes account of the reference periods widely provided for in national legislation. In this event, too, the basic calculation principle of this Article applies. In contrast to Article 62(1) and (2) of Regulation (EC) No 883/2004, Article 62(3) provides a different mode of

calculation for frontier and similar workers (Article 65(5)(a) of Regulation (EC) No 883/2004). Following the *Fellinger* case, Regulation (EC) No 883/2004 requires the competent institution of the Member State of residence to take into account the salary or professional income received by the person concerned in the Member State to whose legislation he or she was subject during the last period of (self-)employment.

**Option 1** is intended to keep to the *status quo*, as described above.

In the outline of the mandate reference is made to the one-day rule according to which aggregation is possible if there is any insurance in the new Member State, irrespective of the length of the insurance. Whether this interpretation is the right one is a moot point.

With regard to Article 61(1) of Regulation (EC) No 883/2004 (and to every other provision of EU law) a uniform interpretation has to be achieved. Perhaps there is a uniform interpretation of Article 61 of Regulation (EC) No 883/2004 by Member States in theory, but there is no uniform application of the one-day rule in its practical implementation. Some Member States require longer periods to be completed under their legislation before the aggregation mechanism is activated. And this is certainly a drawback of the present state of law. Perhaps the different application of Article 61 of Regulation (EC) No 883/2004 does not result from the wording, but from the outcome of the application of the one-day rule which may be seen as undesired. For example, one Member State's reply to the FreSsco questionnaire stated that a one-day insurance/employment period completed is often treated by the competent institutions of this State as a deceitful/abusive action. Generally speaking and judging by the replies to the questionnaire, the picture of application of the aggregation principle is not uniform. A Member State reported the adoption of a one-week rule due to the fact that in this Member State relevant periods are not expressed in days but in weeks. The rejection of the one-day clause is also motivated by the lack of guarantee that the person concerned is integrated into the labour market of this State. This thus pleads in defence of a solution

similar to what Option 2 has in mind. In addition, it is reported that local institutions follow different approaches in their decision-making. As a result, uniform application of the law is not secured, which could be a reason to consider a revision of the wording to respond to the Member States' interests or to address their concerns.

An important topic in the examination of Article 61 of Regulation (EC) No 883/2004 and its one-day interpretation is integration into the national labour market and financial implications. Nobody would say that a one-day employment is sufficient integration. However, one could argue that other short-term benefits (e.g. sickness benefits) are treated likewise offering protection on a one-day basis.

It cannot be ruled out that Article 61 of Regulation 883/2004, in its interpretation of applying the aggregation mechanism even after one day, may tempt people to benefit from it in a fraudulent way. A typical example could be when a person induces or connives with an employer to establish an employment relation which in reality is disguised employment. Other examples could be added, in particular against the background of Article 64 of Regulation (EC) No 883/2004.

Despite these critical arguments against and the evident drawbacks of Article 61 of Regulation (EC) No 883/2004, the defenders of the present state of law may put forward good reasons. The question may be raised as to whether a change of this Article would also entail a divergence from the application of aggregation rules for other benefits. In addition, the fact that everything lies in the hands of the competent State of the last employment is an advantage since it offers legal certainty. Administrative procedures need not be altered and no transitional provision is needed. Against the integration argument it may be said that the goal of unemployment benefits is not only income replacement but also support for job searching. As a result, if the final decision were the choice of Option 1, to enhance a uniform application of the aggregation

principle, a decision by the Administrative Commission could be made which renders the one-day rule obligatory.

The amendments under **Option 2** keep the principle of aggregation intact, but they aim at a postponed application of the aggregation. One month or three months of insurance or (self-)employment would have to be completed before aggregation can be applied.

Since these proposals interfere with the principle of aggregation, the examination of their compatibility with primary law, in particular with Article 48 and Article 45 TFEU, is of the utmost importance. As was already underscored above, the principle of aggregation is one of the central pillars of social security coordination. This was the reason why it was enshrined in the EEC Treaty in 1958.

Article 48 TFEU is placed within the legal framework of the free movement of workers provisions. Free movement of workers is a fundamental right. It protects every European citizen willing to go to and stay in another Member State for work and he or she must not be discriminated against. Compliance with the provisions on free movement of workers is binding not only on Member States but also on all EU institutions. In particular, secondary legislation has to be in accordance with the wording and purpose of Article 45 et seq TFEU.

Against this background the amendments envisaged have to be examined since they would constitute a change of the reach of the principle of aggregation in Article 61 of Regulation (EC) No 883/2004. Following the scheme which the CJEU has developed in its case law concerning the testing of compatibility of secondary law with primary law, the first step is to define the scope of the Treaty provision and then to see whether the derived law interferes with it. If there is interference, a second step has to be taken and possible justification sought.

The principle of aggregation as it is laid down in Article 48(a) TFEU is designed to abolish as far as possible the territorial limitations of the domestic social security schemes. Without guaranteeing aggregation the access to and the amount of benefits the person has worked for could be lost.

As far as the equality of treatment principle pursuant to Article 45 TFEU is concerned, the CJEU emphasised its importance in the arena of social security coordination very early in its case law. With reference to the *Pinna* case, the CJEU ruled that the adoption of rules which provide for unequal treatment among citizens is not permitted. Equality of treatment prohibits all covert forms of discrimination which, by applying other distinguishing criteria, in fact achieve the same result.

If Option 2 is implemented, migrant workers who become unemployed will have to accept a qualifying period the completion of which is necessary to acquire the protection through the application of aggregation of periods. As a result the amendments envisaged represent a restriction to the free movement of workers.

This brings the analysis and the compatibility examination to its second step, i.e. the search for the existence of justifying reasons. It has to be considered that the law-giving bodies of the EU may choose the most appropriate measures for attaining the objective of Article 48 TFEU and therefore dispose of a wide discretion. This includes the possibility to depart from coordination mechanisms designed by this provision.

Since there are no written reasons to justify restrictions with regard to Article 48 TFEU, only overriding reasons or mandatory requirements may justify restrictions. Case law specific to this problem in the area of social security is rare. Most of the judgments delivered by the CJEU concern discrimination resulting from national law. But it is possible to indirectly draw lessons from such cases. Below, the criteria mentioned in the mandate will be picked up and subjected to scrutiny from the viewpoint of justification.

The aspect of fighting fraud and abuse is certainly of great weight. Nevertheless, it has to be said that a good reason alone is not sufficient for justification. The CJEU sets great store on the proportionality principle. Is it really justified to partially dispense with aggregation (which is the case with stating a qualifying period) and punish unemployed people for the unwanted behaviour of a probably small group of claimants? Doubts may be cast on this. The same is true of the argument of lacking integration into the competent Member State's labour market. Even if integration is still weak due to the short length of gainful activity, does this really justify the suspension of the principle of aggregation?

A serious argument refers to the protection of the stability of national social security systems. That one Member State even after one day of employment has to bear the whole burden of unemployment benefits can be considered as inappropriate. However, under the proportionality test we might ask whether the solution to this problem should lie on the shoulders of the unemployed, or is there a way out through the introduction of a reimbursement scheme (see below).

Aspects of simplification and clarification alone are certainly no justifying reason. On the contrary, the realisation of the amendments would require additional rules concerning which State should be competent during the course of the qualifying period.

Weighing the arguments above it seems doubtful whether the CJEU would consider the new law to be in conformity with Article 48 and 45 TFEU. As a consequence additional measures have to be taken into consideration.

The envisaged amendments under Option 2 require an answer to the question which Member State should substitute the State of last employment if the minimum threshold is not met. Without a workable solution to this problem a violation of Article 48 TFEU would occur. Several alternatives can be taken into consideration, all of which have significant drawbacks.

Clarity alone could not justify substantial amendments which significantly change the legal position of large groups of migrant workers to their detriment. If the one-day rule should no longer be accepted, the present law could be modified in the sense of the amendment. But perhaps an interpretation in a decision by the Administrative Commission expressing the will behind the amendments could be sufficient. From the point of view of simplification the new law would certainly not be recommendable, since extensive amendments to other provisions, e.g. Article 64, 65 and 65a of Regulation (EC) No 883/2004 could be required.

The most serious doubts have to be put forward as far as protection of rights is concerned. As was mentioned above, the referral of the unemployed person to a Member State other than that of the last professional activity due to the introduction of a threshold may be a significant disadvantage for this person. In many cases it could be incompatible with the current life situation and the personal goals of the person concerned. To remedy these disadvantages an altered scheme of this presently laid down in Article 64 Regulation (EC) No 883/2004 would be needed.

The enormous amount of problems as to the competence of Member States in the wake of the new law weigh heavily also under the aspect of administrative burden and implementation arrangements. A new procedure would have to be established, including the use of new forms and SEDs.

The threshold of one month or three months could reduce cases of fraud and abuse, a period of three months even more than a period of one month. Still, one cannot rule out that bogus employment would also occur, lasting either one month or three months.

From the angle of financial implications, it has already been said that the new law, with its shift of costs from the Member State of the last professional activity to another Member State, might only partially lead to a cost-effective

solution. In addition, costs may be incurred by the unemployed persons due to their change of residence which would possibly be necessary.

Against this background of significant problems resulting from the enactment of the amendments under Option 2, the preservation of the present scheme in Article 61 of Regulation (EC) No 883/2004 could be preferable to the amendments envisaged. Alternatively, a new reimbursement scheme could be installed. To implement such a new reimbursement scheme the existing scheme in Article 65(6) to (8) of Regulation (EC) No 883/2004 could serve as a template.

