These Fiscal Statistical Tables provide background data relevant for the assessment of the Member States' 2022 Stability and Convergence Programmes. For each Member State, the following tables are provided:

**Table 1 (Macroeconomic developments and forecasts)** shows the main macroeconomic data – real GDP growth and main expenditure components, output gap, employment, unemployment, labour productivity, inflation, GDP deflator, compensation of employees, and the net borrowing/lending vis-à-vis the rest of the world.

The figures from the Stability or Convergence Programme are shown side-by side with those of the Commission 2022 spring forecast (for which the cut-off date was 29 April 2022).

**Table 2 (Main indicators for fiscal surveillance)** includes the relevant indicators that are used for fiscal surveillance at this stage. It also shows the standard Stability and Growth Pact indicators.

**Table 3 (General government budgetary position)** shows data on the main revenue and expenditure variables and the deficit/surplus in the Stability or Convergence Programme, in comparison with the Commission forecast. The table also includes a number of additional indicators used for the assessment of the budgetary projections in the Programme <sup>(1)</sup>.

**Table 4 (General government debt developments)** shows year-on-year developments in general government debt and provides a breakdown of the change in the debt ratio as per the primary balance, the snowball effect (reflecting the relationship between GDP growth and interest expenditure) and the stock-flow adjustment (*i.e.* other elements that have an impact on the debt, such as differences between cash and accrual recording or the net accumulation of financial assets).

**Table 5 (Debt sustainability analysis and sustainability indicators)** contains information on debt sustainability indicators over the short, medium and long terms (the so-called S0, S1 and S2 indicators). The figures reported in the table are based on the Commission 2022 spring forecast; they update the indicators recently published in the Fiscal Sustainability Report 2021 <sup>(2)</sup>.

**Table 6 (RRF – Grants)** presents data on grants from the Recovery and Resilience Facility included in the Programme's revenue projections, their cash disbursements, and the expenditure categories (or other costs) financed by those grants.

**Table 7 (RRF – Loans)** presents data on cash disbursements and repayments of loans from/to the Recovery and Resilience Facility included in the Programme's projections, and the expenditure categories (or other costs) financed by those loans.

---

<sup>(1)</sup> For the Stability or Convergence Programmes, the output gap used for the cyclical adjustment is recalculated by the Commission services based on the macroeconomic scenario in the Programmes using the commonly agreed methodology.

<sup>(2)</sup> Fiscal Sustainability Report 2021, *European Economy-Institutional Papers*, 171, vol. 1 and 2.

**Table 8 (Guarantees adopted/announced according to the Programme)** presents the main guarantee schemes in place, in particular those adopted/announced since spring 2020 in response to the COVID-19 outbreak and related economic recession, as reported by the Member State. The table also provides the take-up of those guarantee schemes, if the information is available.

The differences between the projections in the 2022 Programmes and the Commission 2022 spring forecast may result from different assumptions for the macroeconomic outlook and on the implementation of the Member State's Recovery and Resilience Plans (RRP).

## Indicators used in the assessment of the Stability and Convergence Programmes

Traditionally, the fiscal stance is defined as a measure of the year-on-year change in the general government's budgetary position. It may serve to measure the impact of fiscal policy on aggregate demand in an economy, as well as the speed at which the underlying budgetary situation converges towards medium-term fiscal targets. Using the same indicator to gauge two different concepts was appropriate under the assumption that government expenditure was funded entirely by national revenue sources and debt financing, without large external transfers. However, in the presence of sizeable transfers from the EU budget (such as those from the Recovery and Resilience Facility or other EU grants), conventional indicators do not capture the additional fiscal impulse provided by the EU budget as the related national expenditure is offset by corresponding revenue from the EU.

