TABLE OF CONTENTS

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS.....	6
1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED	6
1.1. Focus and objectives of the impact assessment.....	6
1.2. The political and legal context	7
1.3. Why should the EU act.....	10
2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED	11
2.1. Portfolio of candidates for Institutionalised European Partnerships	11
2.2. Assessing the necessity of a European Partnership and possible options for implementation.....	12
2.3. Overview of the methodology adopted for the impact assessment	16
2.4. Horizontal perspective on candidate Institutionalised European Partnerships	20
PART 2 - THE CANDIDATE EUROPEAN PARTNERSHIP ON EU-AFRICA GLOBAL HEALTH.....	25
1. INTRODUCTION: POLITICAL AND LEGAL CONTEXT.....	25
1.1. Emerging challenges in the field	26
1.2. EU relative positioning in the field	28
1.3. EU policy context beyond 2021	30
2. PROBLEM DEFINITION	32
2.1. What are the problems?	33
2.2. What are the key problem drivers?.....	35
2.3. How will the problems evolve?.....	39
3. WHY SHOULD THE EU ACT?	39
3.1. Subsidiarity: Necessity of EU action.....	39
3.2. Subsidiarity: Added value of EU action	41
4. OBJECTIVES: WHAT IS TO BE ACHIEVED?	42
4.1. General objectives of the initiative.....	42
4.2. Specific objectives.....	43
4.3. Intervention logic of the initiative	44
4.4. What is needed to achieve the objectives – Key functionalities needed	46
5. WHAT ARE THE AVAILABLE POLICY OPTIONS?	55
5.1. What is the baseline from which options are assessed?	55
5.2. Description of the European Partnership policy options	57
5.3. Option discarded at an early stage.....	62

6.	HOW DO THE DIFFERENT POLICY OPTIONS COMPARE TO ACHIEVE THE EXPECTED IMPACTS?	63
6.1.	Effectiveness.....	63
6.2.	Efficiency	70
6.3.	Coherence	72
6.4.	Tabular comparison of options and identification of preferred option.....	75
7.	THE PREFERRED OPTION – HOW WILL ACTUAL IMPACTS BE MONITORED AND EVALUATED?	77
7.1.	The preferred option	77
7.2.	Objectives and corresponding monitoring indicators	81

WHO	World Health Organisation

Definitions

For the purposes of the GHP/EDCTP3 impact assessment, the following definitions apply:

Clinical trial: Any research study that prospectively assigns human participants or groups of humans to one or more health-related interventions to evaluate the effects on health outcomes. Clinical trials may also be referred to as interventional trials. Interventions include but are not restricted to drugs, cells and other biological products, surgical procedures, radiologic procedures, devices, behavioural treatments, process-of-care changes, preventive care, etc.¹

Disease outbreak: The occurrence of disease cases in excess of normal expectancy. The number of cases varies according to the disease-causing agent, and the size and type of previous and existing exposure to the agent. Disease outbreaks are usually caused by an infection, transmitted through person-to-person contact, animal-to-person contact, or from the environment or other media.²

Health technology: The application of organized knowledge and skills in the form of devices, medicines, vaccines, procedures and systems developed to solve a health problem and improve quality of lives.³

Health intervention: An act performed for, with or on behalf of a person or population whose purpose is to assess, improve, maintain, promote or modify health, functioning or health conditions.⁴

Infectious diseases: Those diseases caused by pathogenic microorganisms, such as bacteria, viruses, parasites or fungi; the diseases can be spread, directly or indirectly, from one person to another.⁵

Phases of a clinical trial: A trial of experimental drug, treatment, device or behavioural intervention may proceed through four phases:⁶

- Phase I Clinical trials test a new biomedical intervention in a small group of people (e.g., 20-80) for the first time to evaluate safety (e.g., to determine a safe dosage range and to identify side effects).
- Phase II Clinical trials study the biomedical or behavioural intervention in a larger group of people (several hundred) to determine efficacy and to further evaluate its safety.
- Phase III Studies investigate the efficacy of the biomedical or behavioural intervention in large groups of human subjects (from several hundred to several thousand) by comparing the intervention to other standard or experimental interventions as well as to monitor adverse effects, and to collect information that will allow the intervention to be used safely.

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED

1.1. Focus and objectives of the impact assessment

This impact assessment accompanies the Commission proposal for Institutionalised European Partnerships to be funded under Horizon Europe, the 2021-2027 Framework Programme for EU Research and Innovation (R&I).⁸ It sets out to **help decide in a coordinated manner the right form of implementation for specific candidate initiatives** based on a common approach and methodology according to individual assessments⁹. It also provides an **horizontal perspective on the portfolio of candidate European Partnerships** to identify further efficiency and coherence gains for more impact.

European Partnerships are initiatives where the Union, together with private and/or public partners (such as industry, public bodies or philanthropies) commit to support jointly the development and implementation of an integrated programme of R&I activities. The rationale for establishing such initiatives is to achieve the objectives of Horizon Europe more effectively than what can be attained by other activities of the Horizon Europe programme.¹⁰

Based on the Horizon Europe Regulation, European Partnerships may be set up using **three different forms**: “Co-funded”, “Co-programmed” and “Institutionalised”. The setting-up of **Institutionalised Partnerships** involves new EU legislation and the establishment of dedicated implementing structures based on Article 185 or 187 of the Treaty on the Functioning of the EU (TFEU). This requires an impact assessment to be performed.

The Horizon Europe Regulation defines **eight priority areas**, scoping the domains in which Institutionalised Partnerships could be proposed¹¹. Across these priority areas, **13 initiatives** have been identified **as suitable candidate initiatives** for Institutionalised Partnerships because of their objectives and scope. This impact assessment aims to identify whether 12 of these initiatives¹² need to be implemented through this form of implementation and would not deliver equally well with traditional calls of Horizon Europe or other lighter forms of European Partnerships under Horizon Europe. This means assessing whether each of these initiatives meets the necessity test set in the **selection criteria** for European Partnerships in the Horizon Europe Regulation, Annex III.

This assessment is done **without any budgetary consideration**, as the overall budget of the Multiannual Financial Framework of the EU – and hence of Horizon Europe – for the next financing period is not known at this stage.¹³

⁸ Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

⁹ Based on the European Commission Better Regulation framework (SWD (2017) 350) and supported by an external study coordinated by Technopolis Group (to be published in 2020).

¹⁰ For further details on these points, see below Section 1.2.2.

¹¹ Set out in the Annex Va of the Horizon Europe Regulation (common understanding). <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

¹² Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47).

¹³ EU budget commitments to the European Partnership candidates can only be discussed and decided following the political agreement on the overall Multiannual Financial Framework and Horizon Europe budgetary envelopes. The level of EU contribution for individual partnerships should be determined once there are agreed objectives, and clear commitments from partners. Importantly, there is a ceiling to the partnership budgets in Pillar II of Horizon Europe (the legal proposal specifies that *the majority of the budget in pillar II shall be allocated to actions outside of European Partnerships*).

1.2. The political and legal context

1.2.1. Shift in EU priorities and Horizon Europe framework

European priorities have evolved in the last decades, and reflect the social, economic, and environmental challenges for the EU in the face of global developments. In her Political Guidelines for the new European Commission 2019 – 2024¹⁴, the new Commission President put forward six overarching priorities, which reach well beyond 2024 in scope¹⁵. Together with the Sustainable Development Goals (SDGs), these priorities will shape future EU policy responses to the challenges Europe faces, and thus also give direction to EU research and innovation.

As part of the Multi-annual Financial Framework (MFF) 2021-27 the new EU Framework Programme for Research and Innovation **Horizon Europe will play a pivotal role for Europe to lead the social, economic, and environmental transitions needed to achieve these European policy priorities**. It will be more impact driven with a strong focus on delivering European added value, but also be more effective and efficient in its implementation.¹⁶ Horizon Europe finds its rationale in the daunting challenges that the EU is facing, which call for “*a radical new approach to developing and deploying new technologies and innovative solutions for citizens and the planet on a scale and at a speed never achieved before, and to adapting our policy and economic framework to turn global threats into new opportunities for our society and economy, citizens and businesses.*” While Horizon Europe continues the efforts of strengthening the scientific and technological bases of the Union and foster competitiveness, a more strategic and impact-based approach to EU R&I investment is taken. Consequently, the **objectives of Horizon Europe** highlight the need *to deliver on the Union strategic priorities and contribute to the realisation of EU objectives and policies, contribute to tackling global challenges, including the Sustainable Development Goals by following the principles of the Agenda 2030 and the Paris Agreement.*¹⁷

In this context, **at least 35 % of the expenditure from actions under the Horizon Europe Programme will have to contribute to climate action**. Furthermore, a **Strategic Plan** is co-designed with stakeholders to identify **key strategic orientations for R&I support** for 2021-2024 in line with the EU priorities. In the Orientations towards the first Strategic Plan for Horizon Europe, the need to strategically prioritise and “*direct a substantial part of the funds towards the areas where we believe they will matter the most*” is emphasised. The Orientations specify, that actions under Pillar II of Horizon Europe “Global Challenges and European Industrial Competitiveness” will target only selected themes of especially high impact that significantly contribute to delivering on the political priorities of the Union. Most of the candidate European Partnerships fall under this Pillar.

1.2.2. Key evolutions in the approach to partnerships in Horizon Europe

Since their start in 1984 the successive set of Framework Programmes uses a variety of instruments and approaches to support R&I activities, address global challenges and industrial competitiveness. Collaborative, competition-based and excellence-driven R&I projects funded through Work Programmes are the most traditional and long-standing approach for implementation. Since 2002, available tools also include **partnerships**, whereby

¹⁷ Article 3, Common understanding regarding the proposal for Horizon Europe Framework Programme.

the Union together with private and/or public partners commit to jointly support the development and implementation of a R&I programme. These were introduced as part of creating the European Research Area (ERA) to align national strategies and overcome fragmentation of research effort towards an increased scientific, managerial and financial integration of European research and innovation. Interoperable and integrated national research systems would allow for better flows of knowledge, technology and people. Since then, the core activities of the partnerships consist of building critical mass mainly through collaborative projects, jointly developing visions, and setting strategic agendas.

As analysed in the **interim evaluation of Horizon 2020**¹⁸, a considerable repertoire of partnership initiatives have been introduced over time, with 8 forms of implementation¹⁹ and close to 120 partnership initiatives running under Horizon 2020 - without clear exit strategies and concerns about their degree of coherence, openness and transparency. Even if it is recognised that these initiatives allow setting long-term agendas, structuring R&I cooperation between otherwise dispersed actors, and leveraging additional investments, the evaluation points to the complexity generated by the proliferation of instruments and initiatives, and their insufficient contribution to policies at EU and national level.

Box 1 Key lessons from the interim evaluation of Horizon 2020 and R&I partnerships

- The **Horizon 2020 Interim Evaluation** concludes that the overall partnership landscape has become overly complex and fragmented. It identifies the need for rationalisation, improve their openness and transparency, and link them with future EU R&I missions and strategic priorities.

- The **Article 185 evaluation** finds that these public-public partnerships have scientific quality, global visibility and networking/structuring effects, but should in the future focus more on the achievement of policy impacts. From a systemic point of view, it found that the EU public-to-public cooperation (P2P) landscape has become crowded, with insufficient coherence.

- The **Article 187 evaluation** points out that Public-Private Partnership (PPP) activities need to be brought more in line with EU, national and regional policies, and calls for a revision of the Key Performance Indicators. As regards the **contractual PPPs (cPPPs)** their reviews identified challenges of coherence among cPPPs and the need to develop collaborations and synergies with other relevant initiatives and programmes at EU, national and regional level.

Over 80% of respondents to the Open Public Consultation (OPC) indicated that a significant contribution by future European Partnerships is 'fully needed' to achieve climate-related goals, to develop and effectively deploy technology, and for EU global competitiveness in specific sectors/domains. Views converged across all categories of respondents, including citizens,

¹⁸ Interim evaluation of Horizon 2020, Commission Staff Working Document, SWD(2017)221 and 222
Interim evaluation of the Joint Undertakings operating under Horizon 2020 (Commission Staff Working Document, SWD(2017) 339);
Evaluation of the Participation of the EU in research and development programmes undertaken by several Member States based on Article 185 of the TFEU, Commission Staff Working Document, SWD (2017)340

¹⁹ E.g. initiatives based on Article 187 (Joint Technology Initiatives), Article 185 TFEU, Contractual Public-Private Partnerships (cPPPs), Knowledge & Innovation Communities of the European Institute of Innovation & Technology (EIT-KICs), ERA-NETs, European Joint Programmes, Joint Programming Initiatives.

The impact assessment of Horizon Europe identifies therefore the need to **rationalise the EU R&I funding landscape**, in particular with respect to partnerships, as well as to **re-orient partnerships towards more impact** and delivery on EU priorities. To address these concerns and to realise the higher ambition for European investments, Horizon Europe puts forward a **major simplification and reform for the Commission’s policy on R&I partnerships**²⁰. Reflecting its pronounced systemic nature aimed at contributing to EU-wide ‘transformations’ towards the sustainability objectives, Horizon Europe indeed intends to make a more effective use of these partnerships with a **more strategic, coherent and impact-driven approach**. Key related changes that apply to all forms of European

Box 2 Key features of the revised policy approach to R&I partnerships under Horizon Europe based on its impact assessment

- ✓ **Simpler architecture & toolbox** by streamlining 8 partnership instruments into 3 implementation forms (Co-Funded, Co-Programmed, Institutionalised), under the umbrella ‘European Partnerships’
- ✓ **More systematic and transparent approach** to selecting, implementing, monitoring, evaluating and phasing out all forms of partnerships (**criteria** for European Partnerships):
 - The selection of Partnerships is embedded in the strategic planning of Horizon Europe, thereby ensuring coherence with the EU priorities. The selection criteria require that partnerships are established with stronger ex-ante commitment and higher ambition.
 - The implementation criteria stipulate that initiatives adopt a systemic approach in achieving impacts, including broad engagement of stakeholders in agenda-setting and synergies with other relevant initiatives to promote the take-up of R&I results.
 - A harmonised monitoring & evaluation system will be implemented, and ensures that progress is analysed in the wider context of achieving Horizon Europe objectives and EU priorities.
 - All partnerships need to develop an exit strategy from Framework Programme funding. This new approach is underpinned by principles of openness, coherence and EU added value.
- ✓ **Reinforced impact orientation:**
 - Partnerships are established only if there is evidence they support achieving EU policy objectives more effectively than other Horizon Europe actions, by demonstrating a clear vision and targets (**directionality**) and corresponding long-term commitments from partners (**additionality**).
 - European Partnerships are expected to provide mechanisms – based on a concrete roadmap - to join up R&I efforts between a broad range of actors towards the development and uptake of innovative solutions in line with EU priorities, serving the economy and society, as well as scientific progress.
 - They are expected to develop close synergies with national and regional initiatives, acting as dynamic change agents, strengthening linkages within their respective ecosystems and along the value chains, as well as pooling resources and efforts towards the common EU objectives.

Partnerships encapsulated in Horizon Regulation are summarised in the Box below.

Under Horizon Europe, a ‘European Partnership’²¹ is defined as *“an initiative where the Union, prepared with early involvement of Member States and/or Associated Countries, together with private and/or public partners (such as industry, universities, research organisations, bodies with a public service mission at local, regional, national or international level or civil society organisations including philanthropies and NGOs), commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”*

The Regulation further specifies that European Partnerships shall adhere to the *“principles of Union added value, transparency, openness, impact within and for Europe, strong leverage effect on sufficient scale, long-term commitments of all the involved parties, flexibility in implementation, coherence, coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions.”*

²⁰ Impact assessment of Horizon Europe, Commission Staff Working Document, SWD(2018)307.

²¹ Article 8 and Annex III of the Horizon Europe Regulation (common understanding)

1.3. Why should the EU act

1.3.1. Legal basis

Proposals for Institutionalised European Partnerships are based on:

- 1) Article 185 TFEU which allows the Union to make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; or
- 2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes.²²

1.3.2. Subsidiarity

The EU should act only in areas where there is demonstrable advantage that the action at EU level is more effective than action taken at national, regional or local level. Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the EU can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas. The candidate initiatives focus on areas where there is a demonstrable value added in acting at the EU level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national activities in the same area. Overall European Partnerships find their **rationale in addressing a set of systemic failures**²³:

- Their primary function is to create a platform for a strengthened **collaboration** and knowledge exchange between various actors in the European R&I system and an enhanced **coordination** of strategic research agendas and/or R&I funding programmes. They aim to address **transformational failures** to better align agendas and policies of public and private funders, pool available resources, create critical mass, avoid unnecessary duplication of efforts, and leverage sufficiently large investments where needed but hardly achievable by single countries.
- The concentration of efforts and pooling of knowledge on common priorities to solve multi-faceted societal and economic challenges is at the core of these initiatives. Specifically, enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems are among the key objectives of these instruments. In the light of Horizon Europe, the aim is to **drive system transitions and transformations towards EU priorities**.
- Especially in fast-growing technologies and sectors such as ICT, there is a need to **react to emerging opportunities** and address systemic failures such as shortage in skills or critical mass or cross-sectoral cooperation along the value chains that would hamper attainment of future European leadership and/or strategic autonomy.
- They also aim to address **market failures** predominantly to enhancing industry investments thanks to the sharing of risks.

²² Both Articles are under Title XIX of the TFEU - Research and Technological Development and Space.

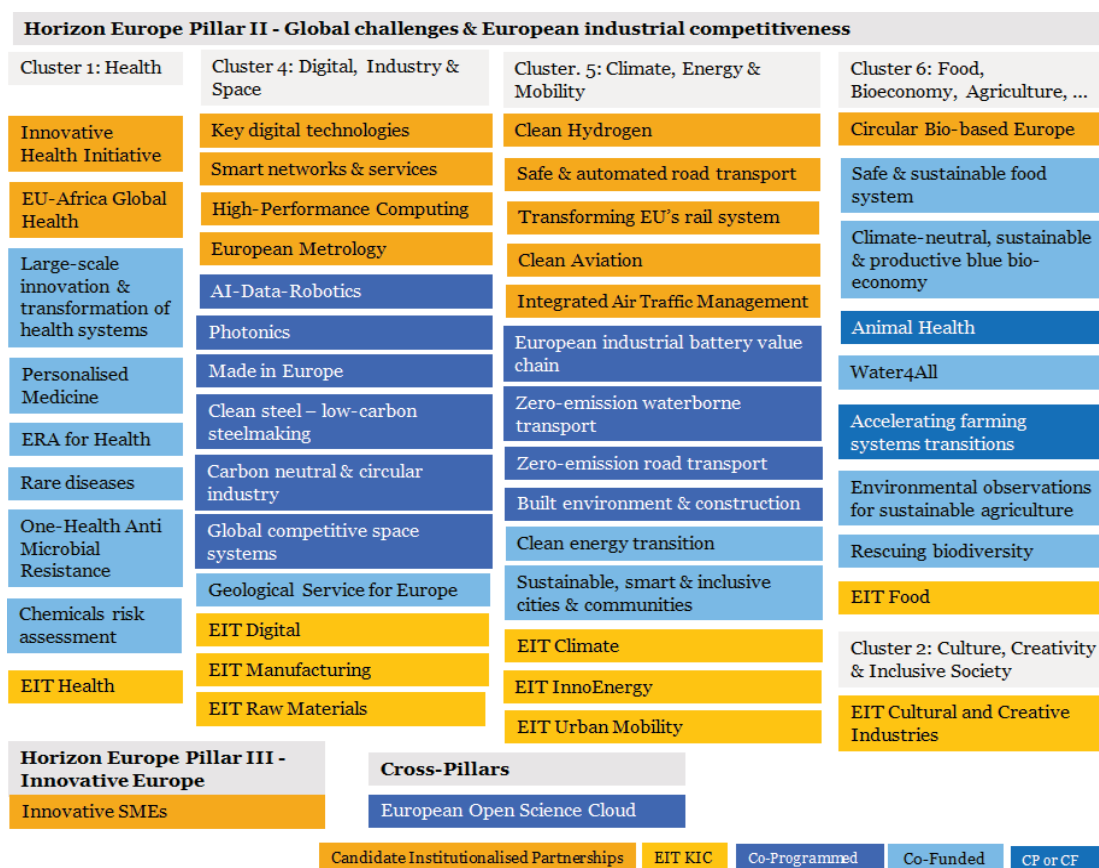

²³ The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide qualitative and quantitative evidence on these points. Sections 1 and 2 of each impact assessment on candidate European Partnerships include more detail on the necessity to act at EU level in specific thematic areas.

2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED

2.1. Portfolio of candidates for Institutionalised European Partnerships

- The new approach for more objective-driven and impactful European Partnerships is reflected in the way candidate Partnerships have been identified. It involved a co-design exercise aiming to better align these initiatives with societal needs and policy priorities, while broadening the range of actors involved. Taking into account the 8 areas for Institutionalised European Partnerships set out in the Horizon Europe Regulation²⁴, a co-design exercise as part of the Strategic Planning process of Horizon Europe lead to the identification of **49 candidates for Co-funded, Co-programmed or Institutionalised European Partnerships**²⁵. Out of these, **13 were identified as suitable candidate Institutionalised Partnerships because of their objectives and scope**²⁶. Whilst the Co-Funded and Co-Programmed Partnerships are linked to the comitology procedure (including the adoption of the Strategic Plan and the Horizon Europe Work Programmes), Institutionalised Partnerships require the adoption of legislation and are subject to an impact assessment. The Figure below gives an overview of all candidate European Partnerships according to their primary relevance to Commission priorities for 2019-2024.

Figure 1 - Overview of the candidates for Co-Funded, Co-Programmed and Institutionalised European Partnerships according to Horizon Europe structure

- Source: Technopolis group (2020)

²⁴ Horizon Europe Regulation (common understanding), Annex Va.

²⁵ Shadow configuration of Strategic Programme Committee for Horizon Europe. The list of candidate European Partnerships is described in “Orientations towards the Strategic Plan of Horizon Europe” - Annex 7

²⁶ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47)

- There are only three partnerships for which implementation as an Institutionalised Partnership under Article 185 is an option, i.e. European Metrology, the EU-Africa Global Health partnership, and Innovative SMEs. Ten partnerships are candidates for Institutionalised Partnerships under Article 187. Overall the initiatives can be categorised into ‘*horizontal*’ partnerships and ‘*vertical*’ partnerships.
- The ‘**horizontal**’ partnerships have a central position in the overall portfolio, as they are expected to develop methodologies and technologies for application in the other priority areas, ultimately supporting European strategic autonomy in these areas as well as technological sovereignty. These ‘horizontal’ partnerships are typically proposed as Institutionalised or Co-programmed Partnerships, in addition to a number of EIT KICs, they cover mainly the digital field in addition to space, creative industries and manufacturing, but also the initiative related to Innovative SMEs. ‘**Vertical**’ partnerships are focused on the needs and development of specific application areas, and are primarily expected to support enhanced environmental sustainability thereby addressing Green Deal related objectives. They also deliver on policies for more people centred economy, through improved wellbeing of EU citizen and the economy, like health related candidate European Partnerships.

2.2. Assessing the necessity of a European Partnership and possible options for implementation

Horizon Europe Regulation Article 8 stipulates that Institutionalised European Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

For all candidate Institutionalised European Partnerships the options considered in this impact assessment are the same, i.e.:

- Option 0 – Baseline option – Traditional calls under the Framework Programme
- Option 1 – Co-programmed European Partnership
- Option 2 – Co-funded European Partnership
- Option 3 – Institutionalised Partnership
 - Sub-option 3a Institutionalised Partnerships based on Art 185 TFEU
 - Sub-option 3b Institutionalised Partnerships based on Art 187 TFEU

2.2.1. Option 0 - Baseline option – Traditional calls

Under this option, strategic programming for R&I in the priority area will be done through the mainstream channels of Horizon Europe. The related priorities will be implemented through **traditional calls** of Horizon Europe covering a range of actions, mainly R&I and/or innovation actions but also coordination and support actions, prizes or procurement. Most actions involve consortia of public and/or private actors in ad hoc combinations, while some actions are single actor (mono-beneficiary). There will be no dedicated implementation structure and no support other than what is foreseen in the related Horizon Europe Work Programme. This means that discontinuation costs/benefits of predecessor initiatives should be factored in for capturing the baseline situation when relevant.

Under this option, strategic planning mechanisms in the Framework Programme will allow for a high level of flexibility in the ability of traditional calls to respond to particular needs over time, building upon additional input in co-creation from stakeholders and programme committees involving Member States. The Union contribution to addressing the priority covers the full duration of the initiative, during the lifetime of Horizon Europe. Without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual commitments and contributions outside their participation in funded projects.

2.2.2. European Partnerships

Under this set of options, three different forms of implementation are assessed: Co-funded, Co-Programmed, Institutionalised European Partnerships. These have **commonalities that cannot serve as a distinguishing factor in the impact assessment process**. They are all based on agreed objectives and expected impacts and underpinned by Strategic Research and Innovation Agendas / roadmaps that are shared and committed to by all partners in the partnership. They all have to follow the same set of criteria along their lifecycle, as defined in the Horizon Europe Regulation (Annex III), including ex ante commitment from partners to mobilise and contribute resources and investments. The Union contribution is defined for the full duration of the initiative for all European Partnerships. The Horizon Europe legal act introduces few additional requirements for Institutionalised Partnerships, e.g. the need for long-term perspective, strong integration of R&I agendas, and financial contributions.

Figure 2 - Key differences in preparation and implementation of European Partnerships

Type	Legal form	Implementation
Co-Programmed	Contractual arrangement / MoU	Division of labour , whereby Union contribution is implemented through Framework programme and partners' contributions under their responsibility.
Co-Funded	Grant Agreement	Union provides co-funding for an integrated programme with distributed implementation by entities managing and/or funding national research and innovation programmes
Institutionalised based on Article 185/187 TFEU	Basic act (Council regulation, Decision by European Parliament and Council)	Integrated programme with centralised implementation

The **main differences** between the different forms of European Partnerships are in their preparation and in the way they function, as well as in the overall impact they can trigger. The Co-Programmed form is assessed as the simplest, and the Institutionalised the most complex to prepare and implement. The functionalities of the different form of Partnerships – compared to the baseline option – are presented in Figure 3. They relate to the types of actors Partnerships can involve and their degree of openness, the types of activities they can perform and their degree of flexibility, the degree of commitment of partners and the priority setting system, and their ability to work with their external environment (coherence), etc. These key distinguishing factors will be at the basis of the comparison of each option to determine their overall capacity to deliver what is needed at a minimised cost.

Figure 3 Overview of the functionalities provided by each form of European Partnerships, compared to the traditional calls of Horizon Europe (baseline)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187

2.2.3. *Option 1 - Co-programmed European Partnership*

This form of European Partnership is **based upon a Memorandum of Understanding or a Contractual Arrangement** signed by the Commission and the private and/or public partners. Private partners are represented by industry associations, which also support the daily management of the partnership. This type of partnership would allow for a large degree of flexibility for the activities, partners and priorities to continuously evolve. The commitments of partners are political efforts described in the contractual arrangement and the contributions from partners are provided in-kind more than financially. The priorities for the calls, proposed by the Partnership's members for integration in the Horizon Europe's Work Programmes, are subject to further input from Member States (comitology) and Commission services. The Union contribution is implemented within the executive agency managing Horizon Europe calls for research and innovation projects proposals. The full array of Horizon Europe instruments can be used, ranging from research and innovation (RIA) types of actions to coordination and support actions (CSA) and including grants, prizes, and procurement.

2.2.4. *Option 2 – Co-funded European Partnership*

The Co-funded European Partnership is **based on a Grant Agreement** between the Commission and a consortium of partners, resulting from a specific call in the Horizon Europe Work Programme. This form of implementation only allows to address public partners at its core. Typically these provide co-funding to a common programme of activities established and/or implemented by entities managing and/or funding national R&I programmes. The recipients of the EU co-funding implement the initiative under their responsibility, with national funding/resources pooled to implement the programme with co-funding from the Union. The expectation is that these entities would cover most if not all EU Member States. Calls and evaluations would be organised centrally, beneficiaries in selected projects would be funded at national level, following national funding rules.

2.2.5. *Option 3 – Institutionalised European Partnership*

This type of Partnership is the most complex and high-effort arrangement, and requires meeting additional requirements. Institutionalised European Partnership are **based on a Council Regulation (Article 187 TFEU or a Decision by the European Parliament and Council (Article 185 TFEU))** and are implemented by dedicated structures created for that purpose. These regulatory needs limit the flexibility for a change in the core objectives, partners, and/or commitments as these would require amending legislation. The basic rationale for this type of partnership is the need for a strong integration of R&I agendas in the private and/or public sectors in the EU in order to address a strategic challenge. It is therefore necessary to demonstrate that other forms of implementation would not achieve the objectives or would not generate the necessary expected impacts, and that a long-term perspective and high degree of integration is needed. For both Article 187 and 185 initiatives, contributions from partners can be in the form of financial and in-kind contributions. Eligibility for participation and funding follows by default the rules of Horizon Europe, unless a derogation is introduced in the basic act.

Option 3a - Institutionalised Partnerships based on Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and limits therefore the scope to **public partners** which are Member States and Associated Third Countries. This type of Institutionalised Partnership aims therefore at reaching the greatest possible impact through the integration of national and EU funding,

aligning national strategies in order to optimise the use of public resources and overcome fragmentation of the public research effort. It brings together R&I governance bodies of most if not all EU Member States (legal requirement: at least 40% of Member States) as well as Associated Third Countries that designate a legal entity (Dedicated Implementation Structure) of their choice for the implementation. By default, participation of non-associated Third Countries is not foreseen. Such participation is possible only if it is foreseen in the basic act and subject to conclusion of an international agreement.

Option 3b - Institutionalised Partnerships based on Article 187 TFEU

Article 187 of the TFEU allows the Union to set up joint undertakings or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes. This type of Institutionalised Partnership brings together a stable set of **public and private partners** with a strong commitment to taking a more integrated approach and requires the set-up of a dedicated legal entity (Union body, Joint Undertaking (JU)) that carries full responsibility for the management of the Partnership and implementation of the calls. Different configurations are possible:

- Partnerships focused on creating strategic industrial partnerships where, most often, the partner organisations are represented by one or more industry associations, or in some cases individual private partners;
- Partnerships coordinating national ministries, public funding agencies, and governmental research organisations in the Member States and Associated Countries;
- Or a combination of the two: the so-called tripartite model.

Participation of non-associated Third Countries is only possible if foreseen in the basic act and subject to conclusion of an international agreement.

2.3. Overview of the methodology adopted for the impact assessment

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines²⁷ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This also integrates **key selection criteria for European Partnerships**.

Box 2 Summary of European Partnerships selection criteria²⁸

- **Effectiveness** in achieving the related objectives and impacts of the Programme;
- **Coherence** and synergies of the European Partnership within the EU R&I landscape;
- **Transparency & openness** as regards the identification of priorities and objectives and the involvement of partners & stakeholders from the entire value chain, backgrounds & disciplines;
- Ex-ante demonstration of **additionality** and **directionality**;
- Ex-ante demonstration of the partners' **long-term commitment**.

2.3.1. Overview of the methodologies employed

In terms of **methods and evidence used**, the impact assessments draw on an external study covering all candidate Institutionalised European Partnerships in parallel to ensure a high level of coherence and comparability of analysis, in addition to an horizontal analysis.²⁹ For all initiatives, the understanding of the overall context of the candidate institutionalised European Partnerships relied on desk research, including among others the lessons learned from previous partnerships. This was complemented by the analysis of a range of quantitative

²⁷ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

²⁸ For a comprehensive overview of the selection criteria for European Partnerships, see Annex 6.

²⁹ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

and qualitative evidence, including evaluations of past and ongoing initiatives; foresight studies; statistical analyses of Framework Programmes application and participation data, and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options, as described below. Public consultations (both open and targeted) supported the comparative assessment of the policy options. For each initiative, up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation run between September and November 2019, the consultation of Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of initiatives.

A more detailed description of the methodology and evidence base that were mobilised, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

2.3.2. *Method for identifying the preferred option*

The first step of the assessments consisted in scoping the problems that the initiatives are expected to solve given the overall economic, technological, scientific and social context, including the lessons to be learned from past and ongoing partnerships on what worked well and less well. This supported the identification of the objectives of the initiative in the medium and long-term with the underlying intervention logic – showing how to get there.

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has then been adapted to introduce “**key functionalities needed**” - making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options while allowing at the same time a structured comparison of the options not only as regards their effectiveness, efficiency and coherence, but also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)³⁰.

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made compared to the baseline. Therefore, for each of these aspects the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. This includes the discontinuation costs/benefits of existing implementation structures when relevant. The policy options are then scored

³⁰ The criterion on the ex-ante demonstration of partners' long-term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

compared to the baseline with a + and – system with a two-point scale, to show a slightly or highly additional/lower performance compared to the baseline. A scoring of 0 of a policy option means that it would deliver as much as the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options³¹.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach³² to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account³³. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.³⁴ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are

³¹ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

³² For further details, see Better Regulation Toolbox # 57.

³³ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

³⁴ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).

- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%), but lead to an additional R&I investment of at least the same amount than the Union contribution³⁵ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution³⁶. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution³⁷. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution³⁸. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0				↑↑
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0				↑↑
Ex-ante Impact Assessment for partnership		0			↑↑↑
Preparation of EC proposal and negotiation		0			↑↑↑
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0				↑
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC			0		↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

³⁵ Minimum contributions from partners equal to the Union contribution

³⁶ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

³⁷ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

³⁸ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**)³⁹. In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

For the **identification of the preferred option**, the scorecard analysis builds a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

As a last step, the alignment of the preferred option with key criteria for the selection of European Partnerships is described, reflecting the outcomes of the ‘**necessity test**’.⁴⁰ The monitoring and evaluation arrangements are concluding the assessment, with an identification of the key indicators to track progress towards the objectives over time.

2.4. Horizontal perspective on candidate Institutionalised European Partnerships

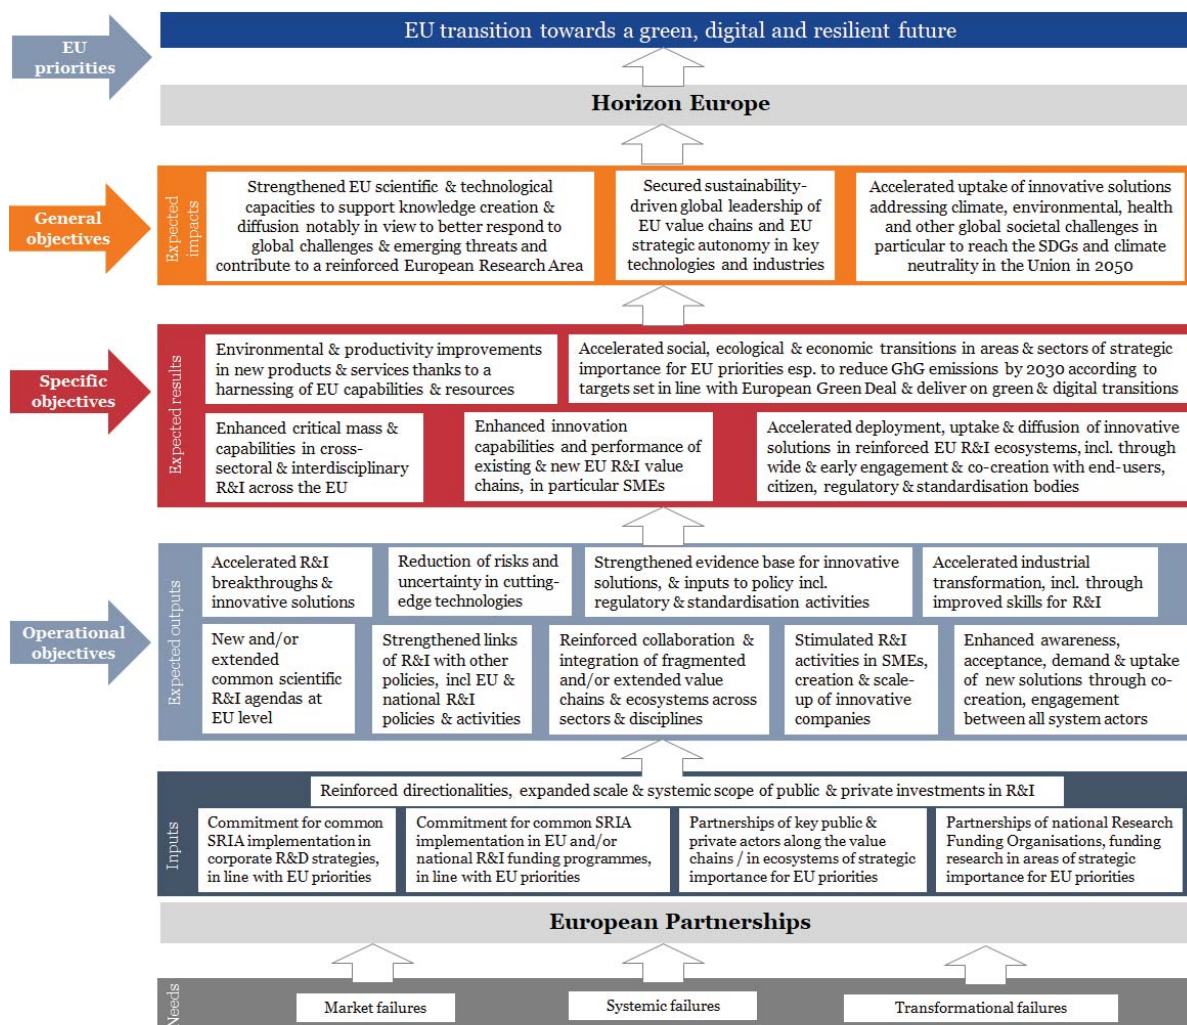

2.4.1. Overall impact orientation, coherence and efficiency needs

The consolidated **intervention logic** for the set of candidate Institutionalised European Partnerships in the Figure below builds upon the objectives as reported in the individual impact assessments.

³⁹ More details on the methodology can be found in Annex 4.

⁴⁰ Certain aspects of the selection criteria will be further addressed/ developed at later stages, notably in the context of preparing basic acts (e.g. Openness and Transparency; Coherence and Synergies), in the Strategic Research and Innovation Agendas (e.g. Directionality and Additionality), and by collecting formal commitments (Ex-ante demonstration of partners’ long-term commitment).

Figure 5 – Overall intervention logic of the European Partnerships under Horizon Europe

Source: European Commission, DG Research & Innovation, Unit A2 Programme Analysis and Regulatory Reform, adapted from Technopolis Group (2020)

When analysed as a package the 12 candidate Institutionalised European Partnerships are expected to support the achievement of the European policy priorities targeted by Horizon Europe by pursuing the following joint general objectives:

- Strengthening and integrating EU scientific and technological capacities to support knowledge creation and diffusion notably in view to better respond to global challenges and emerging threats and contribute to a reinforced European Research Area;
- Securing sustainability-driven global leadership of EU value chains and EU strategic autonomy in key technologies and industries; and
- Accelerate the uptake of innovative solutions addressing climate, environmental, health and other global societal challenges contributing to Union strategic priorities, in particular to reach the Sustainable Development Goals and climate neutrality in the Union in 2050.

In terms of specific objectives, they jointly aim to:

- Enhance the critical mass and scientific capabilities in cross-sectoral and interdisciplinary research and innovation across the Union;
- Accelerate the social, ecological and economic transitions in areas and sectors of strategic importance for Union priorities, in particular to reduce greenhouse gas emissions by 2030 according to the targets set in line with the European Green Deal, and deliver on the green and digital transition;

- c) Enhance the innovation capabilities and performance of existing and new European research and innovation value chains, in particular SMEs;
- d) Accelerate the deployment, uptake and diffusion of innovative solutions in reinforced European R&I ecosystems, including through wide and early engagement and co-creation with end-users, citizen and regulatory and standardisation bodies;
- e) Deliver environmental and productivity improvements in new products and services thanks to a harnessing of EU capabilities and resources.

In terms of their operations, taking an horizontal perspective on all initiatives allows for the identification of further possible collective efficiency and coherence gains for more impact:

- **Coherence for impact:** The extent and speed by which the expected results and impacts will be reached, will depend on the scale of the R&I efforts triggered, the profile of the partners involved, the strength of their commitments, and the scope of the R&I activities funded. To be fully effective it comes out clearly that future partnerships need to operate over their whole life cycle in full coherence with their environment, including potential end users, regulators and standardisation bodies. This relates also to the alignment with relevant EU, national or regional policies and synergies with R&I programmes. This needs to be factored in as of the design stage to ensure a wide take-up and/or deployment of the solutions developed, including their interoperability.
- **Collaboration for impact:** Effectiveness could also be improved collectively through enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems. An adequate governance structure appears in particular necessary to ensure cross-fertilisation between all European Partnerships. This applies not only to initiatives where similar R&I topics are covered and/or the same stakeholders involved or targeted, but also to the interconnections needed between the ‘thematic’ and the ‘vertical’ Partnerships, as these are expected to develop methodologies and technologies for application in EU priority areas. Already at very early stages of preparing new initiatives, Strategic Research and Innovation Agendas and roadmaps need to be aligned, particularly for partnerships that develop enabling technologies that are needed in other Partnerships. The goal should be to achieve greater impacts jointly in light of common challenges.
- **Efficiency for impact:** Potential efficiency gains could also be achieved by joining up the operational functions of Joint Undertakings that do not have a strong context dependency and providing them through a common back-office⁴¹. A number of operational activities of the Joint Undertakings are of a technical or administrative nature (e.g. financial management of contracts), or procured from external service providers (e.g. IT, communication activities, recruitment services, auditing) by each Joint Undertaking separately. If better streamlined this could create a win-win situation for all partners leading to better harmonization, economies of scales, and less complexity in supervision and support by the Commission services.

2.4.2. *Analysis of coherence of the overall portfolio of candidate initiatives at the thematic level*

Looking at the coherence of the set of initiatives at the thematic level, the “**digital centric**” initiatives have a strong focus on supporting the digital competitiveness of the EU ecosystem. Their activities are expected to improve alignment and coordination with Member States and industry for the development of world-competitive EU strategic digital technology value chains and associated expertise. Addressing the Key Digital Technologies, the 5G and 6G

⁴¹ See Annex 6 for an overview of key functions/roles that could be provided by a common back office.

connectivity needs as part of a Smart Networks and Services initiative and the underlying supercomputing capacities through a European High Performance Computing initiative present potential for synergies that can be addressed through cooperative actions (e.g. joint calls, coordinated support activities, etc.). They may as well profit from and contribute to Partnerships envisaged for Photonics, AI, data, robotics, Global competitive space system and Made in Europe, together with the EIT Digital. Synergies between these initiatives and several programmes (Digital Europe and Connecting Europe as well as cohesion programmes) are needed in areas where EU industry has to develop leadership and competitiveness in the global digital economy. They are expected to impact critical value chains including on sectors where digital is a strong enabler of transformation (health, industrial manufacturing, mobility/transport, etc.).

The **transport** sector face systemic changes linked to decarbonisation and digitalisation. Large scale R&I actions are needed to prepare the transition of these complex sectors to provide clean, safer, digital and economically viable services for citizens and businesses. Past decades have shown that developing and implementing change is difficult in transport due to its systemic nature, many stakeholders involved, long planning cycles and large investments needed. A systemic change of the air traffic network through an Integrated Air Traffic Management initiative should ensure safety and sustainability of aviation, while a Clean Aviation initiative should focus on the competitiveness of tomorrow's clean aircrafts made in Europe. The initiative for Transforming Europe's rail system would comprehensively address the rail sector to make it a cornerstone in tomorrow's clean and efficient door-to-door transport services, affordable for every citizen as well as the most climate-friendly mode of transport for freight. Connected and Automated Mobility is the future of road transport, but Europe is threatened to fall behind other global regions with strong players and large harmonised markets. The initiative Safe and Automated Road Transport would bring stakeholders together, creating joint momentum in digitalising road transport and developing new user-based services. Stronger links and joint actions will be established between initiatives to enable common progress wherever possible. The Clean Hydrogen initiative would be fundamental to that regard. Synergies would also be sought with partnerships driving the digital technological developments.

To deliver a deep decarbonisation of highly emitting industrial sectors such as the steel, transport and chemical industries would require the production, distribution and storage of **hydrogen** at scale. The candidate hydrogen initiative would have a central positioning in terms of providing solutions to the challenges for sustainable mobility and energy, but also is expected to operate in synergies with other industry related initiatives. The initiative would interact in particular with initiatives on the zero emission road and water transport, transforming Europe's railway system, clean aviation, batteries, circular industry, clean steel and built environment partnerships. There are many opportunities for collaboration for the delivery and end-use of hydrogen. However, the Clean Hydrogen initiative would be the only partnership focused on addressing hydrogen production technologies.

Metrology, the science of measurement, is an enabler across all domains of R&I. It supports the monitoring of the Emissions Trading System, smart grids and pollution, but also contributes to meeting demands for measurement techniques from emerging digital technologies and applications. More generally, emerging technologies across a wide range of fields from biotechnologies, new materials, health diagnostics or low carbon technologies are giving rise to demands requiring a world-leading EU metrology system.

The initiative for a **Circular Bio-based Europe** is intended to solve a shortage of industry investments in the development of bio-based products whose markets do not have yet certain long-term prospects. The **Innovative Health Initiative** and **EU-Africa Global Health**

address the lack of investments in the development of solutions to specific health challenges. The initiative on **Innovative SMEs** supports innovation-driven SMEs in participating in international, collaborative R&I projects with other innovative firms and research-intensive partners. As a horizontal initiative it is expected to help innovative SMEs to grow and to be successfully embedded in global value chains by developing methodologies and technologies for potential application in the other partnership areas or further development by the instruments of the European Innovation Council.

The description of the interconnections between all initiatives for each Horizon Europe cluster is provided in the policy context of each impact assessment and further assessed in the coherence assessment for each option.

PART 2 - THE CANDIDATE EUROPEAN PARTNERSHIP ON EU-AFRICA GLOBAL HEALTH

1. INTRODUCTION: POLITICAL AND LEGAL CONTEXT

The death toll from infectious diseases is spread disproportionately around the world, with low- and middle- income countries being most affected, particularly sub-Saharan Africa.^{42,43} **Infectious diseases**, such as lower respiratory infections, HIV/AIDS, diarrhoeal diseases, malaria and tuberculosis, remain the main cause of death, disability, and ill-health in sub-Saharan Africa.⁴⁴

The current Sars-CoV-2, also called COVID-19, pandemic is a clear reminder, that due to increased global connectivity through world trade and tourism, infectious diseases spread rapidly around the globe causing huge human and also economic suffering in many countries, including Europe. Therefore research into health technologies to detect, treat and prevent infectious diseases will not only protect people's right to health worldwide, but might also contribute to halt the spread of emerging epidemics.