**Option 3** aims at a change of Article 62 of Regulation (EC) No 883/2004 by introducing a new model for the calculation of unemployment benefits. This calculation will also be based on the salaries earned in the previous Member State(s). Here again the assessment must be undertaken using the criteria and the objectives contained in the mandate. In particular, concerning Option 3 the mandate requires scrutiny of whether the calculation of the amount of the unemployment benefit on very short periods of employment may lead to arbitrary results.

The function of unemployment cash benefits under national law is replacement of the income lost through unemployment. This is why unemployment benefits are income-related and why income preceding the unemployment is the calculation basis. The same is true of unemployment cash benefits on the coordination level. This is confirmed by the consistent case law of the CJEU. As far as the income is concerned upon which the calculation is based, Member States usually lay down reference periods (following the information in the mandate, on average 12 months). Article 62(2) of Regulation (EC) No 883/2004 indirectly confirms the relevance of reference periods. At any rate, Article 62(1) and (2) state that income earned exclusively in the territory of the person's last (self-)employment has to be taken into account. A derogation from these rules applies for persons in terms of Article 65(5)(a) of Regulation (EC) No 883/2004 (Article 62(3) of

Regulation (EC) No 883/2004). Both amendments under Option 3 favour a change of the basic rule in Article 62(1) and (2) in cases in which the period of (self-)employment of the claimant was very short (less than one month/three months). In this event the income basis is extended to (self-)employment in the previous Member State(s).

The new law would not pose problems from the viewpoint of clarification and simplification. A different judgment has to be made when the problem of the administrative burden and implementation arrangements has to be assessed. Taking into account income received in the previous Member State presupposes reliable information from the competent institutions in this State. As a consequence, an exchange of relevant data has to take place. Compared to the present law a further administrative step is necessary. This additional administrative burden could be relieved if use were made of the information channel which is currently used in cases concerning frontier and similar workers according to Article 62(3) of Regulation (EC) No 883/2004. The implementing rule in Article 54(2) of Regulation (EC) No 987/2009 could be extended to cases under the new law. Otherwise the competent institution would apply its law and the income communicated would be fitted into its calculation scheme.

An argument against the introduction of the new mode of calculation could be that it delays the award of the unemployment benefit. However, if this problem arises the benefit could be granted on a provisional basis according to Article 7 of Regulation (EC) No 987/2009. As far as the implementation of the new scheme is concerned the wording of Article 62(1) and (2) of Regulation (EC) No 883/2004 has to be altered correspondingly and jointly with the mentioned extension of Article 54(2) of Regulation (EC) No 987/2009.

Perhaps the most central aspect of the change of law is the protection of rights, since this is what coordination of social security aims at. Is the application of the present scheme with its exclusive reference to the income earned in the last professional activity to the advantage or to the detriment of the unemployed

person? It depends on the level of income at the time of the occurrence of unemployment compared to that of the previous State. That the person concerned is better off when his or her recent income is higher is certainly acceptable if he or she was insured under the applicable scheme for a reasonable time. But how to judge if this was not so?

In legal doctrine, the fact that the present scheme is built on chance is seen by authors as a wrong legal policy. Many an author goes a step further and asserts that indirect discrimination and as a result a violation of Article 45/48 TFEU takes place in cases in which the migrant worker takes up a lower paid employment and becomes unemployed after a very short time. The former income will not be taken into account, which may lead to the person concerned being treated worse than a person who has completed his or her periods of insurance in one and the same country.

Another weighty problem might be seen in terms of justice and fairness. As was said and shown above, Member States' legislations overwhelmingly adopt calculation schemes which form the benefit level according to a longer insurance record. In this way one could say that this method does justice both to the unemployed person and to the granting institution which administers the financial resources and has to use them economically in the interest of all the contributing workers affiliated to the scheme. We are confronted here with the problem related to one of the objectives stated in the mandate, i.e. the objective as to ensure that the financial burden for paying unemployment benefits does not arise in situations where mobile EU workers have not yet made a significant contribution to the scheme of the new Member State. However, this objective is not achieved under the current law in cases where migrant workers with a low level of income in the previous Member State benefit from the high level in the new Member State, even after very short periods of (self-)employment (in the extreme case one day).

The aspect of fraud and abuse has already been touched upon above and the mode of calculation may have a rather modest impact upon fraudulent

behaviour. Yet one aspect seems to be important at this point. The problem of moral hazard has long since been discussed in theory and policy of unemployment insurance. It is requested that unemployment insurance has to be shaped in such a way that it does not allow people to stay unemployed instead of taking up employment even if the income is lower. The present law of Article 62 of Regulation (EC) No 883/2004 could favour such undesired behaviour.

Many an argument discussed above with regard to the protection of rights may again be put forward here. The nucleus of the problem refers to the question whether enjoying the full benefit level, despite only a short time of employment and as a consequence few contributions to a scheme plus weak integration into the scheme, is in harmony with the sound financing of unemployment insurance. It is hard to find an answer in the affirmative.

## Introduction

### *1 The principle of aggregation of periods (Article 61 of Regulation (EC) No 883/2004)*

#### *1.1 The principle under primary law*

The principle of aggregation of periods is one of the leading pillars of coordination and therefore was already enshrined in (now) Article 48 TFEU. The principle has to be seen against the background of the division of competence between EU law and national law. It is consistent case law of the Court of Justice of the European Union (CJEU) that EU law does not detract from the powers of Member States to organize their social security systems.<sup>96</sup> This is the consequence of Article 48 TFEU providing for the coordination,

---

<sup>96</sup> This basic statement was for the first time pronounced in the judgment in *Duphar*, C-238/82, EU:C:1984:45, paragraph 16. See for a recent case the judgment in *Salgado Gonzalez*, C-282/11, EU:C:2013:86, paragraph 35.

not the harmonisation of the Member States' legislations.<sup>97</sup> This means that periods qualifying for the acquisition, retention, duration or recovery of a right to benefits are defined by the law of the Member States. From the beginning the CJEU has underscored this empowerment of Member States and it is now consistent CJEU case law that it is up to the Member States to provide for relevant periods and its premises. It has stated that Regulation (EEC) No 1408/71 (and the same is true of Regulation (EC) No 883/2004) does not determine the conditions governing the constitution of periods of employment or insurance. Those conditions, as is apparent from Article 1(r) of that Regulation (now Article 1(t) of Regulation (EC) No 883/2004), are defined by the Member State's legislation under which the periods in question are completed.<sup>98</sup>

Domestic law traditionally follows the principle of territoriality.<sup>99</sup> And at this point the coordination principles come into operation. In essence, the principle of aggregation aims at overcoming the principle of territoriality as far as periods under domestic law are concerned. From a legal point of view this extension of territoriality takes place through a specific legal technique: equivalence. The aggregation of periods renders periods completed under different systems of social security equivalent. They are not equal, but of equal value in terms of relevance for entitlement to benefits. Therefore, it has quite rightly been said that the aggregation of periods completed under different types of social security is not a sinecure.<sup>100</sup> In other words, a process of assimilation is often needed to offer the possibility of aggregation.

---

<sup>97</sup> This is one of the statements which emerge in many judgments by the CJEU, see for example recently the judgment in *Jeltes*, C-443/13, EU:C:2013:224, paragraph 43.

<sup>98</sup> Judgment in *Schmitt*, C-29/88, EU:C:1989:61, paragraph 15; judgment in *Alonso*, C-306/03, EU:C:2005:44, paragraph 30. Emphasis is laid on this legal position also in doctrine: see for example N. Guastavino (ed.), F. Basurko & M. Boto, *Lecciones de derecho social de la Unión Europea*, Tirant lo Blanch, Valencia, 2012, p. 208; S. van Raepenbusch, *La sécurité sociale des personnes qui circulent à l'intérieur de la Communauté Économique Européenne*, Story Scientia, Brussels, 1991, p. 198.

<sup>99</sup> See for this F. Pennings, *European social security law*, Intersentia, Antwerp, 2010 (5<sup>th</sup> edition), p. 9 et seq.

<sup>100</sup> F. Pennings, *European social security law*, *ibid*, p. 10.