The fiscal stance reported in Table 2 aims to assess the economic impulse stemming from fiscal policies, both those that are nationally financed and those that are financed by the EU budget. It measures the change in primary expenditure (net of discretionary revenue measures, including changes in expenditure financed by the RRF and other EU grants). Taking into account the exceptional circumstances created by the impact of the COVID-19 pandemic, it excludes crisis-related temporary emergency measures, relative to the 10-year average potential growth rate. <sup>(3)</sup> <sup>(4)</sup>

$$\frac{(1 + Pot_t) * (1 + \pi_t) * E_{t-1} - E_t + \Delta RM_t}{Y_t}$$

Where  $E_t = G_t - I_t - U_t - one\_offs_t^G (-emerg.\ temp.\ measures_t^G)$ .

The expenditure aggregate comprises primary expenditure (total expenditure  $G$  minus interest expenditure  $I$ ), net of cyclical unemployment benefits  $U$  and one-off expenditure.  $\Delta RM$  stands for the incremental budgetary impact of revenue measures (other than one-offs) excluding crisis-related temporary emergency measures.

Table 2 also presents a fiscal stance as computed in normal times, that is without excluding crisis-related temporary emergency measures.

Table 3 also monitors the growth rate of nationally financed net (primary) expenditure. In general, the net expenditure aggregate is calculated as:

$$E_t + \Delta RM_t = G_t - I_t - U_t - EU_t - one\_offs_t^G + \Delta RM_t$$

The aggregate is very similar to the one used for the fiscal stance, but excludes expenditure financed by the EU budget. Table 3 presents an aggregate where  $G$  is calculated as general government expenditure excluding/including changes in crisis-related temporary emergency measures, and  $\Delta RM$  representing the incremental budgetary impact of discretionary revenue measures excluding/including crisis-related temporary emergency measures.

<sup>(3)</sup> Crisis-related emergency measures generally aimed at addressing the public health situation and compensating workers and firms for income losses due to lockdown measures and supply chain disruptions. These measures were mostly of a temporary nature, but their impact was contingent on the development of the health situation. While useful in the initial phase of the crisis, these measures are likely to be less efficient to support the recovery when the health related emergency gradually wanes.

<sup>(4)</sup> The computations of the fiscal stance based on the Stability or Convergence Programmes assume no impact of crisis related temporary emergency measures in 2023 and beyond.

Table 1.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
Short-term fiscal risk indicator (S0) <sup>[1]</sup>	0.3			
<b>Medium term</b>	<b>risk</b>			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	6.6	HIGH risk	5.3	HIGH risk
Debt sustainability analysis <sup>[3]</sup>	HIGH risk			
Baseline scenario	HIGH risk			
Stochastic projections	HIGH risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	117.1		109.2	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	7.0	HIGH risk	5.4	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 2.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.3			
<b>Medium term</b>	<b>risk</b>			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	-1.2	LOW risk	-0.6	LOW risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	MEDIUM risk			
Baseline scenario	LOW risk			
Stochastic projections	MEDIUM risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	36.8		40.7	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	3.7	MEDIUM risk	3.9	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 3.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.2			
<b>Medium term</b>	<b>risk</b>			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	1.9	MEDIUM risk	0.9	MEDIUM risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	MEDIUM risk			
Baseline scenario	MEDIUM risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	61.4		48.8	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	7.1	HIGH risk	6.2	HIGH risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

<b>Long term<sup>[5]</sup></b>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	-0.8	LOW risk	0.5	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

<b>Long term<sup>[5]</sup></b>	risk			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	2.6	MEDIUM risk	2.2	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and ‘financing’ of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

<b>Long term<sup>[5]</sup></b>	risk			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	1.6	LOW risk	1.3	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

Table 7.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	LOW risk

<b>Medium term</b>	risk			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	-1.5	LOW risk	-1.4	LOW risk
Debt sustainability analysis <sup>[3]</sup>	LOW risk			
Baseline scenario	LOW risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	36.7		35.7	
<b>Long term</b> <sup>[5]</sup>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	5.3	MEDIUM risk	4.7	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 8.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	<b>HIGH risk</b>		
Short-term fiscal risk indicator (S0) <sup>[1]</sup>	0.5			
<b>Medium term</b>	<b>risk</b>			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	4.4	HIGH risk	2.0	MEDIUM risk
Debt sustainability analysis <sup>[3]</sup>	HIGH risk			
Baseline scenario	HIGH risk			
Stochastic projections	MEDIUM risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	130.5		112.3	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	-3.2	LOW risk	-3.6	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) This estimate does not include the impact of the structural reforms that are part of the Recovery and Resilience Plan and can boost economic growth.