Medical and technological research and innovation are needed to accelerate the production of key interventions such as precise diagnostics tests, therapeutic treatments and preventive vaccines to alleviate the burden of infectious diseases and ensure a healthy and productive life, especially in the most vulnerable and affected region such as sub-Saharan Africa. The successful development and deployment of such interventions needs to take into account the environmental and social context, including the capacities of the health systems, of countries in which these diseases are prevalent. In addition, the development of health technologies, especially at the late stage of clinical development, is an expensive process with high costs and a long timeframe, hence it requires large scale and especially coordinated funding.

This document focuses on assessing the most effective, efficient and coherent way of implementing an initiative under Horizon Europe, which would focus on joint research and innovation activities to accelerate the development of suitable, effective, safe, accessible and affordable health technologies to fight infectious diseases affecting sub-Saharan Africa. The assessment will help to decide on which of the following different policy options should be pursued in order to legally establish and financially support this partnership:

- Option 0: Traditional Framework Programme calls
- Option 1: Co-funded partnership, based on a grant agreement
- Option 2: Co-programmed partnership, based on a memorandum of understanding;
- Option 3a: Institutionalised partnership, based on a decision of European Parliament and Council under Article 185 TFEU;
- Option 3b: Institutionalised partnership, based on a Council regulation under Article 187 TFEU.

1.1. Emerging challenges in the field

The World is undergoing rapid population growth with more than 9.7 billion people by 2050,⁴⁵ whereby Africa is accounting for more than half of the projected global population growth.⁴⁶ Climate and environmental changes such as hotter summers, warmer winters or increased annual rainfalls, potentially introduce diseases to new areas,⁴⁷ and increase the disease burden of many tropical and neglected diseases.⁴⁸

Antimicrobials agents or antibiotics are crucial in the treatment of many infectious diseases, but the spread of drug-resistance, or **antimicrobial resistance** (AMR), could undermine the progress made to date. Although, due to lack of monitoring,⁴⁹ the precise levels of AMR in the African region are not recorded, available data suggest that the African region follows the global trend of rising AMR prevalence, with significant resistance, found for numerous treatments against tuberculosis, malaria, HIV/AIDS, cholera, and dysentery.⁵⁰ Apart from increasing the level of mortality and morbidity in the region, drug-resistance puts a financial burden on health systems as it increases the costs of treatment.

In addition to the burden posed by well-recognised diseases such as HIV, malaria and tuberculosis, as well as neglected tropical diseases, the world is seeing an increasing number of outbreaks of **emerging infectious diseases**, which may be further exacerbated by climate change.⁵¹ Emerging infectious diseases can be caused by newly identified infectious pathogens which cause public health problems either locally or internationally⁵² such as Ebola⁵³ or the new corona viruses. Pathogens may also re-emerge with new characteristics, such as multidrug-resistance, or in different places, to cause new epidemics.⁵⁴ Outbreaks of emerging infectious diseases have the potential to cause enormous social and economic damage globally and particularly in already heavily constrained health systems in Africa.^{55,56,57} Outbreaks can also discourage use of healthcare, indirectly leading to greater morbidity, mortality and financial costs.⁵⁸

Moreover, previously unknown or new strains of virus can emerge due to close contact with animals, spread by modern transportation⁵⁹ or crowded urban environments,⁶⁰ causing epidemics, such as the current COVID-19 pandemic.⁶¹ This is a global health

crisis unlike any in the last 75 years history, killing people, spreading human suffering, and upending people's lives.⁶² Previously other recent known outbreaks have been: SARS in 2002–2003, H1N1 in 2009 or MERS in 2014,⁶³ Zika in 2016⁶⁴ and Ebola in 2014 and 2016.⁶⁵

Preparedness and response research, that can provide an evidence base to increase individual and community resilience, facilitate operational readiness, improve decision-making during emergency response, and speed the recovery of public health and healthcare systems and communities, remain the preferred path to contain epidemics and pandemics, and early public health interventions are the second and essential line of attack.

A further important challenge is the **rise of chronic non-communicable diseases (NCDs)**, such as cardiovascular disease, diabetes and cancer also in Africa.⁶⁶ Along with the unresolved epidemic of infectious diseases, this presents Africa with an unwelcome double burden of disease. Diabetes patients are over three times more likely to become infected with tuberculosis,⁶⁷ while COVID-19 infection is more severe in patients with high blood pressure, heart disease, lung disease, cancer or diabetes.⁶⁸ The resulting increased levels of comorbidity are likely to create new challenges for the development and use of effective treatment strategies, in particular in sub-Saharan Africa, overstretching the already strained health systems.⁶⁹

Encouragingly, over the past decade, there have been significant **scientific and technological advances** in the development of health technologies, such as those in the areas of DNA sequencing and genome editing that are opening up new avenues, to prevent, diagnose and treat infectious diseases.

In addition, since the Ebola crisis in West Africa, the **industry** seems to be gaining interest in global health projects targeting priority R&D gaps.⁷⁰ Some of them have created integrated global health R&D units. Moreover, large **philanthropic foundations** have found the challenges of global health as too big to tackle on their own, and therefore are more willing than before to join forces and collaborate with public organisations to fund research & innovation in the field of infectious diseases.⁷¹

Noteworthy is furthermore the **digitalisation of Africa** and the increasing use of mobile technologies.⁷² Digital technology has the potential to accelerate and transform health research and product development, as well as the delivery of healthcare itself. For instance, it can be used to improve the collection, analysis and sharing of high-quality

research data. It can also change the way services are delivered in hard-to-reach areas, for instance, using digital diagnostics or drones.^{73,74}

1.2. EU relative positioning in the field

Europe has been traditionally strong in tropical diseases research⁷⁵ and during the last two decades the EU has provided support to research and innovation on infectious diseases through the different EU Framework Programmes FP6 (2002-2006), FP7 (2007-2013) and Horizon 2020 (2014-2020). This funding has covered all the phases of the research and innovation pathway from pre-clinical discovery to clinical trials for diagnostics, vaccines, therapeutics, as well as microbicides and vector control.^{76,77,78}

The strength of European research has not been so much in the quantity of investment, but rather in the way funding is addressing the needs of the research community and the impacts on shaping the environment for research. There has been a strong focus on collaboration between researchers from different countries, sectors and disciplines. This has helped to build wide networks of scientists who can cover the entire innovation cycle, from basic research to implementation in order to support crucial discoveries, as well as drive economic growth and job creation.

In 2018, the EU was the third largest public funder of neglected infectious diseases with USD 113 million.⁷⁹ This funding also includes the EU funding to the European and Developing Countries Clinical Trials Partnership (EDCTP).

Table 1: Public R&D funders 2018 on poverty related & neglected infectious diseases

⁷⁹ G-FINDER 2019 Neglected Disease Research and Development: Uneven Progress

The European and Developing Countries Clinical Trials Partnership, was launched in 2003 to accelerate the development of medical interventions to prevent, control and treat HIV/AIDS, malaria and tuberculosis contributing to reduce the economic burden caused by these diseases in sub-Saharan Africa.⁸⁰ Under the second EDCTP programme⁸¹ this scope was extended in 2014 to include the neglected infectious diseases. Currently it is a partnership of 16 African⁸² and 14 European⁸³ member countries, assembled around the EDCTP Association (established under Dutch law), and the European Union. The EU financial contribution to the second EDCTP programme (2014-2020), up to EUR 683 million, comes from the H2020 framework programme, based on the decision of the European Parliament and the Council under Article 185 of the Treaty.

The new partnership, the EU-Africa Global Health Partnership under Horizon Europe, builds on the first and second EDCTP programmes and aims to advance the clinical development of suitable, effective, safe, accessible and affordable health technologies (e.g. diagnostics, treatments and vaccines) to help reduce the burden of infectious diseases in sub-Saharan Africa and strengthen capacities to improve the R&I response to (re-)emerging infectious diseases.

EDCTP has delivered, since 2003, more than 800 scientific peer-reviewed publications, built ethical review panels, regulatory capacity and networks of scientists for exchange high-quality clinical research, generating data with a significant impact on global and national health policy and practice. Moreover, since 2014, EDCTP has integrated the global health Participating States Initiated Activities in the EDCTP work annual plans, providing alignment of the European countries research efforts in this area.

During 2014-2019, EDCTP2 has awarded EUR 605 million in grant funding, supporting 83 clinical trials and other clinical research activities conducted by European-Africa consortia, 130 fellowships in career development of researchers from sub-Saharan Africa, and 57 grants to strengthen the enabling environment for conducting clinical trials and clinical research in Africa. As result, nearly 7,500 people in Africa have participated in training and workshops on study protocol, specimen collection, research administration, good clinical practice and epidemics preparedness, etc. EDCTP-funded studies have made vital contributions to the development of HIV antiretroviral drug formulations tailored to children; EDCTP has also supported the evaluation of the Xpert MTB/RIF diagnostic technology for the detection of drug-resistant tuberculosis bacteria, now recommended by the WHO and implemented globally. EDCTP studies have generated key evidence on malaria treatments for pregnant women, who are particularly susceptible to malaria, among other examples.

Thus, EDCTP is already a well-branded global health initiative that has made vital contributions to the development of treatments against diseases like AIDS, tuberculosis, malaria and neglected infectious diseases. It has strengthened capacity in sub-Saharan Africa and fostered strong research collaboration between the EU and Africa.

⁸⁰ Decision No 1209/2003/EC of the European Parliament and of the Council of 16 June 2003 on Community participation in a research and development programme aimed at developing new clinical interventions to combat HIV/AIDS, malaria and tuberculosis through a long-term partnership between Europe and developing countries, undertaken by several Member States <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2003:169:0001:0005:EN:PDF>

⁸¹ Decision No 556/2014/EU of the European Parliament and of the Council of 15 May 2014 on the participation of the Union in a second European and Developing Countries Clinical Trials Partnership Programme (EDCTP2) jointly undertaken by several Member States <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32014D0556>

⁸² Burkina Faso, Cameroon, Congo, Ethiopia, Gabon, The Gambia, Ghana, Mali, Mozambique, Niger, Nigeria, Senegal, South Africa, Tanzania, Uganda and Zambia

⁸³ Austria, Denmark, Finland, France, Germany, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, and the United Kingdom

The global spreading of COVID-19, in a pandemic of unprecedented global scale, could not be avoided despite existing knowledge about other coronaviruses of earlier epidemics. This means that the GHP candidate becomes even more relevant to addressing explicitly the research preparedness and response in case of emerging epidemics and in its role of coordinating research and innovation support with other funders. Therefore, the proposed EU-Africa Global Health partnership will explicitly address strengthening capacities to improve the R&I response to (re-)emerging infectious diseases.

The scope of the new partnership should also be extended to better cover the threat of antimicrobial resistance (AMR) and emerging infectious diseases with the potential to cause pandemics. This widened scope would also be reflected in the goal of the GHP, also called EDCTP3. The name ‘EU-Africa Global Health Partnership’ was proposed to give an indication of ambition. However, dialogue with Member States and African countries revealed that they would in a first stage prefer to focus on sub-Saharan Africa, as that is where the main burden of infectious diseases lies.

In the **evaluation of all the EU partnerships of Horizon 2020 based on Article 185** carried out in 2017, the Commission has underscored that ‘the topics addressed by [...] EDCTP2 are to a large extent not tackled with other Horizon 2020 actions’.

Moreover, the thematic **EDCTP2 independent Interim Evaluation** panel highlighted the invaluable and unique contribution of the programme to sub-Saharan Africa and that that EDCTP had ‘made important inroads in **strengthening cooperation** and partnership between European and sub-Saharan African countries and **developing clinical trial capacity and scientific career development in Africa**’. It also noted that, because of the long timescales associated with new healthcare product development and implementation, achieving EDCTP’s ambitious goals will **require long-term commitment and investment**.

An impact assessment **study on the EU funding on poverty related and neglected infectious diseases**⁸⁴ concluded that to ensure that innovations can be adopted, more health systems and **implementation research** is needed; as well as to **include the low and middle income countries** at different stages of the health research and innovation pathway. Overall, there is a need for more ‘pull’ policy incentives to help bridge research and impacts, as well as to increase awareness of EU funding efforts for **better coordination** with other funders.

A **SWOT analysis** (strengths, weaknesses, opportunities, threats) of the first two EDCTP programmes carried out by EDCTP, drawing on the independent Evaluations and impact assessments, as well as the insights of Scientific Advisory Committee members and other key stakeholders, suggested that EDCTP has established itself as an important contributor to health research in sub-Saharan Africa, with a distinct niche in the funding landscape – particularly through its progressive commitment to **later-stage trials** and to **under-served groups** with unmet medical needs. The analysis further showed that the partnership’s integration of capacity-building activities into EDCTP projects, as well as its dedicated capacity-building funding, through the regional networks and fellowship programme in sub-Saharan Africa, was a notable feature of the partnership’s work (details in Annex 6).

1.3. EU policy context beyond 2021

The European Commission is committed to the United Nations 2030 Agenda for Sustainable Development, with a set of Sustainable Development Goals directly related to global health: (SDG3), calling to ‘ensure healthy lives and promote well-being for all

⁸⁴ EDCTP-funded clinical studies for medical interventions 2003-2018 http://www.edctp.org/web/app/uploads/2018/09/Tackling-infectious-disease-in-sub-Saharan-Africa_EDCTP-funded-clinical-studies-for-medical-interventions-2003-2018-4.pdf

at all ages’ and SDG1 ‘to end poverty in all its forms everywhere’. Supporting global health is also related to SDG 9 ‘Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation’ and SDG17 ‘Strengthen the means of implementation and revitalize the global partnership for sustainable development”.

The Commission reflection paper *Towards a Sustainable Europe by 2030*, adopted in January 2019, outlines three scenarios on how best to progress on the SDGs: 1) an overarching EU SDGs strategy to guide all actions by the EU and Member States; 2) continued mainstreaming of the SDGs in all relevant EU policies by the Commission, but not enforcing Member States’ action; and 3) putting enhanced focus on external action while consolidating current sustainability ambition at EU level. It emphasizes the continuous need to face persisting or novel challenges in science, society and policy for achieving a sustainable Europe by 2030. In this context health research and related innovation actions play a significant role in improving productivity, health care systems and the functioning of its industries.⁸⁵

The proposed initiative is fully in line with the recent Communication on the *Global EU response to COVID-19*⁸⁶ that asks for ‘Stepping up the preparation with EU Member States and third countries of the Global Health Partnership’ and the Commission’s comprehensive Africa Strategy ‘*Towards a comprehensive Strategy with Africa*’⁸⁷ adopted in March 2020. It is also in line with the ‘*EU-Africa Alliance for Sustainable Investments and Jobs*’⁸⁸ of September 2018, where the EU is committed to increase access to quality education, skills, research, innovation, health and social rights, and to reinforce Africa as a partner in trade, in foreign investment and in development, and to tackle together the green and digital transformations, as well as promoting sustainable investments and jobs.

In December 2019, when the new Commission took office, it presented its new priorities for the upcoming years, including the ‘*A European Green Deal*’, ‘*A people-centred economy*’ and ‘*A Digital Europe*’, which are particularly relevant for health research and innovation.⁸⁹ In her letter to the Commissioner for Innovation, Research, Culture, Education and Youth, Mariya Gabriel, the President of the European Commission, Ursula von der Leyen requests the maximisation ‘of the potential of the EC exchange programmes to foster international cooperation in education, research and innovation’.⁹⁰ Moreover, to the Commissioner for International Partnerships, Jutta Urpilainen, she asks to ‘make the most of the political, economic and investment opportunities that Africa offers, with its growing economies, populations and digital innovations, and to work on a new comprehensive strategy for Africa creating a partnership of equals and mutual interest’.⁹¹

Under Horizon Europe, the GHP/EDCTP3 would be part of R&I activities funded under Pillar II Cluster 1 Health, which is one of the six Horizon Europe clusters. Pillar II addresses global challenges and industrial competitiveness. Cluster Health is supporting

the Sustainable Development Goals, notably SDG 3 ‘Ensure healthy lives and promote well-being for all at all ages’. *The potential inter-connections between partnership initiatives in the Health cluster of Horizon Europe and other EU policies and priorities are presented in Figure 6.*

Figure 6: Potential inter-connections between the Health cluster of Horizon Europe and EU policies and priorities.

2. PROBLEM DEFINITION

Taken into consideration the scale of the challenges ahead for addressing infectious diseases threats globally and the current scientific, technological and economic positioning of Europe, as well as the overarching EU policy context, a set of problems have been identified where EU research and innovation in the field of Global Health would have a specific role to play.

This has been summarised in a problem tree presented in Figure 7 portraying the identified problems, their drivers and potential consequences if the problems are not addressed. The lack of robust health technologies and the insufficient clinical research capacity for tackling infectious diseases in sub-Saharan Africa are due largely to a number of problem drivers: insufficient knowledge of the pathogens causing the diseases; fragmentation of public and private research efforts to tackle infectious diseases affecting sub-Saharan Africa, insufficient number of trained scientists in sub-Saharan Africa and the insufficient capacity of national health systems in sub-Saharan Africa to detect, diagnose and monitor (re) emerging infectious diseases

As well as impacts on population, these factors undermine economic development in the region and increase the risk of global dissemination of novel pathogens. In order to

address these problems and their drivers, it is important to establish a partnership structure that is most suitable for the needed actions. Let us first look at the problems and their drivers in more detail in order to understand what kind of partnership is needed.

Figure 7: Problem tree behind an initiative for European R&I on EU-Africa Global Health

2.1. What are the problems?

The main problem the partnership aims to address is the lack of suitable diagnostics, treatments and vaccines, the so-called health technologies, to address infectious diseases, such as HIV, malaria, tuberculosis but also leishmaniosis that are prevalent in Africa, especially in sub-Saharan Africa. One of the lessons learnt, also now with the COVID-19 pandemic, is that with the increased connectivity of different regions in the world, through world trade and tourism, infectious diseases in one part of the world do not stay there but can rapidly affect other regions. Therefore, developing these health technologies in sub-Saharan Africa is the starting point to contain infectious diseases in this region and protect the health of the citizens in the concerned countries and globally, including in Europe.

1. *Lack of health technologies or interventions for tackling infectious diseases in sub-Saharan Africa*

Although important strides have been made in combating infectious diseases, much still needs to be done at scientific level. For instance, although the development of antiretroviral therapy in the fight against HIV has been a major game changer,⁹² there still is no effective vaccine to prevent HIV infection.⁹³ Likewise, whilst there are numerous treatments against tuberculosis, the increasing threat of (multi-)drug-resistant forms of the disease increase the urgency for the development of new vaccines with greater efficacy and broader application, as well as for continued development of new (combination) treatments.⁹⁴ For other diseases, such as Dengue – a mosquito-borne viral

⁹² Broder S. (2010). The development of antiretroviral therapy and its impact on the HIV-1/AIDS pandemic. *Antiviral research*, 85(1), 1–18. doi:10.1016/j.antiviral.2009.10.002

⁹³ HIV vaccine: better to start together? Felber, Barbara K et al. *The Lancet HIV*, Volume 6, Issue 11, e724 - e725

⁹⁴ McShane, Helen. Insights and challenges in tuberculosis vaccine development *The Lancet Respiratory Medicine*, Volume 7, Issue 9, 810 - 819

infection affecting around 390 million people annually –, there is no effective treatment.⁹⁵

Moreover, the progress made in combatting infectious diseases is being increasingly challenged by the rising levels of drug resistance or antimicrobial resistance. For instance, whilst chloroquine has long been used as a malaria treatment, there now is widespread resistance against it in most areas of the world.⁹⁶

Intensified research efforts aiming at introduction of new modern health technologies in sub-Saharan Africa would have a major effect on the infectious disease burden in this region.

2. *Insufficient clinical research capacity for tackling infectious diseases in sub-Saharan Africa associated with insufficient knowledge exchange and research collaboration with EU*

Even where suitable health technologies are available, there often is a challenge in getting them to where they are most needed and ensuring that they are used to optimal effect. Most sub-Saharan African countries are faced with weak, under-resourced health systems. As a result, health technologies that have proven efficacious in trial environments may show reduced effectiveness in real-world settings, when they are not used correctly, or if they are used only intermittently as a result of insufficient availability.

While development aid and local capacity development activities have led to some progress in the delivery of existing health technologies such as diagnostics, vaccines and therapeutics to the region, much remains to be achieved to ensure that new health technologies are available and accessible to the people in need, calling also for implementation research.⁹⁷

In many disease-endemic countries in Africa, there is insufficient capacity for conducting health research and clinical trials.⁹⁸ This concerns the equipment and tools needed to support trials (e.g. laboratory equipment, computers), as well as the human resources (e.g. health care workers, technicians, researchers) and the broader enabling research environment (e.g. ethical review boards,⁹⁹ and national medicines regulatory authorities). There is also an insufficient capacity to harness and package available local, regional and global evidence to inform health policies and practice.¹⁰⁰ In line with this challenge is the growing importance of implementation research to achieve the Sustainable Development Goals.¹⁰¹

As discussed, research and product development to combat infectious diseases require a multi-stakeholder approach and a common research agenda that brings together different forms of expertise. Crucially, this also demands strong involvement from funders and

stakeholders, including researchers from disease-endemic countries,¹⁰² as these are best placed to understand the specific needs of the populations and how research is expected to serve. This includes increasing attention for principles of fair research,¹⁰³ needed to ensure that African researchers can play a full and equitable role in research collaborations.

2.2. What are the key problem drivers?

The key causes of the problems from the R&I perspective, are the following:

1. *Insufficient knowledge of the pathogens causing infectious diseases that have high capacity to evade immune responses and develop resistance to treatment.*

The most prevalent pathogens that are predominantly affecting low- and middle-income countries, such as HIV, the causative agent of tuberculosis *Mycobacterium tuberculosis* and the malaria parasite *Plasmodium*, have shown tremendous resilience against control measures against them. One of the main reasons is the insufficient knowledge about host-pathogen interaction and about the mechanism on how they cause disease and escape human immune system.¹⁰⁴ This has made the search for new vaccines and treatment a slow process, emphasizing the need to conduct clinical trials in many different target populations and settings.¹⁰⁵

Clinical trials are essential to know how pathogens react to medical interventions and to determining the efficacy and safety of such interventions. While valuable safety and efficacy data can be drawn from studies in high-income countries, often studies need to be conducted within sub-Saharan Africa itself. This may be because the infections are found only in this region, or particular strains of pathogen are found mainly in sub-Saharan Africa. In addition, responses to drugs or vaccines may be different in various populations, because of genetic differences or environmental factors. For example, particular genetic variations found in Africa affect responses to some antiretroviral drugs, while responses to rotavirus vaccine are generally lower in sub-Saharan Africa than in high-income countries.

Importantly, for later-stage and post registration trials and implementation studies, the nature of local health systems is a crucial factor, central to study design. Given their high degree of local relevance, these studies generally deliver the evidence most useful to national policymakers. A collaborative approach is required to develop and evaluate vaccines, drugs and other tools needed to control these diseases. Partnerships across a wide range of actors are needed to chaperone new interventions through complex evaluations in disease-endemic settings, regulatory pathways, and implementation into health systems. Collaboration between public and private funders, together with research institutes, product development partnerships and national health authorities, is therefore key to further progress.

¹⁰⁵ Rappuoli, R. & Aderem, A. (2011) A 2020 vision for vaccines against HIV, tuberculosis and malaria. Nature 473: 463-469. Doi:10.1038/nature10124

2. Fragmentation of public and private research efforts to tackle infectious diseases affecting sub-Saharan Africa.

There are few economic incentives for companies to invest in interventions for diseases that predominantly affect low-resource settings. Development of vaccines and drugs is both costly and high risk, and the lack of financial resources in countries in sub-Saharan Africa inevitably makes them an unattractive market for commercial organisations. The low commercial potential for achieving enough return on investment has led the industry to show, until recently, limited interest to invest in R&I for infectious diseases, especially those that are prevalent in LMICs.

For devices such as diagnostics, a further challenge is the need for products that are affordable, reliable, easy to use, and robust enough for challenging environmental settings. This demanding set of criteria deters investment when the potential to achieve a reasonable return on investment is highly uncertain.

As a result, the product development pipeline for infectious diseases is poorly stocked, and the progress has been slow. For instance, in 2019, there were only 129 active clinical studies/trials on poverty related neglected diseases, compared to 3,499 oncology studies/trials.¹⁰⁶ The 2018 Access to Medicines Index showed that in the pipelines of the 20 largest pharmaceutical companies, out of 1,314 R&D projects, only 298 targeted priority gaps products¹⁰⁷ for infectious diseases.¹⁰⁸

Most of the support to R&I in this area in sub-Saharan Africa has been provided through public sources. Europe has a long history of supporting medical research in sub-Saharan Africa, often being based on informal contacts between researchers and institutions, and bilateral arrangements that reflect long-standing geopolitical legacies. While excellent research has been carried out, clinical evaluation of medical interventions requires systematic investment in infrastructure, generally across several countries, which can be challenging to achieve through bilateral or project-based initiatives.

Tackling infectious diseases affecting sub-Saharan Africa with modern technology tools requires the involvement of a large set of actors. These range from academic researchers to international development agencies, philanthropies and pharmaceutical companies. As each of these actors have their own priorities and focus areas,¹⁰⁹ one of the main challenges is uniting such diverse actors around a common strategic agenda and roadmaps, in order to use resources effectively and efficiently.

Although Member States have shown willingness to align and coordinate their national programmes for R&D infectious diseases around a common strategic research agenda, these efforts are hindered by national political priorities for international cooperation and development, which often follow political international agreements with different criteria than the research and innovation agenda efforts.

Individual funders, both public and private, including industry, and scientists often address a scientific problem in infectious diseases with a single hypothesis or theory. In

¹⁰⁹ Sridhar D (2012) Who sets the global health research agenda? The challenge of multi-bi financing. PLoS Med. 9(9)

case of complex diseases and circumstances, it would be advantageous to combine the knowledge and hypothesis of several groups and get a comprehensive understanding of the disease process. Infectious diseases that represent the most sophisticated mechanisms of evasion and escape from our defences, require a collaborative approach to tackle them, and partnerships with a wide range of actors have the best chances of finding the vaccines and drugs against these diseases. Communication between public and private funders together with scientists and scientists is one of the keys of finding comprehensive solutions.

3. *Insufficient number of trained scientists on infectious diseases clinical research in sub-Saharan Africa (medical doctors, researchers)*

Sub-Saharan Africa is faced with a lack of adequate research infrastructure and established researchers capable of initiating and maintaining competitive research outputs. Despite the many gains over the last few years, sub-Saharan Africa is still faced with a dearth of recognised researchers capable of maintaining competitive research outputs. Many researchers are working in isolation and engaging in activities that may have short-term economic advantages but are often not relevant to clinical research. Partnership-centered networks are needed to train scientists and build clinical research capacity so that more African scientists become experts of clinical research.

Clinical studies are governed by stringent international regulations, covering areas such as the conduct of trials, ethical approvals and the quality of laboratory analyses. Studies therefore require sufficient infrastructure and an appropriately trained workforce in order to carry out studies generating data consistent with the standards imposed by national and international regulatory agencies.

Furthermore, as well as shortcomings in institutional and individual capacity, many countries also have limited capabilities to ensure effective oversight and governance of research. This includes the capacity to oversee ethical approvals and ensure compliance with national and international regulatory standards.

To conduct high-quality clinical trials and implementation research in sub-Saharan Africa, consistent with fundamental ethical principles and recognised international regulatory standards, good participatory practices as well as to perform research effectively, efficiently, and in a sustainable manner, complementary fellowship training programmes are also necessary.

Many resolutions of the World Health Assembly and the WHO Regional Committee for Africa have called upon African countries and their development partners to make the required investments in National Health Research Systems (NHRS) to generate knowledge and promote its use in dealing with priority public health challenges. Implementation of these resolutions is critical to achieving the Sustainable Development Goals.¹¹⁰ Recent review of the NHRS in Africa has observed that despite an improvement in the average NHRS Barometers scores from 43% in 2014 to 61% in 2018, a number of challenges remain. These include lengthy ethical clearance processes; weak research coordination mechanisms, weak enforcement of research laws and regulation, inadequate infrastructure, limited resource mobilisation skills and donor dependence.¹¹¹ This underscores the need to continue to strengthen the NHRS in order to

¹¹⁰ Kirigia, J.M., Ota, M.O., Motari, M. et al. National health research systems in the WHO African Region: current status and the way forward. *Health Res Policy Sys* 13, 61 (2015). <https://doi.org/10.1186/s12961-015-0054-3>

¹¹¹ Rusakaniko, S., Makanga, M., Ota, M.O. et al. Strengthening national health research systems in the WHO African Region – progress towards universal health coverage. *Global Health* 15, 50 (2019). <https://doi.org/10.1186/s12992-019-0492-8>

not only strengthen clinical research capacity but to also facilitate knowledge translation and implementation science in general. This strategy would help reduce the knowledge-practice gap that persists in many LMICs.

4. *Insufficient capacity of national health systems to detect, diagnose and monitor (re-) emerging infectious diseases in sub-Saharan Africa and globally.*

As mentioned before, due to increased globalisation and migration, with overpopulated urban environments, climate change and closer contact with wild animals in certain areas of the world, the potential for infectious diseases to rapidly spread around the world has increased.

Early detection and diagnosis are vital to responding and limiting the number of new infections in case of an outbreak. This can be particularly challenging in sub-Saharan Africa where systems for detection, diagnosis and monitoring are inadequate. In its first annual report, *A World at Risk*, published in September 2019,¹¹² the Global Preparedness Monitoring Board concluded that the world is poorly prepared to respond to new global threats. It suggested that global actions are still dominated by responses to outbreaks, with too little investment in preparedness. This is well illustrated by the current COVID-19 outbreak.¹¹³

Compared to many other countries, the health systems in sub-Saharan Africa show limited capacity for research and innovation. This low research capacity not only impedes the achievement of health SDGs, but causes a slow response to emerging infectious disease threats and insufficient preparedness to epidemics. This leads to less than optimal control of outbreaks, and the potential for further spread to populations at risk and international dissemination. Low level of domestic funding makes it further challenging for health systems to control infectious diseases.

It is critical that African countries are involved in rapid and responsive clinical research to develop diagnostics, treatment regimens, vaccines and other health solutions during a public health emergency. Rapid and responsive research during a public health emergency should also be extended to socio-behavioural research, medical anthropology research as well as applied and translational research. The Ebola and other outbreaks left a legacy that research should take a centre stage and become the norm in responding to a public health emergency, especially when the cause is unknown or novel.

The emergency epidemic infectious diseases such as COVID-19 makes it even more imperative to have both strong and resilient health systems and strong NHRS. The latter is critical to coordinate and facilitate rapid generation of evidence as well as facilitating utilization of that evidence. The COVID-19 pandemic has re-emphasized to the global community the importance of research and innovation and the need to invest more in Research and Development (R&D); as both finding a cure and a vaccine have remained elusive, while both the public health and economic impacts escalate. R&D cannot progress without a functioning NHRS just as Universal Health Coverage would remain a pipedream without strong and resilient National Health Systems. Lastly, this EU-Africa Global Health Partnership rightly places great emphasis on Global Health Security which would be impossible to achieve without strengthening R&D and the NHRS.

¹¹² Global Preparedness Monitoring Board. *A World at Risk: Annual Report on global preparedness for health emergencies*. 2019. Geneva: WHO. Available at https://apps.who.int/gpmb/annual_report.html

¹¹³ <https://www.ecdc.europa.eu/sites/default/files/documents/RRA-sixth-update-Outbreak-of-novel-coronavirus-disease-2019-COVID-19.pdf>

African leadership is essential in examining how governments should engage to improve health systems, a critical step in improving population health. African governments should make an effort to assess the return of investment of different health sector interventions, and to improve data and understand the costs, effectiveness and long-term effects of the investment on both health and economic outcomes.

2.3. How will the problems evolve?

The nature of infectious disease threats is constantly changing, with varying consequences for morbidity and mortality, as well as for social and economic outcomes. However, the major infectious diseases, such as HIV/AIDS, tuberculosis and malaria, are likely to continue causing the greatest disease burden in sub-Saharan Africa also in the near future. Infectious diseases can be combatted with different responses, ranging from clean water provision to new biomedical countermeasures.¹¹⁴ The rise of new antimicrobial resistance mechanisms is reducing the impact of previously effective treatments^{112,113,114} and the climate crisis will only worsen the situation.^{115,116}

Emerging and re-emerging infections present major challenges and represent a grave threat to global health security. As the current global health system is called into question by the current corona virus COVID-19 pandemic, and before by other outbreaks such as the Ebola outbreak, the need for diagnostics, vaccines and drugs for key infectious diseases, as well as novel approaches for rapid detection and effective response to infectious diseases outbreaks, including surveillance and control, remains as pressing as ever.

3. WHY SHOULD THE EU ACT?

3.1. Subsidiarity: Necessity of EU action

Technologies and tools for tackling infectious diseases remain insufficiently available, while there still is a significant disease burden. The EU's commitment to the Sustainable Development Agenda calls for a dedicated approach to support the achievement of SDG3, thus including support for the research and development of vaccines and medicines for infectious diseases that affect developing countries, as well as the European Member States. In the 2019 Eurostat report on the progress towards the SDGs in an EU context, it is noted that while the number of deaths due to HIV, malaria and tuberculosis decreased in the EU, deaths due to other infectious and parasitic diseases rose.¹¹⁷ In light of the **EU's commitment to achieving SDG3**, an initiative to advance a collaborative effort for global health research is deemed necessary, and it should be based on legal structure that would be most effective in reaching its objectives.

¹¹⁷ Eurostat (2019). Sustainable development in the European Union Monitoring report on progress towards the SDGs in an EU context.

The development of health technologies, especially at the late stage of clinical development, is an expensive process with **high costs and a long timeframe**, which requires large scale funding. In addition, much of the research on infectious diseases, including clinical trials, needs to be conducted in the areas where a disease is most prevalent taking into account the environmental and social context, including the capacities of the **health systems**. An underdeveloped health infrastructure does not allow vulnerable populations to benefit from newly developed health technologies, especially if they are not adapted to local circumstances and need.

The **low commercial potential** of the research and development on infectious diseases affecting sub-Saharan has discouraged private **pharmaceutical companies** to invest in this area, as their investments are based on the purchasing power of potential clients or health systems. This means that most of the support, also to cover access and capabilities, needs to be provided through **public sources**, which are very scarce in the sub-Saharan region. Moreover, this lack of investment hinders the development of the scientific leadership of African researchers.

Funding from public sources or philanthropies acting separately is not always sufficient and more international development cooperation is needed. It is crucial to **pool enough funding** for the development of these technologies among public funders in different countries and private philanthropies. There is a strong need of economies of scale, better coordination of efforts, avoiding duplications and generating synergies between public and private funders. In addition, more coordination is needed between European governments. The EU has supported the first and second EDCTP programmes that have helped to conduct clinical trials and to develop research capacity in Africa. Most importantly, they have demonstrated that working in partnership delivers. The results have shown that European and African governments can join forces with the EU around common objectives, and create an enabling environment to obtain results that individual countries, or the EU framework programme alone, could not have achieved.

For instance, in the CHAPAS consortium, five research organisations from Zambia, United Kingdom, Ireland, Spain and India, worked on combination antiretroviral formulations for first-line treatment of HIV-infected children. The consortium provided important data on first-line treatment of HIV-infected children in Africa and data to support the current WHO guidelines for first-line paediatric antiretroviral therapy. The results led to licensed combinations for treatment of children. Other type of results are those stemming from the support and coordination actions funding the four Networks of Excellence that address disparities between countries in terms of clinical research capacity. The East Africa Consortium for Clinical Research (EACCR) includes 23 research organisations from Kenya, Sudan, Ethiopia, Tanzania and Uganda. This network has achieved success in terms of capacity building, staff training and research outputs, playing a pivotal role in supporting South-South cooperation in Africa (e.g. training 281 clinicians, 33 Master students, 5 PhD, 5 Post Docs, 8 training courses, and producing 15 scientific publications).

Recent EDCTP2 support to clinical development of tuberculosis vaccines gives another example. Three Phase II multi-site clinical trials were funded. This has helped to build capacity for late stage clinical development. The next step would be a Phase III trial, which costs more than EUR 100 million. This requires even more pooling of resources from several funders and capacity for multi-centre trials. In addition, many of the diseases that the new partnership would be addressing are not only affecting sub-Saharan Africa, but also other parts of the world. In Europe, the most important problem with

tuberculosis is the high rate of antimicrobial resistance, making the infection very difficult and expensive to cure. The clinical trials conducted in sub-Saharan Africa can provide new efficient drugs and vaccines for tuberculosis that can be globally used, also in Europe.

The EDCTP2 programme has also supported more than 50 projects to strengthen the enabling environment for clinical trials and research in sub-Saharan Africa, including health systems strengthening, pharmacovigilance activities and the translation of research results into policy and practice, and supporting the establishment of functional regulatory systems and capacities for ethical review of clinical research. EDCTP is also a member of the African Medicines Regulatory Harmonisation Partnership Platform, which aims to improve coordination of regulatory systems strengthening and harmonisation activities in Africa. Moreover, EDCTP has established a long-term working relationship with WHO-AFRO, which hosts the African Vaccine Regulatory Forum (AVAREF).

It is important to continue public support to a stable, long-term cooperation that only an institutionalised partnership can offer, in order to address a market failure and the low commercial potential for the private sector to develop health technologies that are appropriate for use also in Africa. The **EU has an important role to play** in the funding and facilitating coordination of funders in this area. The strong and long-term support of the EU can provide a sustainable and well-defined funding stream, around a strategic research and innovation agenda, which would encourage Member States, sub-Saharan countries, pharmaceutical industry and other private funders to invest in this area. Therefore the intervention at EU level is necessary with an initiative that would encourage both public and private sector to invest in this area..

Around three quarters of respondents to the **structured consultation of Member States** agreed that a partnership would be more effective in achieving the objectives and delivering clear impacts for the EU and its citizens, underlying the necessity for EU action.

Among respondents to the **open public consultation**, 34 out of 47 respondents indicated that a European partnership of this kind was fully needed to be more responsive towards societal needs and to make a significant contribution to achieving the SDGs.

Interviewees across all stakeholder groups expressed similar opinions on the importance of EU action. A number of **interviewees** furthermore expressly highlighted the EU's moral responsibility to support LMICs, sometimes referring to European values of solidarity. Some interviewees also stressed the need to support Africa as an emerging economy, and an economic partner to the EU. Furthermore, interviewees regularly indicated that EU action is necessary to ensure the continuity of EU investment efforts in R&I for infectious diseases.

3.2. Subsidiarity: Added value of EU action

Coordinated and coherent EU action would help overcome the current fragmentation of research and help to put together a critical mass of organisations and the investment required to address this important global health challenge. Coordinated action will increase the impact and cost-effectiveness of European activities and investments. Moreover, the high application rate to the EU Framework Programmes¹¹⁸ shows the relevance and attractiveness of the EU support to R&I and the capacity of the EU to convene stakeholders, also in the area of infectious diseases.

¹¹⁸ Interim Evaluation of Horizon 2020, Commission Staff Working Document, SWD (2017)221 and 222

The Interim Evaluation¹¹⁹ of EDCTP2 indicated that EDCTP provides an important mechanism for joint discussions and planning, and identified that the co-leadership provided by European and African Participating States is critical to success.

The candidate initiative would facilitate collaboration and strategic response to existing and emerging infectious diseases by acting as a go-between and knowledge broker in a way that would be difficult to achieve for any national actor or initiative. Moreover, because of the strong role that EDCTP has already played in the global health research arena since its establishment in 2003,¹²⁰ the new initiative would have a competitive advantage by building upon the success of EDCTP.

During EDCTP2 several European Participating States have contributed to calls for proposals launched by EDCTP with EU funding, increasing the number of projects that could be financed and the chances to better tackle the challenges. However, pooling of funding across participating states has been one of the weaker areas until now. The new initiative will revise the mechanism to facilitate alignment of funding around a strategic research and innovation agenda.

The Interim Evaluation found uneven leadership and gaps in joint leadership among European Participating States, and has recommended that additional efforts need to be done. The Participating States Initiated Activities, initially intended to provide a mechanism for synergistic activities among European Participating States, however to be more effective, this mechanism should be revised.

Sub-Saharan African countries are strong stakeholders of EDCTP, and the new initiative would offer a good platform for better pooling of resources and deepened interaction between the European and African countries.

The **Interim Evaluation** identified efforts and successes to exploit synergies with other EU policy directions. However, the Panel advised that the EDCTP Strategic Research Agenda should include explicit strategic direction with respect to collaborative partnerships that would purposefully exploit synergies with other EU policies. To achieve value-add of EDCTP2 and to align efforts of EDCTP2 with other significant global funders and with politically driven goals and directions, the EDCTP2 Interim Evaluation Panel recommended that EDCTP should develop a strategic policy plan and catalyse the development and strengthening of national health research plans especially for African Participating States.

Interviewees almost unanimously stress the added value of EU investments because of the ability to support large-scale activities, going beyond the remits of national research funders. In addition, some interviewees note that having a dedicated initiative can incentivise additional funding for infectious disease research from national funders and other funding bodies (such as charitable foundations).

4. OBJECTIVES: WHAT IS TO BE ACHIEVED?

4.1. General objectives of the initiative

Based on the problems described in Section 2, the following general objectives have been identified for an initiative supporting an EU-Africa Global Health partnership:

¹¹⁹ https://ec.europa.eu/research/evaluations/pdf/edctp2_evaluation_experts_report_2017.pdf

¹²⁰ http://ec.europa.eu/research/evaluations/pdf/edctp2_evaluation_experts_report_2017.pdf

- To reduce the socio-economic burden of infectious diseases in sub-Saharan Africa through the development and uptake of new or improved health technologies against infectious diseases;
- To increase health security in sub-Saharan Africa and globally by strengthening the R&I-based capacities for preparedness and response to control infectious diseases.

These general objectives are directly aligned with SDG3.3 ‘By 2030, end the epidemics of AIDS, tuberculosis, malaria and neglected tropical diseases and combat hepatitis, water-borne diseases and other infectious diseases’ and SDG3.B ‘Support the research and development of vaccines and medicines for the communicable [...] diseases that primarily affect developing countries, [...]’. Likewise, these objectives need to be interpreted in the context of resilience and health systems strengthening. Ultimately, they also support the general objectives of Horizon Europe, in particular that of tackling global challenges, including the SDGs.

An initiative in this area would mainly focus on conducting clinical trials in the field of infectious diseases and building clinical research capacity in sub-Saharan Africa.

Both in the structured open consultation of Member States and in the dedicated interviews performed for the study supporting this impact assessment,¹²¹ some respondents have argued that whilst a focus on diseases affecting sub-Saharan Africa is appropriate, this should not exclude the possibility of supporting activities that are outside of the region when they are relevant to sub-Saharan Africa. This could include the ability to support large multi-centre clinical trials, with some of the trial sites located both in Africa and, for example, in Asia or Latin America. This concerns also the objective to contribute to the control of (re-)emerging infectious diseases, of relevance in sub-Saharan Africa, with global impacts.

The large majority of **interviewees**, regardless of the stakeholder group they represent, support the outlined general objectives for the candidate initiative. Interviewees also acknowledge the rise of non-communicable diseases in Africa and see many ways in which the candidate initiative could address them. However, they also state that maintaining the focus on infectious diseases is essential to ensure that research funding is adequate and can lead to substantial progress.

The **specific consultation of African countries** reflected that for the African countries the most important objectives of the current EDCTP2 were: increasing the number of new or improved medical interventions for HIV/AIDS, tuberculosis, malaria and other poverty-related diseases, including neglected ones; and strengthening cooperation with sub-Saharan African countries, in particular on building their capacity for conducting and interpreting clinical trials. The study also reflected the importance of contributing to the regional and global health research agenda and informing about the most appropriate products and interventions for health security.

4.2. Specific objectives

In order to achieve the general objectives, four specific objectives, which respond to each of the problem drivers discussed in Section 2.2, have been identified together with indicative targets:¹²²

¹²¹ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

¹²² Indicative targets based on the experience of the EDCTP2 programmes and if the initiative could have a similar budget size as of the EDCTP2 programme.

1. Advance the development and use of new or improved health technologies for tackling infectious diseases by supporting the conduct of clinical trials in sub-Saharan Africa.
 - Target: by the end of the initiative to have progressed to license at least two new or improved health technologies in the field of infectious diseases; to deliver evidence to be able to issue 30 guidelines for improved or extended use of existing health technologies; and to have progressed the clinical development of approximately 30 candidate health technologies.

2. Facilitate better alignment of R&I funders around a common strategic research and innovation agenda to increase the cost-effectiveness of European public investments.
 - Target: by the end of the initiative to have launched joint actions with other public and private funders, and increased the budget of the joint actions to at least EUR 500 million compared to EUR 300 million under EDCTP2.

3. Strengthen research and innovation capacity and the national health research systems¹²³ in sub-Saharan Africa for tackling infectious diseases.
 - Target: by the end of the initiative to have supported at least 50 coordination and support actions and at least 250 fellowships, reinforcing the environment for conducting clinical trials in sub-Saharan countries, and in compliance with fundamental ethical principles and relevant national, Union and international legislation.

4. Strengthen capacity in sub-Saharan Africa for epidemic preparedness through effective and rapid research response to develop essential diagnostics, vaccines and therapeutics for early detection and control of (re-)emerging diseases of epidemic potential.
 - Target: by the end of the initiative to have strengthened the preparedness of 100 research institutes in at least 30 sub-Saharan countries for an effective and rapid research response to develop essential diagnostics, vaccines and therapeutics to tackle re-emerging epidemics in accordance to international health regulations.