The aggregation of periods is, if its conditions are met, a way for a migrant worker to retain the rights acquired under a legislation which is different from the one presently applicable. This happens because the aggregation mechanism leads to a unification of migrant workers' professional career.<sup>101</sup> It is based on the irrefutable presumption that the claimant of benefits has to be treated as if he or she had always and continuously performed his or her work under the social security system of that Member State from which he or she claims benefits.<sup>102</sup>

Against this background we can formulate the rationale of the aggregation principle and we can rely for this on the case law of the CJEU. With a view to Article 48 TFEU (and the precursor provision) the case law conceives the purpose of the aggregation principle to ensure that exercising the right to freedom of movement, conferred by the Treaty, does not deprive a worker of social security advantages to which he or she would have been entitled if he or she had spent his or her working life in only one Member State. Such a consequence might discourage community workers from exercising the right to freedom of movement and would therefore constitute an obstacle to that freedom.<sup>103</sup> With this statement the CJEU confers in respect of the aggregation principle what has to be observed as a general rule: all the provisions of the regulations must be interpreted in the light of Article 48 TFEU. The aim must be to remove all barriers in the sphere of social security which impede a generally free movement of workers.<sup>104</sup>

## 1.2 *The codification of the aggregation principle in Article 6 of Regulation (EC) No 883/2004*

Regulation (EEC) No 1408/71 renounced a general rule on aggregation of periods. It preferred to lay down specific rules in different sections of the Regulation. By contrast, Regulation (EC) No 883/2004 opted for a general rule in Article 6. It was intended in this provision to do away with the numerous aggregation rules contained in various sections of the Regulation and to create a unitary and comprehensive regulation for all cases in which aggregation is needed.<sup>105</sup> From Recital 12 and 13 of the Preamble we can gather that the principle of aggregation serves the aim to retain the rights and the advantages acquired and in the course of being acquired by persons moving within the Community and their dependants. The mechanism of aggregation secures the acquisition and retention of the right to benefits and makes the *calculation of the amount of benefits* possible.<sup>106</sup>

The principle of aggregation has been concretised by the Administrative Commission in Decision H6. This Decision partly relies on the case law of the CJEU, but goes a step further. Firstly it requires to take into account all periods for the relevant contingency completed under the legislation of another Member State by applying the principle of aggregation. Obviously, relevant periods are very often not identical with regard to their elements. Nevertheless, point 2 of the Decision requires that periods communicated by other Member States must be aggregated without questioning their quality. However, point 3 acknowledges the Member States' jurisdiction to determine their other conditions for granting social security benefits taking into account Article 5 of

---

<sup>105</sup> B. Spiegel, in B. Spiegel (ed.), *Zwischenstaatliches Sozialversicherungsrecht*, Manz-Verlag, Vienna, 2012, Article 6(2) of Regulation (EC) No 883/2004.

<sup>106</sup> Emphasis by M. Fuchs. I emphasise this aspect because it could have a direct impact on our discussion of the calculation of benefits under Article 62 of Regulation (EC) No 883/2004.

Regulation (EC) No 883/2004. This is a clear reference to the case law of the CJEU.<sup>107</sup>

Article 6 of Regulation (EC) No 883/2004 shows that this principle is not of an exclusive nature. It opens up for other provisions which deviate from what is stated in Article 6 (“*unless otherwise provided for by this Regulation*”). Article 61 is one of the rare specific rules of Regulation (EC) No 883/2004 which derogate from what is required under Article 6 of Regulation (EC) No 883/2004.<sup>108</sup>

### 1.3 *Aggregation of periods under Article 61 – the exception to the rule*

#### 1.3.1 The main contents of Article 61 of Regulation (EC) No 883/2004

Article 61(1) of Regulation (EC) No 883/2004 does not do away with the principle of aggregation of periods. However, compared to Article 6 of Regulation (EC) No 883/2004 it restricts the reach of the principle. This restriction is of a two-fold nature: firstly, periods taken into consideration are only periods of insurance or (self-)employment. Secondly, periods of (self-)employment have a lesser value than periods of insurance (61(1), second paragraph).

Why is it that Article 61 of Regulation (EC) No 883/2004 partly derogates from an unfettered application of the aggregation principle in the sense of Article 6 of Regulation (EC) No 883/2004? The distinction between insurance periods and periods of employment was already made in Article 33(1) and (2) of Regulation (EEC) No 3/58. Regulation (EEC) No 1408/71 has continued this distinction between insurance periods and periods of employment.<sup>109</sup> Article 61 of Regulation (EC) No 883/2004 is likewise based upon this distinction. For an explanation of the necessity of the distinction, reference is

---

<sup>107</sup> Reported above.

<sup>108</sup> With regard to pre-retirement benefits, Article 6 will not apply (Article 66 of Regulation (EC) No 883/2004).

<sup>109</sup> Article 67 of Regulation (EC) No 1408/71.

usually made to the diversity of existing unemployment benefit schemes, which are based either on periods of insurance or periods of employment.<sup>110</sup>

#### 1.4 *The functioning of the aggregation of periods under Article 61(1) of Regulation (EC) No 883/2004*

Due to the wording of Article 61(1) of Regulation (EC) No 883/2004 three variants can be discerned and have to be treated accordingly in what follows.

##### 1.4.1 The competent State and the other Member State follow the insurance approach.

If the law on unemployment benefits in both Member States in question pursues the insurance model, i.e. benefits are dependent on the completion of insurance periods, the aggregation of periods completed in both Member States is obvious. Periods of insurance have to be taken into account also if the law of the competent Member State is based on periods of employment.<sup>111</sup> The competent Member State has no power or discretion to qualify a period of insurance completed and communicated by the authorities of the other Member State.

##### 1.4.2 The competent Member State follows the insurance approach. The other Member State builds upon periods of employment.

In this case Article 61(1), second paragraph is applicable. If the aggregation of periods principle is to apply, the periods of employment in the other Member State have to be periods of insurance under the legislation of the competent

Eichenhofer, *Sozialrecht der Europäischen Union*, Beck, Munich, 2013 (5<sup>th</sup> edition), p. 248; M. Fuchs in M. Fuchs (ed.), *Europäisches Sozialrecht*, Nomos, Baden-Baden, 2013 (6<sup>th</sup> edition), Article 61(1) of Regulation (EC) No 883/2004. For more detailed information about the different approaches see U. Rönsberg, *Die gemeinschaftsrechtliche Koordinierung von Leistungen bei Arbeitslosigkeit*, Centaurus, Herbolzheim, 2006, p. 22 et seq.

<sup>111</sup> Judgment in *Frangiamore*, C-126/77, EU:C:1978:64. See for a detailed analysis S. van Raepenbusch, *La sécurité sociale des personnes qui circulent à l'intérieur de la Communauté Économique Européenne*, Story-Scientia, Brussels, 1991, p. 458 et seq.

Member State. This provision has been criticised because it could deprive the migrant worker of her or his protection against the risk of unemployment, a protection which she or he has possibly earned due to contributions to the unemployment system in her or his country on the basis of an employment relationship which is not acknowledged in the competent Member State.<sup>112</sup>

In the *Warmerdam-Steggerda* case<sup>113</sup> the question was raised whether the aggregation of periods of employment completed in another Member State presupposes that such periods should be regarded as periods of insurance for the same branch of social security by the legislation under which they were completed. The CJEU denies the existence of such a condition. It suffices that the period of employment is considered as a period of insurance according to the applicable law.

1.4.3 The competent Member State and the other Member State take into account periods of employment.

This case has not been subject of controversy so far. And it seems to be obvious that aggregation has to take place. The reason for it can be taken from Article 6 of Regulation (EC) No 883/2004 or Article 61(1) of Regulation (EC) No 883/2004. Article 6 clearly states the necessity of aggregation, because Article 61(1) does not “*provide otherwise*”.

1.5 *Requirement for the application of the aggregation principle (Article 61(2) of Regulation (EC) No 883/2004)*

Article 61(2) of Regulation (EC) No 883/2004 is sometimes wrongly understood as a conflict-of-law rule. However, the applicability of the legislation for the award of unemployment benefits has to be determined by Article 11 to 16 of Regulation (EC) No 883/2004. This was clearly stated by

---

<sup>112</sup> S. Van Raepenbusch, *La sécurité sociale des personnes qui circulent à l'intérieur de la Communauté Économique Européenne*, Story-Scientia, Brussels, 1991.

<sup>113</sup> Judgment in *Warmerdam-Steggerda*, C-388/87, EU:C:1989:196.

the judgment in *Adanez-Vega*.<sup>114</sup> With the exception of frontier workers Article 61(2) of Regulation (EC) No 883/2004 requires the aggregation of periods on condition that the person concerned has “*the most recently completed*” periods in accordance with the legislation under which the benefits are claimed. The objective of this provision is – following the reasoning by the CJEU – to encourage the search for work in the Member State in which the person concerned last paid contributions to the unemployment scheme and to make that State bear the burden of providing the unemployment benefit.<sup>115</sup> This requirement is met if, regardless of the lapse of time between the completion of the last period of insurance and the application for the benefit, no other period of insurance was completed in another Member State in the interim.<sup>116</sup>

The requirement under Article 61(2) of Regulation (EC) No 883/2004 is cogent and, as a consequence, does not preclude a Member State from refusing to grant a worker unemployment benefits if the worker has not most recently completed periods of insurance or employment in that Member State.<sup>117</sup> Article 61(2) of Regulation (EC) No 883/2004 is in tune with Article 48 TFEU.<sup>118</sup>

---

<sup>114</sup> Judgment in *Adanez-Vega*, C-372/02, EU:C:2004:705. In this judgment the CJEU presented a clear-cut scheme how to operate this determination; see paragraph 17 et seq of the judgment.

<sup>115</sup> See the judgment in *Gray v Adjudication Officer*, C-62/91, EU:C:1992:177, paragraph 12.

<sup>116</sup> Judgment in *Adanez-Vega* EU:C:2004:705, paragraph 52.

<sup>117</sup> Judgment in *Van Noorden*, C-272/90, EU:C:1991:219. However, it is not compatible with Article 45(2) TFEU and Article 4 of Regulation (EC) No 883/2004 if a Member State of residence denies unemployment benefits to a national of another Member State on the ground that, on the date when the benefit claim was submitted, the person concerned had not completed a specified period of employment in that Member State of residence, whereas there is no such requirement for nationals of that Member State. See the judgment in *Chateignier*, C-346/05, EU:C:2006:711.

