LEGISLATIVE ACTS AND OTHER INSTRUMENTS

Subject: COUNCIL REGULATION laying down a framework to accelerate the
deployment of renewable energy

COUNCIL REGULATION (EU) 2022/...

of ...

laying down a framework to accelerate the deployment of renewable energy

THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty on the Functioning of the European Union, and in particular Article 122(1) thereof,

Having regard to the proposal from the European Commission,

Whereas:

- (1) The Russian Federation's war of aggression against Ukraine and the unprecedented reduction of natural gas supplies from the Russian Federation to Member States threaten the security of supply of the Union and its Member States. At the same time, the weaponisation of the gas supply and the Russian Federation's manipulation of the markets through intentional disruptions of gas flows have led to skyrocketing energy prices in the Union, not only endangering the economy in the Union, but also seriously threatening security of supply. A fast deployment of renewable energy sources can help to mitigate the effects of the current energy crisis, by forming a defence against Russia's actions. Renewable energy can significantly contribute to counter Russia's weaponisation of energy by strengthening the Union's security of supply, reducing volatility in the market and lowering energy prices.

- (2) In recent months, Russia's actions have further aggravated the situation in the market, in particular by increasing the risk of a complete halt of Russian gas supplies to the Union in the near future, a situation which has affected the Union's security of supply. That sharply increased the volatility of energy prices in the Union and increased gas and electricity prices to all-time highs during the summer leading to growing electricity retail prices which are expected to continue gradually trickling down to most consumer contracts, increasingly burdening households and businesses. The aggravated situation in the energy markets has substantially contributed to the general inflation in the euro area, slowing down economic growth across the Union. That risk will persist regardless of any temporary reduction of wholesale prices and will be even more pertinent next year, as recognised in the emergency proposal by the Commission accompanying the Communication from the Commission of 18 October 2022 on Energy Emergency - preparing, purchasing and protecting the EU together. European energy companies could face severe difficulties in filling gas storage facilities next year, as it is highly probable that less or even no pipeline gas will reach the Union from Russia given the current political situation. In addition, the target for 2023, set out in Regulation (EU) 2022/1032 of the European Parliament and of the Council¹, is to fill 90% of the Union's gas storage capacities as opposed to 80% for this winter. Also, unpredictable events such as sabotage of pipelines and other risks of disruption to security of supply could create additional strain on gas markets. Additionally, the competitiveness outlook of European renewable energy technology industries has been weakened by recent policies in other world regions aimed at providing support and speeding up the scale up of entire renewable energy technology value chains.

¹ Regulation (EU) 2022/1032 of the European Parliament and of the Council of 29 June 2022 amending Regulations (EU) 2017/1938 and (EC) No 715/2009 with regard to gas storage (OJ L 173, 30.6.22, p. 17).

- (3) In this context, and in order to tackle the exposure of European consumers and businesses to high and volatile prices which are causing economic and social hardship, to ease the required reduction in energy demand by replacing natural gas supplies with energy from renewable sources and to increase security of supply, the Union needs to take further immediate and temporary action to accelerate the deployment of renewable energy sources, in particular by means of targeted measures which are capable of accelerating the pace of deployment of renewables in the Union in the short term.
- (4) Those urgent measures have been selected because of their nature and potential to contribute to solutions for the energy emergency in the short term. More particularly, several of the measures in this Regulation can be implemented by Member States rapidly in order to streamline the permit-granting process applicable to renewable energy projects, without requiring burdensome changes to their national procedures and legal systems and ensuring a positive acceleration of the deployment of renewables in the short term. Some of those measures are of general scope, such as the introduction of a rebuttable presumption that renewable energy projects are of overriding public interest for the purposes of the relevant environmental legislation, or the introduction of clarification regarding the scope of certain environmental directives as well as the simplification of the permit-granting framework for the repowering of renewable energy power plants by focusing on the impact stemming from the changes or extensions compared to the original project. Other measures target specific technologies, such as the significantly shorter and faster permit-granting for solar energy equipment on existing structures. It is appropriate to implement those emergency measures as quickly as possible, and to adapt them as necessary to accurately address the current challenges.