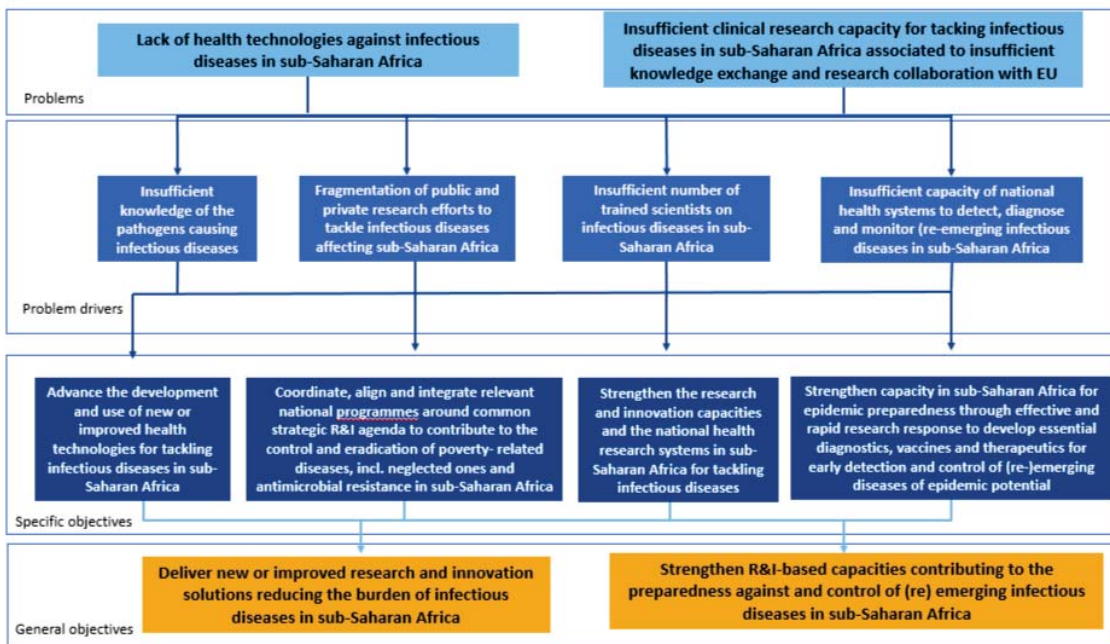

The research priorities should be established in an objective-orientated manner in order to accelerate results and contribute to the control and eradication of poverty- related diseases, including neglected ones, (re-)emerging epidemics, antimicrobial resistance and co-morbidities in sub-Saharan Africa.

4.3. Intervention logic of the initiative

The relationship between the general and specific objectives of the potential initiative is shown in Figure 8.

Figure 8: Intervention logic for the initiative EU-Africa Global Health

¹²³ Following the WHO-AFRO Research for Health: a Strategy for the African Region, 2016-2025
<https://www.afro.who.int/publications/research-health-strategy-african-region-2016-2025>

The lack of health technologies, the fragmentation of the research efforts, the insufficient research capacity for tackling infectious diseases in sub-Saharan Africa, and the insufficient capacity of the sub-Saharan Africa national health systems to detect, diagnose, and monitor emerging infectious diseases, are to a large extent consequence of the insufficient knowledge of the pathogens causing the diseases, the fragmentation of the research funding efforts, the insufficient number of trained scientists in sub-Saharan Africa, and the insufficient R&I capacity of the national health systems in these countries.

The partnership will address the problem drivers by advancing the development of new or improved health technologies in sub-Saharan Africa, facilitating the alignment of the different R&I funders in the region, strengthening the R&I capacities of the national health research systems in sub-Saharan Africa and the preparedness capacity for a rapid R&I response to develop essential diagnostics, vaccines and therapeutics for early detection and control epidemics, which are the specific objectives of the initiative. To reach such ambitious objectives the partnership will need to involve as many partners as possible, from both, public and private sectors, and that all of the partners can commit for a long period of time.

How would success look like?

Should the initiative deliver on its specific objectives, it is expected that it would translate into practise the following impacts:

Scientific impacts

If successful, the initiative is expected to demonstrate various types of scientific impacts:

- Strengthened EU scientific excellence in clinical research for infectious diseases;
- Increased scientific leadership of sub-Saharan Africa in the infectious diseases field;
- Increased research response capacity to control of (re-)emerging epidemics in sub-Saharan Africa;

- Increased evidence base for national and international health policy-making (bridging the gap between science and policy for health).

Economic/technological impacts

If successful, the initiative is expected to demonstrate a set of economic/technological impacts:

- Increased research capacity of institutions in sub-Saharan Africa to design, conduct and manage infectious disease research projects;
- Higher capacity of the research institutions to attract funding;
- Increased industry participation in research projects in sub-Saharan Africa;
- Increased number of employed researchers in sub-Saharan Africa.

Societal impacts

If successful, the initiative is expected to demonstrate a set of societal impacts:

- Higher retention of scientific talent in sub-Saharan Africa;
- Increased uptake of new or improved health technologies;
- Increased gender equality (Tropical diseases can disproportionately affect and disadvantage women),¹²⁴ increasing the protection of the fundamental rights.

The initiative can contribute to better living conditions in sub-Saharan Africa, particularly by increasing and building the capacity of the health research systems and addressing issues affecting vulnerable populations (e.g. women and children).

As the initiative is expected to contribute to reduce disease burden in sub-Saharan Africa and increase employment opportunities, these will also have an impact on poverty reduction and will have a direct effect on an individual's quality of life and social opportunities.

Because it is intended to accelerate the development and production of new health technologies, including pharmaceutical products, the initiative has the potential for negative environmental impacts resulting from pharmaceutical production. Pharmaceutical pollution forms a significant threat to population health and ecosystems globally.¹²⁵ On the other hand, this risk would be mitigated with the aim of the new initiative to use new appropriate technologies with a reduced risk to the environment.

Interviewees across different stakeholder groups expect that the Initiative will have the ability to create impact in the societal domains, particularly through improving access to medicines, reducing disease burden, and encouraging development of the African scientific leadership.

¹²⁴ Uniting to Combat Neglected Tropical Diseases (2016). Neglected tropical diseases: women and girls in focus. Summary report of meeting held on July 27-28, 2016 in London, UK. Available at: https://unitingtocombatntds.org/wp-content/uploads/2017/11/women_and_girls_in_focus_english.pdf

4.4. What is needed to achieve the objectives – Key functionalities needed

Given the focus of the impact assessment on comparing different forms of implementation, the identification of "key functionalities needed" allows making the transition between the definition of the objectives and what would be crucial to achieve them in terms of implementation. These functionalities relate to the type and composition of actors that have to be involved, the type of range of activities that should be performed, the degree of directionality needed and the linkages needed with the external environment. These functionalities have an important influence on the type of partnership that will be selected from a number of options.

Type and composition of the actors to be involved

The partnership will harness the investments of the EU, the EU Member States and Associated States to the Framework Programme and African countries. In addition, for specific trials or diseases, philanthropies, industry and other third countries will join and contribute to the partnership.

The motivation for the **EU, European and African countries** comes mainly from the successes of EDCTP and EDCTP2 partnerships. These partnerships have shown that European and African governments can join forces with the EU around common objectives, creating an environment within which results were achieved that individual countries or the EU research framework programme alone, would not have managed to obtain. The governance of EDCTP2 is based on an EDCTP Association that provides meaningful participation and involvement of the sub-Saharan countries in the decision-making, essential for tackling the burden of diseases in sub-Saharan countries.

For example, EDCTP PREGACT studies have generated key evidence on malaria treatments for pregnant women who are particularly susceptible to malaria. These studies involved several countries in Africa: Burkina Faso, Ghana, Malawi and Zambia, (to be able to better study exposure) and several partners in Europe: Austria, Belgium, The Netherlands and United Kingdom, harnessing the necessary multidisciplinary teams to study such a complex disease as malaria and transfer knowledge to African scientists.

In addition, to further leverage larger and sustained funding and to play a stronger global health leadership than the current EDCTP2, the candidate partnership should be able to answer to the emerging infectious diseases threats, exacerbated by the COVID-19 pandemic, and to the ever increasing problem of antimicrobial resistance and comorbidities with non-communicable diseases, requiring to coordinate with other funders¹²⁶ and to speed up research by harnessing different investments. Therefore, the initiative should include other international research funders, such as the philanthropies and pharma industry as contributors that will contribute to the partnership on *ad hoc basis*. Based on this ambition, the new global health partnership should evolve from EDCTP2 framework to be more inclusive and to have a broader base of funding from partners, which the EU funding can also match.

Philanthropies, such as the Bill and Melinda Gates Foundation or Wellcome Trust, have realised that alone they cannot bear the costs of late stage clinical trials for the development of medicines or vaccine for poverty related diseases (e.g. phase IV of the

¹²⁶ As recommended by the Evaluation of the impact of the European Union's research funding for poverty-related and neglected diseases – Lessons from EU research funding (1998-2013) <https://op.europa.eu/en/publication-detail/-/publication/1f324128-a4c1-11e7-837e-01aa75ed71a1/language-en>

RTS,S malaria vaccine candidate) and they are therefore seeking partners to join forces with. These philanthropies have flexibility in their investments and can act speedily when new developments emerge or in the case of a public health emergency.

The Ebola epidemics in West Africa and the Democratic Republic of Congo have contributed to raise the interest of the **pharma industry** and vaccine in investing in infectious diseases threats affecting Africa and they are actively reaching out to potential partners. Also, for some of these industries, investing in research that is relevant to Africa is part of their corporate social responsibility (e.g. Johnson & Johnson,¹²⁷ GSK¹²⁸) with a commitment to fair pricing. Including pharma industry in the partnership will also allow to produce at scale and cover the whole value chain. While industry has already taken part in some projects under EDCTP2, the limitations were that it was done on an ad hoc basis for a specific disease, and no forward looking dialogue to plan for potential further investments. The industry that would participate in this partnership, is the industry that has a research agenda that is relevant to infectious diseases in low and middle income countries. This is to be seen in contrast to the proposed Innovative Health Initiative partnership that focuses on research on 'integrated' product development that will help transform health systems in Europe, explicitly integrating the pharma, med tech and digital industries.

The current COVID-19 pandemic and the ongoing EU led Coronavirus Global Response pledge¹²⁹ illustrate the need for the public sector, philanthropies and the industry to join forces to combat infectious threats effectively. All these partners working around the same strategic research agenda are seeking partners for cooperation so that they jointly can support larger clinical trials as well as fund research capacity building more efficiently, therefore achieving greater the impact.

Other essential stakeholders such as researchers, scientific leaders and clinical product development experts, product development partnerships, that have often been crucial for ensuring the final development of products and their delivery of to the market,¹³⁰ and national and international institutions focused on infectious disease research (e.g. WHO-TDR, GHIT¹³¹), etc., will also participate but through calls for proposals, projects, consultative groups, etc.

The **Interim Evaluation of EDCTP2** recommended that, based on a thorough analysis of existing programmes and active international funders, EDCTP and the EC should jointly explore the opportunities where synergies can be leveraged, and complementary programmes aligned for greater impact and reach. Furthermore it recommended that EDCTP should develop and/or mobilize a mechanism to attain strategic partnerships.

The EDCTP2 **Interim Evaluation Panel** recommended that in order to reach its full potential and ambitious goals, EDCTP should assume a position as a proactive key strategic player and change agent in sub-Saharan Africa. This effort will require a reinvigorated strategic approach not only by EDCTP management but also by the Participating States and the EC. The Participating States should enhance the executive and political level of EDCTP General Assembly representatives and ensure that representatives are clear on their responsibility to report

¹³⁰ The Initiative on Public-Private Partnerships for Health, Global Forum for Health Research (2004). Combating Diseases Associated with Poverty - Financing Strategies for Product Development and the Potential Role of Public-Private Partnerships. Available at: <http://www.who.int/intellectualproperty/topics/ppp/en/CombatingDiseases-Abridged.pdf>

¹³¹ The Global Health Innovative Technology (GHIT) Fund focuses on investments in the discovery and development of medicines, diagnostics and vaccines (referred to as health technologies) for TB, malaria, NTDs and other diseases. The GHIT Fund supports partnerships and identifies global opportunities for collaboration with Japanese organizations involved in the R&D of global health technologies.

back to their respective government agencies that have the mandate to deliver on their governments' commitment to EDCTP.

In the **specific consultation of African countries**, 94 (81.7%) of the 115 responders indicated that EDCTP3/GHP can benefit from extending membership to the private sector including industry and foundations. However, the majority of the responders thought it was a highly risky venture. The main risks identified relate to conflicts of interest and loss of control.

Type and range of activities needed

The candidate initiative should first and foremost be an instrument for funding **collaborative research and innovation actions**, in particular, those focused on the clinical development of health technologies for prevention, diagnosis and treatment of infectious diseases affecting sub-Saharan Africa, as well as supporting the portfolio approach.

The candidate initiative should also play a significant role in the strengthening of research capacity in sub-Saharan Africa. For this, it needs to fund **coordination and support actions** that allow for, among other things, creation and strengthening of networks of excellence, supporting the **career development and scientific leadership** of African researchers, actions to support **knowledge dissemination**.

All stakeholders indicate that funding and implementation of research and innovation actions should be the primary focus of the initiative. Stakeholders view late-stage clinical trials as the primary area, where initiative can deliver direct impacts, while lower, in financial terms, share of the investment should be directed at capacity building activities.

The **EDCTP2 Interim Evaluation Panel** recommended adopting a portfolio approach in order to use its funding instruments (including competitive calls) more strategically, to enhance the value-add of EDCTP and maximize impact. The Panel viewed the EDCTP regional networks as a critical element of institutional capacity in sub-Saharan Africa. The strategic role of the EDCTP regional networks should be broadened and clearly defined. To support the networks in achieving this next phase of their evolution, the level of funding for networks should increase.

The **EDCTP2 Interim Evaluation Panel** recommended to adopt a more comprehensive and catalytic funding approach for supporting the career path of young talented African investigators and to build African scientific leadership. Particular attention should be paid to gender balance, and assess opportunities in this area to strategically align with other funders and programmes on career development.

The **specific consultation of African countries** revealed that clinical epidemiology activities should also be included in the follow up programme. This consultation also stressed the lessons learned from the COVID-19 pandemic with the critical role played by the regional entities, like Africa CDC and WHO-AFRO as well as the EDCTP Regional Networks of Excellence, for managing public health emergencies.

Directionality and additionality required

Directionality

One of the drivers for the current lack of health technologies for tackling infectious disease is the fragmentation of research and innovation efforts in this field. A jointly agreed **strategic research and innovation agenda** is therefore needed so that the shared vision aligns with the individual goals of the members of the partnership, and so that all actors have a clear understanding of how the various elements of the initiative will fit

together in a coherent manner, building commitment and trust and contributing to reaching the jointly agreed objective and thus impacts. The strategic vision should be shared and implemented as much as possible by the key stakeholders along the whole value chain.

The candidate initiative thus has an important role to play in bringing together different actors and aligning their efforts around a common strategic vision and research agenda, reducing duplication of efforts. To be able to do so, there is the need to have a credible and strong position within the stakeholder landscape. EDCTP is already widely recognized as a key player, as confirmed by various stakeholders throughout the consultation and evident in the substantial research output to which it has contributed. Therefore, a new initiative, building on EDCTP2 would have real potential to further focus and strengthen the measures of various countries and organisations towards common global health goals.

Although EDCTP has positioned itself as a key research funder and contributor to the global health research agenda, it could better align its partners' national efforts. Most of the contributions by the Participating States have been delivered in-kind, through Participating States' Initiated Activities.¹³² At present, these activities need to be in line with the overarching objectives of EDCTP, to be included in the EDCTP2 Annual Work Plans and, once they are executed, to be formally approved by the EC, before their value can be matched from the EU budget. As currently there is no compulsory requirement for the Participating States to align each other's activities, as a result there have been problems in terms of directionality and duplications of efforts from the national funding schemes. Therefore in the future partnership, the Participating States would need to demonstrate upfront the added value of being part of the initiative for their activities to be eligible for matching the EU funding.

The **EDCTP2 Interim Evaluation Panel** recommended that a strategic policy plan needs to be urgently developed. As a high priority, EDCTP should catalyse the development and strengthening of national health research plans especially for African Participating States.

Additionality

Being part of the partnership must be viewed as an added value by the countries. As even countries that are not part of the EDCTP Association have been able to participate in all EDCTP-supported activities, there has been limited incentive for formal commitment and alignment of national activities. Therefore, the establishment of an effective partnership arrangement among Participating States to incentivise participation needs to be further developed. Targeted or restricted calls for specific challenges should be further explored.

As a potential incentive, the **Interim Evaluation** suggested that EDCTP country membership should be a requirement for their legal entities applying to EDCTP calls.

The EU contribution is expected to mobilise an additional (at least 100%) funding from Member States and Associated States to the Framework programme, as well as third countries, private funders and industry contribution (in-kind or financial). This type of commitment to pool resources only happens beyond the scope of individual projects and requires long-term predictability and commitment to the jointly accepted strategic research agenda. Thanks to these additional resources, the initiative will ensure the

¹³² EDCTP Annual Report 2019 <http://www.edctp.org/publication/edctp-annual-report-2019/>

necessary leverage to be able to successfully tackle its objectives and deliver on its impacts.

To be able to set up the partnership and reach the expected impact, it will be necessary to reach a level of financing similar to the one under the current EDCTP2.¹³³ The EU contribution should be at least EUR 700 million with contribution from the partners at least at the same level.

The future partnership with its proposed additional focus on (re) emerging infectious diseases is extremely relevant, also post COVID-19 pandemic, as epidemics are likely to occur more and more often.¹³⁴ There is of course a certain level of uncertainty around Member States and African countries, philanthropies and industry's capacity to commit sizeable amounts, seeing the economic impact of the COVID-19 pandemic. Should fewer resources become available, strategic prioritisation will need to be made on the thematic scope and coverage. This would happen at the level of the annual work programme to be co-developed with the stakeholders.

A number of **interviewees** have pointed out the importance of ensuring alignment with other initiatives and programmes in the field of global health and infectious disease. However, they do so mostly in rather general terms rather than by singling out specific areas or initiatives.

Interviewees questioned what can be done to increase the incentives to participate and to increase the leveraging effect for the candidate partnership. Some have suggested that certain activities should be accessible only to active participants in the partnership. The Interim Evaluation Panel suggested that only legal entities in participating countries should be eligible for funding.

The **EDCTP2 Interim Evaluation** recommended that EDCTP will need to understand the goals and priorities of Participating States and work with them to align EDCTP strategy and programmes. EDCTP should thus actively support the Participating States in developing their own national research agendas.

The Interim Evaluation also found that the capacity for active participation in the EDCTP program varies significantly across sub-Saharan Africa. It is important to ensure a more equitable distribution of EDCTP activities and investments so the benefits of EDCTP impact weaker institutions and regions. A strategy must be developed to incentivise wealthier African Participating States to engage with less resourceful African nations in all EDCTP activities.

Moreover, EDCTP should initiate a process for in-depth analysis of the outcome of the activities initiated by the Participating States in order to identify synergies, gaps and overlaps. These activities should be prospectively and strategically integrated with EDCTP programmes and calls in order to minimize gaps. In addition, they should be strategically integrated among themselves to efficiently maximize their impact. EDCTP and the EC should jointly modify the entire process around the Participating States Initiated Activities (which are the countries' in-kind contributions to the partnership) to improve efficiency and to enhance impact. The aims of these activities must be articulated with consideration given to how they can be used to enhance strategic value-add of both EDCTP and the Participating States. A more efficient way to bring in the Participating States' engagement in EDCTP, and to effectively obtain the co-funding that is conditional to the EU co-funding, should be developed.

¹³³ At present EDCTP2 has the EU contribution of €683M plus the same amount €683M from the Participating States.

¹³⁴ <https://www.ncbi.nlm.nih.gov/pubmed/27318484> Nazir et al. Airborne biological hazards and urban transport infrastructure: current challenges and future directions (2016); Duane J. Gluber Dengue, Urbanization and Globalization: The Unholy Trinity of the 21st Century (2011)

Coherence needed with the internal and external environment

Due to its versatility and cross-sectoral integration, the candidate EU-Africa Global Health Partnership should be managed through close collaboration with other programmes and initiatives to create synergies and limit duplications. It is essential to design administrative mechanisms to appropriately address these synergies and complementarities.

The initiative, that promotes clinical research on infectious diseases in sub-Saharan Africa, would have some areas of common interest, with Horizon Europe work programmes and other EU initiatives or programmes with shared objectives to enable effective prevention, diagnosis and treatment of diseases and to facilitate the uptake of new interventions, in the field of infectious diseases.

In Horizon Europe, health is one of the six Horizon Europe clusters under the Pillar II addressing global challenges and industrial competitiveness through targeted funding of collaborative R&I projects. Cross-cluster research on antimicrobial resistance is expected with the future partnership on One Health Antimicrobial Resistance, focused on animal health and its interaction with human health.¹³⁵ Within Cluster Health, a very relevant candidate partnership is the One Health AMR, which aims at facilitating the fight against the rise of antimicrobial resistance by coordinating activities and facilitate national coherence between different services and ministries with responsibility for the various aspects of AMR (e.g. human and animal health, agriculture, environment, industry, finances, etc).

In addition, the Innovative Health Initiative,¹³⁶ is expected to contribute to advance the development and uptake of health care technologies and innovations to help transform health systems, mainly in Europe. Some solutions developed under IHI, for example those related to novel health technologies to address infectious diseases or new and validated methods for conducting clinical trials, could be relevant for the EU-Africa Global Health partnership. In addition, methods developed under the candidate public-public partnership on Health and Care Systems Transformation, aiming to facilitate the uptake of those solutions into health care systems¹³⁷ might be appropriate for sub-Saharan Africa.

Beyond Cluster Health, the proposed partnership on Key Digital Technologies (successor of ECSEL JU¹³⁸), could provide access to the latest digital technologies and data-driven tools, applicable to several fields. Some of them could prove essential for IHI and GHP/EDCTP3 due to the key role of health data for innovative, integrated health technologies. Another instrument with shared interests in infectious diseases is the InnovFinID¹³⁹ and the future EuropeInvest of the European Investment Bank that foresee support through loans in the infectious diseases area.

¹³⁵ https://ec.europa.eu/health/amr/antimicrobial-resistance_en

¹³⁶ <https://ec.europa.eu/info/law/better-regulation/have-your-say/initiatives/11906-European-Partnership-for-innovative-health>

¹³⁷ It is important to emphasise that solutions proposed by IHI would be concrete goods or services (e.g. medicines, diagnostics, medical devices incl. digital tools etc) rather than organisational solutions. Organisational processes will be in the remit of health care authorities/organisations to consider whether and how these could be deployed in the best way.

¹³⁸ <https://www.ecsel.eu/>

¹³⁹ <https://www.eib.org/en/products/blending/innovfin/products/infectious-diseases.htm>

Potential initiatives in the Health cluster, where complementarities and interconnections are expected, both in terms of research topics covered and stakeholders involved are shown in the Figure 9 below.

Figure 9: EU initiatives related to the SDG 3

The problems that the candidate initiative would address are highly complex and are set in the context of weak health systems and institutions for the delivery of health care. This was particularly evident in the devastating 2014–2016 Ebola Virus Epidemic in West Africa.¹⁴⁰

The candidate partnership aims to support the research and the strengthening of the health research systems in sub-Saharan Africa, and will need to seek for synergies with the EU programmes and initiatives that aim to build resilient and responsive health systems and to implement the International Health Regulations in the region, so that health innovations can be accessible to the poorest populations. The development aid is to be provided through the EU instruments of the Development Cooperation and External Action, the future European Neighbourhood, Development and International Cooperation Instrument,¹⁴¹ the Universal Health Coverage Partnership¹⁴² and other initiatives in the region, including the support to global initiatives such as The Global Fund,¹⁴³ GAVI the Vaccine Alliance¹⁴⁴ and the Global Financing Facility.¹⁴⁵

These instruments also support health systems in case of public health emergencies by fast-tracking approval and subsidizing their delivery in countries once a health

¹⁴⁰ WHO. 2020. Ebola virus disease. <https://www.afro.who.int/health-topics/ebola-virus-disease>

¹⁴¹ https://ec.europa.eu/commission/publications/neighbourhood-and-world_en

¹⁴² <https://www.uhpartnership.net/>

¹⁴³ <https://www.theglobalfund.org/en/>

¹⁴⁴ <https://www.gavi.org/>

¹⁴⁵ <https://www.globalfinancingfacility.org/>

technology is available, strengthening regional health security organisations and supporting epidemiological surveillance. The EU Emergency Trust Funds,¹⁴⁶ provides emergency medical assistance and support in basic health services to irregular migration and displaced persons in Africa.

The support will be done in a coordinated fashion with the European Centre for Disease Prevention and Control (ECDC) and the African CDC (ACDC), both in human capital (doctors, nurses, community health workers, technicians etc.) and in infrastructures (hospitals, equipment, vehicles etc.), which are necessary. In case of outbreaks, the initiative will also contribute and take into account the recommendations of GloPID-R,¹⁴⁷ the unique international network of the major research funding organizations to facilitate a rapid and effective research response.

Whilst development of new health technologies is essential, they cannot be used unless they are authorized for use where they are needed. The regulatory capacity in Africa for assessment and approval of medicines, as well as for conducting post-authorisation pharmacovigilance is still weak. Here, the recently established African Medicines Agency (AMA) will have an important role to play and the initiative will contribute to it through the regulatory capacity building and through interactions with AMA and other agencies, such as the European Medicines Agency (EMA) and the US Food and Drug Administration (US FDA).

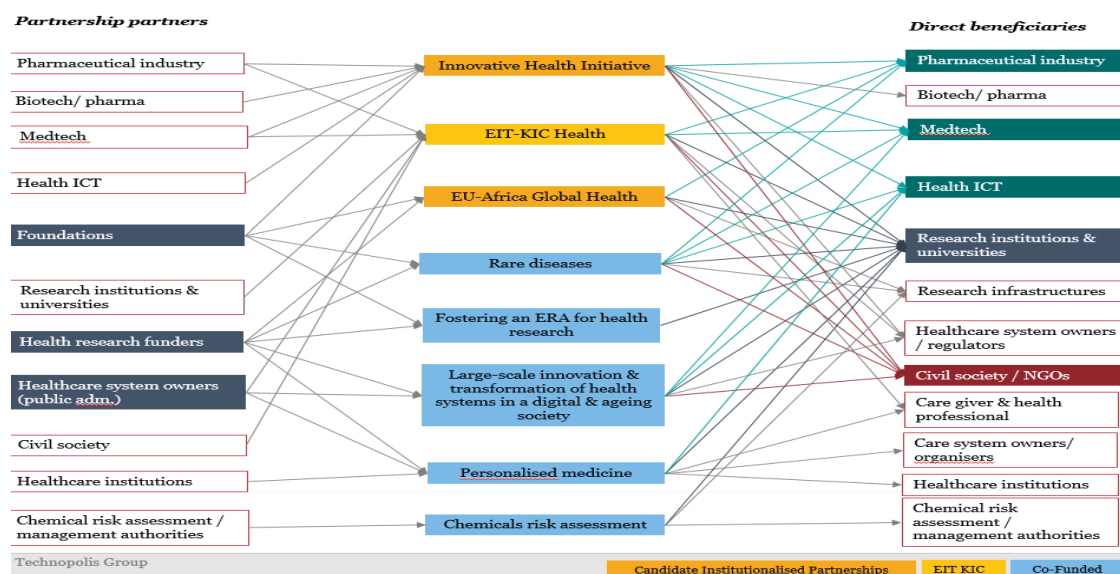

The candidate initiative will need to actively pursue synergies through consultative mechanisms or partnering on ad-hoc basis with other initiatives or programmes taken by other funders with shared objectives to enable effective prevention, diagnosis and treatment of diseases and to facilitate the uptake of new interventions (Figure 10). Therefore, it is important to position the candidate initiative clearly in the global health spectrum to avoid duplications. This initiative will be focused on clinical development and uptake of health technologies addressing infectious diseases affecting sub-Saharan Africa.

The **EDCTP2 Interim Evaluation Panel** recommended that the EU would benefit by having a high level strategy across programmes and policies to facilitate alignment, coordination and collaboration where opportunities exist. This approach would be most effective with the appointment of a specific coordinator responsible for coherence among EU initiatives and policies. The communication role within EDCTP will require considerable networking and coordination across Participating States to identify synergies and to achieve better alignment and coordination with their clinical research activities in sub-Saharan Africa.

¹⁴⁶ https://ec.europa.eu/trustfundforafrica/index_en

¹⁴⁷ <https://www.glopid-r.org/>

Figure 10: Potential synergies with the stakeholders of the EU-Africa Global Health Partnership candidate

As in the case of internal coherence, **interviewees widely agree** that the candidate partnership should coordinate its efforts with other key stakeholders in the field, often without being specific. Some have noted a proliferation of initiatives, some of which appear to share focal areas with the candidate partnership. In addition to EU programmes and initiatives, specific examples include the Coalition for Epidemic Preparedness Innovations, and the Bill & Melinda Gates Foundation. These interviewees indicated that it will be important for the candidate partnership to clearly position itself in relation to these other initiatives and funders and, where applicable, coordinate activities.

The **EDCTP2 Interim Evaluation** recommended that EDCTP and the EC should jointly explore the opportunities where synergies can be leveraged, and complementary programmes aligned for greater impact and reach. In addition, EDCTP should develop and/or mobilize a mechanism to attain strategic partnerships and current communication strategy to become more focused on building relationships and dialogue with Participating States governments and European and International funders and stakeholders.

The **EDCTP2 Interim Evaluation** also recommended that the function of strategic communication and advocacy within EDCTP should be elevated to the highest level of leadership. Closer coordination and planning between the EC leadership and the EDCTP Secretariat and General Assembly will also help to achieve the level of communication and advocacy needed. These coordinated leadership roles will require a mind-set change across organizations and individual leaders.

5. WHAT ARE THE AVAILABLE POLICY OPTIONS?

This section describes the specific functionalities that could be provided under the baseline scenario of traditional calls and the different options of different types of European partnerships.

5.1. What is the baseline from which options are assessed?

Baseline: Traditional calls under the Framework Programme

The baseline scenario used in this impact assessment is a situation without a Partnership, where traditional calls under the Framework Programme, Horizon Europe, are the means

to award grants. Given that there is a predecessor Partnership, the current EDCTP, as well as other funders in the area, most probably will continue collaborations, even if to a lesser extent, generating outputs and results of relevance even in the absence of a new Partnership. It is expected that these already existing initiatives will still have an impact on the burden of infectious diseases. This is taken into account in the effectiveness assessment of the baseline.

In parallel, the baseline option means that the current implementation structure of the Article 185 would be closed, which bears winding down and social discontinuation costs. Traditional calls would represent financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is taken into account in the efficiency assessment.

The closing down of the current EDCTP2 programme is shown in Figure 11. The last EDCTP2 calls, launched during 2020, take into consideration the need to wind down, asking for a shorter duration of projects.

Figure 11: Predicted attrition of EDCTP2 projects (2019-2024)

Notes: RIA: Research and Innovation Actions; CSA: Coordination and Support Actions; TMA: Training and Mobility Actions.

It will be important to take into consideration in this projection another consequence of COVID-19 pandemic and its confinement measures: many of these projects will be obliged to extend their duration by half a year in order to be able to execute them as planned.

Table 2: Key characteristics of the baseline - Traditional calls

Functionalities of option	Key characteristics of Traditional calls
Enabling appropriate profile of participation	Partners: There are no partners, and no common set of actors that engage in planning and implementation Priority setting: open to all, part of Horizon Europe Strategic planning. Given the broad range of activities, the Commission would need to consult with a large group of stakeholders, both from Europe and Africa, to develop the Horizon Europe annual work programmes.

	<p>Participation in R&I activities: fully open in line with standard Horizon Europe rules No common set of actors that engage in planning and implementation. Participation in traditional calls is open to any Horizon Europe eligible legal entity within a consortium. This includes research organisations in Africa, although these are not automatically eligible for funding.</p>
Supporting implementation of R&I agenda	<p>Activities: Horizon Europe standards that allow broad range of individual actions. Calls for proposals would be published in the work programmes of Horizon Europe.</p> <p>No additional activities and investments outside the funded projects. Implementation would rely on standard infrastructure underpinning the open calls procedure, drawing on resources of the Commission or relevant executive agency and Commission IT systems</p> <p>No systemic approach beyond individual actions. Transparency and open publication of results would ensure their availability to all interested parties.</p>
Ensuring alignment with R&I agenda	<p>Priority setting: Strategic Plan and annual work programmes, covering max. 4 years. Strategic programming and the research agenda would be defined by the European Commission via co-creation, with the support of an advisory group and the programme committee. Work programmes would need to reflect the requirement for R&I activity across the health technologies clinical development, with input from representatives of all relevant stakeholders.</p> <p>Limitations: Fully taking into account existing or to be developed SRRIA/ roadmap</p>
Securing effective leveraging of resources	<p>Internal coherence between different parts of the Annual Work programme can be ensured by the Commission. This option does not require upfront determination of a budgetary EU envelope.</p> <p>External coherence limited for other Union programmes, no synergies with national/regional programmes and activities.</p>
Key differences compared to the current situation	<p>Under the current EDCTP2 programme, which is based on Article 185, the EU contributes for ten years to a programme gathering Member States and African countries in an EDCTP Association, where all the countries have voting rights, around a common strategic agenda. A dedicated structure based on the Association and a Secretariat implements the programme and aligns the national activities under the scope of the programme. The EU is matching the European Participating States contributions to the EDCTP2 Programme.</p> <p>With traditional calls under Horizon Europe, there is no common set of actors nor a long-term commitment as the maximum duration of a SRRIA or roadmap would be 4 years. The baseline does not foresee a dedicated implementing structure to help leveraging resources.</p>

5.2. Description of the European Partnership policy options

Option 1 – Co-programmed European Partnership

The co-programmed partnership is based on a Memorandum of Understanding of the partners (the EU, Member and Associated States, African countries and/or other Third countries), or another non-legally binding contractual agreement, around a common strategic research and innovation agenda. The contributions may be financial or in-kind, and any financial risks would be covered by the parties' own contributions to the partnership. The EU calls would be published through the Horizon Europe Work Programme. A co-programmed partnership does not require a separate legislative procedure, and the EU budget is managed by the EC or an EC executive agency.

Table 3: Key characteristics of Option 1 – Co-programmed

Functionalities	Key characteristics of Option 1 – Co-programmed
-----------------	---

of option	
Enabling appropriate profile of participation	<p>Partners: Suitable for all types: private and/or public partners, philanthropies. Based on a declaration of intentions, the co-programmed option enables participation from any kind of partner; EU Member States and Associated States to the Framework Programme, as well as African countries, charitable foundations and the pharmaceutical industry. The composition of partners can change over time, allowing for flexibility and adaptation to emerging needs and priorities in the global health arena</p> <p>Priority setting: Driven by partners, open stakeholder consultation, MS in comitology</p> <p>Participation in R&I activities: fully open in line with standard Horizon Europe rules; the relationships built under the current EDCTP can be maintained.</p>
Supporting implementation of R&I agenda	<p>Activities: Horizon Europe standard actions that allow broad range of individual actions, support to market, regulatory or policy/ societal uptake. The co-programmed partnership allows the Commission to launch collaborative R&I actions, coordination and support actions, and training actions towards a common strategic agenda launched through the Horizon Europe annual work programme</p> <p>Additionality: Activities/investments of partners and national funding.</p> <p>Limitations: Limited systemic approach beyond individual actions. Other partners would have limited control over the precise definition of the EU calls, limiting the extent to which calls can be adapted to the specific needs of certain partners. This may hinder the possibility to issue <i>ad hoc</i> joint calls with other parties.</p>
Ensuring alignment with R&I agenda	<p>Priority setting: Strategic R&I agenda/ roadmap agreed between partners and EC, covering usually 7 years, including allocation of Union contribution.</p> <p>Input to FP annual work programme drafted by partners, finalised by EC (comitology). Under the co-programmed option, a strategic roadmap is agreed between the EC and the partners involved. All partners can contribute to the development of the work programme, but not to the implementation of the calls and actions themselves.</p> <p>Objectives and commitments are set in the contractual arrangement or Memorandum of Understanding. The alignment with other initiatives and parties outside of the partnership would be the responsibility of the EC, or EC Agency, in charge of the programme implementation</p>
Securing effective leveraging of resources	<p>Internal: Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM. This option allows an upfront EU budgetary envelope. Commitments by partners only represent political/best efforts, but these are usually honoured.</p> <p>External: Limited synergies with other Union programmes and industrial strategies as well as with national/ regional programmes and activities. This option allows for the creation of a dedicated small office to manage the coordination of the partners contributions and alignment with the R&I agenda. Under the Co-programmed option, both cash and in-kind contributions can be leveraged for increased impact.</p>
Key differences compared to the current situation	<p>Under the current EDCTP2 programme, which is based on Article 185, the EU contributes for ten years to a programme gathering Member States and African countries in an EDCTP Association, where all the countries have voting rights, around a common strategic agenda. A dedicated structure based on the Association and a Secretariat implements the programme and aligns the national activities under the scope of the programme. The EU is matching the European Participating States contributions to the EDCTP2 Programme.</p> <p>With Co-Programmed option, there is a limited systemic approach beyond individual actions. Other partners would have limited control over the precise definition of the EU calls, limiting the extent to which calls can be adapted to the specific needs of certain partners.</p>

Option 2 – Co-Funded European Partnership

A Co-Funded partnership is based on a Grant Agreement between the Commission and a consortium of public partners (particularly research funders), with a certain degree of flexibility for the involvement of philanthropies and international partners. Whilst public

sector partners can make contributions and formal commitments to the partnership, industry can only apply to calls for proposals. Partner contributions are often financial contributions used for calls for proposals but can also be in-kind.

Table 4: Key characteristics of Option 2 – Co-Funded European Partnership

Functionalities of option	Key characteristics of Option 2 – Co-Funded European Partnership
Enabling appropriate profile of participation	<p>Partners: core of national funding bodies or governmental research organisations. A Co-Funded partnership would be mainly limited to public sector parties and possibly philanthropies. Industry parties would not be able to contribute to the partnership but could be involved in activities (projects).</p> <p>Priority setting: Driven by partners, open stakeholder consultation</p> <p>Participation in R&I activities: limited, according to national rules of partner countries. Under national rules, Member States could issue calls open only to legal entities from countries that are part of the partnership. This form of implementation requires partners (Member States, Associated States, but also charities, product development partnerships, international organisations, among others) to sign a Grant Agreement. Collaborations built under EDCTP, including those with African countries under the EDCTP Association, could be largely maintained, although the type of involvement of parties would be different than under EDCTP.</p>
Supporting implementation of R&I agenda	<p>Activities: Broad, according to rules/programmes of participating States, State-aid rules, support to regulatory or policy/ societal uptake. Based on a EU Horizon Europe Grant Agreement between the Commission and the consortium of participating partners, this option would allow for the support of a broad range of R&I activities, coordination and support actions and training of researchers and technical clinical support, around a strategic R&I agenda.</p> <p>Additionality: National funding</p> <p>Limitations: Scale and scope depend on the participating programmes, often smaller in scale. Other partners would have limited control over the precise definition of the calls, limiting the extent to which calls can be adapted to the specific needs of certain partners. This may hinder the possibility to issue ad hoc joint calls with other parties.</p>
Ensuring alignment with R&I agenda	<p>Priority setting: Strategic R&I agenda/ roadmap agreed between partners and EC. A Co-Funded partnership will have a strategic R&I agenda/roadmap, to be agreed between partners and the EC, and the joint drafting of an annual work programme covering usually 7 years, including allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by COM</p> <p>Objectives and commitments are set in the Grant Agreement. A large number of parties (Member States, Associated States, Third countries, private funders, product development partnerships, etc.) would likely need to be included in the Grant Agreement.</p>
Securing effective leveraging of resources	<p>Internal: Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p>External: Synergies with national/ regional programmes and activities. The Co-Funded partnership option allows for leveraging the commitments made by partners from the EU budget. This includes both financial and in-kind contributions. This form of partnership represents a high degree of political commitment from partners as the funding is committed upfront. This option allows for the creation of a dedicated ‘programme office’, within one of the beneficiary organisations, to manage the coordination of the partners contributions and alignment with the R&I agenda.</p>
Key differences compared to the current situation	<p>Under the current EDCTP2 programme, which is based on Article 185, the EU contributes for ten years to a programme gathering Member States and African countries in an EDCTP Association, where all the countries have voting rights, around a common strategic agenda. A dedicated structure based on the Association and a Secretariat implements the programme and aligns the national activities under the scope of the programme. The EU is matching the European Participating States contributions to the EDCTP2 Programme.</p>

With Co-Funded option, there is the limitation in the participation to only public organisations and philanthropies. Member States could issue calls open only to legal entities from countries that are part of the partnership.

Option 3a and 3b - Institutionalised European Partnerships

The institutionalised European partnerships are subject to implementation under Article 185 or Article 187 of the Treaty on the Functioning of the European Union (TFEU). Both types of initiatives are governed through separately established entities, with partners tied through legally binding commitments. The flexibility of these partnerships is limited since the composition of partners cannot be changed easily, and the strategic priorities and goals are set in advance. The implementation of activities is set up through a specifically created entity (Dedicated Implementation Structures (DIS) or Joint Undertaking (JU) respectively) with a mandate to launch calls and distribute grants based on the annual work programmes, which are approved by the EC.

For both partnership types, contributions from partners can be in-kind and financial, while EU financial contributions are implemented through matching mechanisms and are distributed through the dedicated entity. In both cases, the financial risk at the project level would be covered by the Mutual Insurance Mechanism of Horizon Europe (the former Participant guarantee funds).

The below paragraphs outline the key differences between these two types of institutionalised partnership in relation to the candidate EU-Africa Global Health Partnership.

Option 3a – Institutionalised European Partnership under Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and Associated Countries, aimed at achieving the greatest possible impact through the integration of national and EU funding, aligning national strategies in order to optimise the use of public resources and overcome fragmentation of public research investments. Involvement is limited to Member States and Associated States. Non-associated countries can only participate if foreseen in the basic act, and their participation is subject to concluding individual international agreements. Under EDCTP2, African countries can take part indirectly in the partnership through their involvement in the EDCTP Association, a private association under Dutch law. Private sector actors or charitable foundations cannot formally join the partnership and, whilst they can be partners in specific activities, their contributions cannot be matched from the EU budget. This form of partnership requires participation of at least 40% of all EU Member States.

Table 5: Key characteristics of Option 3a – Institutionalised European Partnership – Article 185 TFEU

Functionalities of option	Key characteristics of Option 3a – Article 185 TFEU
Enabling appropriate profile of	Partners: National funding bodies or governmental research organisation. This form of partnership is open only to Member States and Associated States, represented by public sector organisations. Third countries, private sector organisations and charitable foundations can be involved indirectly, through the partnership’s projects, and their

participation (actors involved)	<p>contributions cannot be matched from the EU budget.</p> <p>Priority setting: Driven by partners, open stakeholder consultation</p> <p>Participation in R&I activities: fully open in line with standard Horizon Europe rules, but possible derogations. EU funding is open to legal entities in all Member States and Associated States, as well as third countries if eligible for funding under Horizon Europe.</p>
Supporting implementation of R&I agenda (activities)	<p>Activities: Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach. Implementation of activities would be responsibility of the Dedicated Implementing Structure, the existing EDCTP Association, which will publish the calls for proposals.</p> <p>Additionality: EU plus national funding.</p>
Ensuring alignment with R&I agenda (directionality)	<p>Strategic R&I agenda/ roadmap agreed between partners and EC, covering usually 7 years, including allocation of Union contribution. By participating in the development of a common strategic agenda, partners are encouraged to improve their alignment and transnational cooperation.</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives and commitments are set in the legal base.</p>
Securing leveraging effects (additionality)	<p>Internal: Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p>External: Synergies with national/ regional programmes and activities. National R&I activities can be integrated into the programme, and can then be matched from the EU budget to increase the synergies and promote transnational cooperation. Legally binding funding requirements would be clearly defined at the outset, with partners other than the EU expected to provide between 50% and up to 75% of partnership resources through in-kind and/or financial commitments. This form of partnership comes with very high visibility and political commitment from partners with upfront commitments. A Dedicated Implementation Structure (DIS) would be responsible for implementing the programme and aligning partners around a shared strategic agenda jointly prepared with the EC. The DIS would also look for synergies between EU and national/regional programmes and activities, as well as with other EU and international programmes or initiatives.</p>
Key differences compared to the current situation	<p>Article 185 option is the current situation. No difference.</p>

Option 3b – Institutionalised European Partnership – Article 187

Whilst the Institutionalised Partnership under Art. 187 shares many characteristics with that under Art. 185, a key difference lies in the possibility of involvement of partners beyond the Member States and Associated States. Under Art. 187 private sector actors and charitable foundations can be included in the partnership and their contributions can be matched from the EU budget. Similar to the Art. 185 option, participation of non-associated countries is possible if foreseen in the basic act. The implementation of the programme is usually managed by a Joint Undertaking, with the European Commission being fully involved in the governance. In comparison with Option 3a under Article 185, which is a Member State led programme where the Commission acts as an observer in the Board, in an Article 187, the Commission will have co-ownership of the programme and will be sitting in the Board, thus participating fully in the decision-making process.

Table 6: Key characteristics of Option 3b – Institutionalised European Partnership under Article 187 TFEU

Functionalities of option	Key characteristics of Option 3b – Article 187
----------------------------------	---

<p>Enabling appropriate profile of participation (actors involved)</p>	<p>Partners: Suitable for all types: private and/or public partners, philanthropies. This form of partnership would enable participation by the key global health stakeholders, contributing to the development and execution of the strategic R&I agenda. It is open to Member States and Associated States, represented by public sector organisations, as well as private sector organisations and charitable foundations. Third countries can participate if foreseen in the basic act.</p> <p>Priority setting: Driven by partners, open stakeholder consultation</p> <p>Participation in R&I activities: fully open in line with standard Horizon Europe rules, but possible derogations. EU funding would be open to legal entities in all Member States and Associated States, as well as third countries if eligible for funding under Horizon Europe. Funding is not limited to institutions from countries in the partnership.</p>
<p>Supporting implementation of R&I agenda (activities)</p>	<p>Activities: Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach (portfolios of projects, scaling up of results, synergies with other funds. Implementation of activities would be the responsibility of a Joint Undertaking. This form of partnership allows for funding of R&I activities, as well as coordination and support actions and capacity building. This full mix of activities is foreseen as needed for the fulfilment of the candidate partnership's objectives.</p> <p>Additionality: Activities/investments of partners including national funding.</p>
<p>Ensuring alignment with R&I agenda (directionality)</p>	<p>Priority setting: Strategic R&I agenda/ roadmap agreed between partners and EC, covering usually 7 years, including allocation of Union contribution. By participation in the development of a strategic agenda, partners are encouraged to improve their alignment and transnational cooperation.</p> <p>Annual work programme drafted by partners, approved by EC (veto-right in governance). Objectives and commitments are set in the legal base.</p>
<p>Securing leveraging effects (additionality)</p>	<p>Internal: Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and EC.</p> <p>External: Synergies with other Union programmes, industrial strategies, philanthropies and Member States with national/ regional programmes and activities. National R&I activities can be integrated into the programme, which can then be matched from the EU budget to increase the synergies and promote transnational cooperation. Legally binding funding requirements would be clearly defined at the outset, with partners other than the EU expected to provide between 50% and up to 75% of partnership resources through in-kind and/or financial commitments. Each partner's contribution can be matched from the EU budget.</p>
<p>Key differences compared to the current situation</p>	<p>Under the current EDCTP2 programme, which is based on Article 185, the EU contributes for ten years to a programme gathering Member States and African countries in an EDCTP Association, where all the countries have voting rights, around a common strategic agenda. A dedicated structure based on the Association and a Secretariat implements the programme and aligns the national activities under the scope of the programme. The EU is matching the European Participating States contributions to the EDCTP2 Programme.</p> <p>With an Article 187 option, in addition to Member States and Associated States, other key global players would be able to join the initiative, and also contribute to the partnership. These are philanthropies (BMGF, Wellcome Trust, etc.), industry (EFPIA, etc.) and other third countries (e.g. United Kingdom, Japan, etc.) and they can participate on ad-hoc basis. Moreover, all these partners contributions would be able to be matched by the EU contribution, increasing the leveraging effect and the coherence of the initiative.</p>

5.3. Option discarded at an early stage

The Co-Funded partnership is unlikely to be feasible for the EU-Africa Global Health Partnership because this form of implementation only allows for public partners (mainly EU Member States and sub-Saharan countries) to participate in the partnership. Industry, which is a key player in the global health area, would not be able to contribute to the partnership, but could only be involved in specific activities (projects). In addition, only

legal entities from countries that are part of the partnership can apply to calls. This means that institutions from non-participating countries would not be able to receive funding. This could hinder access of certain sub-Saharan African countries that are unable to participate in the partnership. Moreover, it is also very unlikely that this form of partnership would be able to raise the amount of funding needed to have a significant impact. This option has thus hereafter been discarded from further assessment.