<sup>118</sup> See the judgment in *Commission v Belgium*, C-62/92, EU:C:1992:177, paragraph 12.

## 2 *Calculation of benefits (Article 62 of Regulation (EC) No 883/2004)*

### 2.1 *The basic principle (62(1))*

Unemployment benefits in cash are typical income replacement benefits. This is why Member States usually shape these benefits with reference to income lost through unemployment. If income was earned in different Member States during periods preceding the unemployment, an answer has to be given by coordination law which income should be the relevant income for the calculation of an unemployment benefit. In principle this answer is offered by Article 62(1) of Regulation (EC) No 883/2004, where the competent institution is required to take into account exclusively the salary or professional income received by the person concerned in respect of her or his last activity as an employed or self-employed person under this legislation.

The CJEU has remarked on this provision referring to the Preamble that in order to secure the mobility of labour under improved conditions, the Regulation seeks to ensure the worker without employment the unemployment benefit provided for by the legislation of the Member State to which he or she was last subject. And it goes on interpreting Article 68(1) of Regulation (EC) No 1408/71 (now Article 62(1) of Regulation (EC) No 883/2004) in such a way that the previous wage or salary which normally constitutes the basis of calculation of unemployment benefits is the wage or salary received from the last employment of the worker. In such a manner the unemployment benefit is regarded as not to impede the mobility of workers and to that end seek to ensure that the persons concerned receive benefits which take account as far as possible of the conditions of employment, and in particular of the remuneration, which they enjoyed under the legislation of the Member State of last employment.<sup>119</sup>

---

<sup>119</sup> Judgment in *Fellinger*, C-67/79, EU:C:1980:59, paragraph 7.

Regulation (EC) No 883/2004 has not taken up the provision in Article 68(1), second sentence of Regulation (EC) No 1408/71, pursuant to which a four-week clause has to be observed. If the worker had his or her last employment in the territory of the competent institution for less than four weeks, the benefit has to be calculated on the basis of the normal wage or salary in the place where the unemployed person was residing or staying corresponding to an employment equivalent or similar to his or her last employment in the territory of another Member State.

## 2.2 *Reference periods*

Member States' unemployment benefit schemes very often refer to specific reference periods when the income for the calculation of benefits is to be established. Article 62(2) states that in this event, too, the basic principle laid down in 62(1) has to be applied.

## 2.3 *The special case of frontier workers (62(3))*

Regulation (EC) No 1408/71 did not contain a provision on the calculation of benefits concerning frontier workers. In a preliminary ruling the CJEU decided that the competent institution of the Member State of residence must take into account the wage or salary received by the worker in the last employment held by him or her in the Member State in which he or she was engaged immediately prior to his or her becoming unemployed. This CJEU case law was adopted in Article 62(3) of Regulation (EC) No 883/2004.<sup>120</sup> For unemployed persons to whom Article 65(5)(a) is applicable, the institution of the place of residence must, pursuant to Regulation (EC) No 987/2009, take into account the salary or professional income received by the person

---

<sup>120</sup> See also in this respect R. Cornelissen, 'The new EU Coordination System for Workers who Become Unemployed', (2007) *European Journal of Social Security*, 187, 198 et seq.

concerned in the Member State to whose legislation he or she was subject during the last period of (self-)employment.

The Member States' legislations very often provide for a ceiling within the framework of calculating both contributions and benefits, whereby contributions are levied from the income that is taken into consideration up to the assessment ceiling for contributions. This is also decisive for the income used to assess the benefit. In the *Grisvard and Kreitz*<sup>121</sup> case the CJEU referred to Article 71(1)(a(ii) and (b(ii) of Regulation (EC) No 1408/71 and held that frontier workers who are wholly unemployed must receive benefits in accordance with the legislation of the Member State in the territory of which they reside as though they had been subject to that legislation while last employed. The legislation of the Member State of residence alone has to be applied and not, therefore, the legislation of the State of employment, including any rules it lays down on ceilings.<sup>122</sup> As the contents of Article 65(5) correspond with the former provisions of Article 71, existing case law can also claim validity under the new legislation.<sup>123</sup>

## Option 1

**Option 1 – *status quo*:** “one-day rule”: aggregation is possible, if there is any insurance in the new Member State, irrespective of the length of the insurance. The unemployment benefit is only calculated on the basis of the salary earned in the State of last activity.

<sup>122</sup> Judgment in *Grisvard and Kreitz* EU:C:1992:368, paragraph 16.

<sup>123</sup> Likewise R. Cornelissen, ‘The new EU Coordination System for Workers who Become Unemployed’, *ibid.*, p. 199 et seq.

## **1 The structure and the contents of Article 61 of Regulation (EC) No 883/2004**

### *1.1 General consideration*

Taking into account that the general content of Article 61 was placed under close scrutiny in the preceding paragraphs, here Option 1 will be examined, pointing out pros and contras. This Option entails the maintenance of this provision with the current wording, without the introduction of any change. Moreover, it is necessary to check out some aspects of this provision that could be considered as controversial. Finally, a possible solution will be provided for the best and a uniform application of this Article.

On the other hand, it has to be stressed that Option 1 not only deals with Article 61, but also with Article 62, the calculation of benefits. In that regard, in this part all the references will be made to Article 61, leaving the analysis of Article 62 for Option 3.

Article 61 of Regulation (EC) No 883/2004 establishes a special rule for the aggregation of periods of insurance or (self-)employment, which derogates from the general rule of Article 6. However, it can be considered that the basic principles of Article 6 are maintained in Article 61 with some particularities. In fact, what Article 6 and Article 61 demand as a prerequisite for the activation of the aggregation principle, is that the person concerned who claims benefits has a link with the competent State – usually through the completion of – at least – one day of insurance or (self-)employment in the said Member State.

### *1.2 Drawbacks of the current provisions*

#### **1.2.1 In the search for the uniform interpretation of Article 61**

The need for a uniform interpretation of all EU law and, in this case, of Article 61 of Regulation (EC) No 883/2004 is a “must” as the Court of Justice of the

European Union (CJEU) often reminds. Indeed, one of the principles of the EU and a prerequisite or condition for its survival and for its development is the uniform application of its law by all Member States.

The CJEU, referring to the said uniform application, determined in *Rheinmühlen-Düsseldorf*<sup>124</sup> in a very clear way that this “*is essential for the preservation of the Community character of the law established by the Treaty and has the object of ensuring that in all circumstances this law is the same in all States of the Community*” and that it “*aims to avoid divergences in the interpretation of Community law. [...] Consequently any gap in the system so organized could undermine the effectiveness of the provisions of the Treaty and of the secondary Community.*”

In theory, there is probably a unanimous interpretation of Article 61. Unfortunately, this unanimity is not reflected in its practical application. Indeed, the “one-day rule” is not followed by all Member States that require, for some cases, longer periods completed under their legislation to activate the aggregation mechanism. As a consequence, the mandatory uniform application of the law is not achieved.

Maybe the problem of the different application of Article 61 does not emanate from the wording of the provision, but from the undesirable and unwanted results of the one-day clause. Some Member States do not consider it appropriate that with a single day of insurance or (self-)employment a Member State has to aggregate periods of other Member States and bear the costs of the whole unemployment benefits. In this regard the answer of one Member State to the questionnaire of FreSsco is very enlightening (“*However, a one-day insurance/employment period completed in our Member State is often treated by the X institution as a deceitful/abusive action, targeting at the granting of the unemployment benefit. Thus, a period longer than one day, completed to our Member State, is mostly required*”).

---

<sup>124</sup> Judgment in *Rheinmühlen-Düsseldorf*, C-166-73, EU:C:1974:3.

On the other hand it has to be pointed out that it is possible, for some Member States, to start the aggregation mechanism with some (few) hours of work and not with a complete working day. This fraction of a day could be rounded up and be considered as one day. More problematic is the practice followed by other Member States which do not apply the one-day rule, but the one-week rule, because their periods of insurance or (self-)employment are expressed not in days but in weeks (*“the Member State X would not therefore aggregate insurance from another Member State until the minimum period of insurance of one week had been completed i.e. ‘registered’ on the system”*).

In an indirect way, this position of rejection responds to the idea that the one-day clause does not guarantee the integration of the person concerned in the labour market of the competent State and defends – with its practical and not harmonised application of Article 61 – the “more-days clause” or, in other words, Option 2 of this report.

Indeed, from one reply received to the questionnaire, it can be concluded that the requirement of more than one day to start with the aggregation mechanism is not only a rare, atypical practice or an exception, but a frequent and common exercise (*“However, since no domestic rule expressly consolidates the ‘one-day rule’, local unemployment institutions may alternately decide that one day is not sufficient for the purpose of aggregation. A uniform application in X of ‘the one-day rule’ is therefore not guaranteed.”*).

Conversely, in theory, the zero-day rule to activate the aggregation mechanism could be envisaged for those Member States which do not require that the claimant of benefits, under their legislations, had completed a specified period of employment in that Member State. In that regard it seems that neither Regulation (EC) No 883/2004<sup>125</sup> nor the CJEU<sup>126</sup> have validated this thesis. In consequence, this possibility will not be dealt with here.

---

<sup>125</sup> See Recitals 10, 11 and 12 of Regulation (EC) No 883/2004.

<sup>126</sup> Judgment in *Chateignier* EU:C:2006:711.