- (5) It is necessary to introduce additional urgent and targeted measures addressed to specific technologies and types of projects which have the highest potential for quick deployment and immediate effect on the objectives of reducing price volatility and reducing the demand for natural gas without constraining the overall energy demand. In addition to the acceleration of the permit-granting processes, with regard to solar energy equipment on artificial structures it is appropriate to promote and accelerate the deployment of small-scale solar installations, including for renewables self-consumers and collective self-consumers, such as local energy communities, since those are the options that cost least, are most accessible and have the least environmental or other type of impact for a fast roll-out of new renewable installations. In addition, those projects directly support households and companies that are facing high energy prices and shield consumers from price volatility. The repowering of renewable energy power plants is an option for rapidly increasing renewable energy production with the least impact on the grid infrastructure and the environment, including in the case of those renewable energy production technologies, such as wind power, for which permit-granting processes are typically longer. Lastly, heat pumps are a direct renewable alternative for natural gas boilers and have the potential to significantly reduce the demand for natural gas during the heating season.

- (6) Due to the urgent and exceptional energy situation, Member States should be able to introduce exemptions from certain assessment obligations set in Union environmental legislation for renewable energy projects and for energy storage projects and electricity grid projects that are necessary for the integration of renewable energy into the electricity system. In order for those exemptions to be introduced, two conditions should be met, namely that the project is located in a dedicated renewable or grid area and that such area should have been subject to a strategic environmental assessment. In addition, proportionate mitigation measures or, where not available, compensation measures should be adopted to ensure species protection.

- (7) This Regulation should apply to permit-granting processes that have a starting date within the period of its application. In view of the objective of this Regulation, and the emergency situation and exceptional context of its adoption, in particular the fact that a short term acceleration of the pace of deployment of renewables in the Union justifies the application of this Regulation to pending permit-granting processes, Member States should be allowed to apply this Regulation, or certain of its provisions, to pending permit-granting processes for which a final decision of the relevant authority has not been taken, provided that the application of those rules duly respects the pre-existing rights of third parties and their legitimate expectations. Member States should therefore ensure that the application of this Regulation to pending permit-granting processes is proportionate and appropriately protects the rights and legitimate expectations of all interested parties.

- (8) One of the temporary measures consists of the introduction of a rebuttable presumption that renewable energy projects are of overriding public interest and serving public health and safety for the purposes of the relevant Union environmental legislation, except where there is clear evidence that those projects have major adverse effects on the environment which cannot be mitigated or compensated for. Renewable energy plants, including heat pumps or wind energy, are crucial to fight climate change and pollution, reduce energy prices, decrease the Union's dependence on fossil fuels and ensure the Union's security of supply. Presuming renewable energy plants, including heat pumps, are of overriding public interest and serve public health and safety would allow such projects to benefit, where necessary, from a simplified assessment for specific derogations foreseen in the relevant Union environmental legislation with immediate effect. Taking into consideration their national specificities, Member States should be allowed to restrict the application of this presumption to certain parts of their territories or certain technologies or projects. It is possible for Member States to consider applying this presumption in their relevant national legislation on landscaping.

- (9) This reflects the important role that renewable energy can play in the decarbonisation of the Union's energy system, by offering immediate solutions to replace fossil-fuel based energy and by addressing the aggravated situation in the market. In order to eliminate bottlenecks in the permit-granting process and operation of renewable energy plants in the planning and permit-granting process, the construction and operation of energy plants from renewable sources and the development of the related grid infrastructure should be given priority when balancing legal interests in the individual case, at least for projects which are recognised as being of public interest. As regards the protection of species, this priority should only be given if, and to the extent that, appropriate species conservation measures contributing to the maintenance or restoration of the populations of the species at a favourable conservation status are undertaken and sufficient financial resources, as well as areas, are made available for this purpose.

- (10) Solar energy is a key source of renewable energy to put an end to the Union's dependency on Russian fossil fuels while achieving the transition towards a climate-neutral economy. Solar photovoltaic energy, which is one of the sources of electricity available that costs least, and solar thermal technologies, which provide renewable heating at low cost per unit of heat, can be rolled out rapidly, and can be of direct benefit to citizens and businesses. In this context, in line with the Communication from the Commission of 18 May 2022 entitled 'EU Solar Energy Strategy', the development of a resilient industrial solar value chain in the Union will be supported, including through the Solar PV Industry Alliance that will be launched at the end of 2022. Accelerating and improving permit-granting processes for renewable energy projects will help underpin the expansion of the Union's clean energy technology manufacturing capacity. The current circumstances and, in particular, the very high volatility of energy prices call for immediate action to ensure significantly faster permit-granting processes in order to significantly accelerate the pace of the installation of solar energy equipment on artificial structures, which is generally less complex than installation on the ground, and which can rapidly contribute to mitigate the effects of the current energy crisis, provided that grid stability, grid reliability and grid safety are maintained. Those installations should therefore benefit from shorter permit-granting processes compared to other renewable energy projects.