Although the option of Article 185 also has the disadvantage that key partners, such as industry, can only participate at project level, we have included the assessment of the Article 185 option, since it is the current set up of EDCTP2.

6. HOW DO THE DIFFERENT POLICY OPTIONS COMPARE TO ACHIEVE THE EXPECTED IMPACTS?

Based on the objectives pursued by the initiative and the key functionalities of each option, each policy option for implementation is assessed in terms of effectiveness, efficiency and coherence compared to the baseline scenario of traditional calls. The analysis is primarily based on the degree to which the different options would cater for the key needed functionalities. All options are compared to the baseline situation of traditional calls, which is thus consistently scored at 0 to serve as reference point.

6.1. Effectiveness

To be in line with the Horizon Europe impact framework,¹⁴⁸ the achievement of the initiative's specific objectives is translated to 'expected impacts' – i.e. how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. This section considers to which extent the different policy options would allow in **delivering these expected impacts** – confronting what is needed (functionalities) with what each form of implementation can provide in practice. The assessments in this section set the basis for the comprehensive comparative assessment of all retained options against all dimensions in Section 6.4, based on a scoring system.

In line with the Better Regulation guidelines,¹⁴⁹ the baseline has a score of 0 and is used as a basis for comparison for the other options. The other options receive a score of 0 if they have the same potential as the baseline, a score of (+) if they have a *good* potential compared to the baseline and a score of (++) if they have a *high* potential compared to the baseline.

Scientific impacts

Baseline: Horizon Europe traditional calls

Under the baseline option, calls for proposals launched under the Horizon Europe Health Cluster could focus on: the development of new or improved health technologies to strengthen the EU's scientific excellence in clinical research on infectious diseases

¹⁴⁸ https://ec.europa.eu/info/publications/horizon-europe-impact-assessment-staff-working-document_en

¹⁴⁹ https://ec.europa.eu/info/law/law-making-process/planning-and-proposing-law/better-regulation-why-and-how/better-regulation-guidelines-and-toolbox_en

relevant to sub-Saharan Africa, increasing the scientific leadership of African researchers, increasing the capacity of the research response to effectively control (re) emerging epidemics in sub-Saharan Africa, and increasing evidence base for national and international health policy-making (bridging the gap between science and policy for health).

Horizon Europe calls are expected to lead to scientific discoveries that are of a precursory and exploratory nature and that lead to the elucidation of the underlying mechanisms of health and disease conditions. Therefore under this option there would be a potential to establish new scientific paradigms providing the foundation for innovative health technologies. However, by themselves, these calls would likely not be focused on long-term clinical development, nor would they deliver implementable solutions. For that to happen, a more strategic approach is needed, with a ‘portfolio-level’ thinking, directionality towards common objectives, alignment of individual projects and the joint participation of key partners.

Under this option, the initiative’s objective of reducing the risk of spread of (re) emerging infectious diseases would be possible, by supporting networks to promote knowledge exchange between disease control institutions and countries, since these activities are typically less resource-intensive than large-scale clinical trials.

However, as this option does not allow for the pooling of additional resources from countries and for cooperation with additional stakeholders around a common strategic agenda, support long-term, multisite and international clinical trials would be difficult. Moreover, the baseline option does not have a dedicated implementing structure that can effectively coordinate the key partners around a common strategic agenda.

In addition, under the baseline option, neither the Commission nor the partners make an upfront budgetary commitment. This implies less political commitment and reduced visibility to the field compared to under a partnership approach. The existing collaboration built under the first and second EDCTP programmes, between the EU, European countries and African countries, would not be maintained at the level that it is currently. Additionally, the scientific leadership and ownership by sub-Saharan African countries would be reduced, as well as the potential to bridge the gap between science and policy for health or evidence base health policy-making.

Even under the current COVID-19 crisis, the baseline scenario is still a valid baseline for the different options. However, if due to the consequences of the pandemic there was a delay in the process for the adoption of the partnerships under Horizon Europe, or a reduced expected budget availability, this option might become the only option, at least for the starting year (2021).

All interviewed stakeholders, from all stakeholder groups, agree that the baseline option is undesirable and would result in a near-complete loss of the momentum that EDCTP has been able to generate. It is thus seen as a major step backwards.

Option 1: Co-Programmed European Partnership

Under a co-programmed option, compared to the baseline option, the partnership is more likely to support late-stage clinical trials, because of the ability of partners to actively align activities around a common research agenda. Therefore it has an increased chance

of contributing to successful product development, thus receiving a score of +, i.e. a *good* potential compared to the baseline.

Under this option, the initiative's objective of reducing the risk of spread of (re) emerging infectious diseases would also be possible, by supporting networks to promote knowledge exchange between disease control institutions and countries, since these activities are typically less resource-intensive than large-scale clinical trials.

However, in all other aspects, the co-programmed option has similar drawbacks as the baseline option. As in the baseline option, there will no dedicated implementing structure, which will reduce the capacity to effectively coordinate countries and other key partners around the common strategic agenda.

Option 3a: Institutionalised European Partnership under Article 185

This form of institutionalised partnership would bring together Member States and Associated States and their contributions would be matched from the EU budget. Other stakeholders could participate indirectly in the partnership. This is the current form of the EDCTP2 programme. This option would generate sufficient financial space to support mid- to late-stage clinical research, where the costs are highest. Additionally, the institutionalised partnership approach encourages partners to come together to commit budget to a common strategic research vision and to plan their activities accordingly.

Since it has the same legal basis as the current EDCTP2, under the Article 185 option, the candidate EU-Africa Global Health Partnership would be able to retain the current programme office, knowledge and know-how of sub-Saharan clinical trials management, and relations with key stakeholders in the region. However, under an Article 185, the EU would not be able to match the contributions from third countries nor from philanthropies or industry.

Compared to the baseline option, this option would have significantly better prospects to reach a high scientific impact. This option has therefore received a score of ++, i.e. a *high* potential compared to the baseline.

Option 3b: Institutionalised European Partnership under Article 187

This option would allow to bring together EU Member States and Associated States, as well as third countries, philanthropies, industry and international organisations around a strategic research and innovation agenda. It would also foresee a long-term budgetary commitment from all parties, which could be matched by the EU budget. A Joint Undertaking would implement the programme under full control of the Commission, which would have a seat in the governing board. The greater number of partners and the possibility for the EU budget to match third parties' contributions, in addition to the Member and Associated States' contributions, would represent greater budget commitments and a greater pooling of resources around a common objective.

In terms of scientific impact, an Article 187 institutionalised partnership appears to be the best option to mobilise the resources needed to support a sustained and coordinated response to infectious diseases in sub-Saharan Africa, as well as to have a significant impact by strengthening the knowledge of clinical research on infectious diseases relevant to sub-Saharan Africa, increasing the scientific leadership of African

researchers, the capacity to control (re) emerging epidemics in sub-Saharan Africa and to have evidence-based national and international health policy making. This option has therefore received a score of +++, i.e. a very high potential compared to the baseline.

Interviewees unanimously express a strong preference for an institutionalised partnership approach. Opinions are, however, divided on whether this should take the form of an Article 185 partnership or an Article 187 partnership. Many acknowledge the advantages an Art.187 set-up would bring to the partnership, arguing that it allows for more meaningful inclusion of a greater range of stakeholders, creates more financial certainty, and would allow for a leaner and more efficient organisational structure. Others, however, have concerns about what this would mean for the relationships built with and between current EDCTP members and for the level of control that the EC would have over the partnership.

Numerous interviewees have expressed varying degrees of concern that countries that cannot substantially contribute to the partnership financially will be left out of the decision-making. Not all stakeholders fully understand the advantages and disadvantages of these two options and question why a change from one to the other would even be under consideration.

In the responses to the **open public consultation**, 26 out of 41 respondents indicated that an institutionalised partnership would be the preferred option, emphasising in particular the need for strong (financial and political) commitment and long-term stability. The consultation, however, did not allow respondents to distinguish between the two individual forms of institutionalised partnership. Among those who expressed a preference for a Co-Funded or Co-Programmed option, the reasons given related to a need for flexibility, inclusiveness of the partnership, and lower costs. Similar to the case among interviewees, however, the open comments provided in response to the consultation clearly show that many respondents struggle to fully understand the details of different forms of partnership.

While consulted non-government stakeholders indicated their preference for an institutional partnership, many of them could not position themselves in favour of Article 185 or Article 187, leaving it to the Commission and the Member States to decide which form of implementation was best suited. The governmental stakeholders consulted for the GHP/EDCTP3 have the experience with an Article 185 for EDCTP2 and an Article 187 for the Innovative Medicine Initiative (IMI), which is a public–private partnership with industry. Consulted governmental stakeholders indicated their preference for an Article 187, since it would allow philanthropies and the industry to join. They highlighted the importance of transparency on industry participation and its contribution, to safeguard public interests.

Summary

Table 7 lists the scores for each of the policy options as regards to the effectiveness criteria for scientific impacts, based on the assessments above, as well as taking into account the support expressed by the different stakeholders.

Table 7: Overview of the options’ effectiveness compared to the baseline - Scientific impacts

Scientific Impacts	Option 0: Horizon Europe calls	Option 1: Co-programmed	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Strengthened EU scientific excellence	0	+	++	+++

Scientific Impacts	Option 0: Horizon Europe calls	Option 1: Co-programmed	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
in clinical research for infectious diseases				
Increased scientific leadership of sub-Saharan Africa in the infectious diseases field	0	0	++	+++
Increased research response capacity to control of (re-)emerging epidemics in sub-Saharan Africa	+	+	++	+++
Increased evidence base for national and international health policy-making (bridging the gap between science and policy for health)	0	0	++	+++

Notes: Score +++: Option presenting a *very high* potential compared to baseline; Score ++: Option presenting *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

Economic/Technological impacts

Baseline: Horizon Europe traditional calls

The lack of commitment to a strategic research and innovation agenda would likely result in a much-reduced ability to support end-of-pipeline product development. This means a lower impact on the capacity of institutions in sub-Saharan to design, conduct and manage infectious diseases research projects, on the number of employed researchers in sub-Saharan Africa, and lower capacity to attract funding in the region. On the other hand, the lack of long-term commitment would discourage industry from participation in research projects in sub-Saharan Africa.

Option 1: Co-Programmed European Partnership

Economic impacts are tied to the increased ability to reduce health care related expenditure, increase the number of employed researchers, and strengthen the capacity in sub-Saharan Africa to manage research projects and attract funding, all resulting in a more attractive environment for industry to participate in research projects in the region. Economic impacts depend not only on the implementation of research results, but also on the level of funding and alignment. In a co-programme partnership, the engagement of all the actors around a strategic research agenda would provide a directionality for all the partners, thus having a higher impact than the baseline option. This option has received a score of + compared to the baseline.

Option 3a and 3b: Partnership under Article 185 and Article 187

The economic and technological impacts are largely dependent on the attainment of scientific results and impacts. With its greater possibility to focus on clinical research and product development and the higher level of budgetary commitments, the institutionalised partnerships have a higher chance to develop technologies ready for their production, distribution and uptake.

The extent of the economic impact resulting from increases in the skills of researchers and research activity depend on the scale as well as on the focus of the initiative. Under an institutionalised partnership, irrespective of whether this takes the form of an Article

185 or an Article 187 partnership, there will be greater opportunities for capacity strengthening in the area of clinical research than under the baseline option. In light of the above, the two institutionalised options have been scored with ++ compared to the baseline.

Summary

Table 8 lists the scores assigned to each of the policy options as regards to the effectiveness criteria for economic / technological impacts, based on the assessments above, as well as taking into account the support expressed by the different stakeholders.

Table 8: Overview of the options' effectiveness compared to the baseline – Economic / technological impacts

Economic/Technological impacts	Option 0: Horizon Europe calls	Option 1: Co-programmed	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Increased research capacity of institutions in sub-Saharan Africa to design, conduct and manage infectious disease research projects	0	+	++	++
Higher capacity of the research institutions to attract funding	0	+	++	++
Increased industry participation in research projects in sub-Saharan Africa	0	+	++	++
Increased number of employed researchers in sub-Saharan Africa	0	+	++	++

Notes: Score +++: Option presenting a *very high* potential compared to baseline; Score ++: Option presenting *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

Societal impacts (including environmental, social and fundamental rights)

Baseline: Horizon Europe traditional calls

The achievement of societal impacts, in particular those impacts directly associated with the health status of people, depend on the increased availability and uptake of new or improved health technologies.

The baseline scenario is likely to have some societal and environmental impact stemming from the funded projects, increasing the higher retention of scientific talent in sub-Saharan Africa. However, it is likely to lack a comprehensive strategic approach. Research focusing on developing and improving health technologies may reduce morbidity and mortality due to infectious diseases in sub-Saharan Africa, as well reduce antimicrobial resistance and the risks of (re-)emerging infectious diseases. To some extent, coordination and support actions could help to communicate and disseminate research results and increase the uptake of the results in the region. Similarly, supporting the training of researchers in sub-Saharan Africa could offer increased chances for their career development and retention in the country, and increase the capacity of the research institutions to manage clinical research, leading to an increased focus on unmet medical needs.

On the other hand, the capacity of the research institutions to provide safe medical interventions would be reduced, as well as the uptake of the health technologies in the

region, leading to a smaller chance of alleviating the infectious diseases burden in sub-Saharan Africa.

Whilst strengthening of research capacity in sub-Saharan Africa through Horizon Europe calls would be possible, it is difficult to foresee to what extent this would be translated into an increase in long-term employment opportunities for researchers and higher retention of scientific talent in the region. Additionally, project funding alone cannot influence nor stimulate the much-needed involvement of other stakeholders.

In the absence of a partnership, the baseline option would struggle to integrate research and innovation efforts to tackle the infectious diseases burden in sub-Saharan Africa.

Option 1: Co-Programmed European Partnership

Whilst a co-programmed partnership does not require formal commitments, it can be expected to leverage sufficient resources to support the research and innovation activities of the candidate partnership. As it would have better strategic vision, it would have greater likelihood of achieving the societal impacts, than the baseline option. This option has therefore received a score of + compared to the baseline.

Option 3a and 3b: Partnership under Article 185 / Article 187

Under the institutionalised partnership option, there would be a more strategic approach and vision, as well as a better integration. Greater emphasis would be placed on supporting the kind of research that is required to produce and deliver health technologies. An institutionalised partnership also has a more strategic approach and stronger impact on the uptake of the new or improved health technologies. As consequence this type of partnerships have higher capacity to reduce morbidity and mortality associated with infectious diseases in sub-Saharan Africa, as well reducing antimicrobial resistance and the risks of (re) emerging infectious diseases.

However, as previously mentioned, in the Article 185 option the EU budget can only match Member and Associated States' contributions, reducing significantly the possibility of leveraging enough resources and therefore reducing the expected impacts. This option has therefore received a score of ++ compared to the baseline. On the other hand, the Art. 187 option would allow the EU budget to match, in addition to the partners under an Art. 185, the contributions from sub-Saharan Africa countries, as well as private charitable funders, industry and other third countries, leveraging substantial and sustainable funding and integrating them around a common agenda. An institutionalised partnership under Art. 187 has the strongest chance to deliver the highest societal impacts, compared to the baseline, the co-programmed and the Art. 185 options. In light of the above, the Art. 187 option has been scored +++ compared to the baseline.

Summary

Table 9, below, lists the scores assigned to each of the policy options as regards the effectiveness criteria for societal impact, based upon the assessments above, as well as taking into account the opinion of the different stakeholders.

Table 9: Overview of the options' effectiveness compared to the baseline – Societal impacts

Societal impacts	Option 0: Horizon Europe calls	Option 1: Co- programmed European Partnership	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187

Societal impacts	Option 0: Horizon Europe calls	Option 1: Co- programmed European Partnership	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Higher retention of scientific talent in sub-Saharan Africa	0	+	++	+++
Better uptake of new or improved health technologies	0	+	++	+++
Better (gender) equality	0	+	++	+++

Notes: Score +++: Option presenting a *very high* potential compared to baseline; Score ++: Option presenting *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

6.2. Efficiency

In order to compare the policy options consistently in terms of their efficiency, a standard cost model was developed for the external study supporting the impact assessment for the set of candidate Institutionalised Partnerships. The model and the underlying assumptions and analyses are set out in the Common Part of this impact assessment, Section 2.3.2 and in the Methodology Annex 4. A dedicated Annex 3 also provides more information on who is affected and how by this specific initiative in line with the Better Regulation framework. The scores related to the costs set out in this context allow for a “value for money” analysis (cost-effectiveness) in the final scorecard analysis in Section 6.4.

On this basis, the scores for the costs of the different options range from a value of 0, in case an option does not entail any additional costs compared to the baseline, to a score of (-) when an option introduces limited additional costs when compared to the baseline and a score of (-)(-) when substantial additional costs are expected in comparison with the baseline. In case the scores are lower than for the baseline scenario, (+) and (+)(+) are used.

For this specific initiative under the **baseline scenario** of traditional calls, there would be winding down and social discontinuation costs for the existing implementation structure of the current Article 185 initiative. There would also be longer term financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. These can be estimated at EUR 1.5 million per year of operation. Overall, it is estimated that the overall longer term cost savings from using traditional calls, instead of an existing Article 185 initiative, would considerably exceed the costs incurred for winding down operations. This overall situation is set as the starting point for the comparison of options. The score of this baseline scenario (traditional Horizon Europe calls) is set to 0 to be used as a reference point.

The overall administrative, operational and coordination costs of Option 3a (**Article 185 Partnership**) would be close to those of the existing initiative EDCTP2, e.g. the EDCTP Secretariat, which has implemented efficiently the EDCTP2, ensuring that programme’s administrative costs do not exceed 6% of the European Union’s financial contribution of EUR 683 million (i.e. EUR 41 million for the period 2014-2024). These costs can be estimated at EUR 4.1 million per year. In this option, the initiative would benefit from the experience of the existing organisation/structure already in place.

Finally, Option 3b (an **Article 187 Partnership**) would imply a change of legal basis from the current situation. The change of legal basis would generate some limited additional

costs to set up the Joint Undertaking from the EDCTP Secretariat. These would include an indicative one-off administrative expenditure to set up the Joint Undertaking of a maximum EUR 0.3 million for the new structure and a recurring annual cost of a maximum EUR 5.5 million depending on the size of the partnership. Further details are provided in Annex 3. It is worth noting, however, that these limited additional costs would be compensated by the yearly recurring costs savings from the simplification of procedures, as the Commission will be part of the decision Board of the Joint Undertaking. This would simplify the adoption of the annual work programmes and provide the JU with the possibility to benefit from the common support office of Horizon Europe for proposal submission, evaluation and selection, and other common services. An important consideration in this respect is the necessity of a mechanism to keep the knowledge generated during the implementation of EDCTP1 and 2 of the current programme office staff. This would require devising a proper solution to preserve this experience in the new partnership, including the expertise in clinical research projects in sub-Saharan Africa and building up relationships with key stakeholders in the region.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership options. Indeed, in terms of cost-efficiency, the Co-Programmed Partnership (Option 1) is two percentage points more efficient than the baseline; an Article 185 Institutionalised Partnership somewhat less cost-efficient than the baseline, and an Article 187 Partnership is two percentage points less cost-efficient than the baseline.

A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed options and a score of (-) for the Institutionalised Partnerships policy option.¹⁵⁰ It is worth noting that the adjusted cost scoring for the Article 185 in the case of the EU-Africa Global Health Partnership departs from the common approach adopted to cost-efficiency.¹⁵¹ Indeed, Option 3a is scored (-) instead of (0). This is to reflect the specificity of this Partnership, involving an important number of third countries, which makes the Article 185 coordination costs higher than in other cases and thus potentially closer to the costs of an Article 187. The scoring for all the other options is in line with the common approach.

Table 10: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 3a: Institutionalised Article 185 TFEU	Option 3b: Institutionalised Article 187 TFEU
Administrative, operational and coordination costs	0	(0)	(-)(-)	(-)(-)
Adjusted administrative, operational and coordination costs per expected co-funding (i.e. cost-efficiency)	0	(+)	(-)	(-)

¹⁵⁰ The baseline (traditional calls) is scored 0, as explained above.

¹⁵¹ Under the common approach to assess efficiency (see Annex 4, p. 51), Options 3a and 3b (Institutionalised Partnerships under Article 185 and 187 respectively) score overall (-)(-) for total administrative/operational/coordination costs. Once these scores are adjusted to better reflect the expected co-financing rates and the total budget available for each option (cost-efficiency), the adjusted score for the Article 185 Partnership becomes 0 (equal to the baseline), while the adjusted score for the Article 187 Partnership becomes (-).

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared with the baseline; score (-)(-) = substantial additional costs compared with the baseline.

The Interim Evaluation of the EDCTP2 programme of 2017 assessed how competently and economically the activities had been executed under an Article 185 in relation to the objectives and indicators during the first two years of the programme implementation, 2014-2016. This evaluation recommended that, in order to ensure more efficient progression, EDCTP should understand the goals and priorities of Participating States and work with them to align EDCTP strategy and programmes, and that EDCTP should thus actively support the Participating States in developing their own national research agendas. The EDCTP2 Interim Evaluation Panel recommended that in addition to the 6% eligible administrative costs, and to reach the ambitious objectives of the partnership, EDCTP be allowed to use the financial contribution from the EU to cover programmatic costs, e.g. costs for analysis and policy-related actions.

6.3. Coherence

Internal coherence

This section assesses the extent to which the policy options could ensure and maximise coherence with other actions, programmes and initiatives under Horizon Europe, in particular European Partnerships (internal coherence).

For the initiative to deliver on its ambitious specific objectives, it needs to show a high degree of internal coherence, from developing a research agenda and coordination of stakeholders to developing linkages to other initiatives within Horizon Europe.

Baseline: Horizon Europe traditional calls

Traditional Horizon Europe calls may create opportunities to exploit synergies within the Health cluster to deliver on health-related challenges for the EU, as well as with other clusters although Coordination and Support Actions could catalyse some opportunities to identify linkages, opportunities for coordination and communication, with other stakeholders. However, it would be challenging for individual Research and Innovation Actions to make steady progress on advancing the development of diagnostics, vaccines, treatments and enabling the environment for the uptake of health innovation in sub-Saharan Africa, from the actions' limited budget, and without a long-term commitment and a dedicated implementing structure.

Work programmes would need to reflect the requirement for R&I activity across the health technologies clinical development, with input from representatives of all relevant stakeholders.

In the absence of a dedicated implementing structure, traditional calls cannot ensure alignment with other key initiatives and organisations in the global health arena.

Option 1: Co-Programmed European Partnership

Through a co-programmed European partnership, the partners can aim to achieve a certain coherence with other partners and with the Annual Work Programme of Horizon Europe, and implementing Coordination and Support Actions to facilitate relationships with European and African governments, funders, industry, academics, policy-makers and regulators. However, its decentralised management structure is not likely to

effectively support the building of strong and sustained integrated relationships with other organisations or initiatives keeping coherent linkages with other initiatives within Horizon Europe, which would be needed for this initiative. This option has therefore received a score of + compared to the baseline.

Option 3a and 3b: Partnership under Article 185 / Article 187

A clear coherence is required between the different types of activities to attain the initiative's objectives. The institutionalised form of implementation would be better placed to deliver this than the baseline option because it can take a more dedicated approach in the criteria of the calls for proposals.

The Article 185 Institutionalised European Partnership supports the widest possible participation of governments, and has a dedicated implementing structure that can facilitate new and deepen existing relationships with policy-makers, academics, industry, regulators, etc. It is also likely to reach a higher level of alignment and coordination of national budgets. It can also provide support to finding synergies with other parts of the Horizon Europe Work Programmes and other Partnerships, as well as with national development agencies and other stakeholders. This option has therefore received a score of ++ compared to the baseline.

An Article 187 Institutionalised European Partnership provides a Joint Undertaking with the capacity to be a single point of access to partners, not only EU Member States and States Associated to the Framework Programme and sub-Saharan countries but also other third countries, industry and private funders, policy makers, regulators, academia and other stakeholders, within the context of Horizon Europe. This can better ensure that synergies are maximised across the Horizon Europe Work Programmes and Horizon Europe Partnerships. This option has therefore received a score of +++ compared to the baseline.

Respondents to the **Open Public Consultation**, as well as a number of interviewees, have pointed out the importance of ensuring alignment with other initiatives and programmes in the field of global health and infectious disease. However, they do so mostly in rather general terms rather than by singling out specific areas or initiatives.

A few **interviewed stakeholders**, including those from within the EC, have indicated that there is space for improved coordination across different Directorate-Generals within the EC. In particular, this relates to the role of DG DEVCO in health systems strengthening and to DG ECHO and DG SANTE in the field of epidemic preparedness.

External coherence

In this section we assess the extent to which the policy options could ensure and maximise coherence with their external environment, including EU-level programmes and initiatives beyond the Framework Programme and/or national and international programmes and initiatives, but as well as with overarching framework conditions, such as regulation, standardisation, etc. (external coherence).

Baseline: Horizon Europe traditional calls

To have an impact it is necessary to strategically share areas of common interest with other initiatives, organisations and research funders. It is important to coordinate and, where necessary, align activities to optimize synergy and minimize duplication. This can be done, for instance, through joint funding calls or collaborative activities. Under

EDCTP, for instance, joint calls have been issued with organisations such as the Bill & Melinda Gates Foundation, WHO-TDR, the Special Programme for Research and Training in Tropical Diseases.

Under traditional calls, the options for structured engagement with actors such as public health, institutions and regulatory authorities, as well as with philanthropies are limited. The baseline option offers few opportunities for regular and continued coordination. Participation in traditional calls is open to any Horizon Europe eligible legal entity within a consortium. This includes research organisations in Africa, although these are not automatically eligible for funding.

Under the baseline option there are no explicit incentives for Member States to increase or maintain their investments in research and innovation to combat infectious diseases as there is no matching of national contributions from the EU budget.

With the discontinuation of the dedicated implementing structure, it will not be possible to effectively facilitate the alignment of national and other funders' programmes around a strategic agenda and the knowledge and know-how of the current EDCTP implementing structure would be lost.

In addition, the current decision-making capacity of sub-Saharan countries within the EDCTP Association will not exist, losing the countries' trust and their buy-in, necessary for the local uptake of the potential innovations resulting from the Horizon Europe projects.

Option 1: Co-Programmed European Partnership

The ability for a co-programmed partnership to interact with other programmes or initiatives is similar to the baseline option. A co-programmed partnership, through the Horizon Europe Work Programme, can provide some opportunities to engage with other initiatives, organisations and research funders through collaborative research projects and coordination and support actions. In addition, individual partners may at a national level have the ability to improve coherence between activities supported within the partnership and those outside of it. However, alignment with globally operating initiatives would be difficult in the absence of a dedicated implementing structure. This option has therefore received a score of + compared to the baseline.

Option 3a and 3b: Partnership under Art. 185 / Art. 187

The institutionalised partnerships have the capacity to include many types of partners in the partnership. Under an Article 185 the EU can contribute to Member States programmes. Moreover, the dedicated implementing structure would engage with other initiatives, organisations, research funders, national development agencies,¹⁵² EU Delegations in sub-Saharan Africa, and would manage such relations. In addition, an institutionalised partnership would have the capacity to launch calls within its own Work Plan to further engage with additional collaborations and to coordinate them. Therefore, the institutionalised partnership option under Article 185 offers greater ability to engage with other relevant actors, including those outside of the partnership increasing the coherence of the EU investment. This option has therefore received a score of ++ compared to the baseline.

¹⁵² Under the current EDCTP2 programme, several national development agencies, (e.g. SIDA from Sweden, DLR from Germany), are already involved in the partnership, contributing to the programme and participating in the decision-making as part of the EDCTP Association.

Furthermore, under Article 187 the EU could set up a joint undertaking (JU) or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes with additional partners that would be more integrated and with a programme office that would ensure external coherence. Therefore this option has received a score of +++ compared with the baseline option.

As in the case of internal coherence, **interviewees** widely agree that the candidate partnership should coordinate its efforts with other key stakeholders in the field, often without being specific. Some have noted a proliferation of initiatives, some of which appear to share focal areas with the candidate partnership. In addition to EU programmes and initiatives, specific examples include the Coalition for Epidemic Preparedness Innovations, and funders such as the Bill & Melinda Gates Foundation.

These interviewees indicated that it will be important for the candidate partnership to clearly position itself in relation to these other initiatives and funders and, where applicable, coordinate activities.

Summary

Table 11, below, lists the scores we assigned to each of the policy options as regards the internal and external coherence criteria, based upon the assessments above, as well as taking into account the support expressed by the different stakeholders.

Table 11: Overview of the options’ potential for ensuring and maximizing coherence

	Option 0: Horizon Europe calls	Option 1: Co-programmed	Option 3 a Art 185	Option 3b Art 187
Internal coherence	0	+	++	+++
External coherence	0	+	++	+++

Notes: Score +++: Option presenting a *very high* potential compared to baseline; Score ++: Option presenting *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline

6.4. Tabular comparison of options and identification of preferred option

The scorecard below provides an overview of the assessment made of each option under each of the criteria based on the performed analysis.

Table 12: Comparison - Ranking the policy options

	Criteria	Option 0: Horizon Europe calls	Option 1: Co-programmed	Option 3a: Art. 185	Option 3b: Art. 187
Effectiveness	Scientific impacts	0	+	++	+++
	Economic/technological impacts	0	+	++	+++
	Societal impacts	0	+	++	+++
Efficiency	Administrative, operational and coordination costs	0	(0)	(-)(-)	(-)(-)

	Adjusted administrative, operational and coordination costs per expected co-funding (i.e. cost-efficiency)	0	(+)	(-)	(-)
Coherence	Internal coherence	0	+	++	+++
	External coherence	0	+	++	+++

The scorecard shows that the baseline performs less well against all dimensions and criteria compared to Co-programmed and Institutionalised Partnership options. Even though it has a higher score in the efficiency criteria, this does not weigh up against its lower performance in the effectiveness and coherence criteria.

Without long-term commitment, the traditional calls would not be able to attract funders and facilitate alignment between programmes of key initiatives and organisations active in the global health arena and they will not have a significant leveraging effect. As a consequence the traditional calls would have lower scientific, economic/technological and societal impacts.

A **co-programmed partnership** based on a **memorandum of understanding** between the Commission and the already established EDCTP Association would be **simple to establish**, however, it would have a **lower level of commitment and integration** than the current EDCTP2. In addition, the participation from the African countries in the decision-making would be reduced in comparison to EDCTP2. African countries could perceive this as **a step backwards**.

An **institutionalised partnership based on Article 185**, based on a decision of the European Parliament and the Council for an EU contribution to a Member States programme, would represent a continuity with the current EDCTP2. This form of partnership would allow the EDCTP Association to continue to function as it is, with a similar set of actors, roles and responsibilities. The EDCTP Association allows for participation of African countries in strategic discussions and decision-making. However, this option would be only possible if at least 40% of the Member States become members of the GHP/EDCTP3. In this option, only contributions from Member States and countries associated to Horizon Europe can be matched by the EU contribution. Other third parties, such as third countries, philanthropies or industry, could contribute at the level of call for proposals or in projects, but their contributions would not be able to be considered for the matching of EU contribution. There is a certain level of uncertainty around Member States' capacity to commit sizeable amounts, seeing the economic impact of the COVID-19 pandemic. This could make an Article 185 partnership even less likely seeing the requirement to have budgetary commitments from 40% of the Member States. This would **reduce the size of the budget and therefore the level of ambition for and the potential impact of the partnership**.

The scorecard also shows that benefits are clearly maximised under the Institutionalised Partnership Art. 187 option. In particular, compared with the other options, option 3b would:

- Provide greater effectiveness by maximising leverage effects, allowing for greater strategic alignment among partners, and supporting a broader range of activities in research and innovation.

- Improve coherence by enhancing collaboration and alignment with the other key stakeholders in the area of combatting infectious diseases and strengthening research capacity in sub-Saharan Africa.

The lower scores of the Art. 185 assessment option are based on the fact that the EU can only match the European countries contributions, and not the third countries, nor the private founders or industry, reducing largely the leverage effect of the partnership. The size of the initiative would be smaller than in an Art. 187, and thus the impact reduced.

The conclusion of the assessment is that the **Institutionalised European Partnership based on Article 187 TFEU** is the preferred option, showing a better cost-effectiveness than the other options and in light of the need to strengthen the partnership through increased participation in comparison to the current EDCTP2.

7. THE PREFERRED OPTION – HOW WILL ACTUAL IMPACTS BE MONITORED AND EVALUATED?

7.1. The preferred option

Based on the comprehensive analysis of the available data, this study concludes that the preferred option for the candidate EU-Africa Global Health Partnership is that of an Institutionalised Partnership under Art. 187. This option would also allow the EU budget to match, the sub-Saharan Africa countries contributions as well as the private charitable funders, industry and other third countries contributions, leveraging substantial and sustainable funding around a common agenda. This type of institutionalised partnership is the most likely option to deliver the targeted impacts, and offers the greatest potential for alignment of partners around shared strategic objectives.

Table 13 shows the alignment of the preferred option with the selection criteria for European Partnerships defined in Annex III of the Horizon Europe Regulation. Considering that the design process of the candidate Institutionalised Partnerships is not yet concluded and several of the related topics are still under discussion at the time of writing, the criteria of additionality/directionality and long-term commitment are covered in terms of expectations rather than ex-ante demonstration.

The COVID-19 crisis does not fundamentally change the foreseen Partnership and confirms the relevance of the proposed initiative. An Article 187 Institutionalised Partnership scores significantly higher overall than the baseline option (traditional calls under Horizon Europe) and Option 1 (Co-Programmed Partnership) in terms of effectiveness. The preferred option remains the Article 187 with the highest capacity to coordinate and generate impact in research preparedness and response research, to provide an evidence base to increase individual and community resilience, facilitate operational readiness, and improve decision-making during emergency response.

Table 13: Alignment with the selection criteria for European Partnerships

Criterion	Alignment of the preferred option
Higher level of effectiveness	As an Institutionalised Partnership based on Art. 187, provides the closest integration of key stakeholder groups across the value chain to ensure that the initiative can respond to ambitious objectives corresponding to scientific, technological/economic and societal impacts. This mode of implementation will ensure a sufficient scale, commitment, leverage and long-term vision for the accelerated development and deployment of health innovations in sub-Saharan Africa. The EU-Africa Global

Criterion	Alignment of the preferred option
	Health Partnership is expected to generate highly competitive knowledge and scientific, economic/technological, and societal impacts in partnership with sub-Saharan Africa countries, as well as to contribute to the integration of research resources, secure sustainability, and strengthen the European Research and Innovation Area.
Coherence and synergies	The preferred option will be able to fulfil a unique position with the EU and global health research and innovation landscape to ensure coordination and complementarity with the EU programmes, as well as with national and international initiatives. Coherence and synergies will be achieved by maintaining a clear focus on infectious diseases affecting sub-Saharan Africa and contributing to the EU international commitments.
Transparency and openness	Under an Art. 187 the Partnership will work around common priorities under a strategic research and innovation agenda. Partners and stakeholders from across the whole clinical development process of health technologies, and from different sectors, backgrounds and disciplines, including international ones, will participate in the initiative. The Partnership will promote principles of research fairness and transparency as well as promote the dissemination and exploitation of results. It will be able as well to design exit-strategy and measures for phasing-out from the Programme.
Additionality and directionality	The financial or in-kind contributions from governments and private partners other than the EU will be between 50% and 75% of the aggregated Partnership budgetary commitments, working towards the common strategic vision and achieving the expected impacts. The partnership will also be able to set up the appropriate approaches to ensure flexibility of implementation of a strategic research and innovation agenda and to adjust to changing policy, societal, market needs and/or scientific advances, and to increase policy coherence between regional, national and EU level, resulting in better health for all (SDG3).
Long-term commitment	The Partnership under the Art. 187 option offers the possibility of a long-term commitment and would cover the whole duration of Horizon Europe.

The main added value of the partnership based on an Article 187 of the Treaty of the European Union is that the African countries' contribution can count towards matching the EU contribution. This new approach provides a strong recognition of the political and the operational importance of the African countries in the partnership. In addition, Article 187 provides the framework within which philanthropies, industry and other third countries can also join and contribute to the partnership, allowing the EU to collaborate with different key global health players. Moreover, under an Article 187, the EU is a full partner and co-owner in the endeavour. This means that the Commission is an active actor in the policy dialogue and the governance mechanism of the partnership and not only an observer, as is the case in the current partnership. In this partnership, based on the Article 185, the EU participates under the H2020 Framework Programme, in a programme jointly undertaken by several Member States (the EDCTP2 programme) and the legal base foresees the Commission's role as an observer.

With its broader, multi-stakeholder partnership, an Article 187 partnership would be a powerful actor to address global health and it would be able to deliver at the necessary speed and scale, with the Commission having a clear role in its governance that ensures that public interests are at the core of the partnership.

While consulted non-government stakeholders clearly indicated their preference for an institutional partnership, many of them could not position themselves in favour of Article 185

and Article 187, leaving it to the Commission and the Member States to decide which form of implementation was best suited.

Consulted governmental stakeholders, who have the experience with both an Article 185 (through EDCTP2) and an Article 187 (through IMI2) partnership, have indicated their preference for an Article 187, embracing the idea that it would allow also public funds to join forces with philanthropies and the industry. However, they highlighted the importance to safeguard transparency and public interests when considering industry participation.

A partnership under Article 187 would attract the widest range of actors, leveraging and pooling resources: the EU, Member States and countries associated to Horizon Europe, third countries,¹⁵³ philanthropies (e.g. Bill and Melinda Gates Foundation, the Wellcome Trust) and pharma industry. One example of this is, as mentioned above, the response to the COVID-19 pandemic, bringing public, industry/private sector and philanthropies together to address the problem.

An **institutionalised partnership based on Article 187** would require a Council regulation to set up a new structure or joint undertaking. While it would be **more demanding in the set-up**, it would however **offer a long-term perspective, a strong political commitment as well as leveraging and pooling resources** from the EU. The **EU would become a full partner** and the **EDCTP Association** would become its **counterpart**, representing its members (EU member states, countries associated to Horizon Europe, third countries from sub-Saharan Africa and any other third country). Any third party could participate as ‘associated partners’ on an *ad hoc* basis. This option would allow the EU to match contributions from the EDCTP Association and its members as well as from the other ‘associated partners’. In turn, it would leverage budgetary commitments and coordination. It would also allow **maintaining inclusive governance with African countries**, as part of the EDCTP Association, which has proven to work. This option has a higher chance of obtaining **higher impact, greater visibility of EU investment and positions the partnership as a stronger global player**.

The **Interim Evaluation of EDCTP2** specified that to improve the efficiency and effectiveness of EDCTP, the partnership should be strengthening the links to policymakers in African Participating States. EDCTP needs to better understand the goals and priorities of Participating States and further work with them to align EDCTP strategy and programmes; EDCTP should thus actively support the Participating States in developing their own national research agendas. An additional emphasis should be on strategic alliances, and a strong focus on developing African scientific leadership. Opportunities to extend the range of partners were also noted, including organisations working in related areas such as antimicrobial resistance and global health security.

As indicated previously, **interviewees** strongly favour an institutionalised partnership approach to the Candidate Initiative, whereas among respondents to the **open public consultation** just over half (26 out of 41) view the institutionalised partnership approach as the best way to address the identified problems. Respondents to the **open public consultation** furthermore see the relevance of a specific dedicated structure to govern the initiative in many different aspects. In particular, they see such a structure as relevant or even very relevant to the Candidate Initiative’s ability to implement activities more effectively (35 out of 45 respondents) and transparently (32 out of 45).

¹⁵³ African countries, United Kingdom, Japan, etc.

All **interviewees** agree that, to achieve impact, the Candidate Initiative needs to encompass a broad range of stakeholders, including European and African countries, research institutions, industry, charitable and international organisations. The extent of participation, particularly stakeholders' involvement in a General Assembly, voting rights and funding decisions have been widely discussed among interviewees but there appears to be no consensus on the best format of participation.

Interviewed representatives of national governments stress the importance of European and African country participation, and their ability to “steer the processes”. All interviewees encourage third party participation, in the form of private entities, associated countries, and charitable foundations. In case of industry participation, many interviewees welcome their inclusion but express a need for transparency in their participation and contributions, as well as limited mandate in order to ensure that public interests are at the core of the partnership.

The need for ensuring involvement of a broad range of partners is confirmed also by respondents to the **open public consultation**: 17 out of 47 deemed it relevant, and 25 out of 47 very relevant. Parties that are considered relevant for pooling and leveraging resources include in particular Member States, Associated Countries and African countries. Most respondents also agree on the need to include industry, academia, philanthropies and NGOs in the partnership, although some respondents expressed some reluctance about doing so.

Interviewees widely agree that funding and implementation of research and innovation actions should be the primary focus of the Candidate Initiative. Interviewees with whom the optimal positioning for the Candidate Initiative was explored in more depth, mostly viewed late-stage clinical trials as the primary area where the Candidate Initiative could deliver direct impacts. Nonetheless, among all interviewees there was a large degree of consensus that investments in research and innovation actions should be done alongside investments in research capacity development activities.

Respondents to the **open public consultation** hold similar views on how best to allocate resources to different types of activities. A large majority are strongly supportive of investment in collaborative R&I projects (35 out of 45 respondents) and in co-creation of solutions with end-users (30 out of 45). These respondents were not explicitly asked to indicate their support for investment in research capacity development, nor did the question allow for open comments.

Among **interviewees**, some representatives of the EC as well as current members of the EDCTP Association agreed that EDCTP has played an important role in maintaining national commitments to combating infectious diseases but felt that this has not necessarily resulted in increased national investments.

Box 2 Comparison between the preferred option & the current partnership existing in the area taking into account lessons from past evaluations

What continues	What is different
<ul style="list-style-type: none"> The current scientific scope covering HIV/AIDS, tuberculosis, malaria and neglected infectious diseases, but it will be enlarged. Geographical focus in sub-Saharan Africa. <p>EU Member States, Associated States to the Framework Programme and sub-Saharan States will part of the EDCTP3, through the EDCTP Association, under Dutch law, enabling all Participating States, also the sub-Saharan countries, to be part in the decision-making.</p>	<ul style="list-style-type: none"> The scientific scope will be enlarged to include (re-)emerging epidemics, antimicrobial resistance and co-morbidities of infectious diseases with non-communicable diseases, affecting sub-Saharan Africa. Additional key global players such as philanthropies (BMGF, Wellcome Trust, etc.), industry (EFPIA, etc.) and other third countries (e.g. United Kingdom, Japan, etc.) would be able to join the initiative, and contribute to the partnership on ad-hoc basis, and their funds would be able to be matched by the EU contribution, increasing the leveraging effect and the coherence of the initiative.

One particular issue raised by **representatives of EDCTP Participating States** in regard to the current EDCTP2 programme, is that even legal entities whose countries are not part of the EDCTP Association, are able to participate in all EDCTP2-supported activities, meaning there has been limited incentive for formal commitment and alignment of activities. Under these conditions, some countries, in particular from the sub-Saharan region, would not see the benefit in committing to the partnership. They question what can be done to increase the leveraging effect for the Candidate Initiative. To encourage countries to participate in the initiative, it is proposed to consider the introduction of provisions that would limit eligibility for funding for certain activities.

7.2. Objectives and corresponding monitoring indicators

Operational objectives

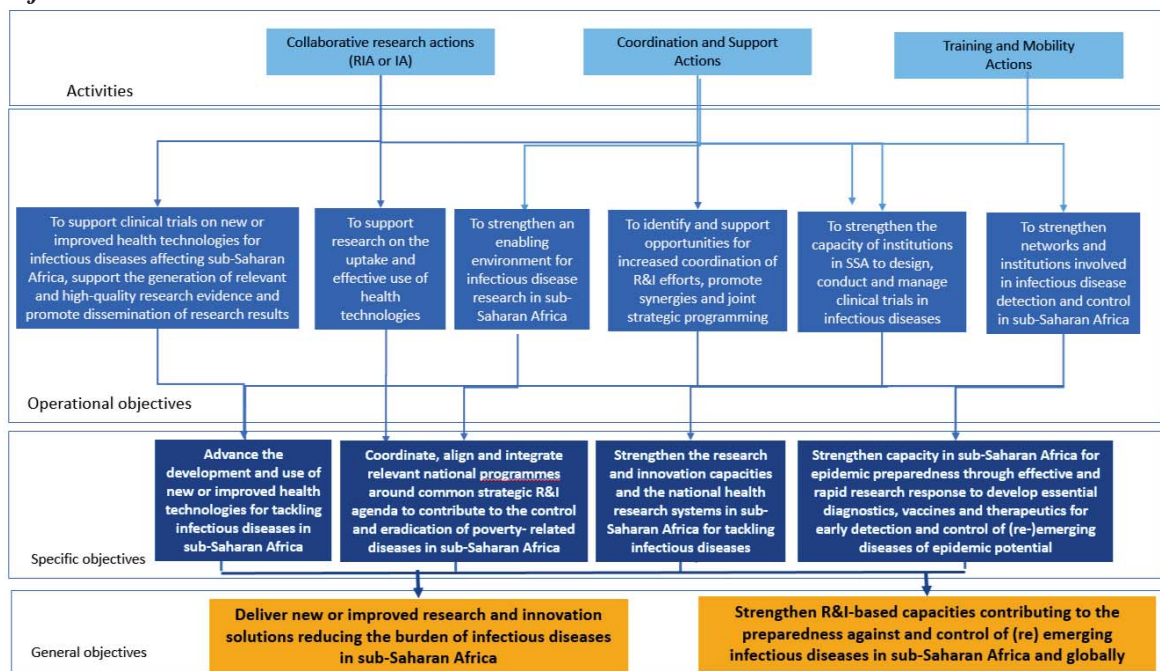

Figure 12 below lists a range of actions and activities to be carried out, which go also beyond the R&I activities that can be implemented under Horizon Europe. This reflects the definition of European Partnerships in the Horizon Europe regulation as initiatives where the Union and its partners “commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.” This figure also shows the links between the actions, operational objectives and the specific and general objectives of the initiative.