### 1.2.2 Simplification and clarity

This report does not pretend to go into the considerations and the reasons why some Member States do not apply the one-day clause and require more days of insurance or (self-)employment to start the aggregation mechanism. In fact, one of the advantages of Article 61 in comparison with Article 6 is precisely that “*theoretically*” it offers a clear rule for the activation of the aggregation mechanism, which makes a uniform application of the provision possible. Indeed, Member States where the person concerned claims benefits have to look if, under their legislation, periods of insurance or (self-)employment were most recently completed and if the nature of these periods fills the requirements of their applicable legislation. If the answer is yes, they start the aggregation mechanism.

It has to be said that the practical implementation of this mechanism can be complicated taking into account in particular some rulings<sup>127</sup> of the CJEU. However, this problem does not concern the purpose of this report.

In principle, no major difficulties appear for the designation of the competent State, according to Article 61 of Regulation (EC) No 883/2004. The real problem comes later when the competent State applies Article 61. At that point, the “one-day rule” or the “more-days rule” play a role, depending on the different interpretation or practical application of Article 61(2). Unfortunately, maybe the wording of this provision opens up possibilities of different interpretations or, some Member States intentionally do not apply the content of this provision because they do not agree with it. This means that one of the pros of the current provision, its clarity, is lost and the uniform application of the law, as required by the CJEU, not achieved. Perhaps a revision is needed to match Member States’ interests or address their concerns.

---

<sup>127</sup> Judgment in *Warmerdam-Steggerda* EU:C:1989:196.

### 1.2.3 Integration in the national labour market and financial implications

On the other side, and going deeply into the content, sense and logic of the current Article 61, it has to be questioned whether with only one day of insurance or (self-)employment the person concerned is integrated in the labour market of the Member State where benefits are claimed or, in other words, if this rule contributes to the labour integration or if the opposite is true. Indeed it can be argued that with respect to other short-term benefits (e.g. sickness benefits) also the one-day rule is applied. However, unemployment benefits are much linked and dependent on the labour market and the integration in this market plays a very important role taking into account the nature and goal of these benefits and the different active and passive measures.

Moreover, and stressing the importance of the integration factor, it does not seem appropriate that one Member State is obliged to bear all the costs of the unemployment benefits when the person concerned only completed very short periods (one day is enough) of insurance or (self-)employment under the legislation of this Member State, due to the fact that all periods completed in other Member States have to be taken into account as a result of the aggregation mechanism.

Precisely to avoid or reduce these drawbacks, a kind of sharing of cost was established in Article 65 (unemployed persons who resided in a Member State other than the competent State). Accordingly, reimbursements between Member States were introduced.

The aim of these reimbursements was to compensate the Member State of residence which has to provide benefits in accordance with its legislation “*as if the person concerned had been subject to that legislation during his last activity as an employed or self-employed person*”.

The logic of Article 65 was clear. The Member State of residence where possibly no periods of insurance or (self-)employment were completed cannot be the only State responsible to bear all the costs.

The reimbursements, between Member States, usually follow a very complicated procedure and for this reason legislatures have always been very reluctant to introduce such instruments, although, at least from the perspective of proportionality, it does not look inappropriate.

Some defenders of the current provision could argue that the situation of Article 65 cannot be compared with the situation of Article 61. In fact, it can be imagined that a frontier worker, for instance, has completed no period (zero-day rule) of insurance or (self-)employment in the Member State of residence, and that this Member State will be considered as the competent Member State and has to provide benefits for a long period. It is reasonable, accordingly, that this Member State receives, as compensation, reimbursement up to five months of the cost of the benefits paid. In the same way, it can also be envisaged that under Article 61 a Member State may be competent as a result of a single day of insurance or (self-)employment. In this regard the difference of the zero-day and one-day rule is very small. Then again, the difference of cost (five months reimbursement/nothing) can be enormous.

It can be agreed that the situations of Article 61 and 65 are totally dissimilar. However, the rationale underlying Article 65 is to avoid that a Member State has to bear a disproportional cost related to the periods completed under its legislation. Unfortunately, this proportionality principle does not appear in the current wording of Article 61, taking into account that it is possible that with one single day of insurance or (self-)employment a Member State is obliged, based on the aggregation mechanism, to provide benefits 6, 12, 18, or 24 months or longer. For this reason the critics of the wording of the current Article 61 are, in some cases, easy to understand. And the voices that call for some restrictions and limits on the aggregation (periods of one or three months completed in the Member State where the benefits are claimed) may to some extent be considered justified and reasonable.

#### 1.2.4 Fraud and abuse

It has to be analysed whether the current Article 61 might foster fraud and abuse. In fact, beside health tourism, social tourism, and poverty tourism also unemployment tourism may be anticipated and, if possible, prevented. Indeed, under the current provision, a single day of employment suffices to be subject to the social security system of the Member State of employment. This could increase the temptation/attraction for nationals of another Member State to seek employment for a few days with a fraudulent intention. For example, the person concerned may induce or agree with an employer to establish an employment relation in a way that in reality is a form of disguised employment. After a dismissal, Article 61 will be applicable and the aggregation mechanism activated, with the possible consequence of many months of unemployment benefits. Moreover, the joint application of Article 61 and Article 62 (calculation of benefits) may as a result entail a pull factor for what is called “unemployment tourism” in particular in the direction of Member States with a high level of wages and protection, undermining the sense of the unemployment benefits coordination provisions.

From a quite different perspective, the current wording of Article 61 may also increase the risk of fraud distorting the correct meaning of the restrictions on the export of benefits of Article 64 of the Regulation. An example could be the best way to describe this problem which may affect in particular but not only the Member States of origin of the unemployment claimants. A national of State A who has been working X years in State B becomes unemployed and decides to return to his or her State of origin. The person concerned knows that the export of benefits is limited to three months (six months exceptionally in some Member States) and that he or she has to be registered as a person seeking work with the employment services of the competent Member State for at least four weeks. To overcome these restrictions, he or she immediately returns to the country of origin. There, this person may, as explained in the precedent paragraph, establish an artificial work relationship and provoke a

simulated dismissal. As a consequence, Article 61 will be applicable and the aggregation mechanism activated with possibly many months of unemployment benefits provided by State A.

This problem is well-known by some Member States, as reflected in a reply to the FreSsco questionnaire (*“A representative from the X Unemployment Service reports that they tend to review all possible simulation of professional relationships (fraud) including also those related with the application of the aggregation after a very short period of insurance in X. Simulation, however, is almost impossible to prove in most cases, especially when the person is hired via a temporary employment agency [...].”* *“According to [the] Department of Coordination of Social Security Systems in the Ministry of Labour and Social Policy of X Member State, it is estimated that over 90% from 1517 cases in 2013 were from its own citizens.”* *“Therefore I believe that a significant percentage of them are expected to be Nationals from X Member State that want to come back to this Member State after a period abroad.”*).

### 1.3 Advantages of the current provision

It can be considered, after reading the precedent paragraphs, that this report makes a plea in favour of the modification of Article 61. In part this is true and in part it is not. Or, as Voltaire said, “the better is the enemy of the good”.

It is true that the current wording of Article 61 has declared enemies but also good friends, the latter being those who consider that any changes introduced in this provision will imply more drawbacks than advantages. In fact, the defenders of the *status quo* estimate that the one-day rule is the common principle and practice, applicable for other benefits (except pensions). They believe that any restriction to the aggregation mechanism for unemployment benefits could entail a kind of time bomb that could undermine the root and pillar of the coordination system.

The arguments put forward by the defenders of maintaining Article 61 as it is now, without any change, are solid. In fact for migrant workers it is a very appropriate solution, taking into account that the Member State where the last employment was carried out will always be the competent State. Actually, this solution offers a legal certainty that perhaps will not be offered by other alternatives.

Also for the competent institutions an unchanged Article 61 implies advantages. For instance, the administrative procedures as they are now may continue. Moreover, no transitional provision will be needed.

Concerning fraud and abuse we do not seem to be confronted with a problem of great magnitude. In fact, Member States have their own legislative instruments to fight disguised employment and simulated lay-offs. Moreover, as the European Commission (EC) admits, “*EU citizens do not use welfare benefits more intensively than the host country’s nationals*”.

A similar opinion is shared by the experts<sup>128</sup> of the *University College London (UCL)*. They declared that “[t]here are claims that immigrants from Europe take advantage of the social security system. But, despite the controversy surrounding this issue, evidence for how much immigrants take out of and contribute to the public purse is surprisingly sparse. Our new research published by the Royal Economic Society in the *Economic Journal* aims to fill this void. Our findings show that European immigrants have paid more in taxes than they received in benefits, helping to relieve the fiscal burden and contributing to the financing of public services”.

Consequently it appears that fraud and abuse have more a political dimension than a real dimension.

On the other hand, the argument of the need of integration in the labour market of the competent State is not quite consistent. Indeed, the goal of

---

<sup>128</sup> C. Dustman & T. Frattini, ‘Yes, EU immigrants do have a positive impact on public finances’, *The New Statesman*, 5 November 2014.

unemployment benefits is not only to replace income but also to facilitate the search for a new job. For this reason, benefits and job search are linked and any separation or distribution of competences between Member States can have, in principle, negative consequences for the employment of this person. In fact, the current provision follows the idea that the unemployed person has to make him or herself available in the Member State that offers the most favourable conditions to find new employment.