- (11) The maximum deadline for the permit-granting process for the installation of solar energy equipment and its related co-located storage and grid connections in existing or future artificial structures created for purposes different than solar energy production should be of three months. A specific derogation from the requirement to carry out environmental impact assessments under Directive 2011/92/EU of the European Parliament and of the Council¹ should also be introduced for those installations given that they are not likely to raise concerns related to competing uses of space or environmental impact. Investing in small decentralised solar energy installations to become renewable self-consumers is one of the most efficient means for energy consumers to reduce their energy bills and their exposure to price volatility. Member States should be allowed to exclude certain areas or structures from the scope of this shorter deadline and this derogation for certain justified reasons.

¹ Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment (OJ L 26, 28.1.2012, p. 1).

- (12) Self-consumption installations including those for collective self-consumers, such as local energy communities, also contribute to reducing overall natural gas demand, to increasing resilience of the system and to the achievement of the Union's renewable energy targets. The installation of solar energy equipment with a capacity below 50 kW, including installations of renewables self-consumers, is not likely to have major adverse effects on the environment or the grid and does not raise safety concerns. In addition, small installations do not generally require capacity expansion at the grid connection point. In view of the immediate positive effects of such installations for consumers and the limited environmental impacts they may give rise to, it is appropriate to further streamline the permit-granting process applicable to them, provided that they do not exceed the existing capacity of the connection to the distribution grid, by introducing the concept of administrative positive silence in the relevant permit-granting processes in order to promote and accelerate the deployment of those installations and to be able to reap their benefits in the short term. Member States should be allowed to apply a lower threshold than 50 kW due to their internal constraints, provided that the threshold remains higher than 10,8 kW. In any event, during the permit-granting process of one month, the relevant authorities or entities may reject the applications received for such installations for reasons related to grid safety, stability and reliability by way of of a duly motivated response.

- (13) Repowering existing renewable energy plants has a significant potential to rapidly increase renewable power generation, thus allowing the reduction of gas consumption. Repowering enables the continued use of sites with significant renewable energy potential, which reduces the need to designate new sites for renewable energy projects. Repowering a wind energy power plant with more efficient turbines allows the existing capacity to be maintained or increased whilst having fewer, bigger and more efficient turbines. Repowering also benefits from the existing grid connection, a likely higher degree of public acceptance and knowledge of environmental impacts.
- (14) It is estimated that onshore wind capacity of 38 GW is reaching the end of its normal operational life of 20 years between 2021 and 2025. Decommissioning those capacities instead of repowering would lead to a substantial reduction of the currently installed renewable energy capacity, further complicating the situation in the energy market. An immediate simplification and acceleration of the permit-granting processes for repowering are crucial for maintaining and increasing the renewable energy capacity in the Union. To this end, this Regulation introduces additional measures to further streamline the permit-granting process applicable to the repowering of renewable energy projects. In particular, the maximum deadline of six months applicable to the permit-granting process for the repowering of renewable energy projects should include all relevant environmental impact assessments. Moreover, whenever the repowering of a renewable energy plant, or the upgrade of a related grid infrastructure which is necessary to integrate renewable energy into the electricity system, is subject to a screening or environmental impact assessment, it should be limited to assessing the potential significant impacts resulting from the change or extension compared to the original project.

- (15) In order to promote and accelerate the repowering of existing renewable energy plants, a simplified procedure for grid connections should be immediately established where the repowering results in a limited increase in total capacity compared to the original project.
- (16) When repowering a solar installation, increases in efficiency and capacity can be achieved without increasing the space occupied. Thus, the repowered installation would not have a different impact on the environment than the original installation as long as the space used is not increased in the process, and the originally required environmental mitigation measures continue to be complied with.
- (17) Heat pump technology is key to producing renewable heating and cooling from ambient energy, including from wastewater treatment plants and geothermal energy. Heat pumps also allow the use of waste heat and cold. The rapid deployment of heat pumps which mobilises underused renewable energy sources such as ambient energy, geothermal energy and waste heat from industrial and tertiary sectors, including data centres, makes it possible to replace natural gas and other fossil fuel-based boilers with a renewable heating solution, while increasing energy efficiency. This will accelerate the reduction in the use of gas for the supply of heating, both in buildings as well as in industry. In order to accelerate the installation and use of heat pumps, it is appropriate to introduce targeted shorter permit-granting processes for such installations, including a simplified procedure for the connection of smaller heat pumps to the electricity grid where there are no safety concerns, no further works are needed for grid connections and there is no technical incompatibility of the system components, unless no such procedure is required by national law. Thanks to a quicker and easier installation of heat pumps, the increased use of renewables in the heating sector, which accounts for almost half of the Union's energy consumption, will contribute to security of supply and help tackle a more difficult market situation.