A set of six operational objectives have been developed for the initiative, which feed into the previously identified specific objectives, subsequently feeding into the general objectives. These operational objectives are:

- To support clinical trials on new or improved health technologies for infectious diseases affecting sub-Saharan Africa, generating relevant and high-quality research evidence and to promote dissemination of research results;
- To support research on the uptake and effective use of new or improved health technologies

- To identify and support opportunities for increased coordination of research and innovation efforts, promote synergies and joint strategic programming, and the dissemination of research results
- To strengthen the capacity of institutions in sub-Saharan Africa to design, conduct and manage clinical trials in infectious diseases
- To strengthen an enabling environment for infectious disease research in sub-Saharan Africa
- To strengthen networks and institutions involved in infectious disease detection and control in sub-Saharan Africa.

Figure 12: Operational objectives of the candidate in relation to the specific and general objectives

Monitoring indicators

In addition to Key Impact Pathways indicators set centrally in the Regulation of Horizon Europe, additional monitoring indicators have been identified to enable the tracking of progress of the partnership towards meeting its objectives. Whenever possible these indicators will be reported in relation to the initial baseline at country level.

In the medical sector, the timelines for development are long, taking up to 12-15 years on average for the development of a new drug, and approximately 2-8 years for the development of a new medical device. The necessary regulatory acceptance/approval and implementation process can add an additional 5 years. Therefore, the attainment of some of the initiative's objectives would not be appreciated until long after the projects have finished.

Table 14: Monitoring indicators in addition to the Horizon Europe key impact pathway indicators

	Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
Scientific impacts	Launching calls to pursue EU-Africa	Generating high quality R&I scientific knowledge of relevance	Advancing development of diagnostic kits, candidate vaccines and treatment products

	Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
	<p>Global health partnership (# of calls launched and projects funded in each scheme (RIA, TMA, CSA), and € invested.</p> <p>Engaging stakeholders to promote generation of high quality scientific knowledge of relevance to EU-Africa GH priorities (Outcomes of stakeholders' consultative meetings (# of topics informing future calls for proposals)</p>	<p>to EU-Africa GH priorities (# of peer-reviewed international publications generated by the partnership projects).</p> <p>Increased cooperation and additional joint actions with other public and private funders, including WHO initiatives and increased aligned strategy with key global players including development agencies (# of new or strengthened international networks sharing good practice, extending capacity, and creating platforms for multicentre trials).</p> <p>Building South-South and North-South networks to facilitate (rapid) decisions, actions and information exchange for making (urgently needed) clinical resources and products available (# of countries and institutions participating in Regional Networks, # of countries and institutions participating in projects addressing epidemic preparedness (# of clinical resources and products on track to gather information for regulatory approval)</p>	<p>for addressing infectious diseases related challenges of relevance to EU and Africa (# of new or improved health technologies progressed to licence; # of new or improved health technologies (diagnostics, vaccines, drug candidates, etc.) having progressed through key milestones</p> <p>Improving R&D preparedness for diseases that might lead to epidemics (surveillance, response and health capacity) and readiness to promptly conduct R&D during an emergency (# of projects resulting in, e.g. guidance and good practices, response mechanisms and other tools facilitating a coordinated response in case of epidemics, # of projects with activities/ deliverables oriented towards "twinning" between stronger and weaker regions/sites # of robust early warning systems in place; effectiveness of investments in building preparedness capacity as judged by independent evaluations)</p>
Economic/ Technological impacts	<p>Supporting studies into cost-effectiveness and economic benefits of products (# of projects addressing improved efficiency of research resources)</p> <p>Facilitating industry and private foundations participation in EU-Africa GHP to speed up R&I process (# of projects with industry and/or private foundations participation)</p>	<p>Leveraging investments in R&I and developing partnerships to support joint working and minimising duplication (€ leveraged through partnerships with other public and private funders, # of public - private publications)</p> <p>More closely aligned national research programmes and activities on poverty-related diseases, at scientific, management, and financial levels</p> <p>Improving coordination of national PSs investments (Participating States' budget in centrally funded activities and in joint activities with other Participating States.)</p>	<p>Driving forward advancements in GH R&I through innovative public-private collaborations (# of new or improved health technologies (diagnostics, vaccines, drug candidates # of new or improved health technologies submitted to standardisation or regulatory approval, or in use in at least one country, etc.) having progressed through key milestones)</p> <p>Increased number of co-funding programs and co-funded activities in Europe (# of new co-funded health technologies activities between Participating States programmes)</p>
Societal impacts Incl. Environmental / sustainability impact	<p>Supporting human capital in R&I through training and mobility schemes (# of TMA calls launched, # of TMA projects supported by gender)</p> <p>Supporting enabling environment for conducting clinical studies in sub-Saharan countries, compliance with fundamental ethical principles and relevant national, Union and international legislation (# number of Coordination and Support Action projects)</p>	<p>Addressing through research specific needs of more vulnerable groups (# of clinical studies targeting vulnerable populations: women, children, adolescents, etc.)</p> <p>Building and sustaining engagement and co-ownership EU-Africa Global health partnership and increased joint actions with development partners(#of sub-Saharan Africa and European institutions and countries participating in partnership projects, # of sub-Saharan African and European countries participating in EDCTP both through ongoing activities,</p>	<p>Pursing effective and sustainable investments into and retention of human capital in R&I (number of trainees retained by gender, career advancement and professional recognition of researchers following funding)</p> <p>Increased clinical research capacity and scientific leadership, including advancement of women scientists. #projects completed -- categorised by gender, country and regional representation.</p> <p>Enhanced ethics and regulatory capacities and more closely aligned regulatory mechanisms across countries, with increased common regulatory reviews of new products (# of projects completed and committees created and active two years after creation - categorised by country and regional</p>

	Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
	funded)	and through political and financial commitment as members of the Partnership or joint undertaking) Encouraging uptake of new or improved health technologies (# of calls and projects addressing uptake of research results into policy and practice)	representation) Increased influence on national and international policy guidelines and improved policy research uptake (# of policy changes to which EU-Africa research contributed to –e.g. citations in clinical reviews, clinical guidelines, systematic reviews or other policy documents issued by national, regional or international policy-making bodies) Enhanced implementation of evidence-based interventions (# of interventions whose implementation has been enhanced)

Evaluation framework

The evaluation of the Partnership will be done in full accordance with the provisions laid out in Horizon Europe Regulation Article 47 and Annex III, with external interim and ex-post evaluations feeding into the overall Horizon Europe evaluations. As set in the criteria for European Partnerships, the evaluations will include an assessment of the most effective policy intervention mode for any future action; and the positioning of any possible renewal of the Partnership in the overall European Partnerships landscape and its policy priorities. In the absence of renewal, appropriate measures will be developed to ensure phasing-out of Framework Programme funding according to conditions and timeline agreed with the legally committed partners ex-ante.

Annex 1 Procedural information

1. LEAD DG, DECIDE PLANNING REFERENCES

Lead DG: Directorate General Research and Innovation (RTD)

Decide number: PLAN/2019/5240

2. ORGANISATION AND TIMING

Institutionalised partnerships are foreseen in Articles 185 and 187 of the Treaty on the Functioning of the European Union (TFEU). The preliminary agreement on Horizon Europe contained a list of possible areas for institutionalised partnerships based on Article 185 and 187. For each of these areas the Commission considered 12 potential institutionalised partnerships. Their set up involves new EU legislation and the establishment of dedicated implementing structures and therefore an impact assessment for each of these initiatives.

Following political validation in June 2019, the impact assessment process started with the publication of inception impact assessments for each initiative in August 2019.

An inter-service steering group (ISSG) on research and innovation partnerships under Horizon Europe was set up in May 2019 and held 4 meetings before submission of the Staff Working Document to the Regulatory Scrutiny Board (7 May 2019, 19 June 2019, 5 December 2019, 20 January 2020). The ISSG consisted of representatives of the Secretariat-General, Directorate-General for Budget, Directorate-General for Research and Innovation Directorate-General for Communications Networks, Content and Technology, Directorate-General for Mobility and Transport, Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs, Directorate-General for Energy, Directorate-General for Environment, Directorate-General for Climate Action, and the Legal Service.

An online public stakeholder consultation was launched between September and November 2019, gathering 1635 replies for all 12 initiatives.

3. CONSULTATION OF THE RSB

Two upstream meetings with the Regulatory Scrutiny Board were held on 10 July 2019 and 30 September 2019.

In accordance with the feedback received from the Regulatory Scrutiny Board on 13 May 2020 the Staff Working Document has been revised as presented in Figure 1. The impact assessment was endorsed by the Inter Service Steering Group on 20 January 2020.

On 15 May 2020 the Regulatory Scrutiny Board (RSB) gave a positive opinion with reservations to a draft version of the EU-Africa Global Health Partnership candidate impact assessment. The revision was done to ensure that the assessment relies on a solid methodology that meets the RSB standards. The Board's recommendations covered the following key aspects: (1) The report defines the problem too widely in view of what the EU-Africa health partnership aims to achieve. It does not sufficiently focus on informing the choice of form of the candidate partnership. (2) The added value of the preferred option over an alternative type of partnership is not sufficiently demonstrated. (3) The report does not

sufficiently explain which players the new partnership can attract in its upgraded form and what they will contribute to delivering on its objectives.

The core text and annexes of the EU-Africa Global Health Partnership candidate impact assessment report were adjusted following the recommendations of the RSB. In particular to focus the problems in view of what the partnership aims to achieve, and to properly inform the choice of form of the candidate partnership, demonstrating the added value of the preferred option over an alternative type of partnership and explaining in a more detailed manner which players the new partnership can attract in its upgraded form and what they will contribute to delivering on its objectives.

Figure 1 Modifications to the draft Staff Working Document based on comments received from the Regulatory Scrutiny Board

Comments from the Regulatory Scrutiny Board	Actions taken for the Staff Working Document
<p>The report defines the problem too widely in view of what the EU-Africa health partnership aims to achieve. It does not sufficiently focus on informing the choice of form of the candidate partnership</p> <p>The logic of the intervention presented in the report should be clarified to support the analysis. It should focus on the central theme of the impact assessment, i.e. the choice of partnership form. In doing so, the report should better clarify the relationship between the problems, the ‘functionalities’, ‘expected impacts’, and the specific objectives. Impacts should be assessed with respect to the specific objectives. In the particular case of establishing a partnership for EU-Africa research health cooperation, the report should narrow down the problem definition. This should build on the experience gathered with the previous research programmes with and in African countries and focus on supporting clinical trials and enhancing research capacities.</p>	<p>The context of the initiative has been shortened to focus on the aim of the Impact Assessment, in particular on the analysis of the types of partnerships that can be created in the specific area of research cooperation with African countries and other global partners.</p> <p>The intervention logic has been revised based on a better definition for the two main problems the partnership aims to address - the lack of suitable health technologies and the emergence and spread of infectious diseases – analysing the problem drivers, their corresponding specific objectives and expected impacts.</p> <p>For each policy option, the different functionalities have been detailed and assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (<i>‘openness’</i>); the range of activities that can be performed (including <i>additionality and level of integration</i>); the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (<i>internal coherence</i>), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (<i>external coherence</i>).</p>

	<p>It has been highlighted that the new partnership builds on the success and experience gathered by its predecessors, the EDCTP and EDCTP2 programmes.</p>
<p>The added value of the preferred option over an alternative type of partnership is not sufficiently demonstrated.</p> <p>The report should clarify the scoring system applied when assessing the options and explain the relative importance of the different criteria. It should remove the discrepancies between the text and the tables and correct inconsistencies in terms of expected impacts. The report should justify any deviations from the common efficiency analysis.</p> <p>On this basis, the report should better explain the advantages of an institutionalised Article-187 partnership over other organisational forms. This should include the prospective participation of national, international and private organisations or donors. It should also include the financial requirements and the needed time horizon of the commitment to support clinical trials and grow research capacity in sub-Saharan Africa.</p>	<p>The scoring system applied when assessing the options has been better explained as well as the relative importance of the different criteria and the deviations from the common efficacy analysis.</p> <p>The discrepancies between the text and the tables and inconsistencies in terms of expected impacts have been corrected. The report should justify any deviations from the common efficiency analysis.</p> <p>The advantages of the institutionalised Article-187 partnership over other organisational forms has been explained. The main added value of the partnership based on an Article 187 of the Treaty of the European Union is that the African countries' contribution can count towards matching the EU contribution. This new approach provides a strong recognition of the political and the operational importance of the African countries in the partnership. In addition, Article 187 provides the framework within which philanthropies, industry and other third countries can also join and contribute to the partnership, allowing the EU to collaborate with different key global health players. Moreover, under an Article 187, the EU is a full partner and co-owner in the endeavour. This means that the Commission is an active actor in the policy dialogue and the governance mechanism of the partnership. With its broader, multi stakeholder partnership, an article 187 partnership would be a powerful actor to address global health and it would be able to deliver at the necessary speed and scale ensuring that public interests are at the core of the partnership.</p> <p>The quantitative information on the required budget have been indicated including for the envisaged set up and running costs.</p>
<p>The report does not sufficiently explain which players the new partnership can</p>	<p>The report has been revised to better explain which players can be attracted to the</p>

attract in its upgraded form and what they will contribute to delivering on its objectives.

The report should expand on how the preferred form of the partnership would attract private industry and donors. It should explain how it would coordinate with similar global initiatives.

partnership.

The motivation for the **EU, European and African countries** comes mainly from the successes of the EDCTP and EDCTP2 partnerships. These partnerships have shown that European and African governments can join forces with the EU around common objectives, creating an environment within which results were achieved that individual countries or the EU research framework programme alone, would not have managed to obtain. **Philanthropies**, such as the Bill and Melinda Gates Foundation or Wellcome Trust, have realised that alone they cannot bear the costs of late stage clinical trials for the development of medicines or vaccine for poverty related diseases (e.g. phase IV of the RTS,S malaria vaccine candidate) and they are therefore seeking partners to join forces with. The Ebola epidemics in West Africa and the Democratic Republic of Congo has contributed to raise the interest of the **pharma industry** and vaccine in investing in infectious diseases threats affecting Africa and they are actively reaching out to potential partners. Also, for some of these industries, investing in research that is relevant to Africa is part of their corporate social responsibility (e.g. Johnson & Johnson¹, GSK²) with a commitment to fair pricing. Including pharma industry in the partnership will also allow to produce at scale and cover the whole value chain. Here also a partnership under Article 187 would better harness industry's contribution as it can be matched. While industry has already taken part in some projects under EDCTP2. The industry that would participate in this partnership, is the industry that has a research agenda that is relevant to infectious diseases in low and middle income countries.

² <https://www.gsk.com/en-gb/responsibility/>

<p>Additional changes to the Core Impact Assessment Staff Working Document</p>	<p>Introductory paragraphs to the Figure 6 and 7 have been added.</p> <p>Following suggestions from the GHP Working Group on African Involvement additional information has been added to the problem drivers.</p> <p>In the General and Specific objectives, points 4.1 and 4.2 references to the specific African countries consultation have been added.</p> <p>The target to measure the objective of strengthening the capacity of sub-Saharan Africa for epidemic preparedness has been better defined.</p> <p>In point 4.4, under ‘Type and composition of the actors to be involved’ and ‘Type and range of activities needed’ a reference to the specific African consultation has been added.</p> <p>Under the ‘Coherence needed with the internal and external environment’, more information has been added to better explain Figure 9.</p> <p>Under point 7.1 The preferred option, a paragraph has been adapted to avoid the repetitions.</p> <p>The Table 14 on Monitoring indicators has been adapted to include additional indicators from the Draft EDCTP3 Strategic Research and Innovation Agenda.</p>
<p>Additional changes to the Annex of the Impact Assessment Staff Working Document</p>	<p>The ‘Overview of costs’ (Annex 3.3) has been revised based on the DG BUDG average costs to be used for the estimates on ‘Human resources’ in the legislative financial statements.</p> <p>The ‘specific African consultation on GHP/EDCTP3’ has been added (Annex 6.2.7).</p>

4. EVIDENCE, SOURCES AND QUALITY

To ensure a high level of coherence and comparability of analysis for all candidate initiatives, an external study was procured to feed into the impact assessments of the 12 candidate

institutionalised partnerships ³ (Technopolis Group, 2020). It consisted of an horizontal analysis and individual thematic analyses for each of the initiatives under review.

For all initiatives, the evidence used includes desk research partly covering the main impacts and lessons learned from previous partnerships. A range of quantitative and qualitative data sources complement the evidence base, including evaluations; foresight studies; statistical analyses of Framework Programmes application and participation data and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis).

A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options. Public consultations (open and targeted) supported the comparative assessment of the policy options. For each initiative up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition the analysis was informed by the results of the Open Public Consultation (Sep – Nov 2019), the consultation of the Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of candidate Institutionalised European Partnerships.

A more detailed description of the methodology and evidence base used, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

³ Technopolis Group, 2020, forthcoming.

Annex 2 Stakeholder Consultation

1. OVERVIEW FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1.1. Introduction

In line with the Better Regulation Guidelines,⁴ the stakeholders were widely consulted as part of the impact assessment process of the 12 candidates for institutionalised partnerships, including national authorities, the EU research community, industry, EU institutions and bodies, and others. These inputs were collected through different channels:

- A feedback phase on the inception impact assessments of the candidate initiatives in August 2019, gathering 350 replies for all 12 initiatives on the “Have your say” web portal during a period of 3 weeks;
- A structured consultation of Member States performed by the EC services over 2019 through the Shadow Strategic Configuration of the Programme Committee of Horizon Europe (in line with the Article 4a of the Specific Programme of Horizon Europe). This resulted in 44 possible candidates for European Partnerships identified as part of the first draft Orientations Document towards the Strategic Plan for Horizon Europe (2021-2024), taking into account the areas for possible institutionalised partnerships defined in the Regulation.
- An online public stakeholder consultation administered by the EC, based on a structured questionnaire, open between September and November 2019, gathering 1635 replies for all 12 initiatives;
- A targeted consultation run by the external study contractors with a total of 608 interviews performed as part of the thematic studies by the different study teams between August 2019 and January 2020.

1.2. Horizontal results of the Open Public Consultation

The consultation was open to everyone via the EU Survey online system.⁵ The survey contained two main parts to collect views on general issues related to European partnerships (in Part 1) and specific responses related to one or more of the 12 candidate initiatives (as selected by a participant). The survey was open from 11 September till 12 November 2019. The consultation was available in English, German and French and advertised widely through the European Commission’s online channels as well as via various stakeholder organisations.

1.2.1. Profile of respondents

In total, 1635 respondents filled in the questionnaire of the open public consultation. Among them, 272 respondents (16.64%) were identified to have responded to the consultation as part of a campaign (coordinated responses). Based on the Better Regulation Guidelines, the groups of respondents where at least 10 respondents provided coordinated answers were labelled as ‘campaigns’, segregated and analysed separately and from other responses. In total 11 campaigns were identified, the largest of them includes 57 respondents⁶. In addition, 162

⁴ https://ec.europa.eu/info/files/better-regulation-guidelines-stakeholder-consultation_en

⁵ <https://ec.europa.eu/eusurvey/runner/ConsultationPartnershipsHorizonEurope>

⁶ The candidate Institutionalised Partnership Clean Hydrogen has the highest number of campaigns, namely 5. A few initiatives, such as Innovative SMEs, Smart Networks and Systems, were not targeted by campaigns. Some campaign respondents decided to provide opinions about several partnerships.

respondents in the consultation also display similarities in responses but in groups smaller than 10 respondents. Hence, these respondents were not labelled as campaigns and therefore were not excluded from the general analysis.

Table 1: Country of origin of respondents (N=1635)

Country	Number of respondents	Percentage of respondents
Germany	254	15.54%
Italy	221	13.52%
France	175	10.70%
Spain	173	10.58%
Belgium	140	8.56%
The Netherlands	86	5.26%
Austria; United Kingdom	61	3.73%
Finland	49	3.00%
Sweden	48	2.94%
Poland	45	2.75%
Portugal	32	1.96%
Switzerland	28	1.71%
Czechia	24	1.47%
Greece	23	1.41%
Norway; Romania	22	1.35%
Denmark	20	1.22%
Turkey	19	1.16%
Hungary	14	0.86%
Ireland	12	0.73%
United States	11	0.67%
Estonia; Slovakia; Slovenia	10	0.61%
Bulgaria; Latvia	9	0.55%
Bosnia and Herzegovina	7	0.43%
Lithuania	4	0.24%
Canada; Croatia; Israel	3	0.18%
China; Ghana; Iceland; Japan; Luxembourg; Morocco	2	0.12%
Bhutan; Botswana; Cyprus; Iran; Malta; Mexico; Moldova; Mongolia; Palestine; Russia; Serbia; South Africa; Tunisia; Ukraine; Uruguay	1	0.06%

As shown in Figure 2, the three biggest **categories of respondents** are representatives of companies and business organisations (522 respondents or 31.9%), academic and research institutions (486 respondents or 29.7%) and EU citizens (283 respondents or 17.3%). Among the group of respondents that are part of campaigns, most respondents are provided by the same groups of stakeholders, namely company and business organisations (121 respondents or 44.5%), academic and research institutions (54 respondents or 19.8%) and EU citizens (42 respondents or 15.4%).

Figure 2 Type of respondents (N=1635) - For all candidate initiatives

Among all consultation respondents, 1303 (79.69%) have been **involved in the on-going research and innovation framework programme** Horizon 2020 or the preceding Framework Programme 7, while 332 respondents (20.31%) were not. In the group of campaign respondents, the share of those who were involved in these programmes is higher (245 respondents out of 272 or 90.07%) than in the group of non-campaign respondents (1058 out of 1363 or 77.62%). When respondents that participated in the Horizon 2020 or in the preceding Framework Programme 7 were asked to indicate in which capacity they were involved in these programmes, the majority stated they were a beneficiary (1033 respondents) or applicant (852 respondents). The main stakeholder categories, e.g. companies/business organisation, academic/research institutions, etc., show a similar distribution across the capacities in which they ‘have been involved in Horizon 2020 or in the Framework Programme 7’ as the overall population of consultation respondents.

Among those who have been involved in Horizon 2020 or the preceding Framework Programme 7, 1035 respondents (79.43%) are/were **involved in a partnership**. The share of respondents from campaigns that are/were involved in a partnership is higher than for non-campaign respondents, 89.80% versus 77.03% respectively. The list of partnerships under Horizon 2020 or its predecessor Framework Programme 7 together with the numbers, percentages of participants is presented in Table 4, the table also show the key stakeholder categories for each partnership. Most consultation respondents participated in the following partnerships: Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, Clean Sky 2 Joint Undertaking, European Metrology Programme for Innovation and Research (EMPIR) and in Bio-Based Industries Joint Undertaking. The comparison between the non-campaign and campaign groups of respondents shows that the overall distribution is quite similar. However, there are some differences. For the campaign group almost a half of respondents is/was involved in the Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, a higher share of campaign respondents is/was participating in Clean Sky 2 Joint Undertaking and in Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking.

When respondents were asked in which **role(s) they participate(d) in a partnership(s)**, over 40% indicated that they act(ed) as partner/member/beneficiary in a partnership. The second largest group of respondents stated that they applied for funding under a partnership. The roles selected by non-campaign and campaign respondents are similar.

Table 4: Partnerships in which consultation respondents participated (N=1035)

Name of the partnership	Number and % of respondents from both groups (n=1035)	Number and % of respondents from a non-campaign group (n=815)	Academic/research institutions	Business associations	Company/business organisations	Company/business organisations	EU citizens	NGOs	Public authority
Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking	354 (33.33%)	247 (30.31%)	97	9	37	43	41	8	5
Clean Sky 2 Joint Undertaking	195 (18.84%)	145 (17.79%)	57	2	10	27	37	1	7
European Metrology Programme for Innovation and Research (EMPIR)	150 (14.49%)	124 (15.21%)	64	0	13	9	14	2	19
Bio-Based Industries Joint Undertaking	142 (13.72%)	122 (14.97%)	39	8	20	27	14	1	6
Shift2Rail Joint Undertaking	124 (11.98%)	101 (12.40%)	31	7	5	31	14	3	7
Electronic Components and Systems for European Leadership (ECSEL) Joint Undertaking	111 (10.72%)	88 (10.80%)	42	2	7	20	12	0	5

European High-Performance Computing Joint Undertaking (EuroHPC)	22 (2.13%)	18 (2.21%)	6	0	2	3	5	0	2

For the remaining of the consultation respondents could provide their views on each/several of the candidate initiatives. The majority of respondents (31.4%) provided their views on the Clean Hydrogen candidate partnership. More than 45% of respondents from the campaigns selected this partnership. Around 15% provided their views for European Metrology, Clean Aviation and Circular Bio-based Europe. The share of respondents in the campaign group that chose to provide views on the Clean Aviation candidate partnership is of 20%. The smallest number of respondents provided opinions on the candidate initiative ‘EU-Africa research partnership on health security to tackle infectious diseases – Global Health’.

Table 5: Candidate Institutionalised Partnerships for which consultation respondents provide responses (N=1613)

Name of the candidate Institutionalised European partnership	Number and % of respondents from both groups (n=1613)	Number and % of respondents from a non-campaign group (n=1341)
Clean Hydrogen	506 (31.37%)	382 (28.49%)
European Metrology	265 (16.43%)	225 (16.78%)
Clean Aviation	246 (15.25%)	191 (14.24%)
Circular bio-based Europe	242 (15%)	215 (16.03%)
Transforming Europe’s rail system	184 (11.41%)	151 (11.26%)
Key Digital Technologies	182 (11.28%)	162 (12.08%)
Innovative SMEs	111 (6.88%)	110 (8.20%)
Innovative Health Initiative	110 (6.82%)	108 (8.05%)
Smart Networks and Services	109 (6.76%)	107 (7.98%)
Safe and Automated Road Transport	108 (6.70%)	102 (7.61%)
Integrated Air Traffic Management	93 (5.77%)	66 (4.92%)
EU-Africa research partnership on health security to tackle infectious diseases – Global Health	49 (3.04%)	47 (3.50%)

1.2.2. Characteristics of future candidate European Partnerships

Respondents were asked to assess what areas, objectives, aspects need to be in the **focus of the future European Partnerships** under Horizon Europe and to what extent. According to Figure 6, a great number of respondents consider that a significant contribution by the future European Partnerships is ‘fully needed’ to achieve climate-related goals, to the development and effective deployment of technology and to EU global competitiveness in specific sectors/domains. Overall, respondents’ views reflect that many aspects require attention of the Partnerships. The least attention should be paid to responding towards priorities of national, regional R&D strategies, including smart specialisation strategies, according to respondents.

Overall, only minor differences can be found between the main stakeholder categories. Academic/research institutions value the responsiveness towards EU policy objectives and focus on development and effective deployment of technology a little less than other respondents. Business associations, however, find that the future European Partnerships under Horizon Europe should focus a little bit more on the development and effective deployment of technology than other respondents. Furthermore, business associations, large companies as

well as SMEs value the role of the future European Partnerships for significant contributions to EU global competitiveness in specific sectors domains a little higher than other respondents. Finally, both NGOs and Public authorities put a little more emphasis on the role of the future European Partnerships for significant contributions to achieving the UN SDGs. The views of citizens (249, or 18.3%) do not reflect significant differences with other types of respondents. However, respondents that are/were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7 assign a higher importance of the future European Partnerships to be more responsive towards EU policy objectives and to make a significant contribution to achieving the UN’s Sustainable Development Goals.

A qualitative analysis of the “other” answers highlights the importance of collaboration and integration of relevant stakeholders to tackle main societal challenges and to contribute to policy goals against which fragmentation of funding and research efforts across Europe should be avoided. Additionally, several respondents suggested that faster development and testing of technologies, acceleration of industrial innovation projects, science transfer and market uptake are needed. Next to that, many respondents provided answers related to the hydrogen and the energy transition, which corresponds to the high number of respondents that provided answers to the candidate initiative on this topic.

Figure 6: To what extent do you think that the future European Partnerships under Horizon Europe need to (N=1363) (non-campaign replies) For all candidate initiatives

1.2.3. Main advantages and disadvantages of Institutionalised European Partnerships

An open question asked to outline the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe (1551

respondents). The advantages mentioned focus on the development of technology, overall collaboration between industry and research institutions, and the long-term commitment. Disadvantages mentioned are mainly administrative burdens. An overview is provided below.

Advantages mentioned: Long term commitment, stability, and visibility in financial, legal, and strategic terms; Participation of wide range of relevant stakeholders in an ecosystem (large/small business, academics, researchers, experts, etc.); Complementarity with other (policy) initiatives at all levels EU, national, regional; Efficient and effective coordination and management; High leverage of (public) funds; Some innovative field require high levels of international coordination/standardisation (at EU/global level); Ability to scale up technology (in terms of TRL) through collaboration; Networking between members; Direct communication with EU and national authorities

Disadvantages mentioned: Slow processes; System complexity; Continuous openness to new players should be better supported as new participants often bring in new ideas/technologies that are important for innovation; Lower funding percentage compared to regular Horizon Europe projects; Cash contributions; Administrative burdens; Potential for IPR constraints.

1.2.4. Relevance of EU level to address problems in Partnerships' areas

Respondents were asked to rate the **relevance of research and innovation efforts at EU level efforts to address specific problems in the area of partnerships**. Research and innovation related problems were rated as most relevant across all candidate initiatives, followed by structural and resources problems and problems in the uptake of innovations. Overall, all three areas were deemed (very) relevant across the partnerships, as more than 80% of respondents found these challenges (very) relevant. Only minor differences were found between stakeholder categories. Research and innovation problems were found slightly more relevant by academic/research institutions, yet slight less relevant by large companies and SMEs. Structural and resource problems were indicated as slightly more relevant by NGOs, but slightly less by academic/research institutions. While both NGOs and public authorities find slightly more relevant to address problems in uptake of innovation than other respondents. The views of citizens are not differing significantly. Respondents that are/were directly involved in a current/preceding partnership find, however, the need to address problems related to the uptake of innovations slightly more relevant than other respondents.

Figure 9: To what extent do you think this is relevant for research and innovation efforts at EU level to address the following problems in relation to the candidate partnership in question? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.5. Horizon Europe mode of intervention to address problems

Respondents were asked to indicate how these challenges could be addressed through **Horizon Europe intervention**. Just over 50% of all respondents indicated that institutionalised partnerships were the best fitting intervention, with relatively strong differences between stakeholder categories. The use of Institutionalised Partnership was indicated more by business associations and large companies, but less by academic/research institutions and SMEs. While academic/research institutions valued traditional calls more often, this was not the case for business associations, large companies and public authorities. Public authorities indicated a co-programmed intervention more often than other respondents. Citizens indicated slightly less often that institutionalised partnerships were the best fitting intervention. Respondents that are/were directly involved in a current/preceding partnership, selected the institutionalised partnership intervention in far higher numbers (nearly 70%).

Figure 10: In your view, how should the specific challenges described above be addressed through Horizon Europe intervention? (non-campaign replies) For all candidate initiatives

When asked to reflect on their answers, respondents that pointed to the need for using institutionalised partnership mentioned the long-term commitment of collaboration, a common and ambitious R&I strategy as well as the overall collaboration between industry and research institutions. Others shared positive experiences with other modes of interventions:

- Traditional calls, because of their flexibility and integration of a wide range of actors, as long as the evaluation panels do not deviate from the policy focus. This was mentioned by 94 participants, including companies (25), academics (26) and EU citizens (25).
- Co-funded partnership, as a mechanism to ensure that all participants take the effort seriously, while allowing business partnerships to develop. This approach was deemed suitable based on previous experiences with ERANETs. This was raised by 84 participants, 36 of them academic respondents, 18 companies and 16 EU citizens.
- Co-programmed partnerships, to tackle the need to promote and engage more intensively with the private sector. This was mentioned by 97 participants, most of them companies (34), followed by academics (22), business associations (15) and EU citizens (11).

1.2.6. Relevance of a set of elements and activities to ensure that the proposed European Partnership would meet its objectives

Setting joint long-term agendas

Respondents were asked how relevant it is for the proposed European Partnerships to meet their objectives to have a strong involvement of specific stakeholder groups in setting joint long-term agenda. All respondents see stakeholders from industry as the most relevant,

followed by academia and governments. The involvement of foundations and NGOs as well as other societal stakeholders were, however, still found to be (very) relevant by more than 50% of the respondents. Most respondents indicated the stakeholder group they belong to themselves or that represent them as relevant to involve.

Figure 11: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives - Setting joint long-term agenda with strong involvement of: (non-campaign replies) For all candidate initiatives

Pooling and leveraging resources through coordination, alignment and integration with stakeholders

Respondents were asked how relevant it is for the proposed European Partnership to meet its objectives to pool and leverage resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with specific groups of stakeholders. Respondents see stakeholders from industry as the most relevant, followed by academia and governments (Member States and Associated Countries). The involvement of foundations and NGOs as well as other societal stakeholders are also still found to be (very) relevant for more than 50% of the respondents. Similarly as described for the question on setting joint long-term agendas, most stakeholder categories valued their own involvement higher than other respondents – although also here differences between stakeholder categories were minor.

Figure 12: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Pooling and leveraging resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with: (non-campaign replies) For all candidate initiatives

Composition of the partnerships

Regarding the composition of the partnership most respondents indicated that for the proposed European Partnership to meet its objectives the composition of partners needs to be flexible over time and that a broad range of partners, including across disciplines and sectors, should be involved (see Figure 13). When comparing stakeholder groups only minor differences were found. Academic/research institutions and public authorities found the involvement of a broad range of partners and flexibility in the composition of partners over time slightly more relevant than other respondents, while large companies found both less relevant. SMEs mainly found the flexibility in the composition of partners over time less relevant than other respondents, while no significant differences were found regarding the involvement of a broad range of partners. Citizens provided a similar response to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, indicated a slightly lower relevance of the involvement of a broad range of partners and flexibility in the composition of partners over time.

Figure 13: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Partnership composition (non-campaign replies) Aggregation of responses of all candidate initiatives

Implementation of activities

Most respondents indicated that implementing activities like a joint R&I programme, collaborative R&I projects, deployment and piloting activities, providing input to regulatory aspects and the co-creation of solutions with end-users are all (very) relevant for the partnerships to be able to meet its objectives. Minor differences were found between the main stakeholder categories, the differences found were in line with their profile. As such, academic/research institutions found joint R&I programme & collaborative R&I projects slightly more relevant and deployment and piloting activities, input to regulatory aspects and co-creation with end-users slightly less relevant than other respondents. For SMEs an opposite pattern is shown. Large companies, however, also found collaborative R&I projects slightly more relevant than other respondents, as well as input to regulatory aspects. The views of citizens are similar to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, show a slightly higher relevance across all activities.

Figure 14: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Implementing the following activities (non-campaign replies) For all candidate initiatives

1.2.7. Relevance of setting up a legal structure (funding body) for the candidate European Partnerships to achieve improvements

Respondents were asked to reflect on the relevance of setting up a legal structure (funding body) for achieving a set of improvements, as shown in the Figure below. In general, 70%-80% of respondents find a legal structure (very) relevant for these activities. It was found most relevant for implementing activities in a more effective way and least relevant for ensuring a better link to practitioners on the ground, however differences are small.

Figure 15: In your view, how relevant is to set up a specific legal structure (funding body) for the candidate European Partnership to achieve the following? (non-campaign replies) Aggregation of responses of all candidate initiatives

When comparing stakeholder categories there are only minor differences. Academic/research institutions indicated a slightly lower relevance for transparency, better links to regulators as well as obtaining the buy-in and long-term commitment of other partners. SMEs also indicated a lower relevance regarding obtaining the buy-in and long-term commitment of other partners. Large companies showed a slightly higher relevance for implementing activities effectively, ensure better links to regulators, obtaining the buy-in and long-term commitment of other partners, synergies with other EU/MS programmes and collaboration with other EU partnerships. NGOs find it slightly more relevant to implement activities faster for sudden market or policy needs. Public authorities, however, find it slightly less relevant to facilitate collaboration with other European Partnerships than other respondents. The views of citizens show a slightly lower relevance for a legal structure in relation to implementing activities in an effective way. Respondents that are/were directly involved in a current/preceding partnership indicated a higher relevance across all elements presented.

1.2.8. Scope and coverage of the candidate European Partnerships based on their inception impact assessments

Consulted on the scope and coverage for the partnerships, based on their inception impact assessments, the large majority feels like the scope and coverage initially proposed in the inception impact assessments is correct. However, about 11% to 15% of the respondents indicated the scope and coverage to be too narrow. About 11%-17% of respondents answered “Don’t know”. Overall, differences between the main stakeholder categories were found to be minor. Academic/research institutions indicated slightly more often that the research area was “too narrow” than other respondents. SMEs on the other hand indicated slightly more often that the research area and the geographical coverage were “too broad”. NGOs and public authorities, however, found the geographical coverage slightly more often “too narrow”. Large companies found the range of activities slightly more often “too broad” and the sectoral focus slightly more often “too narrow” when compared to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership more often indicated that the candidate institutionalised European Partnership have the “right scope & coverage”.

Figure 16: What is your view on the scope and coverage proposed for this candidate institutionalised European Partnership, based on its inception impact assessment? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.9. Scope for rationalisation and alignment of candidate European Partnerships with other initiatives

When asked whether it would be possible to rationalise a specific candidate European Institutionalised Partnership and its activities, and/or to better link with other comparable initiatives, nearly two thirds of respondents answered “Yes” (1000, or 62%), while over one third answered “No” (609, or 39%). Nearly no differences were found between stakeholder categories, only large companies and SMEs indicated slightly more often “Yes” in comparison to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership, indicated “No” more often, the balance is about 50/50 between “Yes” and “No” for this group.

1.2.10. Relevance of European Partnerships to deliver targeted scientific, economic/technological and societal impacts

Finally, respondents were asked to rate the relevance of partnership specific impacts in three main areas: Societal; Economic/technological; and Scientific impacts. All three areas were deemed (very) relevant across the candidate partnerships. Scientific impact was indicated as the most relevant impact, more than 90% of respondents indicated that this as (very) relevant. Only minor difference between stakeholder groups were found. Academic/research institutions found scientific impacts slightly more relevant, while large companies found economic and technological impacts slightly more relevant than other respondents. NGOs found societal impact slightly more relevant, while SMEs found this slightly less important. Citizens did not a significantly different view when compared to other respondents. Respondents that are/were directly involved in a current/preceding partnership find all impacts slightly more relevant than other respondents.

Figure 17: In your view, how relevant is it for the candidate European Institutionalised Partnership to deliver on the following impacts? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.3. Stakeholder consultation results for this specific initiative

1.3.1. Feedback to the inception impact assessment on candidate initiatives for Institutionalised Partnerships

Following the publication of the inception impact assessment, a feedback phase of three weeks allowed any citizen to provide feedback on the proposed initiative on the “Have your say” web portal⁷. In total 34 responses were collected for the initiative “EU-Africa Global Health”, mainly from academic/research institutions, non-governmental organisations, EU and non-EU citizens, industry associations, and public authorities.⁸ Among the elements mentioned were:

- The scope of the initiative should cover late-stage clinical trials for infectious diseases, especially those poverty-related and neglected as well as emerging diseases in sub-Saharan Africa. Capacity building and education of African scientists should also be prioritised in the scope of the partnership.
- The partnership needs to guarantee a strong involvement of non-EU countries, particularly the African partners, in decision-making, strategic planning, and funding allocation.
- The partnership is expected to facilitate a coordinated scientific agenda for tackling infectious and emerging diseases.
- Funding decisions should follow public health needs in Sub-Saharan Africa, and research priority areas.
- Flexibility in funding decisions should be increased, possibly through adopting a portfolio-based funding approach.
- Efforts should be made to prevent brain-drain from Africa through strengthening local research systems and creating opportunities for researchers to continue their academic career in Africa.
- An increase (over €1.3 billion) in financial support from the EU is needed to ensure that the development of new technologies can be supported. Contributions of European and African partners need to be increased, while financial accounting needs to be simplified.
- Public-private collaboration should be boosted through stronger engagement of private partners and in-kind and financial investments. This would allow to pool adequate resources for the ambitious goals.
- The partnership should become a platform for EU science diplomacy in Africa to strengthen the ties between the continents.
- Stakeholders indicate that Institutionalised Partnership under Article 187 would allow a greater flexibility to attract a variety of stakeholders to achieve the goals of the partnership and should therefore be preferred.

1.3.2. Structured consultation of the Member States on European partnerships

A structured consultation of Member States through the Shadow Strategic Configuration of the Programme Committee Horizon Europe in May/June 2019 provided early input into the

⁷<https://ec.europa.eu/info/law/better-regulation/have-your-say/initiatives/11907-EU-Africa-Global-Health-Partnership/public-consultation>

preparatory work for the candidate initiatives, in line with the Article 4a of the Specific Programme of Horizon Europe. For the initiative “EU-Africa Global Health” the following overall feedback was received from Member States.

Relevance and positioning in a national context

Overall the results of the Member State consultation confirm the relevance of the proposed EU-Africa partnership on health security to tackle infectious diseases, with 69% considering it relevant for national policies and priorities, and 70% for their research organisations, including universities. The proposed partnerships is considered less relevant for industry by most countries (46% relevant), see Figure 18.

Figure 18: Relevance of the EU-Africa partnership on health security to tackle infectious diseases in the national context

On the question of existing national/regional R&I strategies, plans and/or programmes in support of the proposed EU-Africa Partnerships, 21 countries (70 %) report to have relevant elements in place. National R&I strategies or plans were identified most frequently (56%, BE, DE, EE, ES, HR, IT, LV, MT, PL, RO, SE, SI, UK, NO), followed by national economic, sectoral strategy and/or plan with a strong emphasis on research and/or innovation (48%, DK, EE, ES, HR, LV, NL, PL, RO, SE, SI, UK, NO) and dedicated R&I funding programmes or instruments (44%, AT, DE, ES, FR, HR, LV, PL, RO, SE, UK, NO).

Delegations identified a number of aspects that could be reinforced in the proposal for this partnership that would increase its relevance for national priorities. These are all individual comments, with few common elements, e.g.⁴:

- The zoonotic origin of many tropical diseases should be strongly re-enforced and studies on vectors of tropical diseases included;
- Better definition of the role of AMR, also in relation to other partnerships candidates;
- Extension to investigating health behaviour. The fight against infectious diseases in Africa is more effective when it is approached systematically, not only from the clinical perspective;
- Increase the scope of infectious diseases covered, and geographical coverage (e.g. Latin America);
- Include major threats in terms of global burden such as diarrheal, respiratory diseases and meningitis as major causes of death for children under 5, or vector-borne diseases;

- Better alignment with policies in relation to sexual reproductive health and rights. Also, a clear gender analysis and approach;
- Increased efforts for engagement of more partners from the parts of Africa that have weak research culture (areas of greatest impact);
- Better involvement of countries that are not contributing with funding;

The majority of countries (52%) are at this stage undecided concerning their interest to participate, and 4 countries have expressed there is no national interest to participate (CY, CZ, HU, IS). At this stage 7 countries (DE, FR, IT, MT, SI, UK, NO) express interest to join as a partner. National R&I programmes and governmental research organisations are identified as main potential partners or contributors. A number of countries express that their interest to participate would increase if their comments would be taken into account. While most are undecided concerning their participation, many countries (74%) expressed interest in having access to results produced in the context of the partnership.

Feedback on objectives and impacts

Overall there is a strong agreement (84%) on the use of a partnership approach in addressing health security tackling infectious diseases. There is broad agreement (76%) that the partnership is more effective in achieving the objectives and delivering clear impacts for the EU and its citizens, and only to a small degree (36%) that it would contribute to improving the coherence and synergies within the EU R&I landscape.

Countries indicate good agreement with the proposed objectives at short, medium and long term (84%) and the expected scientific, economic and societal impacts at European level (88%), with the remaining ones remaining neutral. Slightly less (72%) consider the impacts relevant in the national context. There is good agreement (80%) with the envisaged duration of the proposed partnership, but strong request for exit strategies, given that the initiative has started in 2003.

Additional comments made by individual delegations reiterate points made previously under elements to be reinforced. On the scope there are diverging views, between those that want to maintain the proposed focus, and others that want to expand the geographical and thematic scope.

Views on partners, contributions and implementation

There is no clear view between countries on the type and composition of partners, yet few comments (e.g. doubts on the inclusion of industry or foundations) are made that further elaborate their assessment. At this stage most countries (68%) would need more information on contributions and level of commitments expected from partners, while 24% agree with the proposal.

The proposed change of the implementation, from the use of Article 185 to the use of Article 187, and the establishment of a Joint Undertaking, is supported by around one third of countries (36%), while 24% disagree, with the rest expecting more details in order to be able to make an informed decision. Arguments made in relation to either implementation relate to the following:

- Article 185: Political aspects (role of the European Parliament), continuation of implementation that is considered well-working, future role of the UK (currently UK is the major contributing country in EDCTP2); positive experience with the current governance model;
- Article 187: more possibilities for private and NGO partners and reduced liability issues for Member States, need to be clear about role of industry (limitation to ad-hoc participation seems more acceptable), ensuring the programme is developed by the public domain, consideration to enhance the territorial scope beyond African countries.

1.3.3. Targeted consultation of stakeholders

The objective of this targeted consultation based on interviews was to collect stakeholder insights on the different issues. These included the functionalities of the initiative required to attain the objectives, the commitment of Member States and other stakeholders to the initiative, the costs of eventual future partnership, the leveraged R&D investments from stakeholders and the impacts and differentiators to take into account for the options assessment. The interview questions were based on the objectives, scope, type of partnership, partner engagement, governance, coherence, funding sustainability and impact.

Overview of respondents to the targeted consultation

The number of interviews with representatives in each stakeholder category, along with their percentage share is shown in Table 2. Within the category “country representatives to the EDCTP GA”, a number of interviewed (European and African) representatives are affiliated with research institutions. Thus, the number of interviewed academics exceeds the number of interviews shown in the category ‘academia’. Furthermore, a number of interviews were performed as group interviews with two or more participants.