#### *1.4 An alternative proposal for amendment*

In case the final decision about Article 61 would be the election of Option 1, i.e. the maintenance of the current text, it could be appropriate to look for a uniform application of this provision, avoiding misunderstandings or different interpretations. For this purpose, the best solution would be the adoption of a Decision by the Administrative Commission establishing with clarity the “one-day rule” for the activation of the aggregation mechanism and eliminating other alternatives, in particular the “more-than-one-day rule”.

### **Option 2**

**Option 2: a threshold** is applied for the aggregation of periods of insurance or (self-)employment fulfilled in another Member State.

**Sub-option 2a: One month** of insurance or (self-)employment needs to be completed before aggregation can be applied.

**Sub-option 2b: three months** of insurance or (self-)employment needs to be completed before aggregation can be applied.

The principle of aggregation has a specific aim. It protects migrants from disadvantages that could be provoked by movements from one Member State to another. This aim is expressively assigned in Article 48 TFEU (see above Introduction, 1). Option 2 derogates from this principle. The idea produced by

the European Commission (EC) is to introduce a “threshold” (one could also call it a “qualifying” or “waiting” period). During a certain period of time (one or three months), the aggregation principle would not apply and, as a consequence, the person concerned would not be able to bring into account periods accomplished under the legislation of the previous Member State. Given the fundamental character of the aggregation principle on the one hand and the sharpness of the proposal on the other hand, we can note that Option 2, as such (without any protecting rules), is not compatible with superior EU law, especially with the Treaties. There is some relevant case law of the Court of Justice of the European Union (CJEU)<sup>129</sup> as well as doctrine<sup>130</sup> about the question (see Introduction, 1). In order to avoid a violation of primary law, additional rules should be adopted concerning the situation during the proposed qualifying (or waiting) period and connected questions (return of contributions if the waiting period is not fulfilled and if no benefits have been paid, access to other benefits and employment services etc). The report therefore includes considerations how to organise a lawful treatment of the person concerned and formulates some draft rules (see Option 2, 2).

### ***1 The compatibility of Option 2 with higher ranked EU Law***

The first part of the present report (see Introduction) explains the functioning of the aggregation principle. Option 2, however, calls for some additional remarks, because it is focused on persons who are pursuing a professional activity. It sets up a rule which covers workers. It is therefore more difficult to justify a restriction, especially by referring to the integration argument, because working and contributing to the social security system does represent a good way to integrate into the local job market.

---

<sup>129</sup> Judgment in *Vougioukas*, C-443/93, EU:C:1995:394, paragraph 30. Also see Opinion of the Court 1/91, EU:C:1991:490: “*EEC Treaty, albeit concluded in the form of an international agreement, nonetheless constitutes the constitutional charter of a Community based on the rule of law.*”)

<sup>130</sup> U. Becker, in J. Schwarze (ed.), *EU-Kommentar*, Nomos, Baden-Baden, 2012 (3rd edition), Article 48 AEUV/3.

The following shortly recalls the legal effect of the rights granted by the Treaty (1.1), summarises the obligations of the EU legislature in terms of coordination (1.2), explains why the draft rule deviates from essential coordination rules required by the Treaty (1.3) and finally looks at the justifying reasons mentioned in the mandate (1.4).

### 1.1 *Free movement of workers and entitlements associated to the right of free movement*

Free movement of workers is a fundamental principle of European law<sup>131</sup> and has the function of a fundamental right.<sup>132</sup> It provides a legally protected position to every European citizen willing to work and stay in a Member State.<sup>133</sup> The relevant rules (especially Article 45 TFEU) are directly applicable,<sup>134</sup> prevail over contrary national law<sup>135</sup> and can establish a claim of compensation if violated.<sup>136</sup> In respect of Option 2, it should be recalled that the right of free movement is binding not only for the Member States but also for all EU institutions.<sup>137</sup>

### 1.2 *Obligations of the EU legislature in terms of social protection*

The EU legislature is required to set up a system to enable workers to overcome obstacles with which they might be confronted in national social security rules.<sup>138</sup> It is also obliged to omit measures which introduce additional obstacles to the free movement of workers, such as rules which allow the

---

<sup>131</sup> Judgment in *Watson and Belmann*, C-118/75, EU:C:1976:106, paragraph 16.

<sup>136</sup> Judgment in *Larsy*, C-118/00, EU:C:2001:368.

<sup>137</sup> Also see Article 15(2) of the EU Charter of Fundamental Rights, which guarantees that “every citizen of the Union has the freedom to seek employment, to work, to exercise the right of establishment and to provide services in any Member State”, and which is binding for the EU.

<sup>138</sup> Judgment in *Vougioukas* EU:C:1995:394, paragraph 30.

Member States to discriminate against EU citizens.<sup>139</sup> This follows from Article 45 TFEU combined with Article 48 TFEU.<sup>140</sup> It hence could be held that the legislature does not fully discharge its obligations under Article 45 and Article 48 TFEU if Option 2, without alternatives, were adopted.

### 1.2.1 Aggregation of periods

The aggregation principle is expressly mentioned in Article 48 TFEU. It therefore appears to be part of the coordination principles the Treaty assumes to be important. The other coordination rules, like the designation of the law applicable, rules opening the access to cross-border health care, the cooperation between national social security institutions, are not. Article 48 TFEU focuses on two instruments: the aggregation of periods and the exportation of benefits. Those principles are “*intended to ensure that workers do not lose, as a result of their exercising the right to freedom of movement, social security advantages granted to them by the legislation of a Member State*”.<sup>141</sup> They are designed to abolish “*as far as possible the territorial limitations*” of the domestic social security schemes.<sup>142</sup> The principle is fundamental because without aggregation the access to and the amount of benefits the person has already worked for could be lost.<sup>143</sup> It is necessary in order to undertake a useful implementation of Article 48 TFEU. Hence aggregation of periods belongs to the measures the legislature is required to set up.<sup>144</sup> Consequently, the CJEU has held that Article 48 TFEU does not only provide the competence to adopt legal acts. Article 48 TFEU also contains a mandate the legislature has to observe.<sup>145</sup> This follows from Article 45 TFEU, which is the ‘*raison d’être*’ of Article 48 TFEU: as the CJEU has pointed out several times “*the establishment of as complete freedom of movement for*

<sup>144</sup> Judgment in *Vougioukas* EU:C:1995:394, paragraph 30.

<sup>145</sup> Judgment in *Pinna v Caisse d’allocations familiales de la Savoie* EU:C:1986:1, paragraph 24.

*workers as possible, which forms part of the foundations of the Community, constitutes the ultimate objective of Article 51 of the EEC Treaty and thereby conditions the exercise of the power which it confers upon the Council.*”<sup>146</sup>

### 1.2.2 Equality of treatment

Equality of treatment is anchored in Article 20 of the EU Charter of Fundamental Rights and all measures taken by the EU have to conform to this right.<sup>147</sup> This is also true for Article 45(2) TFEU, which prohibits “*any discrimination based on nationality*”. Article 4 of Regulation (EC) No 883/2004 applies the principle to social security. The formulation used by this Article (“*unless otherwise provided for by this Regulation*”) suggests that waivers could be allowed by the legislature. According to the CJEU, however, coordination must secure the equal treatment laid down by Article 45 TFEU<sup>148</sup> and must not add to the disparities caused by national legislation.<sup>149</sup> As stated by the CJEU in the *Pinna I* case concerning a French family allowance, EU institutions are not permitted to adopt rules which provide unequal treatment among citizens; such rules are void as contrary to the Treaties, especially in respect to Article 45 TFEU mentioned above. Equality of treatment also “*prohibits (...) all covert forms of discrimination which, by applying other distinguishing criteria, in fact achieve the same result*”.<sup>150</sup> This was the case in the *Pinna* judgment mentioned above.

### 1.3 Derogation from the above-noted principles

According to Option 2, people who move their work from one Member State to another have to wait one or three months before the aggregation principle

---

<sup>146</sup> Judgment in *Khalil*, C-95/99, EU:C:2001:532, see also the judgment in *Singer* EU:C:1965:122.

<sup>147</sup> Judgment in *Razzouk v Commission*, C-117/82, EU:C:1984:116; judgment in *P - Lindorfer v Council*, C-227/04, EU:C:2007:490; judgment in *Koninklijke Scholten-Honig NV and Others v Hoofdproduktschaap voor Akkerbouwprodukten*, C-125/77, EU:C:1978:187.

<sup>148</sup> Judgment in *Pinna v Caisse d'allocations familiales de la Savoie* EU:C:1986:1, paragraph 24.

<sup>149</sup> Judgment in *Pinna v Caisse d'allocations familiales de la Savoie* EU:C:1986:1, paragraph 22.

<sup>150</sup> Judgment in *Pinna v Caisse d'allocations familiales de la Savoie* EU:C:1986:1, paragraph 23.

applies. Therefore, the proposal restricts free movement of workers. The aggregation principle (1.3.1) is affected, since the draft says to not apply it. The principle of equality of treatment is also concerned because it potentially allows Member States to treat foreign workers differently (1.3.2).

#### 1.3.1 Aggregation of periods

Option 2 deviates from a rule prescribed by the Treaty. Article 48 TFEU clearly shows that the aggregation rule is one of the principles that allows workers to move freely within the European Union. The solution suggested under Option 2, however, does exactly the opposite. Whereas the Treaty says “do aggregate”, Option 2 says “do not aggregate”. Therefore, the result of Option 2 does not correspond with the aims pursued by the Treaty. The proposed change would create obstacles to the free movement of workers, because for the moment, the national legislation is not harmonised. Member States are fully allowed to define all kinds of qualifying periods. Without aggregation of periods, migrant workers would not get the protection necessary to encourage free movement.