- (18) When applying the deadlines for the installation of solar energy equipment, the repowering of renewable energy power plants and for the deployment of heat pumps, the time during which the plants, their grid connections and the related necessary grid infrastructure are being built or repowered should not be counted within those deadlines except when it coincides with other administrative stages of the permit-granting process. In addition, the time spent on the administrative stages necessary for completing significant upgrades to the grid required in order to ensure grid stability, grid reliability and grid safety should not be counted within those deadlines.
- (19) In order to further facilitate the deployment of renewable energy, Member States should be allowed to retain the possibility to further shorten the deadlines of the permit-granting process.
- (20) The provisions of the United Nations Economic Commission for Europe (UNECE) Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters ('the Aarhus Convention') regarding access to information, public participation in decision-making, and access to justice in environmental matters, and in particular, the obligations of Member States relating to public participation and to access to justice, remain applicable.

- (21) The principle of energy solidarity is a general principle under Union law as stated by the European Court of Justice in its judgment of 15 July 2021, in Case C-848/19 P¹, Germany v Poland and it applies to all Member States. In implementing the principle of energy solidarity, this Regulation allows for cross-border distribution of the effects of faster deployment of renewable energy projects. The measures set out in this Regulation are directed at renewable energy installations in all Member States and capture a wide scope of projects, including on existing structures, new installations of solar energy equipment and repowering of existing installations. Given the degree of integration of Union energy markets, any increase in renewable energy deployment in a Member State should be beneficial also to other Member States in terms of security of supply and lower prices. It should help renewable electricity flow across the borders to where it is most needed and ensure that renewable electricity produced at low cost is exported to Member States where electricity production is more expensive. In addition, the newly installed renewable energy capacities in the Member States will have an impact on the overall gas demand reduction across the Union.

¹ Judgment of the Court of Justice of 15 July 2021, Germany v Poland, C-848/19 P, ECLI:EU:C:2021:598.

- (22) Article 122(1) of the Treaty on the Functioning of the European Union allows the Council to decide, on a proposal from the Commission and in a spirit of solidarity between the Member States, upon the measures appropriate for the economic situation, in particular if severe difficulties arise in the supply of certain products, notably in the area of energy. In the light of recent events and Russia's recent actions, the high risk of a complete halt of Russian gas supplies, combined with the uncertain outlook for alternatives, poses a significant threat of disruption of the energy supplies, increasing energy prices further and consequently adding pressure on the Union's economy. Therefore, urgent action is necessary.
- (23) Considering the scale of the energy crisis, the level of its social, economic and financial impact and the need to act as soon as possible, this Regulation should enter into force as a matter of urgency on the day following that of its publication in the *Official Journal of the European Union*. Its validity is limited to 18 months, with a review clause in order for the Commission to propose extending its validity, if necessary.
- (24) Since the objectives of this Regulation cannot be sufficiently achieved by the Member States, but can rather be better achieved at Union level, the Union may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality, as set out in that Article, this Regulation does not go beyond what is necessary to achieve those objectives,

HAS ADOPTED THIS REGULATION:

Article 1
Subject matter and scope

This Regulation establishes temporary rules of an emergency nature to accelerate the permit-granting process applicable to the production of energy from renewable energy sources, with a particular focus on specific renewable energy technologies or types of projects which are capable of achieving a short term acceleration of the pace of deployment of renewables in the Union.

This Regulation applies to all permit-granting processes that have a starting date within the period of its application and is without prejudice to national provisions establishing shorter deadlines than those laid down in Articles 4, 5 and 7.

Member States may also apply this Regulation to ongoing permit granting processes which have not resulted in a final decision before ... (OJ: please insert date of entry into force of this Regulation), provided that this shortens the permit granting process and that pre-existing third party legal rights are preserved.