1. *Table 2: Number of interviews per stakeholder category*

Stakeholder category	Number	Share (%)
EDCTP Secretariat and Scientific Advisory Committee	7	18.9%
Country representatives to the EDCTP General Assembly	9	24.3%
European Commission and related bodies	6	16.2%
Academia	3	8.1%
Product Development Partnerships (PDPs)	3	8.1%
Charitable foundations	2	5.4%
Industry	3	8.1%
International organisations	2	5.4%
Other	2	5.4%
TOTAL	37	100%

Political and legal context

Although no interview questions directly cover issues of political and legal context directly, interviewees were vocal in expressing their views on the subject. Interviewees discussed areas where Africa has achieved substantial progress, such as scale up of e-health technologies, and overall digitalisation of the continent. However, respondents state that, much still needs to be done. Issues of emerging infectious diseases, climate change, and antimicrobial resistance were highlighted as external factors that may shape future policy priorities for global health.

Problem definition and drivers

What are the problems? Interviewees across all categories agree that the burden of infectious disease is still high in sub-Saharan Africa. The EDCTP Secretariat, EC, PDPs, industry, and others highlighted that emerging diseases also constitute a problem that needs to be addressed. They also mention the lack of accessible and affordable technologies as a driver for this burden, as well as the limited commercial interest in the area of infectious diseases. Interviewees, from all stakeholder categories, stress that there remains a large unmet need for effective, affordable and safe treatments, vaccines and diagnostic tools to combat infectious diseases. The large majority of stakeholders across all categories believe that limited capacity of African countries to conduct clinical research for disease is a major problem driver.

Why should the EU act? Interviewees unanimously agree that there is a strong need for the EU to address the identified problems. Many stakeholders (across all stakeholder groups) believe that the Candidate Initiative is unique to address the needs. Many stakeholders (from EDCTP, country representatives, PDPs, academia, international organisations) stress the added value the initiative brings to African countries in terms of strengthened research capacity and infrastructure. Interviewees (EDCTP Secretariat and SAC, academia, other) emphasise that the partnership format is effective in promoting long-term commitments from all partners, including African countries.

Since the costs of conducting late-stage clinical trials can be extremely high, many of them (EDCTP and SAC, country representatives, EC, academia, PDPs) state that the Candidate Initiative would be essential to achieve a critical mass in terms of funding, as the expected costs are beyond the capacities of national funders. They (EDCTP and SAC, EC, academia,) also state that the Candidate Initiative could enhance coherence between national research programmes funded by EU Member States. Furthermore, some stakeholders (academia, other) believe that the large financial contributions made into EDCTP could be (partially) lost if no successor initiative is in place.

Many stakeholders (EC, country representatives, academia, product development partnerships, charities, international organisations, others) also stress the political commitment of EU to fund actions for research and innovation in Africa and the need to keep up with other international players. EU commitment to SDGs and human right principles are discussed. A few stakeholders have pointed out that supporting development of Africa is in line with European values and feel that EU has a moral obligation to do so.

Objectives: What is to be achieved?

General objectives Across all stakeholder groups, interviewees strongly favour a clear focus on diseases affecting sub-Saharan Africa, in particular on infectious diseases. It is viewed that there is still much to be done in this area and that it will be crucial to sustain and continue the progress made to date. Several interviewees – including representatives of the EC, charitable foundations, and industry – have also highlighted the rise of non-communicable diseases in Africa. However, numerous interviewees have indicated that a broadening of the scope of the Candidate Initiative, compared to that of EDCTP2, would necessitate a concomitant increase in funding.

Interviewees widely agree that the primary focus of the Candidate Initiative should be on sub-Saharan Africa. Nonetheless, some interviewees – in particular those working on emerging infectious diseases and diseases with a high prevalence in other parts of the world – have underscored that it should include other regions and collaborate with other relevant initiatives.

Specific objectives All interviewees were familiar with the type of activities that were supported under EDCTP and have expressed that the Candidate Initiative should support a similarly wide range of activities and support the development of new or improved health technologies to tackle infectious diseases. Furthermore, several interviewees – including EDCTP staff, representatives of PDPs and academics – have expressed a desire for the Candidate Initiative to increase support for implementation research, aimed at improving uptake and effective use of existing health technologies. A limited number of interviewees – in particular those working at a more overarching global health policy level – have underscored the need to promote and support integration of research efforts in the field and to convene stakeholders across the world. Interviewees also indicate the need of sustained support for capacity strengthening. At the same time, several interviewees indicate that various sub-Saharan African countries have already developed substantial capacity and now focus should be on areas where this is most needed, thus capitalising effectively on previous success and South-South networking and cooperation.

A number of stakeholders recognise emerging infectious diseases as a growing problem, affecting not only sub-Saharan Africa but also other parts of the world, including the EU. These stakeholders are in favour of bolstering capacity in the African region to timely detect and respond to such diseases, recognising that existing systems are often weak. At the same time, a number of interviewees are somewhat cautious about the extent to which the Initiative should engage in this area, where already several other initiatives are active. Whilst overall there is support among stakeholders for this specific objective, it is widely seen as one that necessitates collaboration and coordination.

Targeted impacts

Interviewees widely agree that, by supporting research in the field of infectious diseases, the Candidate Initiative has a clear and strong potential to contribute to scientific impact, in the form of new knowledge generated and new health technologies developed. Another area where the Candidate Initiative is generally expected to deliver scientific impact is in the strengthening of research capacity.

Across stakeholder groups, interviewees anticipate that any new technologies developed could have important societal impacts, by reducing the burden of infectious diseases in the African region. This is universally viewed as the ultimate goal of the Candidate Initiative. At

the same time, most interviewees have realistic expectations about the potential for the Candidate Initiative to deliver such societal impacts, recognising both the significant challenges associated with health technology development, and the broader socio-economic context of the African continent.

A number of interviewees from academia have seen first-hand what impacts EDCTP has had on career development opportunities for African researchers. They are therefore optimistic that the Candidate Initiative would likewise achieve such positive impacts if it supports a similar, or extended range, of activities.

None of the interviewees have discussed the potential for the Candidate Initiative to deliver economic impact by increasing the production, distribution and sales of health technologies for infectious diseases. That is not to say that they would not deem such impacts likely, but rather reflects the fact that this form of economic impact is not seen as a goal in itself. This similarly applies to other possible areas of economic impact, such as those on EU-Africa trade and sustainable investments, or on increased research spending in Sub-Saharan Africa. Rather, interviewees are focused on tackling the burden of infectious diseases itself, thereby reducing the associated economic burden.

Functionalities

Across the different stakeholder groups, there is unanimous recognition that to achieve impact the Candidate Initiative needs to encompass a broad range of stakeholders, including European and African countries, research institutions, industry, charitable and international organisations. The extent of participation, particularly stakeholders' involvement in the General Assembly, voting rights and funding decisions have been widely discussed among interviewees. There is no consensus on the format of participation.

Representatives of national governments stress the importance of European and African country participation, and their ability to "steer the processes". Interviewees encourage third party participation, in the form of private entities, associated countries, and charitable foundations. In case of industry participation, they welcome their involvement but express a need for transparency in their participation and contributions as well as limited mandate in order to ensure that public interests are at the core of the Candidate Initiative.

Interviewees uniformly indicate that funding and implementation of research should be the primary focus of the Candidate Initiative. In particular, they view late-stage clinical trials as the primary area where the Candidate Initiative can deliver direct impacts.

A number of interviewed representatives of the EC, as well as some members of the EDCTP Association, have expressed frustration with what they perceive as 'free riding' under EDCTP: the ability for countries that are not part of the EDCTP Association to participate in all EDCTP-supported activities. They argue that this provides limited incentive for countries to formally commit to and align activities. They thus suggest that certain activities should be accessible only to active participants in the Candidate Initiative.

Comparative assessment of policy options and preferred option

Effectiveness

All interviewees expect an institutionalised partnership approach to be most effective to achieve the objectives of the Candidate Initiative. Opinions are, however, somewhat divided

on whether this should take the form of an Article 185 partnership or an Article 187 partnership. Many acknowledge, or even embrace, the advantages an Art.187 set-up would bring to the partnership, arguing that it allows for more meaningful inclusion of a greater range of stakeholders, creates more financial certainty, and would allow for a leaner and more efficient organisational structure. Others, however, have concerns about what this would mean for the relationships built with and between current EDCTP members and for the level of control that EC would have over the partnership, possibly at the expense of the representation of current members. This group of interviewees contains in particular current representatives to the General Assembly of EDCTP, both those from Europe and those from Africa.

Among many interviewees, particular representatives from African countries, there are also concerns that countries that cannot substantially contribute to the partnership financially will be left out of the decision-making. However, several interviewees acknowledge that they do not fully understand the respective advantages and disadvantages of these two options.

Coherence

Numerous interviewees have pointed out the importance of ensuring alignment with other initiatives and programmes in the field of global health and infectious disease. However, they do so mostly in rather general terms rather than by singling out specific areas or initiatives.

A few interviewed stakeholders, including those from within the EC, have indicated that there is space for improved coordination across different Directorates-General within the EC. In particular, this relates to the role of DG DEVCO in health systems strengthening and that of DG ECHO and DG SANTE in epidemic preparedness. Other initiatives named include the Joint Programme for Anti-Microbial Resistance and the Innovative Medicines Initiative. However, these interviewees did not always seem to be fully aware of the exact focus or scope of activities supported by these activities.

Stakeholders also widely agree that the Candidate Initiative should coordinate its efforts with other key stakeholders in the field, but again often without being specific. A few suggest that there has been a proliferation of initiatives that appear to share focal areas with the Candidate Initiative. In addition to EC programmes and initiatives, specific examples include the Coalition for Epidemic Preparedness Innovations, and funders such as the Bill & Melinda Gates Foundation. These interviewees indicate that it will be important for the Candidate Initiative to clearly position itself in relation to these other initiatives and funders and, where applicable, coordinate activities

Efficiency

Few interviewees expressed any views on the comparative efficiency of the different policy options, as many lack the detailed understanding of the options to be able to comment on this meaningfully. Representatives of the EC, both in interviews and during meetings of the PSG, have expressed concerns that any change compared to the Art. 185 partnership that has been in place for EDCTP will result in loss of momentum and expertise. The main reason for this view is the fact that under any other arrangement, the current EDCTP Secretariat will

effectively cease to exist⁹. This is expected to result in important knowledge being lost, which cannot easily be found within the current EC services, and the breakdown of relationships that have been built with stakeholders and partners. Similar concerns have been voiced by members of the EDCTP Secretariat themselves.

1.3.4. Open Public Consultation

Approach to the open consultation

As part of its better regulation agenda, the Commission listens more closely to the views of citizens and stakeholders. The aim is to make evidence-based proposals of EU policies that address their needs. The consultation was open to everyone via the EU Survey online system.¹⁰ The survey contained two main parts and an introductory identification section. The two main parts collected responses on general issues related to European partnerships (in Part 1) and specific responses related to 1 or more of the 12 candidate initiatives (as selected by a participant).

The survey contained open and closed questions. Closed questions were either multiple choice questions or matrix questions that offered a single choice per line, on a Likert-scale. Open questions were asked to clarify individual choices.

The survey was open from 11 September till 12 November 2019. The consultation was available in English, German and French. It was advertised widely through the European Commission's online channels as well as via various stakeholder organisations.

The analysis of the responses was conducted by applying descriptive statistic methods to the answers of the closed questions and text analysis techniques to the analysis of the answers of the open questions. The keyword diagrams in this report have been created by applying the following methodology: First, the open answer questions were translated into English. This was followed by cleaning of answers that did not contain relevant information, such as "NA", "None", "no comment", "not applicable", "nothing specific", "cannot think of any", etc. In a third step, common misspellings were corrected. Then, then raw open answers were tokenised (i.e. split into words), tagged into parts of speech (i.e. categorised as a noun, adjective, preposition, etc) and lemmatised (i.e. extraction of the root of each word) with a pre-trained annotation model in the English language. At this point, the second phase of manual data cleaning and correction of the automatic categorisation of words into parts of speech was performed. Finally, the frequency of appearance and co-occurrences of words and phrases were computed across the dataset and the different sub-sets (e.g. partnerships, stakeholder groups). Data visualisations were created based on that output.

The keyword graphs in the following sections have been built based on the relationships between words in the open responses of the survey participants. It features words that appear in the same answer either one after the other or with a maximum distance of two words

⁹ [A change from an Article 185 into an Article 187 initiative would also affect the legal structure of the Dedicated Legal Structure](#)

¹⁰ <https://ec.europa.eu/eusurvey/runner/ConsultationPartnershipsHorizonEurope>

between them. Each keyword is represented as a node and each co-occurrence of a pair of words is represented as a link. The size of the nodes and the thickness of the links vary according to the number of times that keywords are mentioned and their co-occurrence, respectively. In order to facilitate the visualisation of the network, the keyword graphs have been filtered to show the 50 most common co-occurrences. Although the keywords do not aim to substitute a qualitative analysis, they assist the identification of the most important topics covered in the answers and their most important connections with other topics, for later inspection in the set of raw qualitative answers.

Open public consultation for the candidate European Partnership on EU-Africa Global Health

The chapter outlines for the candidate European Partnership on EU-Africa Global Health the type of respondents; the views on the needs of the future European Partnerships under Horizon Europe and on the advantages and disadvantages of participation in an Institutionalised European Partnership.

It also analyses the results on the views to specific questions related to: Relevance of research and innovation efforts at the EU level to address problems; Horizon Europe interventions to address these problems; Relevance of elements and activities in setting a joint long-term agenda; Pooling and leveraging resources; Partnership composition; and Implementation of activities; Setting up a specific legal structure (funding body); Proposed scope and coverage of this candidate European Partnership; Alignment of the European Partnership with other initiatives; and on Relevance of this candidate European Partnership to deliver impacts.

Profile of respondents

Only 47 respondents provided views on the EU-Africa Global Health partnership. Among them 13 respondents (27.66%) are citizens. The group is dominated by respondents from academic and research institutions (15 respondents or 31.91%), citizens and company/business organisations (7 respondents or 14.89%). The majority of respondents, namely 35 (74.47%), have been involved in the on-going research and innovation framework programme, while 31 respondents (88.57%) were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7.

Characteristics of future candidate EU-Africa Global Health initiative as viewed by respondents

At the beginning of the consultation, the respondents of this partnership indicated their views of the needs of the future European Partnerships under Horizon Europe. There were two options for which many respondents indicated that they were fully needed, namely be more responsive towards societal needs (34, 72,34%) and make a significant contribution to achieving SDGs (33, 70.32%). The only options where less than 30% of respondents indicated that options were fully needed, was in response to be more responsive toward priorities in national and/or regional R&I strategies and for the other category. With regard to Other, it is likely that respondents did not have a concrete idea of other needs of the future European Partnerships.

No statistical differences were found between the views of citizens and other respondents.

Figure 19: Views of respondents in regard to the needs of future European Partnerships under Horizon Europe (N=47)

The respondents also had the option to indicate other needs. The results of the analysis show that respondents have indicated needs around extensive support linkage and the development and scaling of technology.

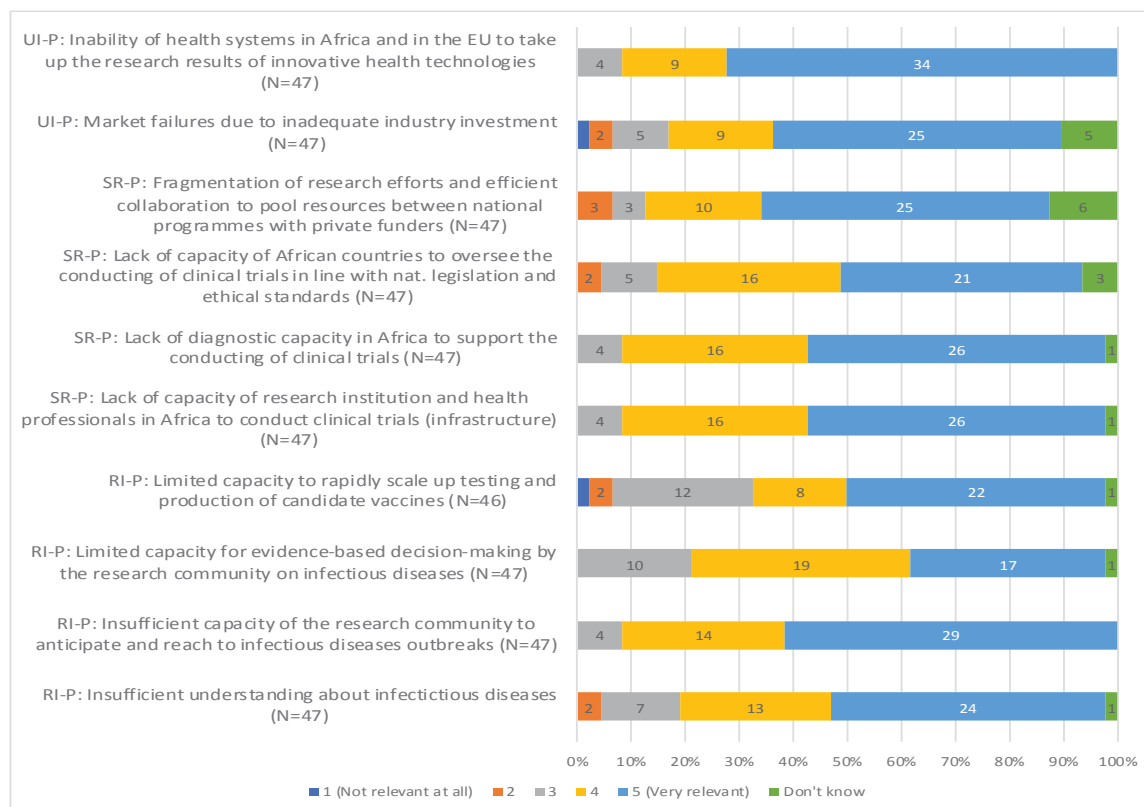

Main advantages and disadvantages of Institutionalised European Partnerships

The respondents were asked what they perceived to be the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe. The keyword analysis used for open questions showed the respondents viewed a network as the main advantage of the institutionalized partnership, as well as long term funding.

Relevance of EU level efforts to address problems in relation to Global Health

In the consultation, respondents were asked to provide their view on the relevance of research and innovation efforts at EU level to address the following problems in relation to global health, specifically on three types of problems: problems in uptake of health innovations (UI-P), structural and resource problems (SR-P) and research and innovations problems (RI-P). In Figure 20 the responses to these answers are presented.

Figure 20: Views of respondents on relevance of research and innovation efforts at the EU level to address problems in relation to global health

With regard to the uptake in innovation problems, the inability of health systems in Africa and in the EU to take up the research results of innovative health technologies was highlighted as the main area of concern (34 respondents, 72.34%, indicated it as very relevant).

With regard to structural and resource problems, the answers are fairly similar. 26 respondents (55.32%) have indicated that both the lack of capacity of research institutions and health professionals in Africa to conduct clinical trials and the lack of diagnostic capacity in Africa to support the conducting of clinical trials are very relevant.

Last, with regard to research and innovation problems, 29 respondents have indicated that they view insufficient capacity of the research community to anticipate and react to infectious diseases outbreaks as a very relevant problem (61.70%). Limited capacity for evidence-based decision-making by the research community on infectious diseases outbreaks has received the least amount of very relevant answers out of all the problems presented, as 17 respondents have indicated that it is relevant for research and innovation efforts at the EU level to address this issue (36.17%). No statistical differences were found between the views of citizens and other respondents.

Horizon Europe mode of intervention to address problems

To the question on how the challenges could be addressed through HE intervention, just over 60% of respondents indicated that institutionalised partnerships were the best fitting intervention. No statistical differences were found between the views of citizens and other respondents.

Figure 21: Assessment of Horizon Europe intervention

The respondents were asked to justify their answers. An in-depth analysis of the open responses shows that those in favour of an institutionalised partnership viewed this as offering the greatest stability, with long-term political and financial commitments. These respondents view the institutionalised partnership as the best way to pool resources, foster collaboration between a wide range of partners and other stakeholders, with coordination and alignment of efforts. It was also noted that this partnership form best allows for a pipeline or portfolio management approach to selecting projects for funding. The small number of respondents in favour of a co-programmed partnership believe that this option would allow for inclusion of a greater range of actors, including non-EU countries and SMEs, and comes with the lowest administrative cost. The respondents opting for the co-funded partnership approach mentioned flexibility and transparency reasons. There are no significant differences between different groups of respondents.

Relevance of elements and activities to ensure meeting of objectives

Setting joint long-term agendas

To the question on how relevant the involvement of actors is in setting a joint long-term agenda to ensure that the proposed European Partnership would meet its objectives, over 90% of respondents consider that the involvement of African countries is very relevant (Figure 22). Over 60% of them suggest that the participation of Member States and Associated Countries, as well as, foundations and NGOs is very relevant. The least number of respondents (21 respondents or 44.68%) suggested that industry should be involved in setting a joint long-term agenda. No statistical differences were found between the views of citizens and other respondents.

Figure 22: Views of respondents on relevance of actors in setting joint long-term agenda

Relevance of elements and activities in pooling and leveraging resources

With respect to the relevance of actors in pooling and leveraging resources, such as financial, infrastructure, and in-kind expertise to meet the candidate Partnership objectives, over 50% of respondents indicated Member States and Associated Countries, African countries, foundations and NGOs are most relevant. Based on the opinions of respondents, the role of academia is considered smaller for pooling and leveraging resources, in contrast to setting a

long-term agenda, as only 15 respondents consider that their involvement is very relevant to pool and leverage resources.

No statistical differences were found between the views of citizens and other respondents.

Figure 23: Views of respondents on relevance of actors for pooling and leveraging resources

Relevance of elements and activities for the partnership composition

Around 55% of respondents consider that both the flexibility in partners’ composition and a broad range of partners (including across disciplines and sectors) are very relevant to reach the Partnership’s objectives. Less than 10% of respondents consider these elements as not very relevant (Figure 24). No statistical differences were found between the views of citizens and other respondents.

Figure 24: Views of respondents on relevance of partnership composition elements

Relevance of implementation of activities

Concerning the relevance of implementation of several activities for meeting objectives, the activities listed included: joint R&D programme, collaborative R&D projects, deployment and piloting activities, input to regulatory aspects (i.e. to developers of medicines or health technologies on approvals and pre-qualifications) and co-creation of solutions with end-users (e.g. national health systems). Out of 45 respondents, 77.8% indicated that collaborative R&D projects are very relevant. The co-creation of solutions with end-users is also considered as very relevant by a large number of respondents (66.6%). In contrast, deployment and piloting activities, and input to regulatory aspects is considered less relevant. Overall, citizens provided similar views, but found Joint R&I programme more relevant.

Figure 25: Views of respondents on relevance of implementation of the following activities

Relevance of setting up a legal structure (funding body) for the candidate European Partnerships to achieve improvements

Respondents were asked to assess the relevance of a specific legal structure (funding body) for the candidate European Partnership to achieve several activities. According to Figure 26, a greater number of respondents indicated that the legal structure would be needed to obtain more buy-in and long-term commitment from other partners, to increase financial leverage and to implement activities more effectively. In contrast, the least number of respondents suggest that the legal structure would assist in ensuring better links to regulators, as only 16 respondents indicated that it would be very relevant for this purpose. No statistical differences were found between the views of citizens and other respondents.

2. *Figure 26: Views of respondents on relevance of a specific legal structure*

Scope and coverage of the candidate European Partnerships based on their inception impact assessments

The majority of the respondents consider that the proposed scope and coverage of the Partnership is right in terms of technologies, research areas, geographical coverage, types of partners, range of activities and sectors. However, among listed areas, a higher share of respondents (14 respondents or 31.11%) indicated that the geographical coverage might be too narrow. No statistical differences were found between the views of citizens and other respondents.

Figure 27: Views of respondents on the scope and coverage proposed for the Global Health institutionalised Partnership

Respondents were also asked to comment on the proposed scope and coverage for this candidate Institutionalised Partnership. The keyword in-depth analysis used for open questions of these responses shows that some suggested expanding the scope, compared to that proposed, to include also anti-microbial resistance and hospital-acquired infections, as well food-, water- and vector-borne diseases and zoonoses. This effectively calls for inclusion of a ‘One Health’ approach.

Other research areas suggested for inclusion were non-communicable diseases, health systems research, and social and behavioural determinants of health. On the spectrum of research and development to be covered, comments were mixed. Whereas some suggested a full coverage from early stage research to bringing products to market, others advocated for keeping the focus on Phase I and II clinical trials. In terms of geographical scope, a small number of respondents suggested including areas other than sub-Saharan Africa, in particular the Middle East and South America.

Other respondents, however, emphasised that sub-Saharan Africa continues to carry a disproportionate burden of poverty-related infectious diseases and thus argue that this focus remains appropriate. It is furthermore cautioned that expanding the scope of the partnership, both in terms of geography and disease areas covered, would dilute resources and focus, thereby jeopardising potential impact. In all cases, the number of clarifying comments was too small and answers were too heterogeneous to determine any significant differences between different groups of respondents.

Scope for rationalisation and alignment of candidate European Partnerships with other initiatives

Among 39 respondents, 31 (79.49%) consider that it would be possible to rationalise the candidate European Institutionalised Partnership and its activities, and/or to better link it with other comparable initiatives. No statistical differences were found between the views of citizens and other respondents.

The respondents who answered affirmative, where asked which other comparable initiatives it could be linked with. The analysis of the results show that respondents mention scientific capability, infectious diseases, other programmes and new partnerships as well as clinical trials.

A more in-depth analysis of the comments shows that several respondents, mostly from academic organisations, see potential for collaboration or alignment with, in particular, WHO-TDR, the candidate ‘One Health Partnership’, the candidate Innovative Health Initiative, the candidate Key Digital Technologies Partnership and European vaccine development initiatives like Transvac2, as well as national initiatives (not specified). A NGOs nevertheless highlighted the need to make strategic investment decisions and to dedicate predetermined budget envelop to the development of products to heal specific diseases. A representative of the industry sector similarly reported the need to ensure the sustainability of new products by ensuring, through alignment with other initiatives, the engagement of multiple types of stakeholders.

For the four respondents who answered negatively on the question, the analysis shows that they mention capacity building, broader initiatives, sufficient knowledge and specific objectives.

All respondents highlighted that the candidate partnership has very specific objectives and that, like its predecessors, it is unique, so that there should not be any risk of duplication of research and innovation efforts. A representative from the industry sector, in the same line, stated that the candidate partnership could learn from other initiatives, but it should be given the full freedom of adapting its specific objectives to the circumstances. An EU citizen added that EDCTP would not have achieved its goals if it had had broader objectives.

Relevance of the candidate to deliver targeted scientific, economic/technological and societal impacts

Respondents were asked to assess the relevance of the candidate Partnership to deliver on listed impacts. Based on results, among societal impacts, it is expected to be ‘very relevant’ for stimulation of the development of effective, affordable and appropriate health products for developing countries and for fighting against communicable diseases and reduction of the societal and societal burden that they entail (Figure 28). Among presented economic impacts, a greater number of respondents, namely 26 out of 45 (57.78%), indicated that the candidate Partnership would be ‘very relevant’ for ensuring better, safe and affordable health technologies, tools and digital solutions for health. The majority of respondents (32 out of 45, or 71.11%) suggest that the initiative would have a significant effect on local capacity development to support and conduct clinical trials. Overall, citizens provided similar views, but found the societal impact regarding ‘More efficient and sustainable health systems’ more relevant.

Figure 28: Views of respondents on the relevance of the candidate Partnership to various impacts

1. Practical implications of the initiative

The ultimate beneficiaries of the EU-Africa Global Health partnership will be **people in sub-Saharan Africa who will gain access to potentially life-saving interventions**. However, the programme will also directly and indirectly deliver benefits to the EU and sub-Saharan Africa in multiple ways:

- Global leadership: The partnership will be a demonstration of the EU’s commitment to the health and well-being of disadvantaged populations in sub-Saharan Africa, and its pursuit of the SDGs.
- Health security: By addressing key global threats to health such as emerging and re-emerging infections and antimicrobial resistance, the partnership will help to ensure the health security of Europe as well as in sub-Saharan Africa.
- Global influence: The partnership will enable the EU to undertake activities beyond the capacity of individual countries. It will provide a powerful voice for Europe in global health research, as well as an important mechanism to promote European objectives and values, including open access to research findings.
- Industrial competitiveness: By sharing the risks of new product development with companies and product development partnerships, it is helping to create sustainable markets for products and safeguarding a strategically important industrial sector in Europe and promoting it in sub-Saharan Africa.
- Scientific competitiveness: International networking will benefit researchers in Europe and sub-Saharan Africa. Strengthening ties with sub-Saharan Africa, these networks will enable researchers, from Europe and sub-Saharan Africa, to focus their research on global priority questions and achieve greater impact.

2. Summary of benefits and costs

<i>I. Overview of Benefits (total for all provisions) – Preferred Option</i>		
<i>Description</i>	<i>Estimation (quantitative or qualitative)</i>	<i>Comments</i>
Direct benefits		
Delivering on EU commitments to tackle global challenges	Infectious diseases have a profound economic impact on countries (healthcare costs and lost productivity). The partnership will make an important contribution by advancing in the development of new or improved health technologies to combat these diseases.	<p>The initiative under 187 would be able to incorporate not only Member States and Associated States contributions but also additional contributions from the sub-Saharan countries and other third countries, private charitable foundations and the pharma industry.</p> <p>Some examples from the current initiative would help to understand the benefits of the proposed initiative:</p> <p>During the period, 2014-2019 EDCTP supported 84 large-scale clinical trials and other clinical research activities with €526 million. The PredART trial provided the first evidence of a strategy to reduce the risk of fatal complication when HIV-infected patients begin antiretroviral treatment while being treated with tuberculosis therapy. TB-NEAT consortium generated evidence on new tuberculosis diagnosis.</p>
Boosting scientific excellence and Europe's global competitiveness in research and innovation	The initiative will further increase the EU's global influence within the international research community.	Between 2003 and 2011, over 90% of publications from EDCTP-funded projects were published in high-impact journals. Moreover, papers from Europe-wide or Europe-sub-Saharan Africa collaborations typically have high citation rates and research impact.
Developing the evidence base for national and international health policy-making (bridging the gap between science and policy for health)	The initiative will support multiple studies that will be able to influence national and international health policy and practice.	<p>The predecessor EDCTP, supported the WANECAM study that demonstrated the safety and efficacy of an antimalarial formulation for children, paving the way for its approval by the European Medicines Agency and recommendation by the WHO. EDCTP-UK studies contributed to Paediatric European Network for Treatment of AIDS (PENTA) guidelines. EDCTP established the Pan African Clinical Trials Registry (PACTR), which is the only WHO-endorsed primary registry in Africa, with >1,000 clinical trials registered. EDCTP is a member of the African Medicines Regulatory Harmonisation Partnership Platform, which aims to improve coordination of regulatory systems strengthening and harmonisation activities in Africa. EDCTP also has a long-term working relationship with WHO-AFRO, which hosts the African Vaccine Regulatory Forum (AVAREF).</p> <p>In order to boost country ownership and alignment with specific national health research needs in sub-Saharan Africa, EDCTP has been collaborating with WHO-AFRO on a National Health Research Systems (NHRS) survey project for the assessment of NHRS, informing progress towards the achievement of Universal Health Coverage.</p>
Providing mechanisms to	Globalisation and broad access to	EDCTP has invested € 23.43 million to support preparedness

<p>prepare for and respond to public health emergencies in Africa and Europe</p>	<p>international travel coupled with the emergence of new communicable diseases highlight the importance of doing local field research to address public health risks.</p>	<p>to respond to infectious disease outbreaks in sub-Saharan African countries, including two large multidisciplinary consortia, ALERRT and PANDORA-ID-NET, involving 22 institutions in 18 sub-Saharan African countries and 16 institutions in 6 European countries. Each consortium has actively responded to disease outbreaks in the region (Lassa fever, Ebola, plague, monkeypox, Coronavirus) as well as redirected their research to immediately address the COVID-19 pandemic in sub-Saharan Africa, and jointly enhanced the capacity of African regions to detect, prepare, and to carry out clinical research in emergency situations. Joint calls with the World Health Organisation have developed capacity in responding to Ebola outbreaks, clinical research and implementation research.</p>
<p>Creating and retaining a new generation of African scientists</p>	<p>Africa's potential in science and innovation is handicapped by a shortage of trained scientists. The partnership will contribute to the research capacity building by supporting the researchers' careers in Africa and strengthening national health research systems.</p>	<p>The majority of EDCTP-funded clinical studies include a capacity-building work package that supports long- and short-term training, including PhDs and Master's degrees, in addition to improving site infrastructure and equipment. 7,488 people have participated in EDCTP project-related trainings and workshops to improve the capacity to conduct clinical trials, on topics such as study protocol, specimen collection, research and administration, Good Clinical Practice and epidemics preparedness.</p> <p>In addition a comprehensive EDCTP fellowship programme is focused on the career development of individual African researchers and already supported 126 individual fellowships (€ 31.28 million). Since its inception in 2003 the EDCTP has supported more than 500 African researchers, including fellows and MSc/PhD candidates, with 90% continuing their research career in Africa.</p>
<p>Supporting integrated capacity building for health research in Africa</p>	<p>As well as a training scientific workforce and leadership, the partnership will contribute to other key aspects of health research capacity by supporting Networks of Excellence in African regions enabling the sharing of research experience, expertise and knowledge, and developing sustainable capabilities; and by supporting for the establishment of functional regulatory systems and capacities for ethical review of clinical research. The partnership will make efforts to address gender, language and regional research and related capacity disparities.</p>	<p>EDCTP has supported the creation of 4 Networks of Excellence across 63 institutions in 42 sub-Saharan African institutions in 28 countries, in Central Africa CANTAM, Western Africa WANETAM, Southern Africa TESA and Eastern Africa EACC, to address disparities between countries in terms of clinical research capacity. EDCTP is supporting 57 projects to strengthen the enabling environment for clinical trials and research in sub-Saharan Africa (EUR 51.28 million), including health systems strengthening, pharmacovigilance activities and the translation of research results into policy and practice. Moreover EDCTP is contributing to the strengthening of national health research systems in sub-Saharan Africa. They have received EDCTP support for the establishment of functional regulatory systems and capacities for ethical review of clinical research.</p> <p>EDCTP is also developing innovative fellowship approaches (such as tandem fellowships), offering grant writing workshops in different languages (English, French and Portuguese) and project and financial management training, amongst other activities. It is also supporting the development of a standardised Financial Management Assessment Tool for assessing the financial capacity of beneficiaries and the international standard for Good Financial Grant Practice for better financial governance.</p>
<p>Developing European and African capacities in clinical research against</p>	<p>The partnership will encourage interdisciplinary and cross-disease approaches, enabling institutions to</p>	<p>EDCTP is encouraging collaboration between its Participating States' Initiated Activities and the centrally-managed activities in order to optimise investments in infectious</p>

poverty-related infectious diseases	build and diversify their expertise to combat infectious diseases and to build skills in managing global collaborative projects.	diseases R&D and maximise the impact of the limited financial resources. EDCTP also collaborates with The Global Health Network to develop online tools to facilitate open source clinical trials and data sharing. This includes a data management tool for better clinical data management; a Clinical Trial Protocol builder for open source development of clinical trial protocols; and a one-stop data sharing portal called EDCTP Knowledge Hub to provide free access to a virtual research community.
<i>Indirect benefits</i>		
Contributing to the achievement of the African Union Agenda	The partnership will contribute to reduce the economic and social impact of infectious diseases on African countries which is central to delivering the Sustainable Development Goals (SDG 3) and Aspiration 1 of African Union Agenda 2063	EDCTP contributes to the Sustainable Development Goals and to African Union Agenda 2063.
Contributing to the provision of safe medical interventions	The partnership will contribute to better national pharmaco-vigilance systems as the safety of new interventions needs to be monitored when they are introduced into routine care and are used by much larger numbers of people.	EDCTP has supported several projects building national and international expertise, from WHO international drug monitoring programme to Uppsala monitoring centre, to strengthen pharmaco-vigilance systems, to build national capacities to detect and respond to possible adverse events and to maintain public confidence. In addition EDCTP is promoting development of cooperation between academic researchers and product developers (PDPs and Pharmaceutical industry), thus matching scientific excellence with efficiency in advancing products along the product development value chain.

3. Overview of costs

II. Overview of costs – Preferred option							
		Citizens/Consumers		Businesses		Administrations	
		One-off	Recurrent	One-off	Recurrent	One-off	Recurrent
Management/ Administrative cost (a)	Direct costs					EUR 0.1 million ¹¹ (1FTE)	EUR 0.9-1.0 million ¹² /year
	Indirect costs						
Personnel costs	Direct costs					EUR 0.2 million ¹³ (2FTE)	EUR 5.0-6.0 million/year (46 FTE)
	Indirect costs						

Notes to the administrative budget summary:

1. Missions: the costs budgeted under this category exclude the travel costs of expert groups (Scientific Advisory Committee and Scientific Review Committee) and for specific events, which are budgeted for under other EU-funded activities (chapter 3).
2. Consumables and supplies: the costs budgeted for under this category include bank charges incurred in making fund transfers to beneficiaries, postage and courier costs, office utilities, office consumables and stationery.
3. Service contracts (including non-recoverable taxes): the costs budgeted for under this category include annual audit fees in relation to secretariat's annual financial reports and statutory accounts, office cleaning, IT support services, office rent (for the EDCTP Association offices in The Hague and Cape Town), and other hosting costs.

REFIT Cost savings table

Not applicable for the proposed EU-Africa Global Health Partnership. The initiative would benefit from the experience of the existing organisation/structure already in place (e.g. the EDCTP Secretariat) which has implemented efficiently the EDCTP2 keeping that programme's administrative costs do not exceed 6% of the European Union's financial contribution of EUR 683 million (i.e. EUR 40.98 million).¹⁴ However, as there

¹¹ Indicative one-off administrative costs associated for the setting up the Joint Undertaking (logistic structures to adapt from Art 185 to Art 187)

¹² Indicative yearly figure based on draft EDCTP2 Annual Activity Report 2019 (Table 41 Comparison of actual and budget for 2019 Administrative costs). Under Article 185, the EDCTP2 administrative direct costs amount covered the expenses incurred by the EDCTP Secretariat in implementing the EDCTP2 programme. The administrative and personnel costs of the initiative will depend on several factors, including the total budget of the initiative.

¹³ Indicative one-off personnel costs associated to the setting up the Joint Undertaking (organisation of selection of personnel, etc.)

¹⁴ The EDCTP2 Interim Evaluation Panel strongly recommended that in addition to the 6% eligible administrative costs, EDCTP be allowed to use the financial contribution from the EU to cover programmatic costs, e.g. costs for analysis and policy-related actions

will be a change of partnership from an Article 185 to an Article 187 initiative, some limited additional costs would be necessary to set up the Joint Undertaking from the EDCTP Secretariat. These limited additional costs will be compensated by the savings from the simplification of procedures, as the Commission will be part of the decision Board of the JU, which will simplify the adoption of the annual work plans and the JU will be benefiting from the common support of the Horizon Europe for proposal submission, evaluation and selection, as well as other dissemination services like Cordis. In addition, there will be also (training) savings from the possibility to recruit knowledgeable and experienced staff from the current EDCTP2 programme implementing structure that will be progressively closing down.

Annex 4 Analytical Methods

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines¹⁵ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This is complemented by integrating the **conditions and selection criteria for European Partnerships**, as well as requirements for setting up Institutionalised Partnerships.¹⁶

4. Overview of the methodologies employed

In terms of **methods and evidence used**, the set of impact assessments for all candidate Institutionalised European Partnerships draw on an external study covering all initiatives in parallel to ensure a high level of coherence and comparability of analysis¹⁷.

All impact assessments mobilised a mix of qualitative and quantitative data collection and analysis methods. These methods range from desk research and interviews to the analysis of the responses to the Open Consultation, stakeholder analysis and composition/portfolio analysis, bibliometrics/patent analysis and social network analysis, and a cost-effectiveness analysis.

The first step in the impact assessment studies consisted in the definition of the context and the problems that the candidate partnerships are expected to solve in the medium term or long run. The main data source in this respect was desk research. This includes grey and academic literature to identify the main challenges in the scientific and technologic fields and in the economic sectors relevant for the candidate partnerships, as well as the review of official documentations on the policy context for each initiative.

In the assessment of the problems to address, the lessons to be learned from past and ongoing partnerships were taken into account, especially from relevant midterm or ex-post evaluations.

The description of the context of the candidate institutionalised European Partnerships required a good understanding of the corresponding research and innovation systems and their outputs already measured. Data on past and ongoing Horizon 2020 projects, including the ones implemented through Partnerships, served as basis for descriptive statistic of the numbers of projects and their respective levels of funding, the type of organisations participating (e.g. universities, RTOs, large enterprises, SMEs, public administrations, NGOs, etc.) and how the funding was distributed across them. Special attention was given to analysing the participating countries (and groups of countries, such as EU, Associated Countries, EU13 or EU15) and industrial sectors, where relevant. The sectoral analysis required enriching the eCORDA data received from the European Commission services with sector information extracted from ORBIS, using the NACE codification up to level 2. These data enabled the identification of the main and, where possible, emerging actors in the relevant systems, i.e. the organisations, countries and sectors that would need to be involved (further) in a new initiative.

¹⁵ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

¹⁶ A pivotal element of the present analysis is the so-called two-step ‘necessity test’ for European Partnerships, used to establish: step 1) the need for a partnership approach in the first place, followed by step 2) a justification for the form of Institutionalised Partnership. The necessity test is described in Annex 6. This impact assessment focuses on the second step of the test.

¹⁷ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe.

A Social Network Analysis was performed by the contractors using the same data. It consisted in mapping the collaboration between the participants in the projects funded under the ongoing R&I partnerships. This analysis revealed which actors – broken down per type of stakeholders or per industrial sector – collaborate the most often together, and those that are therefore the most central to the relevant research and innovation systems.

The data provided finally served a bibliometric analysis run by the contractor aimed at measuring the outputs (patents and scientific publications) of the currently EU-funded research and innovation projects. A complementary analysis of the Scopus data enabled to determine the position and excellence of the European Union on the international scene, and identify who its main competitors are, and whether the European research and innovation is leading, following or lagging behind.

A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options.

The conclusions drawn from the data analysis were confronted to the views of experts and stakeholders collected via three means:

- The comments to the inception impact assessments of the individual candidate institutionalised European Partnerships;
- The open public consultation organised by the European Commission from September to November 2019;
- The interviews (up to 50) conducted by each impact assessment study team conducted between August 2019 and January 2020 (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others).

The views of stakeholders (and experts) were particularly important for determining the basic functionalities (see further below) that the future partnerships need to demonstrate to achieve their objectives as well as their most anticipated scientific, economic and technological, and societal impacts. The interviews allowed more flexibility to ask the respondents to reflect about the different types of European Partnerships. Furthermore, as a method for targeted consultation, it was used to get insights from the actors that both the Study Teams and the European Commission were deemed the most relevant. For the comparative assessment of impacts, the external contractors confronted the outcomes of the different stakeholder consultation exercises to each other with a view of increasing the validity of their conclusions, in line with the principles of triangulation.

Annex 2 includes also the main outcomes of the stakeholder consultation exercises.

5. Method for assessing the effectiveness, efficiency and coherence of each option - The use of functionalities

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has been adapted to introduce “**key functionalities needed**” – so as to link the intended objectives of the candidate European Partnerships and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1 in the main body of the impact assessment). In practical terms, each option is assessed on the basis

of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved ('openness'), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options. It also allows for a structured comparison of the options as regards their effectiveness, efficiency and coherence, and also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)¹⁸.

Figure 29: Overview of key functionalities of each form of implementation of European Partnerships

Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
Type and composition of actors (including openness and roles)				
<u>Partners:</u> N.A., no common set of actors that engage in planning and implementation <u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> core of national funding bodies or governmental research organisations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> limited, according to national rules of partner countries	<u>Partners:</u> National funding bodies or governmental research organisation <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations
Type and range of activities (including additionality and level of integration)				
<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions <u>Additionality:</u> no additional activities and investments outside the funded projects <u>Limitations:</u> No systemic approach beyond individual actions	<u>Activities:</u> Horizon Europe standard actions that allow broad range of individual actions, support to market, regulatory or policy/societal uptake <u>Additionality:</u> Activities/investments of partners, National funding <u>Limitations:</u> Limited systemic approach beyond individual actions.	<u>Activities:</u> Broad, according to rules/programmes of participating States, State-aid rules, support to regulatory or policy/societal uptake <u>Additionality:</u> National funding <u>Limitations:</u> Scale and scope depend on the participating programmes, often smaller in scale	<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach <u>Additionality:</u> National funding	<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach (portfolios of projects, scaling up of results, synergies with other funds). <u>Additionality:</u> Activities/investments of partners/ national funding
Directionality				

¹⁸ The criterion on the ex-ante demonstration of partners' long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
<p><u>Priority setting:</u> Strategic Plan and annual work programmes, covering max. 4 years.</p> <p><u>Limitations:</u> Fully taking into account existing or to be developed SRIA/roadmap</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution</p> <p>Input to FP annual work programme drafted by partners, finalised by COM (comitology)</p> <p>Objectives and commitments are set in the contractual arrangement.</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by COM</p> <p>Objectives and commitments are set in the Grant Agreement.</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by COM</p> <p>Objectives and commitments are set in the legal base.</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by COM (veto-right in governance)</p> <p>Objectives and commitments are set in the legal base.</p>
Coherence: internal (Horizon Europe) and external (other Union programmes, national programmes, industrial strategies)				
<p><u>Internal:</u> Between different parts of the Annual Work programme can be ensured by COM</p> <p><u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Limited synergies with other Union programmes and industrial strategies</p> <p>If MS participate, with national/regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with national/regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with national/regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with other Union programmes and industrial strategies</p> <p>If MS participate, with national/regional programmes and activities</p>

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made in comparison to the baseline. Therefore, for each of the above criteria, the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. When relevant, this estimation also includes the costs/benefits of discontinuing existing implementation structures. The policy options are then scored compared to the baseline with a + and – system along a two-point scale, to indicate limited (+ or -) or high (++ or --) additional/lower performance compared to the baseline. When a policy option is scored 0, this means that its impact is expected to be roughly equal to the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact

framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options¹⁹.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach²⁰ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account²¹. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²² The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the

¹⁹ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

²⁰ For further details, see Better Regulation Toolbox # 57.

²¹ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²² A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

overall investment).

- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%),²³ but lead to an additional R&I investment of at least the same amount than the Union contribution²⁴ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution²⁵. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).²⁶
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution²⁷. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution²⁸. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 30 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0	↑↑			
Set-up of a dedicated implementation structure	0			Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0	↑↑			
Ex-ante Impact Assessment for partnership	0			↑↑↑	
Preparation of EC proposal and negotiation	0			↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0	↑			
Call and project implementation	0	0 In case of MS	↑	↑	↑

²³ Specifically, some additional set-up costs linked for example to the creation of a strategic research and innovation agenda (SRIA) and additional running costs linked with the partners role in the creation of the annual work programmes and the Commission's additional supervisory responsibilities. A CPP will have lower overall costs than each of the other types of European Partnership, as it will function with a smaller governance and implementation structure than will be required for a Co-Funded Partnership or an Institutionalised Partnership and – related to this – its calls will be operated through the existing HEU agencies and RDI infrastructure and systems.