#### 1.3.2 Equality of treatment

The draft rule of Option 2 does not expressly refer to the nationality of workers. Therefore, it does not constitute an overt discrimination. But it allows Member States to not take into account periods accomplished under the legislation of another Member State.<sup>151</sup> This type of disguised or hidden discrimination can be avoided by aggregation of periods. Option 2, instead, opens the door to such treatments. There is some case law concerning similar rules which might be interesting to mention.

In the *Roviello* case, the CJEU declared void a rule adopted by the Council in 1983. The rule in question did not itself lay down any formal difference in treatment between nationals and European citizens, but it allowed a Member

---

<sup>151</sup> R. Langer, in M. Fuchs (ed.), *Europäisches Sozialrecht*, Nomos, Baden-Baden, 2013 (6th edition), Article 48 AEUV/18.

State to do so<sup>152</sup>; it was “*not of such a nature as to guarantee the equal treatment [...] and therefore [had] no place in the coordination of national law*”.<sup>153</sup> According to the CJEU, such provisions are liable to have an effect on foreigners more often than on nationals and include the risk of placing them at a particular disadvantage. The same is true for Option 2 as well, because the waiting period will typically apply to migrants; it is evident, moreover, that it reduces the rights of those migrants because unemployment benefits might be refused to them. It is therefore plausible to affirm that Option 2 is not compatible with the principle of equal treatment.

Option 2 is also problematic in terms of mutuality, because the migrant worker is not protected by the system of the receiving Member State although it is likely that the worker will have to pay social security contributions there. In several judgments the CJEU has held that an unlawful disadvantage occurs if EU citizens, other than nationals, must pay higher contributions than usual without being entitled to additional benefits<sup>154</sup> or if they are subject to social contributions “*on which there is no return*”.<sup>155</sup>

## 1.4 *Justifying reasons*

### 1.4.1 “threshold”

The EU legislature may choose the most appropriate measures to attain the objective of Article 48 TFEU and therefore disposes of a “*wide discretion*”.<sup>156</sup> This includes the right to formulate formal conditions, like the obligation to register as a jobseeker at the employment services of the competent Member

---

<sup>152</sup> According to this rule only the occupation periods insured in Germany were taken into account in determining entitlement to an occupational invalidity pension.

<sup>153</sup> Judgment in *Roviello*, C-20/85, EU:C:1988:283.

<sup>155</sup> See, to that effect, the judgment in *Hervein and Others*, C-393/99 and C-394/99, EU:C:2002:182, paragraph 51; judgment in *Piatkowski*, C-493/04, EU:C:2006:167, paragraph 34; judgment in *van Delft and Others*, C-345/09, EU:C:2011:57, paragraph 100 and 101; and the judgment in *da Silva Martins*, C-388/09, EU:C:2011:439, paragraph 72 and 73.

<sup>156</sup> Judgment in *Vougioukas* EU:C:1995:394, paragraph 35.

State (Article 64(1) of Regulation (EC) No 883/2004).<sup>157</sup> Furthermore, material conditions may be set, for instance the necessity of having the most recently completed period in the competent Member State (Article 61(2) of Regulation (EC) No 883/2004).<sup>158</sup> And finally, it also includes the possibility to depart from the coordination mechanisms designed by this provision.<sup>159</sup> As a consequence, exceptions or restrictions provided by EU coordination law may be regarded as valid even if they do not furnish the whole protection assigned by Article 48 TFEU.<sup>160</sup>

This leads to the questions whether deviations from fundamental principles must be justified by overriding reasons and how those reasons are to be examined. They are not completely solved yet. The case law concerning restrictions and exemptions decided by the EU legislature is relatively rare. Some decisions do not discuss justifying reasons as such. In the *Pinna* case, the CJEU does not examine the existence of justifying reasons at all.<sup>161</sup> The *Testa* judgment concerning the three-month limitation to exportation of unemployment benefits does not mention justifying reasons either; it only explains that the rule is reasonable, because it confers the possibility to seek employment outside the competent Member State.<sup>162</sup> In the *Gray* case, the CJEU notes that the “*Council considered it necessary*” to attach conditions to the entitlement to unemployment benefits (the obligation to register and the necessity to have the most recent period in the competent Member State); the CJEU also explains that people should be encouraged to seek work in the Member State in which they were last employed and that the latter should have the financial burden of providing the unemployment benefits.<sup>163</sup> Technical difficulties due to profound differences between Member State law were

<sup>163</sup> judgment in *Gray v Adjudication Officer* EU:C:1992:177.

discussed but denied in the *Vougioukas* case.<sup>164</sup> In the *Snares* case the CJEU accepted the argument that special non-contributory benefits are closely linked with the social environment and therefore justify the condition of residence introduced by the EU legislature in 1992.<sup>165</sup> This case law at least answers the first question. It shows that deviations need to be justified by some reasons and, evidently, that a reason must outweigh the rights conferred by Article 45 TFEU. This approach is consistent with the rule of law laid down in Article 2 TEU.

The second question could be answered in the light of the *Gray* judgment mentioned above, in which the CJEU held that the Treaty does not prohibit the Community legislature from attaching conditions to the rights granted by Article 45. In the *Gray* case the CJEU identified and approved the intention of the legislature to encourage persons to seek work in the Member State they were last employed. Therefore, the restriction is considered as valid. As Advocate General Tesouro pointed out in this case, the idea of Article 61(2) Regulation (EC) No 883/2004 is to “avoid the exportation of unemployment”.<sup>166</sup> This aim does not exactly correspond to the problem focused on by Option 2. Option 2 wants to avoid abuse and excessive financial burden for the Member States, especially the Member State where the worker has lost his or her last job. This motivation is different from the one protected by the CJEU in the *Gray* case, even if the rule proposed might have a similar impact on the European job market. For this reason we do not think that the argumentation used in the *Gray* case may be transposed on Option 2.

Furthermore, the case law related to deviations set up by the EU legislature does mention justifying reasons such as technical difficulties of coordination or the financial burden due to the exportation of benefits. However, they do not go much further, for instance explaining that the reasons put forward must

<sup>166</sup> Opinion of the Advocate General in *Gray*, C-62/91, EU:C:1992:18, paragraph 5.

be rational and that every restrictive measure has to respect the principle of proportionality; those arguments are proper to the case law related to measures taken by the Member States.<sup>167</sup> However, they should also govern the use of competence by the Union, as Article 5(1) TEU stipulates. The necessity to have the most recent period in the competent Member State, as examined in the *Gray* case, has an effect on the aggregation principle because the jobseeker cannot ask for aggregation before having worked at least one day in the receiving Member State. But this rule is less severe than Option 2, which applies to people who have already worked in this State. Option 2 goes a step further than the existent law. It refuses aggregation to workers who already have found a job in another Member State and thus have established a link to the legal system of this Member State; those workers may not apply for benefits in the former Member State any longer. The existent law might be considered sufficient to protect the Member States' financial interests.

As far as we know, the arguments mentioned by the EC (mandate, p. 2, p. 3: clarification, simplification, risk of fraud and abuse, uneven financial burden for Member States) have not yet been subject to CJEU decisions concerning the validity of EU coordination law. In any case, arguments which allow to justify a restriction of the fundamental right of free movement of workers have to be solid. They are typically related to important interests such as inner security, public health and hospital planning.<sup>168</sup> This follows from the case law related to the internal market in general because the necessity of rational and proportionate justifying reasons are relevant for all the freedoms granted by the Treaty, especially for free movement of goods, free movement of persons (movement of workers and right of establishment) and freedom of services.<sup>169</sup> In the field of unemployment benefits or benefits which are similar to the

<sup>168</sup> Judgment in *Watts*, C-372/04, EU:C:2006:325; this example falls within the scope of the freedom of services, but similar justifying reasons related to health care also appear in the field of social coordination under Regulation (EC) No 883/2004; see e.g. the judgment in *Elchinov*, C-173/09, EU:C:2010:581, paragraph 44 and 51.

<sup>169</sup> R. Bieber & F. Maiani, *Précis de droit européen*, Bern, 2011 (2<sup>nd</sup> edition), p. 191.

latter, the CJEU has held that conditions such as a residence requirement have to be proportionate.<sup>170</sup> It should also be noted that most of the case law about the question how to justify discriminating rules concern national law. Restrictions can be justified, under EU law, “*if [they are] based on objective considerations independent of the nationality of the persons concerned and (are) proportionate to the legitimate objective of the national provisions.*”<sup>171</sup> The rule must be “*appropriate for securing the attainment of the objective pursued*” and it must not “*go beyond what is necessary in order to attain it.*”<sup>172</sup> Usually, the CJEU takes into account the particular national rules and circumstances. In the *Stewart* case, for instance, the CJEU had to consider the situation of a British subject to whom a disability allowance was refused, for the sole reason that she was not present in Great Britain on the date on which she claimed the allowance.<sup>173</sup> The CJEU held that this restriction could not be described as appropriate; it neither ensured a genuine link between the claimant and Great Britain nor was it necessary to preserve the financial balance of the British social security system.<sup>174</sup> In other words, the amendment proposal would have to explain why, in certain Member States, the waiting period is necessary. It would also be necessary to define under which conditions or in which kind of situation a waiting period would not apply (e.g. to persons who had already worked in the receiving Member State in former times and have contributed to the social security system of the State).