Article 2

Definitions

For the purposes of this Regulation, the definitions set out in Article 2 of Directive (EU) 2018/2001 of the European Parliament and of the Council¹ shall apply. In addition, the following definitions shall apply:

- (1) ‘permit-granting process’ means the process:
 - (a) comprising all relevant administrative permits issued to build, repower and operate plants for the production of energy from renewable sources including heat pumps, co-located energy storage facilities, and assets necessary for their connection to the grid, including grid connection permits and environmental impact assessments where those are required; and
 - (b) comprising all administrative stages starting from the acknowledgment of the reception of the complete application by the relevant authority and ending with the notification of the final decision on the outcome of the process by the relevant authority;
- (2) ‘solar energy equipment’ means equipment that converts energy from the sun into thermal or electrical energy, including solar thermal and solar photovoltaic equipment.

¹ Directive (EU) 2018/2001 of the European Parliament and of the Council of 11 December 2018 on the promotion of the use of energy from renewable sources (OJ L 328, 21.12.2018, p. 82).

Article 3
Overriding public interest

1. The planning, construction and operation of plants and installations for the production of energy from renewable sources, and their connection to the grid, the related grid itself and storage assets shall be presumed as being in the overriding public interest and serving public health and safety when balancing legal interests in the individual case, for the purposes of Articles 6(4) and 16(1)(c) of Council Directive 92/43/EEC¹, Article 4(7) of Directive 2000/60/EC of the European Parliament and of the Council² and Article 9(1)(a) of Directive 2009/147/EC of the European Parliament and of the Council³. Member States may restrict the application of those provisions to certain parts of their territory as well as to certain types of technologies or to projects with certain technical characteristics in accordance with the priorities set in their integrated national energy and climate plans.

¹ Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ L 206, 22.7.1992, p. 7).

² Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (OJ L 327, 22.12.2000, p. 1).

³ Directive 2009/147/EC of the European Parliament and of the Council of 30 November 2009 on the conservation of wild birds (OJ L 20, 26.1.2010, p. 7).

2. Member States shall ensure, at least for projects which are recognised as being of overriding public interest, that in the planning and permit-granting process, the construction and operation of plants and installations for the production of energy from renewable sources and the related grid infrastructure development are given priority when balancing legal interests in the individual case. Concerning species protection, the preceding sentence shall only apply if and to the extent that appropriate species conservation measures contributing to the maintenance or restoration of the populations of the species at a favourable conservation status are undertaken and sufficient financial resources as well as areas are made available for that purpose.

Article 4
Accelerating the permit-granting process
for the installation of solar energy equipment

1. The permit-granting process for the installation of solar energy equipment and co-located energy storage assets, including building-integrated solar installations and rooftop solar energy equipment, in existing or future artificial structures, with the exclusion of artificial water surfaces, shall not exceed three months, provided that the primary aim of such structures is not solar energy production. By way of derogation from Article 4(2) of Directive 2011/92/EU, and Annex II, points 3(a) and (b), read alone or in conjunction with point 13(a) of Annex II to that Directive, such installations of solar energy equipment shall be exempted from the requirement, if applicable, of being subjected to a determination whether the project requires an environmental impact assessment, or from the requirement to carry out a dedicated environmental impact assessment.

2. Member States may exclude certain areas or structures from the provisions of paragraph 1, due to reasons of cultural or historical heritage protection, or for reasons related to national defence interests or safety.
3. For the permit-granting process regarding the installation of solar energy equipment, including for renewables self-consumers, with a capacity of 50 kW or less, the absence of a reply by the relevant authorities or entities within one month following the application shall result in the permit being considered as granted, provided that the capacity of the solar energy equipment does not exceed the existing capacity of the connection to the distribution grid.
4. Where the application of the capacity threshold referred to in paragraph 3 of this Article leads to a significant administrative burden or constraints to the operation of the electricity grid, Member States may apply a lower threshold provided that it remains above 10,8 kW.
5. All decisions resulting from the permit-granting processes referred to in paragraph 1 of this Article shall be made public in accordance with existing obligations.

Article 5

Repowering of renewable energy power plants

1. The permit-granting process for the repowering of projects, including the permits related to the upgrade of the assets necessary for their connection to the grid where the repowering results in an increase in capacity, shall not exceed six months including environmental impact assessments where required by relevant legislation.