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

<b>Long term<sup>[5]</sup></b>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	1.9	LOW risk	0.9	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 11.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	LOW risk		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.4			
<b>Medium term</b>	risk			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	1.1	MEDIUM risk	0.0	MEDIUM risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	MEDIUM risk			
Baseline scenario	MEDIUM risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	69.3		62.6	
<b>Long term<sup>[5]</sup></b>	risk			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	1.0	LOW risk	1.2	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(\*) In the table, the figures related to the Stability Programme correspond to the budgetary projections transmitted by Italy. Except for the overall figures on government deficit and debt, those projections do not take into account the fiscal package announced by Italy for May 2022. This package, adopted on 2 May 2022, included additional support measures in 2022 as well as more resources for nationally financed investment projects in both 2022 and in the coming years. The estimates reported for the Stability Programme in Table 12.2 (Indicators for the fiscal surveillance) are based on those detailed budgetary projections, and therefore do not take into account the additional fiscal package.

(1) This estimate does not include the impact of the structural reforms that are part of the Recovery and Resilience Plan and can boost economic growth.

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

<b>Short term</b>	<b>LOW risk</b>

<b>Medium term</b>	<b>risk</b>			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	9.6	HIGH risk	8.1	HIGH risk

<b>Long term</b> <sup>[5]</sup>	<b>risk</b>			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	1.6	LOW risk	0.5	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 13.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.4			
<b>Medium term</b>	<b>risk</b>			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	-0.4	LOW risk	-3.0	LOW risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	MEDIUM risk

<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	1.0	LOW risk	-0.9	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 16.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	LOW risk		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.3			
<b>Medium term</b>	risk			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	-3.5	LOW risk	-2.7	LOW risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	LOW risk			
Baseline scenario	LOW risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	19.4		23.0	
<b>Long term<sup>[5]</sup></b>	risk			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	7.4	HIGH risk	7.4	HIGH risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 17.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	LOW risk		
Short-term fiscal risk indicator (S0) <sup>[1]</sup>	0.3			
<b>Medium term</b>	risk			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	1.9	MEDIUM risk	-1.7	LOW risk
Debt sustainability analysis <sup>[3]</sup>	MEDIUM risk			
Baseline scenario	LOW risk			
Stochastic projections	MEDIUM risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	72.8		46.1	
<b>Long term</b> <sup>[5]</sup>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	6.3	HIGH risk	3.7	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

<b>Long term<sup>[5]</sup></b>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	10.1	HIGH risk	8.3	HIGH risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

Long-term fiscal risk indicator (S2) <sup>[6]</sup>	6.2	HIGH risk	6.8	HIGH risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 21.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.2			
<b>Medium term</b>	<b>risk</b>			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	0.5	MEDIUM risk	-1.4	LOW risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	LOW risk			
Baseline scenario	LOW risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	53.9		43.2	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	4.4	MEDIUM risk	2.9	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 22.5: Debt sustainability analysis results and fiscal sustainability indicators

<i>Time horizon</i>	Commission scenario		Stability programme scenario	
<b>Short term</b>	LOW risk			
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.3			
<b>Medium term</b>	risk			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	3.7	HIGH risk	2.1	MEDIUM risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	HIGH risk			
Baseline scenario	HIGH risk			
Stochastic projections	MEDIUM risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	100.0		90.0	
<b>Long term<sup>[5]</sup></b>	risk			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	-1.4	LOW risk	-2.5	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 25.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	LOW risk		
Short-term fiscal risk indicator (S0) <sup>[1]</sup>	0.2			
<b>Medium term</b>	risk			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	1.8	MEDIUM risk	1.5	MEDIUM risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	HIGH risk			
Baseline scenario	MEDIUM risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	61.0		57.3	
<b>Long term<sup>[5]</sup></b>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	9.6	HIGH risk	9.2	HIGH risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) This estimate does not include the impact of the structural reforms that are part of the Recovery and Resilience Plan and can boost economic growth.