#### 1.4.2 Justifying reasons such as mentioned in the mandate

The mandate also explains that the current rules bear the risk of fraud or abuse because people can claim benefits just after arriving in another Member State (p. 2 of the mandate). According to the EC, Option 2 would limit this risk,

<sup>171</sup> Judgment in *De Cuyper*, C-406/04, EU:C:2006:491, paragraph 40. See also the judgment in *Sotgiu*, C-152/73, EU:C:1974:13, paragraph 4.

<sup>172</sup> Judgment in *De Cuyper* EU:C:2006:491, paragraph 42.

<sup>173</sup> Judgment in *Stewart*, C-503/09, EU:C:2011:500.

<sup>174</sup> Judgment in *Stewart* EU:C:2011:500, paragraph 108. See also the judgment in *Petersen*, C-228/07, EU:C:2008:494.

since the person would have to wait a certain period of time before he or she could ask for aggregation. In the field of social security, the CJEU has not yet discussed the risk of fraud and abuse as a justifying reason. This might be due to the fact that parts of the case law mentioned above go back to the 1970s and 1980s. Today, the Treaties include a chapter about Area of Freedom, Security and Justice, wherein the Union is to prevent and combat crime (Article 67(3) TFEU); the European Anti-Fraud Office investigates fraud against the EU budget. Therefore, it seems plausible that the EU is also concerned about fraud and abuse directed against its members. As recently pointed out by the EC, EU law contains “*a range of robust safeguards to help Member States to fight abuse and fraud*”<sup>175</sup>. In the field of social security coordination, the Treaty does not expressly mention rules fighting fraud and abuse, but neither does it prohibit such rules (Article 48 TFEU). Hence, the risk of fraud and abuse may be taken into account by the EU legislature while adopting coordination rules. It could even constitute a justifying reason for exemptions and deviations from the principles mentioned in Article 48 TFEU. The question, however, if Option 2 is justified by this argument needs some additional clarifications. It should first be verified if the fear about possible abuse is based on objective facts. The statistics seem to indicate the opposite: “*EU citizens do not use welfare benefits more intensively than the host country’s nationals*”.<sup>176</sup> Furthermore, it should be asked if the simple risk of abuse is sufficient. Would it not be more appropriate and proportional to figure out a rule which sanctions abuse committed by persons instead of choosing a measure of general prevention? Such measures are not allowed when adopted by the Member States and, consequently, should not be used by the EU legislature either.<sup>177</sup>

Moreover, the waiting period could help to make sure that the migrant worker is fully integrated in the job market before getting unemployment benefits. But the integration argument (p. 1 of the mandate) is problematic if we consider the relevant Treaty provisions and the settled case law of the CJEU. The Member States may indeed adopt rules which require the migrant to show a certain degree of integration; the CJEU uses the expression “*degree of connection to society*” and admits that “*the aim of solidarity may constitute an objective consideration of public interest.*”<sup>178</sup> Conditions of territory, however, usually fail to comply with the principle of proportionality; they are not an appropriate means by which to obtain the objective of solidarity if the person who has his or her residence in another Member State is in fact as well integrated as a resident.<sup>179</sup> Several CJEU decisions did not even evoke the possibility that the refusal to take into account external events might be justified; the CJEU found a violation of EU law without discussing any overriding consideration.<sup>180</sup> In the *Mulders* case, the CJEU held that a Member State cannot preclude, as a period of insurance, an entire period during which contributions were paid for the sole reason that the person concerned did not reside in that Member State during this period.<sup>181</sup> It should also be noted that the recent case law concerning persons who move into another Member State without the intention to work, cannot be applied to the present situation.<sup>182</sup> The draft amendment concerns migrant workers, which means persons who intend to accomplish a gainful activity and therefore contribute to the national economy of the receiving Member State. This is an important factor proving integration. In the case mentioned above it was completely absent; the applicants did not have any economic activity, nor did they look for such an activity.<sup>183</sup>

<sup>182</sup> Judgment in *Dano*, C-333/13, EU:C:2014:2358.

<sup>183</sup> Judgment in *Dano* EU:C:2014:2358, paragraph 39.

The waiting period might be desired by some Member States, especially by Member States with a high level of EU immigration. The mandate (p. 2) mentions the financial burden put on the shoulders of those Member States and hence refers to another important principle of the EU. The Treaties indeed contain several provisions which refer to economic difficulties the Member States have to face. Beside rules concerning the economic and social cohesion (Article 162 and 174 TFEU), competition rules<sup>184</sup> and the chapter concerning the Monetary Union (Article 140 TFEU) take into account the financial and economic power of the Member States. All Member States of the Eurozone have to guarantee financial stability and must not overload their budget. Therefore, it is plausible to defend that solidarity and the limits inherent to the latter require a measure such as Option 2. But the proposal then raises the question how to cover the person during the qualifying period and which Member State should reasonably have the financial burden (see 2 below).

This also answers the question if Option 2 could be justified by the simplification argument (p. 2 of the mandate). We do not think so. If the aim is to adopt simple coordination rules, the legislature should choose a system in which the worker is clearly subject to the law of one Member State. Option 2, however, requires the adoption of additional rules about access to benefits during the waiting period (see 2 hereafter: a paragraph added to Article 61 of Regulation (EC) No 883/2004 provides exportation of unemployment benefits from the previous Member State). The system does not become easier this way. Moreover, by abandoning the one-day rule, the draft introduces the necessity to calculate terms and periods. Such calculations do not promise any simplification.

A last reason mentioned is to ensure uniform application of the rules on aggregation of periods by all Member States (p. 2 of the mandate). This aim, however, can already be attained by a correct application of the existing law.

---

<sup>184</sup> Judgment in *Kingdom of the Netherlands v Commission*, C-28/66, EU:C:1968:5.

The mapping, which is attached to this report shows that most of the questioned Member States apply the one-day rule (e.g. Germany, the Netherlands). If other Member States might not do so, they would deviate from a uniform rule and therefore violate EU law.

### 1.5 *Intermediate result*

Option 2 is not, as such, compatible with Articles 45 and 48 TFEU. By deviating from the aggregation principle it does the opposite of what is prescribed in Article 48 TFEU. It allows Member States to refuse unemployment benefits if the person concerned has less than three months (or one month) of a working period under domestic law. The motivating reasons are not solid enough to justify the restriction entailed. Even if the rule were qualified valid, a person could claim aggregation directly on the ground of Article 45 TFEU.<sup>185</sup> The provisions would also have to be interpreted restrictively<sup>186</sup> and in the light of this Article.<sup>187</sup> The additional rules proposed hereafter (see 2) take into account this aspect.

An amendment of Regulation (EC) No 883/2004 which introduces a waiting period must guarantee that the free movement of workers would not be restricted. Therefore, the following part outlines additional provisions in order to enhance Option 2 (see 2). The proposal contains rules about the protection the migrant worker gets during his or her waiting period. Those rules indicate the Member State competent to pay benefits. The new system should also be proportionate (Article 5(4) TFEU). Introducing a waiting period might be considered as such since it does not totally exclude aggregation but provides a temporary limitation; a waiting period of one month rather than three months might suffice (for more details see the draft provision in the following part of this report, 2).

## 2 *Evaluation of Option 2*

### 2.1 *Which Member State could be competent to aggregate if the minimum period in the last Member State of employment is not fulfilled?*

There can be no doubt that currently the focus of the rules to coordinate unemployment benefits lies predominantly on the migrant workers' interests, providing the most favourable conditions for finding new employment. The financial concerns of the institutions are being taken into account to a much lesser extent. At least this is the case while the unemployed person is available to the employment services of the State that pays the benefits. The proposals by the EC in Option 2 would shift the focus significantly to the institutions' interests by ensuring that the financial burden for paying unemployment benefits does not arise in situations where mobile EU workers have not yet made a significant contribution to the scheme of the new Member State. However, this would only be the case with regard to certain groups of migrant workers, while the coordination provisions for migrant workers falling under Article 65 would remain unchanged, unless wider amendments to Regulation (EC) No 883/2004 are implemented.

Option 2 would mean that migrant workers would not be entitled to benefits in the last Member State of employment if aggregation with periods concluded in other Member States would be necessary in order to fulfil the waiting period of this Member State. As shown in the mapping at the end of this report, this would concern 7,188 persons in only six selected Member States in a period of one year (2013, respectively 2014). If the Regulation were not to provide for another Member State to apply aggregation in such cases, this would lead to the situation that the migrant workers concerned would be entitled to benefits in no Member State at all, unless entitlement would be opened purely under the national legislation of a Member State. This would undoubtedly form an obstacle to the free movement of workers and – as shown above – would most probably be incompatible with the Treaty.

We therefore hold the view that a different Member State would have to substitute the last State of employment and apply the aggregation rule under Article 61 if the minimum threshold is not fulfilled. It would be most likely a violation of primary law to stipulate that periods completed by the person concerned would be aggregated in no Member State at all. Which institution could be obliged to apply the aggregation provision and pay the unemployment benefit instead of the last Member State of employment if the minimum period of insurance or (self-)employment was not completed in the competent Member State?