2. Where the repowering does not result in an increase in the capacity of the renewable energy power plant beyond 15%, and without affecting the need to assess any potential environmental impacts pursuant to paragraph 3 of this Article, grid connections to the transmission or distribution grid shall be permitted within three months following application to the relevant entity unless there are justified safety concerns, or there is technical incompatibility with the system components.
3. Where the repowering of a renewable energy power plant, or the upgrade of a related grid infrastructure which is necessary to integrate renewables into the electricity system, is subject to a determination whether the project requires an environmental impact assessment procedure or an environmental impact assessment pursuant to Article 4 of Directive 2011/92/EU, such prior determination and/or environmental impact assessment shall be limited to the potential significant impacts stemming from the change or extension compared to the original project.
4. Where the repowering of solar installations does not entail the use of additional space and complies with the applicable environmental mitigation measures established for the original installation, the project shall be exempted from the requirement, if applicable, of being subjected to a determination whether the project requires an environmental impact assessment pursuant to Article 4 of Directive 2011/92/EU.
5. All decisions resulting from the permit-granting processes referred to in paragraphs 1 and 2 of this Article shall be made public in accordance with existing obligations.

Article 6

Acceleration of the permit-granting process of renewable energy projects and for related grid infrastructure which is necessary to integrate renewables into the system

Member States may exempt renewable energy projects, as well as energy storage projects and electricity grid projects which are necessary to integrate renewable energy into the electricity system, from the environmental impact assessment under Article 2(1) of Directive 2011/92/EU and from the species protection assessments under Article 12(1) of Directive 92/43/EEC and under Article 5 of Directive 2009/147/EC, provided that the project is located in a dedicated renewable or grid area for a related grid infrastructure which is necessary to integrate renewable energy into the electricity system, if Member States have set any renewable or grid area, and that the area has been subjected to a strategic environmental assessment in accordance with Directive 2001/42/EC of the European Parliament and of the Council¹. The competent authority shall ensure that, on the basis of existing data, appropriate and proportionate mitigation measures are applied in order to ensure compliance with Article 12(1) of Directive 92/43/EEC and Article 5 of Directive 2009/147/EC. Where those measures are not available, the competent authority shall ensure that the operator pays a monetary compensation for species protection programmes in order to secure or improve the conservation status of the species affected.

¹ Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment (OJ L 197, 21.7.2001, p. 30).

Article 7

Acceleration of the deployment of heat pumps

1. The permit-granting process for the installation of heat pumps below 50 MW electrical capacity shall not exceed one month, whilst in the case of ground source heat pumps it shall not exceed three months.
2. Unless there are justified safety concerns, further works are needed for grid connections or there is technical incompatibility of the system components, connections to the transmission or distribution grid shall be permitted following notification to the relevant entity for:
 - (a) heat pumps of up to 12 kW electrical capacity; and
 - (b) heat pumps installed by a renewables self-consumer of up to 50 kW electrical capacity, provided the capacity of the renewables self-consumer's renewable electricity generation installation amounts to at least 60% of the capacity of the heat pump.
3. Member States may exclude certain areas or structures from the provisions of this Article, due to reasons of cultural or historical heritage protection, or for reasons related to national defence interests or safety.
4. All decisions resulting from the permit-granting processes referred to in paragraphs 1 and 2 of this Article shall be made public in accordance with existing obligations.

Article 8

Timelines for the permit-granting process for the installation of solar energy equipment, the repowering of renewable energy power plants and for the deployment of heat pumps

When applying the deadlines referred to in Articles 4, 5 and 7, the following time shall not be counted within those deadlines except when it coincides with other administrative stages of the permit-granting process:

- (a) the time during which the plants, their grid connections and, with a view to ensuring grid stability, grid reliability and grid safety, the related necessary grid infrastructure are being built or repowered; and
- (b) the time spent on the administrative stages necessary for significant upgrades to the grid required in order to ensure grid stability, grid reliability and grid safety.

Article 9

Review

By 31 December 2023 at the latest, the Commission shall carry out a review of this Regulation in view of the development of the security of supply and energy prices and the need to further accelerate the deployment of renewable energy. It shall present a report on the main findings of that review to the Council. The Commission may, based on that report, propose to prolong the validity of this Regulation.

Article 10

Entry into force and application

This Regulation shall enter into force on the day following that of its publication in the *Official Journal of the European Union*.

It shall apply for a period of 18 months from its entry into force.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

Done at ...,

For the Council

The President