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 26.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Stability programme scenario	
	<b>Short term</b>	LOW risk		
Short-term fiscal risk indicator (S0) <sup>[1]</sup>	0.2			
<b>Medium term</b>	risk			
Medium-term fiscal risk indicator (S1) <sup>[2]</sup>	0.0	MEDIUM risk	0.6	MEDIUM risk
Debt sustainability analysis <sup>[3]</sup>	LOW risk			
Baseline scenario	LOW risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	62.5		68.2	
<b>Long term</b> <sup>[5]</sup>	risk			
Long-term fiscal risk indicator (S2) <sup>[6]</sup>	3.1	MEDIUM risk	3.5	MEDIUM risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*

(1) This estimate does not include the impact of the structural reforms that are part of the Recovery and Resilience Plan and can boost economic growth.

(2) Output gap (in % of potential GDP) and cyclically-adjusted balance according to the programme as recalculated by Commission on the basis of the programme scenario using the commonly agreed methodology.

(3) Structural (primary) balance refers to cyclically-adjusted (primary) balance excluding one-offs.

(1) The snow-ball effect captures the impact of interest expenditure on accumulated debt, as well as the impact of real GDP growth and inflation on the debt ratio (through the denominator). The stock-flow adjustment includes differences in cash and accrual accounting (including leads and lags in the disbursements in RRF grants), accumulation of financial assets and valuation and other residual effects.

Table 27.5: Debt sustainability analysis results and fiscal sustainability indicators

Time horizon	Commission scenario		Convergence programme scenario	
	<b>Short term</b>	<b>LOW risk</b>		
<b>Short-term fiscal risk indicator (S0)<sup>[1]</sup></b>	0.3			
<b>Medium term</b>	<b>risk</b>			
<b>Medium-term fiscal risk indicator (S1)<sup>[2]</sup></b>	-5.7	LOW risk	-6.6	LOW risk
<b>Debt sustainability analysis<sup>[3]</sup></b>	LOW risk			
Baseline scenario	LOW risk			
Stochastic projections	LOW risk			
(Per memo.) Baseline projected government debt-to-GDP in 2032 (%) <sup>[4]</sup>	10.5		7.8	
<b>Long term<sup>[5]</sup></b>	<b>risk</b>			
<b>Long-term fiscal risk indicator (S2)<sup>[6]</sup></b>	0.9	LOW risk	0.2	LOW risk

(1) The S0 indicator informs the early detection of fiscal stress associated to fiscal risks within a one-year horizon.\*

(2) The S1 indicator measures the effort required to bring the debt-to-GDP ratio to 60 % in 15 years. It corresponds to a cumulated improvement in the structural primary balance over 5 years compared with the baseline. Below 0: low risk. Between 0 and 2.5: medium risk. Above 6: high risk.\*

(3) The debt sustainability analysis is performed around the Commission's baseline scenario to test the response to different shocks, including sensitivity tests and stochastic projections.\*

(4) The Commission scenario assumes a gradual reversal of temporary pandemic-related measures (and 'financing' of permanent ones).\* The stability or convergence programme scenario assumes that the budgetary plans in the programmes are fully implemented over the period covered by the programmes.

(5) The long-term risk classification is based on both the S2 indicator and the results of the debt sustainability analysis.

(6) The S2 indicator shows the upfront and permanent fiscal adjustment required to stabilise the debt-to-GDP ratio over the infinite horizon. Below 2: low risk. Between 2 and 6: medium risk. Above 6: high risk.\*