²⁴ Minimum contributions from partners equal to the Union contribution.

²⁵ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

²⁶ These costs reflect set-up costs and additional running costs for partners, and the Commission, of the distributed, multi-agency implementation model.

²⁷ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

²⁸ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
		contributions: ↑			
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC	0				↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

6. Method for identifying the preferred option – The scorecard analysis

For the **identification of the preferred option**, a scorecard analysis is used to build a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

This scorecard approach also relies on a standard cost model developed for the external study supporting the impact assessment, as illustrated in Figure 31. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

These costs essentially refer to the administrative, operational and coordination costs of the various options. The figure shows how the scoring of costs range from a value of 0, in case an option does not entail any additional costs compared to the baseline (traditional calls), to a score of (-) for options introducing limited additional costs relative to the baseline and a score of (- -) when substantial additional costs are expected in comparison with the baseline. Should the costs of a policy option be lower than those of the baseline, (+) and (+ +) are used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed

policy options – and the least cost-efficient – the Institutionalised Partnership option. A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed and Co-Funded options, a score of 0 to the Article 185 option and a score of (-) for the Article 187 Institutionalised Partnership policy option²⁹.

Figure 31: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3a: Institutionalised 185	Option 3b: Institutionalised 187
Administrative, operational and coordination costs	0	(0)	(-)	(- -)	(- -)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. <i>cost-efficiency</i>)	0	(+)	(+)	(0)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to baseline; score (- -) = substantial additional costs compared to baseline. ; score (+) = lower costs compared to baseline

²⁹ The baseline (traditional calls) is scored 0, as explained above.

1. Can the Union act? What is the legal basis and competence of the Unions' intended action?
1.1 Which article(s) of the Treaty are used to support the legislative proposal or policy initiative?
<p>This proposal is based on (1) Article 185 TFEU which stipulates that in implementing the multiannual framework programme, the Union may make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; and (2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes (both Articles are under Title XIX of the TFEU - Research and Technological Development and Space).</p> <p>The proposal aims to implement Article 8 of the Commission proposal for Horizon Europe - the future EU research and innovation (R&I) programme for 2021-2027, according to which, “<i>European Partnerships shall be established for addressing European or global challenges only in cases where they will more effectively achieve objectives of Horizon Europe than the Union alone and when compared to other forms of support of the Framework programme</i>”. The Horizon Europe proposal has received the political agreement of the Council and the European Parliament.</p>
1.2 Is the Union competence represented by this Treaty article exclusive, shared or supporting in nature?
<p>Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the European Union can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas.</p> <p><i>Subsidiarity does not apply for policy areas where the Union has exclusive competence as defined in Article 3 TFEU³⁰. It is the specific legal basis which determines whether the proposal falls under the subsidiarity control mechanism. Article 4 TFEU³¹ sets out the areas where competence is shared between the Union and the Member States. Article 6 TFEU³² sets out the areas for which the Unions has competence only to support the actions of the Member States.</i></p>

³⁰ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E003&from=EN>

³¹ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E004&from=EN>

³² <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E006:EN:HTML>

2. Subsidiarity Principle: Why should the EU act?

2.1 Does the proposal fulfil the procedural requirements of Protocol No. 2³³:

- Has there been a wide consultation before proposing the act?
- Is there a detailed statement with qualitative and, where possible, quantitative indicators allowing an appraisal of whether the action can best be achieved at Union level?

This proposal and the accompanying impact assessment were supported by a wide consultation of stakeholders, both during the preparation of the Horizon Europe proposal and - later on, all the candidates for European Partnerships. Member States were consulted via the Shadow Strategic configuration of the Horizon Europe Programme Committee. On candidates for institutionalised Partnerships based on Article 185/187 of the TFEU, an Open Public Consultation (OPC) was held between 11 September and 6 November 2019. Over 1 600 replies were received. In addition, targeted consultation activities were undertaken to prepare the present impact assessment. In particular, for each of the candidate partnerships, an external consultant interviewed a representative sample of stakeholders. The need for EU action as well as its added value were covered in those interviews.

The explanatory memorandum and the impact assessment (horizontal part, Section 3) contain a dedicated section on the principle of subsidiarity, as explained in question 2.2 below.

2.2 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the conformity with the principle of subsidiarity?

The impact assessment accompanying the proposal features a horizontal part on relevant common elements to all the candidate partnerships, including the conformity of the proposed initiative with the principle of subsidiarity (Section 3). Moreover, the individual assessments of each candidate partnership include additional details on subsidiarity, touching in particular on the specificities of a candidate partnership that could not be adequately reflected in the horizontal part of the impact assessment. This will also be reflected in the explanatory memorandum.

2.3 Based on the answers to the questions below, can the objectives of the proposed action be achieved sufficiently by the Member States acting alone (necessity for EU action)?

National action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives, to deliver on the EU's strategic policy priorities (including the climate and energy goals set out in the Paris Agreement, and the European Green Deal), and to contribute to tackling global challenges and meeting the

³³ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12016E/PRO/02&from=EN>

Sustainable Development Goals (SDGs).

(a) Are there significant/appreciable transnational/cross-border aspects to the problems being tackled? Have these been quantified?

The thematic areas covered by the candidate partnerships feature a series of challenges in terms of cross-border/transnational aspects, need to pool resources, need for a critical mass to meet intended policy objectives, need to coordinate different types of actors (e.g. academia, industry, national and regional authorities) across different sectors of the economy and society, which cannot be tackled to the same degree by Member States alone. This is particularly true for the research and innovation (R&I) dimension of the proposed initiative: the importance of a multi-centre and interdisciplinary approach, cross-country data collection and research, and the need to develop and share new knowledge in a timely and coordinated manner to avoid duplication of efforts are key to achieve high quality results and impact. The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide extensive qualitative and quantitative evidence on the above points. In addition, Sections 1 and 2 of the individual impact assessments on the candidate partnerships include more detail on the necessity to act at EU-level in specific thematic areas. Finally, it is worth noting that not all Member States have the same capacity or R&I intensity to act on these challenges. As the desired policy objectives can be fully achieved only if the intended benefits are widespread across the Member States, this requires action at the EU-level.

(b) Would national action or the absence of the EU level action conflict with core objectives of the Treaty³⁴ or significantly damage the interests of other Member States?

As per Article 4(3) TFEU, national action does not conflict with core objectives of the Treaty in the area of R&I. The absence of EU level action in this area would however prevent the achievement of core objectives of the Treaty. Indeed, national action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives on e.g. competitiveness, to deliver on the EU's strategic policy priorities, and to contribute to tackling global challenges and meet the Sustainable Development Goals (SDGs).

(c) To what extent do Member States have the ability or possibility to enact appropriate measures?

As foreseen by Article 4(3) TFEU, this proposal does not hamper Member States' ability to enact appropriate measures in the field of R&I. However, the scale and complexity of the policy objectives pursued by the present initiative cannot be fully addressed by acting at national level alone.

(d) How does the problem and its causes (e.g. negative externalities, spill-over effects)

³⁴ https://europa.eu/european-union/about-eu/eu-in-brief_en

<p>vary across the national, regional and local levels of the EU?</p>
<p>As described in the horizontal part of the impact assessment accompanying the present proposal, several problems (e.g. on competitiveness, global challenges, demographic change) and their underlying causes affect the EU as a whole rather than individual Member States. Where important differences between Member States are present, these are described in Sections 1 and 2 of the individual impact assessments.</p>
<p>(e) Is the problem widespread across the EU or limited to a few Member States?</p>
<p>The problem of coordinating R&I efforts in the thematic areas covered by the candidate partnerships affects all Member States, albeit to different degrees. However, from a general EU perspective, available evidence shows that the EU as a whole needs to step up efforts and investments in thematic areas that are crucial to tackle present and future policy challenges on several fronts, e.g. ageing population, global technological trends, and climate change to name a few. The way these problems affect the EU and its Member States is described in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual impact assessments.</p>
<p>(f) Are Member States overstretched in achieving the objectives of the planned measure?</p>
<p>As indicated in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual assessments, the sheer scale, speed and scope of the needed support to R&I would overstretch national resources, without guaranteeing the achievement of the intended objectives. Acting at EU-level would achieve greater impact in a more effective and efficient manner.</p>
<p>(g) How do the views/preferred courses of action of national, regional and local authorities differ across the EU?</p>
<p>No specific differences between the views of national, regional and local authorities emerged from the stakeholder consultation.</p>
<p>2.4 Based on the answer to the questions below, can the objectives of the proposed action be better achieved at Union level by reason of scale or effects of that action (EU added value)?</p>
<p>EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national initiatives in the same area.</p>

(a) Are there clear benefits from EU level action?

Quantitative and qualitative evidence of the benefits of EU level action are available in the interim evaluation of Horizon 2020 and in the impact assessment of Horizon Europe, among others. An analysis of the emerging challenges in each thematic areas, of the EU's competitive positioning, as well as feedback gathered from different types of stakeholders for the present impact assessment indicate that EU level action remains appropriate also for the present proposal. In addition, the benefits of acting at EU-level have been illustrated by the success and the impact achieved by the predecessors to the proposed initiative.

(b) Are there economies of scale? Can the objectives be met more efficiently at EU level (larger benefits per unit cost)? Will the functioning of the internal market be improved?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. This is the case both in terms of effectiveness in achieving intended policy objectives, but also in terms of efficiency. Positive impact is also visible in terms of competitiveness: recent data on EU funded R&I activities indicate that EU-funded teams grow 11.8% faster and are around 40% more likely to be granted patents or produce patents applications than non-EU funded teams. Efficiency gains are also visible in terms of dissemination of results to users beyond national borders, including SMEs and citizens. EU funded R&I is more effective in leveraging private investment. Finally, there are clear additionality benefits (i.e. EU R&I funding does not displace or replace national funding), as the EU focuses on projects that are unlikely to be funded at national or regional level. Overall, this is beneficial to the functioning of the internal market in several respects, including human capital reinforcement through mobility and training, the removal of barriers to cross-border activity for economic players including SMEs, easier access to finance and to relevant knowledge and research, and increased competition in the area of R&I.

(c) What are the benefits in replacing different national policies and rules with a more homogenous policy approach?

A homogeneous policy approach in the various thematic areas covered by the present proposal would reduce fragmentation and increase efficiency and effectiveness in meeting the intended policy objectives. Indeed fragmentation, persisting barriers in the internal market and differences in the resources available to Member States are some of the key problems that stand in the way of fully achieving the intended policy objectives and reaching the required critical mass to obtain tangible results. Specific detail on how these issues differ in each thematic area are illustrated in Sections 1 and 2 of the individual impact assessments, so as to reflect the specificities of each case.

(d) Do the benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities (beyond the costs and benefits of acting at

national, regional and local levels)?
The proposed initiative does not lead to a loss of competence of the Member States. In fact, the proposed initiative should be seen as complementary and reinforcing national and sub-national initiatives in the same area. Previous quantitative and qualitative assessments of Horizon Europe and Horizon 2020 have shown that the proposed EU-level action do not displace national ones and tend to concentrate on initiatives that would not have been funded by the Member States themselves, or would not have reached the same scale and ambition without EU-level intervention, due to their complexity and trans-national nature.
(e) Will there be improved legal clarity for those having to implement the legislation?
Yes. The proposed initiatives will be implemented in line with the Horizon Europe single set of rules for participation; this will ensure increased clarity and legal certainty for end beneficiaries, other stakeholders and programme administrators. It will also reduce the administrative burden for beneficiaries, and for the Commission services. In addition, the accessibility and attractiveness of the broader Horizon Europe programme, in particular for applicants with limited resources, would be sustained.
3. Proportionality: How the EU should act
3.1 Does the explanatory memorandum (and any impact assessment) accompanying the Commission’s proposal contain an adequate justification regarding the proportionality of the proposal and a statement allowing appraisal of the compliance of the proposal with the principle of proportionality?
The principle of proportionality underpins the entire analysis of the candidate partnerships. Specifically, the analysis included in the accompanying impact assessment is structured along the following logic: 1. Justification of the use of a partnership approach in a given area (including considerations on additionality, directionality, link with strategic priorities) instead of other forms of intervention available under Horizon Europe; 2. If the partnership approach is deemed appropriate, proportionality considerations guide the assessment of which type of partnership intervention (collaborative calls, co-programmed, co-funded or institutionalised partnership) is most effective in achieving the objectives. This will also be reflected in the explanatory memorandum.
3.2 Based on the answers to the questions below and information available from any impact assessment, the explanatory memorandum or other sources, is the proposed action an appropriate way to achieve the intended objectives?
The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the present proposal leaves full freedom to the Member States to

pursue their own actions in the policy areas concerned. This will also be reflected in the explanatory memorandum.

(a) Is the initiative limited to those aspects that Member States cannot achieve satisfactorily on their own, and where the Union can do better?

The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments.

(b) Is the form of Union action (choice of instrument) justified, as simple as possible, and coherent with the satisfactory achievement of, and ensuring compliance with the objectives pursued (e.g. choice between regulation, (framework) directive, recommendation, or alternative regulatory methods such as co-legislation, etc.)?

For each of the candidate partnerships, the analysis carried out in the accompanying impact assessment has explored several options for implementation. A comparative assessment of the merits of each option also included an analysis of the simplicity of the intervention, its proportionality and effectiveness in achieving the intended objectives. This is reflected in the fact that a tailored approach has been suggested for each candidate partnership, ranging from looser forms of cooperation to more institutionalised ones, depending on the intended policy objectives, specific challenges, and desired outcome identified in each case.

(c) Does the Union action leave as much scope for national decision as possible while achieving satisfactorily the objectives set? (e.g. is it possible to limit the European action to minimum standards or use a less stringent policy instrument or approach?)

The proposed approach leaves full freedom to the Member States to pursue their own actions in the policy areas covered by the present proposal.

(d) Does the initiative create financial or administrative cost for the Union, national governments, regional or local authorities, economic operators or citizens? Are these costs commensurate with the objective to be achieved?

The proposed initiatives do create financial and administrative costs for the Union, national governments and, depending on the chosen mode of implementation, for regional and local authorities. In addition, economic operators and other stakeholders potentially involved in the candidate partnerships will also incur some costs linked to implementation. The financial cost of the proposed initiative is covered under the Horizon Europe programme. Its exact amount is still subject to political decision. As regards the candidate partnerships and the different modes of implementation (co-programmed, co-funded, institutionalised), the relevant costs and benefits are assessed in the individual impact assessments covering each candidate partnership. The additional administrative costs of implementation via partnerships are

limited, when compared to the administrative costs of implementation through traditional calls. As indicated by comparable experience with previous initiatives and in feedback provided by a variety of stakeholders, these costs are expected to be fully justified by the benefits expected from the proposed initiative. Where available, additional details on costs are provided in Annex 3 of the impact assessment.

(e) While respecting the Union law, have special circumstances applying in individual Member States been taken into account?

Where relevant, differences between Member States in capacity and stage of advancement of R&I in specific thematic areas have been taken into account in the individual impact assessments.

Annex 6 Additional background information

1. BACKGROUND INFORMATION FOR ALL INITIATIVES

1.1. Selection criteria of European Partnerships

Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

The necessity test for a European Partnership (as set out in the Horizon Europe regulation) has two levels:

1. **The justification for implementing a priority with a European Partnership** to address Horizon Europe and EU priorities. This is linked to demonstrating that a European Partnership can produce added value beyond what can be achieved through other Framework Programme modalities, notably traditional calls in the work programmes (Option 0 – Baseline).
2. **The justification for the use of the form of Institutionalised Partnership:** Once it has been demonstrated that a partnerships approach is justified, co-programmed and/or co-funded forms are considered for addressing the priorities as they are administratively lighter, more agile and easier to set-up (Options 1 and/or 2). As Institutionalised Partnerships require setting up a legal framework and the creation of a dedicated implementation structure, they have to justify higher set-up efforts by demonstrating that it will deliver the expected impacts in a more effective and efficient way, and that a long-term perspective and high degree of integration is required (Option 3).

The outcomes of the ‘necessity test’ is presented together with the preferred option.

Figure 32: Horizon Europe selection criteria for the European Partnerships

Common selection criteria & principles	Specifications
1. More effective (Union added value) clear impacts for the EU and its citizens	Delivering on global challenges and research and innovation objectives
	Securing EU competitiveness
	Securing sustainability
	Contributing to the strengthening of the European Research and Innovation Area
	Where relevant, contributing to international commitments
2. Coherence and	Within the EU research and innovation landscape

Common selection criteria & principles	Specifications
synergies	Coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions
3. Transparency and openness	Identification of priorities and objectives in terms of expected results and impacts
	Involvement of partners and stakeholders from across the entire value chain, from different sectors, backgrounds and disciplines, including international ones when relevant and not interfering with European competitiveness
	Clear modalities for promoting participation of smes and for disseminating and exploiting results, notably by smes, including through intermediary organisations
4. Additionality and directionality	Common strategic vision of the purpose of the European Partnership
	Approaches to ensure flexibility of implementation and to adjust to changing policy, societal and/or market needs, or scientific advances, to increase policy coherence between regional, national and EU level
	Demonstration of expected qualitative and significant quantitative leverage effects, including a method for the measurement of key performance indicators
	Exit-strategy and measures for phasing-out from the Programme
5. Long-term commitment of all the involved parties	A minimum share of public and/or private investments
	In the case of institutionalised European Partnerships, established in accordance with article 185 or 187 TFEU, the financial and/or in-kind, contributions from partners other than the Union, will at least be equal to 50% and may reach up to 75% of the aggregated European Partnership budgetary commitments

1.2. Overview of potential functions for a common back office among Joint Undertakings

Functions	Current situation	Option of joint back-office	Comments
Organising calls for grant and proposal evaluations	Each JU organises this independently.	A central organisation of evaluation, logistics, contracting evaluators, managing the data of the evaluation results Central database of potential evaluators with domain expertise in thematic areas of partnerships	The evaluations would still need to be supervised by the Scientific staff of the individual Joint Undertakings (consensus meetings of expert evaluators etc)
Human Resources related matters	Each JU has own HR policy and resources Quite some resources spent on recruitment in some JUs Some HR facilities are procured	More generic resources and expertise for HR matters More consistency in HR policy	Ensuring consistency with EC HR policies is already in place

	<p>from external contractors</p> <p>Some JUs have a Service Level Agreement with COM for HR</p>	<p>Shared HR investment for specialised expertise (IP and legal)</p>	
Financial management	<p>Each JU conducts own financial contract management; differences between JUs</p> <p>Each JU is audited separately.</p> <p>Auditing at project level more frequent than in other Horizon 2020 parts and outsourced by JUs thus differences</p> <p>ECA: too many audits on JUs</p>	<p>Financial management by one core team of financial staff</p> <p>Would reduce the number of interfaces for audits and simplifies the auditing of the all JUs</p> <p>Harmonisation of project auditing</p>	<p>Simplifies the harmonisation of financial management across JUs in line with Horizon Europe</p>
Communication (internal and external)	<p>Each JU has a separate communication strategies, teams and resources</p>	<p>A common back-office can support activities such as event organisation, dissemination of results, setting up website communication</p> <p>Can help create a more visible Partnership brand</p>	<p>A considerable share of communication activity is partnership specific (addressing particular target groups, synthesising project results) however there are generic communication activities that can be shared</p> <p>Needs to avoid duplication of efforts</p>
Data management on calls, project portfolios, information on project results	<p>Most JUs but not all use e-Corda for project data</p> <p>Overall IT integration of JUs still difficult</p>	<p>Harmonised data management</p> <p>Reduction of IT systems and support that is procured</p>	<p>This will need to happen regardless of the common back office but will likely be more smooth if managed centrally</p>

2. BACKGROUND INFORMATION FOR THIS SPECIFIC INITIATIVE

2.1. Implementation of the EDCTP2

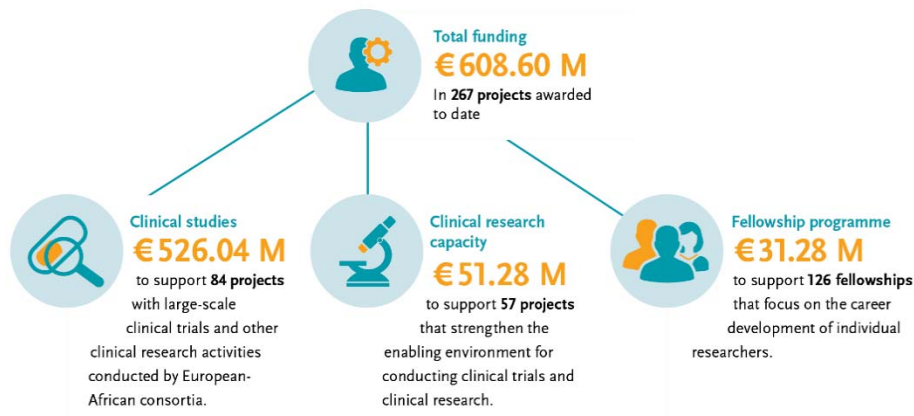

Between 2014 and 2019, the EDCTP2 programme has committed €608.6m funding (as at November 2019). A total of 347 institutions are involved in EDCTP2 projects, including 198 sub-Saharan African institutions and 137 in Europe. In addition, 147 private entities have been involved in EDCTP2 projects, receiving support of EUR 68m, while contributing matching co-funding of a higher amount in-kind through various product development services and supply of investigational products. The number of countries participating in EDCTP2-funded activities has risen to 65 – of which 37 are from Africa, 20 from Europe and eight from elsewhere. A total of 211 clinical studies have been funded, including 123 clinical trials.

The EDCTP2 European Participating States have so far contributed EUR 159.0m in cash to the EDCTP2 programme and EUR 556.3m on Participating States Initiated Activities (in-kind contributions) by the end of 2018. These national activities include 144 clinical studies as well as support for capacity development, ethics and regulatory activities, operational and implementation research, and health systems strengthening. More than 465 publications have been reported as resulting from Participating States Initiated Activities-funded research. Moreover, Participating States have also reported that these activities have resulted in significant policy change and positive influence on national or international guidelines.

EDCTP2 has so far leveraged an additional €300m funding from third parties, including global funders such as the US National Institutes of Health (NIH), philanthropic donors such as the President's Emergency Fund for AIDS Relief (PEPFAR) and the US Agency for International Development (USAID), global funders such as the Bill and Melinda Gates Foundation, Product Development Partnership, such as the TB Alliance and Medicines for Malaria Venture, and pharmaceutical companies.

EDCTP has an integrated approach to capacity development for health research in Africa as a means of ensuring sustainable development of the research environment and increasing its preparedness for conducting clinical research according to ethical principles and regulatory standards. This is done through comprehensive fellowship programmes, 126 African researchers are being supported through fellowships, and more than 6000 have benefited from training opportunities, 57 ethics and regulatory projects have been funded in 27 African countries, including health systems strengthening, pharmacovigilance activities and the translation of research results into policy and practice, also under infectious disease outbreak conditions and through collaborative research networks.

Figure 33: EDCTP2 funding (from January 2014 up to November 2019).

Joint initiatives have been launched with WHO/TDR, Fundacion Mundo Sano-Espana, African Research Excellence Fund and GlaxoSmithKline. Further joint initiatives are planned with the Coalition for Epidemic Preparedness Innovations (CEPI), the Novartis Foundation, Fondation Botnar, and the Africa Centres for Disease Control and Prevention.

EDCTP2 funding has been well spread across priority disease areas, with the greatest number of grants and funding going towards TB projects (Figure 34).

Figure 34 Allocation of EDCTP2 funding up to November 2019.

Of the clinical trials funded, 58% are phase II and III studies of drugs and vaccines, providing key data on safety and efficacy; 16% are phase IV post-licensing studies designed to inform policymaking and practice.

In terms of priority populations, 14% of projects focus on pregnant women and new-born babies, 35% involve children, and 43% adolescents.

2.2. Recommendations of the First Interim Evaluation of the EDCTP2 programme³⁵

Living up to the potential of EDCTP

- To reach its full potential and the ambitious goals outlined in the Strategic Business Plan, EDCTP should assume a position as a proactive key strategic player and change agent in sub-Saharan Africa. This effort will require a reinvigorated strategic approach not only by EDCTP management but also by the PSs and the EC. The Panel recommends EDCTP to develop a strategic policy plan.
- As a priority, we propose EDCTP catalyse the development and strengthening of national health research plans of African PSs.
- A change in ‘mindset’ will be required within EDCTP and at the heart of EDCTP, which is the PSs. The establishment of an effective partnership arrangement among PSs needs to be further developed.
- Being part of the EDCTP programme must be viewed as an added value. The Panel thus recommends that EDCTP membership should be a requirement for applying to EDCTP calls.
- EDCTP will need to understand the goals and priorities of PSs and work with them to align EDCTP strategy and programmes. EDCTP should thus actively support the PSs in developing their own national research agendas.
- The Panel views the EDCTP regional networks as a critical element of institutional capacity in sub-Saharan Africa. The strategic role of the EDCTP regional networks should be broadened and clearly defined.
- The EDCTP regional networks should develop a plan that includes a focus on its capacity building activities, with emphasis across the spectrum of scientist career development, and their support of weaker institutions and regions.
- The capacity for active participation in the EDCTP program varies significantly across sub-Saharan Africa. It is important to ensure a more equitable distribution of EDCTP activities and investments so the benefits of EDCTP impact weaker institutions and regions. A strategy must be developed to incentivise wealthier PSs to engage with less resourceful African nations in all EDCTP activities.
- To support the networks in achieving this next phase of their evolution, the level of funding for networks should increase.
- EDCTP should adopt a more comprehensive and catalytic funding approach for supporting the career path of young talented African investigators and to build African scientific leadership. Particular attention should be paid to gender balance.
- EDCTP should assess opportunities in this area to strategically align with other funders and programmes on career development.

Strengthening coherence and added value of the EDCTP programme

- Based on a thorough analysis of existing programmes and active international funders, EDCTP and the EC should jointly explore the opportunities where synergies can be leveraged, and complementary programmes aligned for greater impact and reach.
- EDCTP should develop and/or mobilize a mechanism to attain strategic partnerships.
- The EU would benefit by having a high level strategy across programmes and policies to facilitate alignment, coordination and collaboration where opportunities exist. This approach would be most effective with the appointment of a specific coordinator responsible for coherence among EU initiatives and policies
- The strategic value of the EDCTP target to obtain at least €500M in additional public or private contributions is questionable. The EU should, together with the PSs, reconsider this rather high €500M target so that EDCTP can focus on more relevant aspects of partnerships.

EDCTP visibility and advocacy

³⁵ http://ec.europa.eu/research/evaluations/pdf/edctp2_evaluation_experts_report_2017.pdf

- EDCTP should put considerably more focus on external strategic communication and advocacy efforts. The current communication strategy should not only be aimed at delivering information but also become more focused on building relationships and dialogue with PSs' governments and European and International funders and stakeholders. Communication functions and strategies must better reflect the fact that EDCTP2 is a programme that PSs own collectively. Currently, this joint ownership, coordination and support of EDCTP are not evident in programmes or in advocacy and communication efforts. This lack of co-leadership weakens the overall potential and effectiveness of EDCTP2.
- To determinedly implement the communication strategy, the function of strategic communication and advocacy within EDCTP should be elevated to the highest level of leadership. This role within EDCTP will require considerable networking and coordination across PSs to identify synergies and to achieve better alignment and coordination with PSAs. Closer coordination and planning between the EC leadership and the EDCTP Secretariat and GA will also help to achieve the level of communication and advocacy needed. These coordinated leadership roles will require a mindset change across organizations and individual leaders.
- To achieve the advocacy goals of EDCTP2 to execute the communication strategy, clear objectives, tactics, timelines, and milestones to describe how EDCTP will achieve its advocacy goals is needed. Opportunities to align messaging and programmes with PSs should be prioritized for communications and advocacy.

Improving instruments to advance research in sub-Saharan Africa

- Adopting a portfolio approach: EDCTP should take on a portfolio approach in order to use its funding instruments (including competitive calls) more strategically. This would enhance the value-add of EDCTP and maximize impact.
- EDCTP should adopt a more flexible funding approach that, after careful analysis of the current conditions, would include both broad and more specific calls. The analysis should incorporate considerations of disease burden, the potential for improving health equity and also the global funding landscape.
- Grant Funding Reference Group: In order to ensure high quality and credibility of the grant application process, EDCTP and the EC should jointly initiate an external review of the processes related to funding, including launch of calls, peer-review, evaluation and selection. EDCTP should consider establishing a 'Grant Funding Reference Group' which could mimic the approach already taken by the EC. For example, inviting Independent Observers to assess the peer review process and its implementation (e.g. 1-2 observers for each call). Alternatively, another mechanism could involve members of the research community obtaining information on how the funding strategy and funding instruments are perceived on a regular basis.
- Modifying the process of PSAs: EDCTP and the EC should jointly modify the entire process around PSAs to improve efficiency and to enhance impact. The aims of PSAs must be articulated with consideration given to how they can be used to enhance strategic value-add of both EDCTP and the PSs. A more efficient way to bring in the Participating States' engagement in EDCTP, and to effectively obtain the co-funding that is conditional to the EU co-funding, should be developed.
- EDCTP should initiate a process for in-depth analysis of the outcome of the activities initiated by the PSs in order to identify synergies, gaps and overlaps. PSAs should be prospectively and strategically integrated with EDCTP programmes and calls in order to minimize gaps. In addition, PSAs should be strategically integrated among themselves to efficiently maximize their impact.
- The EC should jointly with EDCTP analyse the possible effects of the United Kingdom's decision to withdraw from the EU and develop mitigating strategies.

Governance for reaching long-term objectives and sustainability

- General Assembly (GA): The EC and EDCTP should jointly define the responsibilities and expectations for both the PSs and their General Assembly representatives.

- The PSs should enhance the executive and political level of GA representatives and ensure that representatives are clear on their responsibility to report back to their respective government agencies that have the mandate to deliver on their governments' commitment to EDCTP.
- Scientific Advisory Committee (SAC): EDCTP must further develop Scientific Advisory Committee and its critical role of providing strategic scientific advice as stated in the EDCTP Decision.
- Strategic Advisory Group: EDCTP should create a separate, Strategic Advisory Group, a high-level strategic group to advise on matters of policy, coherence and partnership to achieve value-add of EDCTP2, to align efforts of EDCTP2 with other significant global funders and with politically driven goals and directions. A strategic policy plan needs to be urgently developed. As a high priority, EDCTP should catalyse the development and strengthening of national health research plans especially for African PSs.
- 3-year work plans: EDCTP and the EC should jointly and urgently review and modify the process of approving the annual work plans so that the entire process is completed prior to the year of operation.
- The process should be changed so that EDCTP submits a 3-year work plan for approval by the EC but with annual milestones that are to be reported and evaluated on an annual basis so that timely adjustments can be made.
- Executive Director: EDCTP should further strengthen the position of the Executive Director by emphasizing his/her role to proactively initiate and implement strategic work and high-level advocacy as well as to engage in long-term planning and sustainability issues. To support the Executive Director, EDCTP should create the position of a Deputy Executive Director. The subsequent recruitment and appointment process should reflect the imperative for an improved gender balance at the high-level management.

Financial contribution

- According to the Terms of Reference, the Panel should also discuss the level of financial contribution to EDCTP2. With effectively two years of data, it is essentially impossible to evaluate this aspect of the programme. Provided that in-kind contributions stay at a level similar to today and provided that PSiAs are effectively and strategically integrated with the EDCTP programme, the current level may be appropriate.
- The Panel strongly recommends that in addition to the 6% eligible administrative costs, EDCTP be allowed to use the financial contribution from the EU to cover programmatic costs, e.g. costs for analysis and policy-related actions

2.3. Actions taken in response to the EDCTP2 Interim Evaluation Recommendations

Recommendation	Recommendation involve	Actions taken (until March 2020)
<p>Living up to the potential of EDCTP</p>	<ul style="list-style-type: none"> Supporting development and strengthening of national health research plans of African Participating States Improving gender ratio and achieving more equitable distribution of activities and funding across countries/ regions 	<ul style="list-style-type: none"> National Health Research Systems (NHRS) assessment has been launched in collaboration with WHO-Afro to establish baseline data for guiding planning to strengthening health research capacity within sub-Saharan Africa: <ul style="list-style-type: none"> Survey to determine the barometer scores for NHRs in the 17 African countries that are members of the EDCTP Association (completed, see here) Development of strategies for uptake of survey results (Consultative meeting held on 17-18 October 2019 in Brazzaville, Republic of Congo and on-going). <p>Improving gender ratio of EDCTP-funded activities:</p> <ul style="list-style-type: none"> Workshop <i>Enhancing networking among African and European scientists to close regional and gender disparities experienced in EDCTP1 and EDCTP2 funded health research capacity activities in sub-Saharan Africa</i> (completed Nov 2019) Scientific Advisory Committee working group on gender (activities ongoing) initial report presented to the EDCTP General Assembly (June 2019) Expansion of monitoring efforts to track and analyse gender balance (ongoing, with completed analysis on <i>EDCTP2 Evaluation Procedures and Gender Balance</i>) Independent evaluation of Sida support to EDCTP assessing, among others, gender balance in the areas of research supported by EDCTP³⁶ (completed) <p>Achieving more equitable distribution of activities and funding across SSA countries/ regions:</p> <ul style="list-style-type: none"> Launch of Senior Fellowships Plus 2019 call aimed to engage less resourced African countries (completed with proposal evaluation ongoing, see here) Independent evaluation of EDCTP Regional Networks activities (completed)³⁷

³⁶ The Sida evaluation concluded that: “The gender balance across projects that have received Sida funding overall is very good. Across different capacity building programmes, the balance has an average of 43% of project staff being female (...) EDCTP are making efforts to address gender issues. This has become more visible in 2018 and 2019 with reviews being commissioned on the make-up of evaluation panels/ the gender dimensions of proposal review processes together with an evaluation of the barriers to female researchers in Africa being commissioned. The Scientific Advisory Committee (SAC) also now has a gender working group. We have not been able to investigate the degree of training given to researchers on gender equality and/or how to design research taking into account gender equality issues. However, at least one project is highly gender aware (PANDORA) and includes gender issues in its research design and evaluation”.

³⁷ EDCTP Networks evaluation concluded that the EDCTP Networks are a strong brand with increasing goodwill. It was therefore recommended that in order to sustain the achievements the EDCTP Networks have made to date, it is important that EDCTP continues to financially and operationally support, and politically advocate for their sustainability. Increasing funding would strengthen

		<ul style="list-style-type: none"> • Three ‘grant writing’ workshops held in Gabon, Ivory Coast and Mozambique (targeting Portuguese-speaking and French speaking scientists) for young African scientists (completed) with a total of number of 96 participants • Funding to large multi-country consortia pursuing inter and intra-regional research cooperation (ongoing projects): Four Regional Networks addressing disparities between SSA countries in terms of clinical research capacity EDCTP; Two epidemic preparedness consortia with governance and management structures organised to promote equitable decision-making and execution of research activities. • An EDCTP Alumni Platform³⁸ has been launched to facilitate networking of sub-Saharan Africa researchers and to make the professional profiles of all current and past EDCTP fellows easily accessible. It facilitates reflection and collaboration among them. Working groups on HIV, tuberculosis, malaria, and neglected or emerging infectious diseases have also been established.
<p>Strengthening (internal) coherence and added value of the EDCTP programme</p>	<ul style="list-style-type: none"> • Improving alignment of Participating States activities with EDCTP-centrally managed activities 	<ul style="list-style-type: none"> • Facilitating Participating States to launch joint or aligned activities (e.g. Joint WHO-AFRO/TDR/EDCTP Small Grants Scheme for implementation research on infectious diseases of poverty-funded by Germany, Sweden and the UK • Facilitating Participating States in aligning reporting and data sharing: in the UK Department Health Social Care’s evidence mapping³⁹, independent evaluation of Sida funding, data sharing initiatives such as G-FINDER, World RePORT, and the WHO Global Observatory on Health R&D. • Creation of a dedicated webpage with the Analysis of Participating States Initiated Activities (PSIAs) and sharing of information of both centrally managed activities and PSIAs via EDCTP participating states profiles have been done to facilitate easy sharing of information⁴⁰.

clinical trials and researcher support, networking of the Networks, as well as development and implementation of digital platforms, all of which are important for data generation and sharing. Reducing funding would limit EDCTP’s contribution to generation of big data and health research ecosystems capacity building broadly, which is invaluable for reducing the burden of the diseases targeted by EDCTP. Stopping the financial support towards the EDCTP Networks would reverse the gains of a model that has so far proved useful for clinical trials capacity building in Africa through North-South and South-South collaborations. Evaluation of the EDCTP Regional Networks Report: <http://www.edctp.org/edctp-regional-networks-2015/>

³⁸ <https://edctpalumninetwork.org/>

³⁹ <https://eppi.ioe.ac.uk/cms/Default.aspx?tabid=73>

<p>Strengthening (external) coherence and added value of the EDCTP programme</p>	<ul style="list-style-type: none"> • Strategic building programmes with other initiatives and partnerships 	<p>Strategic partnership building</p> <ul style="list-style-type: none"> • Launching EDCTP Strategic grant scheme (6 calls completed as part of WPs 2015-2018 resulting in EUR 323.87 M in direct project funding from third-parties (international organisations, industry and private funders) and several collaboration agreements have been concluded with WHO-TDR Special Programme on Research and Training in Tropical Diseases, Mundo Sano Foundation, GSK, Novartis Global Health, Botnar Foundation, Leprosy Foundation. Efforts are underway to finalise a cooperation agreement with WHO-AFRO • Two High-level policy dialogue meetings with African States to consult on the EDCTP strategy (Dakar and Lisbon) • EDCTP has contributed to strengthening national health research systems (NHRS). The report 'WHO African Region – progress towards universal health coverage' shows that between 2014 and 2018, the majority of the countries participating in EDCTP have improved their NHRS⁴¹. • WHO fully supports EDCTP's plans to develop a follow up programme and has nominated WHO observers to both the EDCTP Scientific Advisory Committee and General Assembly (WHO Director General's letter of 29 08 2019).
<p>Visibility and advocacy</p>	<ul style="list-style-type: none"> • Coordination with other EU initiatives and national development agencies • Strategic communications aimed at building relationships and dialogue with Participating States' governments and European and International funders and stakeholders 	<p>Engagement with DG DEVCO and other EU programmes and development agencies:</p> <ul style="list-style-type: none"> • Appointment of an additional observer at the EDCTP General Assembly, representing DG DEVCO. • Launch of two strategic calls requiring cofunding from development cooperation agencies : <i>Strategic actions supporting health systems/services optimisation research capacities in cooperation with development assistance initiatives</i> (completed with 2 projects ongoing) and Strategic actions to maximise the impact of research on reducing disease burden, in collaboration with development cooperation initiatives (planned as part of work plan 2020) • Outreach through active participation events and meetings: DEVCO info point, European Development Days, side meeting at the EU Africa High Level Policy Dialogue • Nomination of two High Level Representatives with a strategic programme each to promote and encourage higher financial commitment and active participation of Participating States in Europe and sub-Saharan Africa. • Communications strategy has increased focus in involving Participating States' Initiated Activities in the overall EDCTP communication activities. • Dedicated pages for each Participating State are under preparation for the EDCTP website to presenting their involvement under the EDCTP2 programme. • More informative and user-friendly communication resources have been introduced such as: scaled up use of interactive online annual reports, case studies summarising ongoing activities and success stories,

⁴¹ <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6660673/>

<p>Improving instruments to advance research in sub-Saharan Africa</p>	<ul style="list-style-type: none"> Introducing portfolio funding and diversification of funding approach Establishment of a grant reference group involving independent observers Improving the process of the Participated States Initiated Activities An in-depth analysis of the outcome of the activities initiated by the PSs to identify synergies, gaps and overlaps 	<p>summary documents highlighting the added value of EDCTP to Europe and Africa.</p> <ul style="list-style-type: none"> Grant to PAMAfrica consortium to support a portfolio of projects developing new treatments for malaria in the most-at-risk populations (ongoing 5-year project under portfolio funding, see here) Narrow thematic (e.g. malaria vaccine) and fairly broad (e.g. diagnostics) calls launched. There are however, limits to the flexibility of allocation of EU funding, as H2020 rules must be followed, limiting the possibilities of very targeted funding (to a specific organisation or product candidate) Involvement of independent observers in call for proposals evaluations, their reports and recommendations are followed up providing quality and transparency (ongoing) Establishing a General Assembly-Scientific Advisory Group Working Group on Participating States Initiated Activities Meetings organized in 2018 and 2019 to improve efficiency and to enhance impact. Draft report presented to the General Assembly of November 2019 Mapping and analysis of Participating States Initiated Activities (PSIAs) to identify overlaps and opportunities for synergies with EDCTP-centrally managed activities in relation to the EDCTP2 Strategic Research Agenda (ongoing: Draft report presented to the EDCTP General Assembly Nov. 2019)
<p>Governance for reaching long-term objectives and sustainability</p>	<ul style="list-style-type: none"> Strengthening the role of Scientific Advisory Committee (SAC) in providing strategic (policy) advice to the General Assembly (GA) Improving support for the Executive Director and gender balance in EDCTP Senior Management 	<ul style="list-style-type: none"> Secretariat restructuring in 2018 (completed) Created position of Executive Governance Officer to facilitate coordination of EDCTP constituencies Two High Level Representatives for Africa and Europe scaled up their work to support the ED on advocacy and fundraising activities The recruitment of current and future members of the SAC takes into account their dual role of providing both scientific and strategic advice The interaction between SAC and GA has been strengthened and thus facilitating the sharing of information between the two constituencies.

2.4. Strengths, Weaknesses, Opportunities and Threats of the EDCTP programmes

Strengths	Weaknesses
<p>ORGANISATION</p> <ul style="list-style-type: none"> Established a presence and visibility in sub-Saharan Africa Covered a key gap in the funding landscape; few other private and public bodies fund large late-stage clinical trials in sub-Saharan Africa Supported scientific excellence, with projects generating major publications in high-profile publications Focused research activity on underserved populations, addressing key market failures Integrated capacity-building into grants Developed African scientific leadership Established new African networks Strengthened the regulatory and ethics review capabilities of multiple African countries Expanded the range of African countries with capacity to carry out clinical research Facilitated formation of enduring global partnerships <p>PORTFOLIO</p> <ul style="list-style-type: none"> Impactful HIV studies, particularly prevention of mother-to-child transmission, paediatric HIV treatment Influential trials on HIV co-infections, particularly HIV–TB and HIV–malaria co-infections and opportunistic infections (e.g. Cryptococcus) Significant advances in TB diagnostics Major studies in TB drug development and vaccine evaluation, with globally important collaborations and innovative trial methodologies Landmark studies on malaria treatment during pregnancy, in children, and in co-infected patients Capacity developed in malaria vaccine evaluation Advances in diagnostics for neglected infectious diseases 	<p>ORGANISATION</p> <ul style="list-style-type: none"> Relatively small player, in terms of funds available per pathogen, compared with some funders in global health research General lack of visibility/awareness Fewer funding partners than initially envisaged, especially with pharmaceutical companies Lack of flexibility in funding approach can be an obstacle to joint initiatives with other funders Challenges leveraging additional cash funding from PSs Lack of incentives to join EDCTP Association Challenges aligning funding strategies of EU PSs Lack of support to enable researchers from French- and Portuguese-speaking countries with weaker research systems to submit high-quality applications. <p>PORTFOLIO</p> <ul style="list-style-type: none"> Disappointing results in early microbicide and HIV vaccine trials Large range of pathogens covered resulted in limited funding per disease category in EDCTP2 thus far, particularly for the newly incorporated diseases
Opportunities	Threats
<p>ORGANISATION</p> <ul style="list-style-type: none"> Enhanced global networking and engaged new partners Additional engagement with newer EU ‘EU13’ Member States Alignment with other global health agendas (e.g. outbreak preparedness, antimicrobial resistance, universal health coverage and design of people-centred health systems) Alignment with other EU initiatives (e.g. other Horizon Europe initiatives, Joint Programming Initiative on Antimicrobial Resistance, Innovative Medicines Initiative). Increased synergies and better coordination of the PSs’ own contributions to research activities within EDCTP’s scope (PSIAs). Additional joint funding initiatives and co-funding schemes Increased proportion of projects led by African and 	<p>ORGANISATION</p> <ul style="list-style-type: none"> Insufficient funds to support all highly ranked projects Expanded scope to include non-communicable diseases or other bigger thematic areas could spread resources too thinly Ineffective global collaboration could lead to both duplication of efforts and missed opportunities Inappropriate use of funds by recipients could damage confidence and cause reputational harm to EDCTP Insufficient funding to support activities of the growing EDCTP Alumni Network and its integration with the EDCTP Regional Networks <p>PORTFOLIO</p> <ul style="list-style-type: none"> Major disease outbreaks could overwhelm country response capacity and undermine research efforts on priority diseases

Commission européenne/Europese Commissie, 1049 Bruxelles/Brussel, BELGIQUE/BELGIË - Tel. +32 22991111
Office: CDMA 00/175 - Tel. direct line +32 229-51143

Inmaculada.Penas-Jimenez@ec.europa.eu

female researchers

- Increased collaboration among emerging research leaders funded by EDCTP

PORTFOLIO

- Improved pipelines offer more scope for later-phase studies and head-to-head comparisons
- Scope for additional implementation studies and synergy with health system strengthening in pursuit of universal health coverage
- Co-infections and co-morbidities associated with longer survival
- Maternal vaccination
- Drug repurposing
- Multiplex diagnostic platforms
- New digital and other technologies, to enhance diagnosis, delivery of interventions and design of people-centred care
- Opportunities for greater multi-disciplinary input, e.g. from social and behavioural sciences, anthropology
- Repurposing of platforms/infrastructure to address new threats, including emerging infectious disease threats and antimicrobial resistance
- Innovative trial designs for faster and more flexible clinical evaluation

- Rising antimicrobial resistance could compromise use of therapeutics
- Civil unrest and conflict could compromise countries' ability to conduct clinical research
- Public rejection of research or experimental interventions could threaten research and implementation
- Major adverse reactions to a new intervention could trigger negative public attitudes to clinical research
- Significant global funding gaps could compromise achievement of challenging global targets
- Insufficient local investment could threaten sustainability of newly developed research capacity

2.5. Progress towards EDCTP2's objectives (2014-2019)

Medical interventions	Collaboration and capacity development	European coordination	External partnerships	EU cooperation
 <p><i>New or improved medical interventions against poverty-related infectious diseases.</i></p>	 <p><i>Increase cooperation with sub-Saharan Africa through capacity building for conducting clinical trials according to ethical principles and regulatory standards.</i></p>	 <p><i>Improve coordination, alignment and integration of European National Programmes.</i></p>	 <p><i>Increase international cooperation with public and private partners.</i></p>	 <p><i>Increase interaction with other EU initiatives, including those linked to development assistance.</i></p>
<p>217 is the total number of clinical studies supported by EDCTP2 since 2014. Of these, 59% (130) are interventional (clinical trials) and 41% (87) are non-interventional studies.</p>	<p>€51.07 M is the total grant investment to support 57 projects to strengthen the enabling environment for clinical trials and research in sub-Saharan Africa.</p>	<p>30 researchers from sub-Saharan Africa received funding from the 'Joint WHO-AFRO/TDR/EDCTP Small Grants Scheme for implementation research on infectious diseases of poverty launched in 2017. The call was supported through a partnership between Germany, Sweden and the UK.</p>	<p>16 sub-Saharan African countries are full members of the EDCTP Association. These members have contributed to a total of €1.21 million by end of 2018 through the Participating States' Initiated Activities (PSIAs) – research activities within the scope of the EDCTP programme that are funded and implemented by one or more member countries.</p>	<p>162 private sector entities are involved in EDCTP projects. By end of 2018, these organisations have received €89.26 M in grant value.</p>
<p>57% (71) of interventional studies are phase II and III trials of drugs and vaccines which aim to deliver key evidence on safety and efficacy. The phase III trials also aim to provide data to support product registration.</p>	<p>27 sub-Saharan African countries have received EDCTP support for the establishment of functional regulatory systems and capacities for ethical review of clinical research.</p>	<p>€158.8 M the total cash received from the European Participating States to the EDCTP programme.</p>	<p>65 countries participate in EDCTP-funded activities: 37 sub-Saharan African countries and 20 European countries.</p>	<p>3 grant consortia were established through an EDCTP call to support health systems/service optimisation research capacities in cooperation with development assistance'. Two of these consortia received funding from international development cooperation partners (SIDA and USAID).</p>
<p>15% (18) of the interventional studies involve post-license (phase IV) studies with a view to influencing health policies and practice and optimising the delivery of medical interventions for the wide range of sub-Saharan health systems and diverse populations.</p>	<p>€23.43 M has been invested to support preparedness of 6 sub-Saharan African countries in the fight against Ebola outbreaks.</p>	<p>130 fellowships that focus on the career development of researchers.</p>	<p>371 institutions are involved in EDCTP projects: 198 sub-Saharan African institutions and 137 European institutions.</p>	<p>17 EDCTP African member countries participated in a survey to inform the development of a strategic policy plan for strengthening health research system capacities of countries in sub-Saharan Africa. This project is a joint initiative between EDCTP and WHO AFRO.</p>
<p>10% (21) of all studies target pregnant women and their children. Other key populations are also involved in the studies, such as newborns and infants (35; 17%), children (64; 31%) and adolescents (60; 29%).</p>	<p>42 sub-Saharan African institutions in 28 countries participate in the EDCTP-supported Networks of Excellence: CANTAM (Central Africa), WANETAM (Western Africa), TESA (Southern Africa) and EACCR (Eastern Africa).</p>	<p>7468 people have participated in EDCTP project-related trainings and workshops on topics such as study protocol, specimen collection, research and administration, Good Clinical Practice and epidemics preparedness.</p>	<p>57% of the total EDCTP grant value is allocated to sub-Saharan African institutions (€302 million).</p>	
<p>32 sub-Saharan Africa countries host recruitment sites of EDCTP-funded collaborative clinical studies.</p>				

2.6. Success stories of the EU funding through FPs and EDCTPs programmes

The EU funding has contributed to:

- The generation of new knowledge through development research publications, best practices and guidelines:

As a result of the NeutNET (FP6) project, seven novel and reproducible types of neutralisation assays were developed, thus contributing to the advancement of scientific and medical knowledge and aiding future vaccine research; STOPPAM (FP7) provided valuable information with respect to a revision of the current administration regimen of Intermittent Preventive Therapy in pregnancy, to date the most effective and most widely adopted strategy for combatting pregnancy malaria; IDAMS (FP7) led to advancements in clinical knowledge about variables affecting dengue presence, and developed tools, strategies and treatments in order prevent the spread of dengue. New insights generated by the project led the WHO to revise their estimates of dengue prevalence and guidelines for outbreak protocol

- Development of new drugs, devices, diagnostics, vaccines and vector control methods:

NIDIAG (FP7) successfully developed a new Rapid Diagnostic Test for human African trypanosomiasis, which is now commercially available. CHAPAS (EDCTP) provided evidence in support of the current WHO guidelines for first-line paediatric antiretroviral therapy; the results also led to licensed combinations for treatment of children. GeneXpert (EDTCP) developed diagnostics technology that could potentially improve health care providers' ability to diagnose tuberculosis and could thereby lead to improved health systems. PanACEA (EDCTP) developed better treatments for tuberculosis. Anti-malarials for pregnant women PREGVAC (EDCTP) and for children 4ABC (EDCTP); MCD (FP7) developed the eave tubes a low-cost device and frugal innovation to control malaria mosquitoes in tropical settings with significant impact on disease prevention.

- Capacity building, primarily in relation to research and education system strengthening, but some evidence of health system strengthening:

EUROPRISE (FP6) brought together a new network of HIV/AIDS researchers from 32 institutions across the fields of vaccines and microbicides. The project developed the FluoroSpot assay that is now commercially available and could, in future, be an efficient tool for vaccine trials in low and middle income countries; COSMIC (FP7) brought health services closer to the people and used village health workers to provide an antimalarial prevention to women. Through training community health workers involved in the case management of malaria, it increased the capacity to test and treat women in Burkina Faso. SILVER (FP7), where leading international virologists, medicinal chemists and bio-informaticians across Europe, Russia, China and Africa joined forces to design small molecule inhibitors against emerging and neglected RNA viruses, including dengue. ELAN2LIFE (FP6) facilitated knowledge exchange and capacity

development through North-South and South-South research cooperation, with more than a thousand South American participating scientists; EACCR (EDCTP) achieved success in terms of capacity building and staff training, as well as in terms of research outputs, playing a pivotal role in supporting South-South cooperation in Africa.

- Generating evidence of later stage development and commercialisation:

EARNEST trial (EDCTP) provided strong support for the current WHO guidelines to switch antiretroviral therapy in a limited-resource setting for people with HIV; Kesho Bora study (EDCTP) identified ways to prevent mother-to-child transmission of HIV and findings of the study strongly influenced the WHO's 2010 Guidelines ; 4ABC trials (EDCTP) contributed to key evidence on safety and efficacy of an antimalarial combination therapy that now is registered with the European Medicines Agency and recommended by the WHO for uncomplicated malaria.

- Improved access, affordability, equity and equality, or informing the revision of the World Health Organisation (WHO) guidelines:

WANETAM (EDTCP) developed a molecular line probe assay technology for rapid detection of multi-drug resistant tuberculosis in Ghana, which is now a unique asset to identify second-line anti-TB drugs. The new approach, promoted by the WHO, has contributed to changing policies regarding treatment of patients who had failed a first, standard therapy. The TB CHILD (EDCTP) was a proof of concept study to identify children with active tuberculosis, which could help to better diagnose TB in children in future.

2.7. Specific African countries consultation on GHP-EDCTP3

As the EU-Africa Global Health Partnership is addressing the clinical research of infectious diseases affecting sub-Saharan Africa in partnership with the sub-Saharan countries, an additional consultation was launched addressed to the African countries.

1. Executive Summary

On May 5, 2020, member states of the African Union and relevant stakeholders, including grantees and scientific advisors outside Africa, were invited to participate in an online survey about the future orientation of the European & Developing Countries Clinical Trials Partnership (EDCTP).

A short, user-friendly instrument of 25 items, was developed and disseminated by the government of South Africa.

A total of 161 people accepted to participate in the survey, but only 150 completed the online survey form. Responses were received from 26 countries in Africa, 12 countries in Europe and one in America.

Among the 130 participants who responded to the question about expertise in global health research, 59 indicated expertise in Epidemiology, 59 in Clinical trials, 58 in Public health, and 49 in Biomedical research.

Political will and awareness through education were perceived as the most important drivers for advancing Universal Health Coverage (UHC) in Africa.

Among the 115 participants that responded to the question about the benefit of EDCTP association membership, 89 (77.4%) considered membership to be beneficial to their countries.

‘Mentorship programme for science writing’ was ranked as most important by 42 (35.6%) of 118 responders addressing additional activities that could further facilitate the implementation of the current EDCTP2 programme. It was followed closely by ‘simplification of the processing of calls’ which was given the highest rank by 38 responders (32.2%). Most of the responders (74.8%) thought specific calls for female scientists was the most important driver for gender equity in health research in sub-Saharan Africa.

Increasing the number of new or improved medical interventions for HIV/AIDS, tuberculosis, malaria and other poverty-related diseases, including neglected ones; and strengthening cooperation with sub-Saharan African countries, in particular on building their capacity for conducting and interpreting clinical trials, were identified as the two most important objectives of EDCTP2.

When asked about how EDCTP3/GHP can bring onboard countries that are not currently members of the EDCTP Association, 38.7% of 119 responders considered ‘Demonstrate benefit for African countries with limited capacities for health research’ as the most important action, followed by ‘Enhance South-South collaboration’ (29.4%) and ‘Enhance EU-Africa collaborations to achieve UHC in all countries’ (25.2%).

The same responders identified the critical role of regional entities like Africa Centres of Disease Control (Africa CDC) and World Health Organisation – Regional Office for Africa (WHO-AFRO), as the most important lesson learnt so far from COVID-19 pandemic. Examples cited of important regional entities, networks and consortia that have been important during the COVID-19 pandemic include all EDCTP Regional Networks of Excellence (WANETAM, EACCR, CANTAM, TESA), EDCTP-supported epidemic consortia (PANDORA-ID-NET and ALERRT), and all regional economic communities in the African region.

For EDCTP participating states to be fully committed to the future EDCTP3/GHP programme, ‘contributing to the regional and global health research agenda’ was considered the most important factor.

An overwhelming majority (81.7%) of 115 responders indicated that EDCTP3/GHP can benefit from extending membership to the private sector, including industry and foundations. However, most of the responders thought it was a highly risky venture. The main risk identified is that relating to conflicts of interest and loss of control.

Conducting the survey during the COVID-19 pandemic was timely as it allowed input on the relevance of working for the global good and the importance of south-south networking, coordinated by EDCTP Regional Networks of Excellence, regional economic communities and key institutions like Africa CDC and WHO-AFRO. However, the COVID-19 outbreak also posed some limitations to the outcome of the survey. With most people working from home during lockdowns, there was limited access to the internet. Administering the survey form in English, targeting responders in all AU member states, met some language barriers, especially in Central Africa, where most of the AU members have French as the official language.

2. Background

This Report on the Global Health Partnership online consultation forms part of the deliberations regarding the successor to the second European & Developing Countries Clinical Trials Partnership programme (EDCTP2).

During the last EU-AU High Level Policy Dialogue on Science, Technology and Innovation (HLPD), held in Addis Ababa, Ethiopia in November 2019, senior officials called ‘on all European and African Union Member States to consider the questions for reflection on the future orientation of the European & Developing Countries Clinical Trials Partnership (EDCTP), and proposed the convening of a consultation event’. The South African Department of Science and Innovation (DSI) offered to host the consultation. DSI and the EDCTP Secretariat duly set out to co-host a high-level consultative dialogue on EDCTP3/GHP, as part of the ongoing discussions and public consultation about the framework concerning the EDCTP2 successor programme.

The current EDCTP2 programme started in November 2014 and is expected to end in 2024. The proposed third EDCTP programme (EDCTP3/GHP) under Horizon Europe, the EU Framework Programme of Research and Innovation, is envisaged as a partnership between the European Union (EU), European countries and sub-Saharan Africa countries as well as other potential partners like private industry and foundations and other third countries. EDCTP3/GHP seeks to contribute to the United Nations global agenda for sustainable development, the sustainable development goals (SDG), by contributing to better health for all (SDG 3) and poverty reduction (SDG 1).

On 9 March 2020, the European Commission (EC) and the High Representative for Foreign Affairs and Security proposed the basis for a new strategy with Africa. In her address, the European Commission President, Ursula von der Leyen, said: “Today's Strategy with Africa is the roadmap to move forward and bring our partnership to the next level. Africa is the European Union's natural partner and neighbour. Together we can build a more prosperous, more peaceful and more sustainable future for all.”

The renewed cooperation on the EU-Africa Global Health partnership (EDCTP3/GHP) proposed will build on the EDCTP2 programme, the public consultation launched in 2019 and the ongoing consultations with African partners, including the partners in global health security. The proposed EU-Africa Global Health Partnership (EDCTP3/GHP) will promote development of diagnostics, medical devices, medicines, and vaccines to combat infectious diseases including those of epidemic potential, and to improve national and global health security. This goal could not have been timelier given the COVID-19 pandemic that has clearly unveiled the research, human resources, infrastructure and coordination gaps on the Africa continent and globally.

It is noted that the first evaluation of EDCTP2 conducted in 2017 ‘positively assessed the EDCTP programme and acknowledged it as highly relevant as the challenges addressed by the EDCTP persist.’

3. Method

The consultative dialogue was to take the form of a workshop on 16 March 2020 at the Protea Breakwater Lodge, Cape Town, South Africa.

DSI, the EDCTP Africa Office and the Directorate General Research and Innovation (DG RTD) of the EC proceeded to organise the event to share views, and ideas, and to pave a way forward for the next programme.

Unfortunately, the COVID-19 pandemic led to the postponement of the event. Therefore, the consultative dialogue accordingly took the form of an online survey that was coordinated by the DSI in collaboration with the EDCTP Africa Office and the DG RTD of the EC. DSI, through a Project coordinator based at South African Medical Research Council (SAMRC), disseminated the instrument which was developed with assistance from the EDCTP secretariat. On 5 May 2020, invitations to participate in the survey were sent to member states in the African Union and strategic partners relevant to the EDCTP3/GHP programme.

The main objective of the online consultation is to explore the views of sub-Saharan Africa States, the African Union, and other key stakeholders on how practically to galvanise Africa-EU cooperation in global health research and innovation. The consultation informs the scope and possible modalities of the EU-Africa GHP/EDCTP3.

A questionnaire with 25 survey items (SI) was developed and hosted on the survey monkey™ platform (see Appendix). The EDCTP Secretariat disseminated the instrument with the undertaking of confidentiality. Although the South African Protection of Personal Information Act was not mentioned, the associated legislation applies to the retention of personal information.

Aside from standard biodata (SI 1-5), fourteen items were completed by means of pre-assigned options of drop-down menus. SI 17, SI 20, SI 24 and SI 25 elicited free text responses.

The free text responses were examined, interpreted, coded, and then clustered thematically.

All interpretation was anonymised. The author had no access to the individual questionnaire returns.

6. Results

General response

A total of 161 people accepted to participate in the survey but only 150 people completed the online survey form. Responses were received from 26 countries in Africa, 12 countries in Europe and the United States of America. All African member countries of EDCTP Association, including Angola (an aspirant member), participated in the survey. Out of the total 150 who participated in the survey, 113 (75.3%) were from Africa, 34 (22.7%) from Europe and 3 (2%) from USA. The number of responders per country in Africa is shown in Figure 1.

26 African countries participated in the survey, including 10 from West Africa, 5 from East Africa, 6 from southern Africa, 4 from Central Africa and 2 from North Africa, including Sudan. The highest number of responses (36) came from southern Africa, including 26 from South Africa. The total number of responses from Central, East, North and West Africa were 16, 29, 2 and 30 respectively.

Respondents from all 16 EDCTP African member states, and the aspirant member state (Angola) participated in the survey. Two or more people participated from each of the 16 EDCTP participating states except for Gabon and Gambia which returned one response each. There were two responders from Angola.

Responders from African countries outside the EDCTP Association came from Algeria, Burundi, Botswana, Guinea, Liberia, Malawi, Mauritania and Sudan.

All responses associated with African countries were from African participants because SI 1 specifically asked for country of origin. More than 73% of the African responders were from public institutions. The number of participants from EDCTP African participating states (102) accounted for 68% of all responders (150). While it was not possible to associate responses with countries of origin in most cases, it is clear from the 115 people who provided written text in their responses to SI 24 and SI 25 that the participants were overwhelmingly from Africa or promoters of the African interest.

The participants included 102 (68%) males, 46 (31%) females and two with unspecified gender.

Profiles of responders

Figure 2 shows responses for SI 7 about primary area of research expertise. Among the 130 participants who responded to SI 7 about expertise in global health research, 59 indicated expertise in Epidemiology, 59 in Clinical trials, 58 in Public health, and 49 in biomedical research. Expertise in Ethics was indicated by 25 people, followed by Policy (18), Data (12), Social Science (11) and Advocacy (7). The ‘other responses’ included research translation, product development and management. There was one response for Entomology.

Figure 2. Profiles of responders to SI7: What is your primary area of research expertise? (More than one can be selected)

Figure 3 shows the number of responses indicating expertise in specific disease areas as asked in SI 8. Most responders to SI 8 indicated expertise in the malaria space (53), followed by HIV (46), tuberculosis (43), NTDs (32), Other (27), emerging infections (25), Non-Communicable Diseases (18), Diarrhoeal Diseases (13) and Lower Respiratory Tract Infections (9). The ‘Other’ category with 27 responders included management, public health and care, and research.

Figure 3. Profile of responders to SI 8: What is your primary area of health expertise? (You can select more than one choice)

Responders involvement in EDCTP2 Programme

The question about involvement in the EDCTP2 programme (SI 3) received the highest response rate. Over 99% (149) of the 150 participants responded to this survey item and 94 (63.1 %)

indicated an association with the current programme in various capacities as shown in Table 1 below. Only 38 of the 94 responders indicated that they were nationals of EDCTP participating states even though 102 had indicated an African EDCTP member country as country of origin.

Current or previous EDCTP grantees accounted for 42% (63) of the 149 participants that responded to SI 3.

Strategic partners in Africa, including the Africa Union Commission for Social Affairs, Africa CDC, AUDA-NEPAD and WHO-AFRO participated in the survey.

Table 1: Number of responders (94) who answered yes to involvement with the EDCTP2 programme in various capacities. Some were involved in more than one capacity

Are you associated with EDCTP in these capacities?	Yes
National of an EDCTP2 participating state	38
Current resident of an EDCTP2 participating state	20
Member of the EDCTP General Assembly	17
EDCTP High Representative	2
Member of the EDCTP Scientific Advisory Committee	4
Member of the AU Secretariat (Commissions)	1
Member of other organs of the AU	3
Member of WHO	1
Reviewer of EDCTP grants	11
Current EDCTP grantee	47
Independent researcher	7
Previous EDCTP Grantee	16
Have applied for EDCTP grants	25
Private sector (Industry, NGO)	6
Funder (Contributed to joint calls)	3

Among the 115 participants that responded to the question about the benefit of EDCTP Association membership (SI 21), 89 (77.4%) considered the membership to be beneficial to their countries, two responders (one from Africa) thought it was not beneficial, and 24 (20.9%) responders had no comments.

Achieving Universal Health Coverage and SDG3 in Africa

SI 10 asked responders about the most important contextual factors for achieving Universal Health Coverage (UHC) in Africa, and what could be the role of EDCTP3/GHP in the transformation process in Africa.

Given the choice to rank six factors indicated in Figure 4, in order of importance, for achieving UHC, almost half (49.9%) of the 119 responders considered 'Political will' to be the most important factor. 'Education' was ranked highest by 20% of responders. Only 13.5% considered 'Economic stability' as the most important factor. More responders (6.7%) ranked 'Global cooperation' as the leading factor than 'Regional cooperation' (5.0%). Strengthening 'Health Security' was considered the most important factor for achieving UHC by 5.9% of responders.

Figure 4. Percentage (%) of responders assigning the highest importance to listed factors affecting UHC in Africa (n=119).

More than half of the 119 responders (52.1%) to SI 11 considered ‘Strengthening health (research) systems’ as the most important role EDCTP can play to achieve UHC in Africa (Figure 5). This was followed by ‘Strengthen public-public partnership and science diplomacy in global health research’ which 23.5% of responders gave the highest ranking. The proportion of responders that ranked the other options as most important varied from 0.8% for ‘Promoting greater engagement with WHO-AFRO’ to 6.7% for ‘Enhancing South-South collaboration’.

Figure 5. Percentage (%) of responders assigning the highest importance to listed roles that EDCTP can play to achieve UHC in Africa (n=119)

Achieving SDG3 (Good health and well-being)

In response to SI 12, a large majority (83.2%) of the 119 responders agreed that achieving the following objectives will, to a large extent, facilitate meeting the SDG 3 (Good health and well-being):

- Reduction of the social and economic burden of infectious diseases in sub-Saharan Africa and by extension in Europe.
- Development and uptake of new or improved interventions against infectious diseases.
- Enhancement of health security in sub-Saharan Africa, and by extension in Europe and worldwide, in the context of environmental and climate change, by reducing the risk of outbreaks, pandemics or antimicrobial resistance.

Promotion of gender equity in global health research in sub-Saharan Africa (SSA)

Figure 6 shows the results for the level of importance 119 responders assigned to a list of options for promoting gender equity in global health research in Africa (SI 13). Most of the responders (74.8%) thought specific calls for female scientists was the most important driver for gender equity in health research in SSA. More than half of the responders (52.9%) considered launching specific calls for female scientists as the most important driver. This was followed by specific calls addressing gender issues (21.0%). Addressing ‘away from family’ support for female scientists was assigned the highest rank by 19.3% of the responders.

Figure 6. Percentage (%) of responders assigning the highest importance to listed options for promoting gender equity in sub-Saharan Africa (n=119).

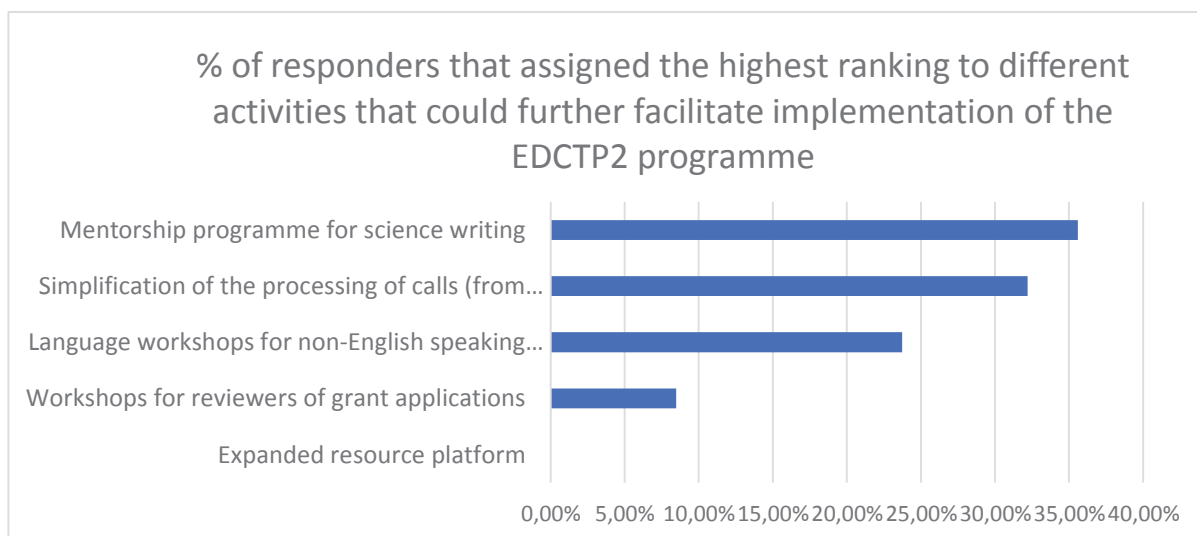

Additional activities to facilitate implementation of EDCTP2

A total of 118 participants responded to SI 18 about the additional activities that could further facilitate implementation of the current EDCTP2 (Figure 7).

‘Mentorship programme for science writing’ was ranked as most important by 42 (35.6%) responders, followed by ‘simplification of the processing of calls’ which was ranked highest by 38 responders (32.2%). Not far behind was ‘Language workshops for non-English speaking applicants’ which got 28 votes (23.7%) for the most important activity that accelerate the

implementation process for the EDCTP2 programme. Only 10 (8.5%) responders assigned the highest ranking to conducting ‘Workshops for reviewers of grant applications’. ‘Expanding the resource platform’ was considered the least important of the five options provided for SI 18.

Figure 7. Ranking of additional activities that that could further facilitate implementation of the current EDCTP2 (n=118)

Objectives of the current EDCTP2

SI 9 requested participants to rank the EDCTP2 objectives in Figure 8 below in order of importance. Most of the 130 responders (51.5%) considered “Increased number of new or improved medical interventions for HIV/AIDS, tuberculosis, malaria and other poverty-related diseases, including neglected ones” as the most important objective. ‘Strengthened cooperation with sub-Saharan African countries, in particular on building their capacity for conducting and interpreting clinical trials’ was ranked the highest by 34.6% of the responders. Each of the other objectives were ranked as most important by less than 10% of the responders. ‘Extended international cooperation with other public and private partners’ received the least number of votes as the most important. It was ranked top by only 2.3% of responders.

Figure 8: Percentage (%) of responders assigning the highest importance to the different EDCTP2 objectives (n=130)

How to increase countries participation in the EDCTP3/GHP Programme.

To address SI 14, 119 participants responded to the question ‘How could the EDCTP3/GHP bring onboard countries that are not currently members of the EDCTP Association?’

Among the options listed for ranking, 38.7% gave the highest rank to ‘Demonstrate benefit for African countries with limited capacities for health research’, followed by ‘Enhance South-South collaboration’ (29.4%) and ‘Enhance EU-Africa collaborations to achieve UHC in all countries’ (25,2%). Only 6.7% of the responders considered ‘Demonstrate benefit for EU countries’ as the most important factor in bringing onboard countries that are not members of the EDCTP Association.

Additional areas to be tackled by EDCTP3/GHP

In response to the question ‘Do you think that EDCTP3/GHP should tackle additional areas than the ones currently tackled by the EDCTP2 programme? (SI 15), 86.6 % (107) of the 119 responders answered in the affirmative. Among those that answered ‘yes’, ‘Clinical epidemiology’ was considered the most important area by 28.6% of the 119 responders. This was closely followed by 27% for ‘Vector control’ and 24.0% for ‘Social science’. ‘Climate change’ was considered the most important additional area by only 20% of responders.

Lessons learned from COVID-19 pandemic

In response to SI 19, the most important lesson learnt from COVID-19 pandemic that could inform the EDCTP3/GHP funding scope, ‘regional entities like Africa CDC and WHO-AFRO are critical for managing public health emergencies’ was ranked number 1 by 43.2 % of responders. However, this was just marginally higher than the number of responders who thought that the roles of EDCTP Regional Networks of Excellence should be expanded with increased funding to accommodate regional entities (36.4%). One in five responders (20.3%) considered EDCTP3/GHP support for regional platforms (e.g. AVAREF and WAHO) to implement ethics and regulatory activities was the most important lesson learnt. The examples indicated of regional entities, networks and consortia that have been important during the COVID-19 pandemic include all EDCTP Regional Networks of Excellence (WANETAM, EACCR, CANTAM, TESA), EDCTP supported epidemic consortia (PANDORA-ID-NET and ALERRT), and all regional economic communities (RECs) in the African region. Also mention were H3Africa, COHRED, REACTing and Red Cross.

Incentives to commit to EDCTP3/GHP

Among the key incentives listed in Figure 9 for EDCTP participating states to be fully committed to the future EDCTP3/GHP programme, ‘contributing to the regional and global health research agenda’ was assigned the highest ranking by 64 (55.7%) out of 115 responders. ‘Informing discussions about the most appropriate products and interventions for health security’ was considered the most important by 25 (21.7%) responders. The other two options were each given high importance by 13 (11.3%) responders.

Figure 9. Importance of incentives for country commitment to EDCTP3/GHP (n=115)

Private sector involvement (industry and foundations)

In response to SI 23, 94 (81.7%) of the 115 responders indicated that EDCTP3/GHP can benefit from extending membership to the private sector including industry and foundations. The others did not think so. However, the majority of the responders thought it was a highly risky venture. The main risk identified is that relating to conflicts of interest and loss of control. The various narratives about the risk of engaging private partners are best exemplified by these three:

1. “For most Africa, the private sector is poorly regulated rendering highly risky for investment in terms of grants. However fostering Private-Public sector partnerships might be beneficial”
2. “In my opinion, membership in the private sector will rather contribute to strengthening the association by mobilizing financial resources. But as a risk I fear that c sector will want to change the orientations of the association for purposes other than those it has set for itself”.
3. “Increased risk for competing priorities of the private sector may not be UHC but as an expansion of their profit margins by the health hazards. If the private sector is to be involved, the regulations and ethical acumen should be updated to ensure the Public Health good is the priory and not otherwise”

5. Discussion

The primary goal of the online consultation was to explore the views of African institutions, including public and private initiatives, and member states of the African Union, about how EU-Africa cooperation in global health research and innovation might be enhanced through the envisaged EDCTP3/GHP initiative. To this end, a short, user friendly online instrument was developed, disseminated, collated and analysed.

African involvement

The majority of the 150 responders were from Africa. Respondents from all 16 current African member states of the EDCTP Association, and the aspirant member state (Angola) participated in the online consultation. Fewer responses were received from non-English speaking countries, particularly Francophone countries in central Africa. The low response rate from these countries may be because the questionnaire was available only in English. A similar low response rate, from Lusophone and Francophone, was reported by WHO-AFRO for a recent online survey, conducted in English, about ethics and regulatory capacities in Africa (<https://www.edctp.org/news/avaref-survey-highlights-edctps-role-supporting-ethical-regulatory-oversight-africa/>). Most of the African participants were from public institutions, including government departments/ministries, national research institutions, the AU Commission for Social Affairs, the African CDC, the African Union Development Agency (AUDA-NEPAD) and the Regional Economic Communities (RECs). Responders were mainly epidemiologists and clinical trialists, but some had expertise in ethics and regulatory activities, social science, health policy, data, knowledge translation and advocacy. One was an entomologist.

Achieving Universal Health Coverage (UHC) in Africa

Political will and awareness through education were perceived as the most important drivers for advancing UHC in Africa. Most responders thought EDCTP can accelerate this process by strengthening health (research) systems and promoting public-public partnership and science diplomacy in global health research. There was an overwhelming agreement among participants that the sustainable development goal for health and well-being (SDG3) will be met largely through a reduction of the social and economic burden of infectious diseases in sub-Saharan Africa. Meeting the SDG3 targets can be accelerated by the development and uptake of new or improved interventions against infectious diseases in Africa and globally to reduce the risk of outbreaks, pandemics or antimicrobial resistance. To achieve UHC leaving no one behind, there were suggestions for closing the gender gap. Most of the responders advocated for specific calls for female scientists to enhance equity in health research in sub-Saharan African and ‘away from family’ support for female scientists.

The EDCTP2 Programme

All 150 participants, except one, responded to the question about involvement in the EDCTP2 programme. Most of the responders, mainly grantees, were associated with the EDCTP2 programme in various roles, but many of them were from countries that are not members of the EDCTP Association, indicating that responders outside the EDCTP participating states considered membership of the association to be beneficial to their countries. However, there was little enthusiasm for extending international cooperation with other public and private partners outside the EU-Africa network.

Increasing the number of new or improved medical interventions for HIV/AIDS, tuberculosis, malaria and other poverty-related diseases, including neglected ones; and strengthening cooperation with sub-Saharan African countries, in particular on building their capacity for conducting and interpreting clinical trials, were identified the two most important objectives of EDCTP2.

To further enhance the EDCTP2 programme, the participants thought that a mentorship programme for science writing should be implemented and the processing of calls should be simplified and presented in different languages.

Two responders did not think that the EDCTP2 programme was beneficial to their countries, but no reason was given except from one whose the country of origin was not in Africa which could be established through the free text narrative.

EDCTP3/GHP programme

There was a general consensus that for the EDCTP participating states to be fully committed to the future EDCTP3/GHP programme, it should be seen firstly as ‘adding value to the regional and global health research agenda’ and by ‘providing current information about the most appropriate products and interventions for health security’. An overwhelming majority of responders (86.6%) wanted EDCTP3/GHP to embrace additional areas not addressed in the EDCTP2 programme. As the survey was conducted during the COVID-19 outbreak, Clinical epidemiology was the favourite new topic; followed closely, and in order of importance, by Vector control, Social science and Climate change. Vector control has become popular since the Zika outbreak, and more recently with the use of medicines for vector control to tackle vector-borne diseases like malaria and filariasis.

The coordinating role played by regional entities like Africa CDC and WHO-AFRO in managing public health emergencies was considered the most important lesson learnt so far from the COVID-19 pandemic that could inform the EDCTP3/GHP funding scope. But equally important are the emerging critical networking activities of the EDCTP Regional Networks of Excellence (NoE). The responders thought the support for EDCTP Networks of Excellence should be expanded with increased funding to accommodate more regional entities. The list, they provided, of regional entities, networks and consortia that have been important during the COVID-19 pandemic included all EDCTP Regional Networks of Excellence (WANETAM, EACCR, CANTAM, TESA), EDCTP supported epidemic consortia (PANDORA-ID-NET and ALERRT), and all regional economic communities (RECs) in the African region. Also listed were AVAREF, H3Africa, COHRED, REACTing and Red Cross.

Extending EDCTP3/GHP membership to the private sector, including industry and foundations was considered beneficial by most responders. However, many thought it was a highly risky venture because of conflicts of interest and loss of control. The following text about the risk of engaging private partners can best illustrate most of the views expressed

“For most Africa, the private sector is poorly regulated rendering highly risky for investment in terms of grants. However, fostering Private -public sector partnerships might be beneficial”

Conclusion

The views expressed in the online consultation process came from a wide range of strategic entities from across Africa. Key influencers in Africa, including the African Union Commission, Africa CDC, Africa Union Development Agency, and the WHO-AFRO shared their views on the way forward for EDCTP3/GHP. There was a consensus about demonstrating value addition to the regional and global health research agenda through support for the most appropriate products and interventions for health security. Conducting the survey during the COVID-19 pandemic was timely as it allowed input on the relevance of working for the global good and the importance of south-south networking, coordinated by EDCTP regional networks of excellence, regional economic communities and key institutions like Africa CDC and WHO-AFRO. Extending EDCTP3/GHP membership to the private sector, including funders and foundations was considered beneficial but should be managed carefully to avoid conflicts of interest and mitigate risks related to profits from products. EDCTP might also explore the best ways to determine country capabilities for health research and through resources like the WHO Joint External Evaluations, and the WHO-AFRO national health research systems barometer that is partly supported by EDCTP. Such analysis might assist in shaping the EDCTP3/GHP yet further in light of the COVID-19 pandemic.

Limitations

The online consultation survey had some limitations. Administering the survey form in English, targeting responders in all AU member states, met some language barriers, especially in Central Africa, where most of the AU members have French as the official language. Moreover, the online survey was performed during a public health emergency, with people observing lockdown restriction and working from home with limited access to the internet. The number of invitations sent out were also limited by access to contact details due to privacy and data protection policies.

The visibility of EDCTP in Africa has been perceived as suboptimal, and it is not clear from the online survey what the leadership of strategic partners in health in Africa think about EDCTP as a valued partner going forward with the proposed EDCTP3/GHP programme. High-level engagements with leaders in the African Union, EU, Africa CDC and WHO-AFRO, after the survey, provided some indicators about the role of EDCTP in supporting health research in Africa. Their thoughts have been summarised in Appendix 2 in this report.

Questionnaire

1. Accept/reject conditions
2. Country of origin (Please add your country of origin, or that of your organisation when responding on behalf of one)
3. Gender
4. Current employer
 - Government
 - Public institution
 - Private institution
 - Multilateral institution
 - Other (please specify)
5. Have you been involved in the on-going European and Developing Countries Clinical Trials Partnership (EDCTP2) programme? [Yes/No]
6. If yes, please identify in which capacity (You can select more than one choice)
 - From an EDCTP 2 participating State
 - Current resident of an EDCTP2 participating state
 - Member of the EDCTP General Assembly
 - EDCTP High Representative
 - Member of the EDCTP Scientific Advisory Committee
 - Member of the AU Secretariat (Commissions)
 - Member of other organs of the AU (e.g. AUDA/NEPAD, AAS, Africa CDC, RECs).
 - Member of WHO
 - Reviewer of EDCTP grants
 - Current EDCTP grantee
 - Independent researcher
 - Previous EDCTP Grantee
 - Have applied for EDCTP grants
 - Private sector (Industry, NGO)
 - Funder (Contributed to joint calls)
7. What is your primary area of research expertise? (You can select more than one)
 - Epidemiology

- Public health
 - Clinical trials
 - Biomedical
 - Policy
 - Data
 - Advocacy
 - Social science
 - Ethics and regulatory
 - Other (please specify)
8. What is your primary area of health expertise? (You can select more than one choice)
- Malaria
 - TB
 - HIV
 - NTD
 - LRTI
 - Diarrhoeal diseases
 - NCD
 - Emerging infections
 - Other (please specify)
9. Please rank, in order of importance, the specific objectives of the current EDCTP2 programme:
- a. Increased impact due to effective cooperation with relevant Union initiatives, including its development assistance
 - b. Increased number of new or improved medical interventions for HIV/AIDS, tuberculosis, malaria and other poverty-related diseases, including neglected ones
 - c. Better coordination, alignment and, where appropriate, integration of relevant national programmes to increase the cost-effectiveness of European public investments
 - d. Strengthened cooperation with sub-Saharan African countries, in particular on building their capacity for conducting and interpreting clinical trials
 - e. Increased impact due to effective cooperation with relevant European Union initiatives, including its development assistance
 - f. Extended international cooperation with other public and private partners
10. What are the most important contextual factors in your opinion for achieving Universal Health Coverage (UHC) in Africa? Rank the choices below:
- a. Political will
 - b. Economic stability
 - c. Education
 - d. Health Security
 - e. Regional cooperation
 - f. Global cooperation
11. What role can the EDCTP3/GHP programme play to achieve the UHC in Africa. Rank the choice below
- a. Strengthen public-public partnership and science diplomacy at global health research
 - b. Strengthen Health (research) systems in Africa
 - c. Strengthen health security in Africa
 - d. Promote partnership at global level
 - e. Enhance south -south collaboration
 - f. Promote greater engagement of the AU organs (AUDA/AUDA-NEPAD, AAS, Africa CDC, RECs).
 - g. Promote greater engagement of WHO-AFRO.
12. To what extent will achieving these objectives facilitate meeting the SDG 3 (Good health and well-being). The proposed EDCTP3/GHP general objectives are:

- Reduction of the social and economic burden of infectious diseases in sub-Saharan Africa and by extension in Europe
- Development and uptake of new or improved interventions against infectious diseases;
- Enhancement of health security in sub-Saharan Africa, and by extension in Europe and worldwide, in particular in the context of environmental and climate change, by reducing the risk of outbreaks, pandemics or antimicrobial resistance.
- Large extent
- Limited extent
- None

13. In your opinion, how could EDCTP3/GHP promote gender equity in sub-Saharan Africa? Rank choices below

- a. Launch specific calls for female scientists
- b. Promote leadership by female scientists through female specific fellowships
- c. Address 'away from family' support for female scientists
- d. Launch specific calls addressing gender issues
- e. Celebrate women achievers

14. How could the EDCTP3/GHP bring onboard countries that are not currently members of the EDCTP Association? Rank the choices below

- a. Enhance EU-Africa collaborations to achieve UHC in all countries
- b. Enhance South-South collaboration
- c. Demonstrate benefit for African countries with limited capacities for health research.
- d. Demonstrate benefit for EU countries

15. Do you think that EDCTP3/GHP should tackle additional areas than the ones currently tackled by the EDCTP2 programme ? Yes/No

16. If yes, rank the choices below for other areas in order of importance.

- a. Climate change
- b. Vector control
- c. Clinical Epidemiology
- d. Social Science

17. If no, give reasons

18. In your opinion, what additional activities could further facilitate implementation of the current EDCTP2? Please rank the choices below in order of importance:

- a. Expanded resource platform
- b. Language workshops for non-English speaking applicants
- c. Mentorship programme for science writing
- d. Workshops for reviewers of grant applications
- e. Simplification of the processing of calls (from launch, review to outcome)

19. What lessons do you think we have learnt from the recent and ongoing Global Health Emergencies that should inform the EDCTP3/GHP future funding approach? Rank the choices below

- a. Regional entities like Africa CDC and WHO-AFRO are critical for managing public health emergencies
- b. The roles of EDCTP Regional Networks of Excellence should be expanded with increased funding to accommodate regional entities.
- c. EDCTP3/GHP should support regional platforms (e.g. AVAREF and WAHO) for ethics and regulatory activities

20. If appropriate, please give examples of regional entities, networks and or consortia that have been active during PHE (Max 50 words)

21. If your country is currently a member of the EDCTP Association, do you think that being part of the EDCTP Association is beneficial for your country?
- Yes
 - No
 - No comments
22. What are the key incentives for your country to be fully committed to the future EDCTP3/GHP? Rank choices below.
- a. Contribution to the regional and global health research agenda
 - b. Benefiting from EU- Africa dialogue about global health
 - c. Informing discussions about the most appropriate products and interventions for health security
 - d. Benefiting from products shown to be safe and effective through EDCTP supported projects
23. In your opinion, can EDCTP3/GHP benefit from extending membership to the private sector including funders and foundations?
- Yes
 - No
24. In your view/opinion, what are the risks of extending membership to the private sector? (Max 50 words)
25. Please add any other comments, views or information you deem important, and that have not been tackled in this online consultation, which should be considered when developing the future EDCTP3/GHP (Max 200 words)

Post-survey engagements with AU, EU, Africa CDC and WHO-AFRO

High-level engagements with the African Union, EU, Africa CDC and WHO-AFRO after the survey provided some indicators about role of EDCTP in supporting health research in Africa. Members of the EDCTP secretariat contributed to important high-level discussions about EDCTP's role and value addition to the public health space in Africa. EDCTP was mentioned in speeches by African Ministers of Health, the AU commissioner for Social Affairs, the Regional Director for the WHO Africa Region and the Director of Africa CDC.

24 & 25 June 2020: Africa's Leadership in COVID-19 vaccine development and access

The role of EDCTP in research in vaccine development in Africa was highlighted during the virtual meeting of Africa's Leadership in COVID-19 vaccine development and access held on 24 and 25 June 2020 (<https://africacdc.org/download/africas-leadership-in-covid-19-vaccine-development-and-access-highlights-day-1-2/>).

The meeting, which was opened by H.E. President Cyril Ramaphosa, Chairperson of the African Union and President of the Republic of South Africa brought together African leaders, public health professionals, policymakers, the media, civil society, community leaders, private sector representatives, pharmaceutical industry experts, and partners to discuss a roadmap for the development of safe, efficacious, affordable, equitable and accessible COVID-19 vaccine in Africa, with the involvement of Africans.

During the closing session there were presentations by the Executive Director of UNAIDS, H.E. Amira Elfadil Mohammed, Commissioner for Social Affairs, African Union Commission and Dr Leonardo Simao, EDCTP High representative for Africa.

Dr Leonardo Simao, said that the conference was timely because it will ensure that Africa is not left behind in COVID-19 vaccine development. He highlighted some of the activities of EDCTP

in Africa since 2003. He reminded the participants EDCTP is engaged in high level dialogue in Africa, Europe and globally to find solutions to the vaccine challenge and they will continue working with partners as we move into the next phase of the programme.

16 July 2020: European Union (EU) - African Union (AU) Research & Innovation Ministerial meeting

The first ever EU - AU Research & Innovation Ministers' Meeting took place on 16 July 2020, under the framework of the EU-AU High-Level Policy Dialogue (HLPD) on Science, Technology and Innovation (https://ec.europa.eu/info/news/european-union-and-african-union-research-and-innovation-ministers-meet-first-time-2020-jul-16_en)

The policy discussions on public health focused on the human health impacts and the more far reaching socioeconomic effects of COVID-19. The two main discussion points for public health were i) the emergency call for expressions of interest launched by the EDCTP to support COVID-19 research activities and ii) the impact of COVID-19 on ongoing EDCTP Projects.

The ministers advocated for international cooperation (north-south and south-south), and better support for EDCTP and the successor, the planned Global Health Partnership (GHP). Some AU Ministers called for increasing the EDCTP membership by African countries currently not represented, giving the Partnership a whole of Africa approach. The Ministers (or their representatives) of non-EDCTP participating states, including Hungary, Egypt, Romania that advocated for additional financial resources for the EDCTP/GHP.

EDCTP was represented in the meeting by Dr Michael Makanga, EDCTP Executive Director; Dr Leonardo Simao, EDCTP High Representative Africa, and Professor Marcel Tanner, EDCTP High Representative Europe.

11-12 August 2020: 34th session of the African Advisory Committee for Health Research and Development (AACHRD) Meeting.

EDCTP participated in the 34th session of the WHO-AFRO African Advisory Committee for Health Research and Development (AACHRD) on 11-12 August 2020. The theme of the meeting was 'Health Research in the context of COVID-19' but the regional health research agenda for Africa was presented and discussed with inputs from EDCTP and strategic partners. The key partners included NEPAD, TDR, Africa CDC and the Regional economic Communities. More than 50 people participated in the meeting, including many that were invited to the proposed Cape Town meeting on EDCTP/GHP. The main goal of AACHRD is to provide advice to the Regional Director on the WHO core function of shaping the research agenda and stimulating the generation, translation and dissemination of valuable knowledge in Africa.

The WHO-AFRO Regional Director, Dr Matshidiso Moeti, in her opening remarks acknowledged the presence of EDCTP and highlighted the valuable recent outputs from joint activities that informed the MOU between WHO-AFRO and EDCTP signed in June 2020.

Professor Moses Bockarie gave an overview of the emergency call launched by EDCTP in April 2020 to support COVID-19 research activities, and the impact of COVID-19 on ongoing EDCTP Projects. Professor Bockarie also presented the roadmap for strengthening National Health Research Systems in Africa that was developed during the EDCTP-WHO joint meeting held in Brazzaville on in October 2019 (<https://publications.edctp.org/nhrs-consultative-meeting-report/cover>).

Recommendations and action points

The participants resolved to develop and implement a work plan around the following recommendations of the 34th AACHRD:

1. Leadership, governance and innovation in health research

3. Develop a collaboration framework to guide engagement with stakeholders.
4. Promote indigenous innovations from the region.
5. Develop guidance document on access options should a vaccine be available.
6. Finalise the strategy for strengthening the use of evidence information and research for policy making in the WHO/AFRO region for presentation at the 2021 regional committee meeting.
7. In the context of COVID 19, the AACHRD, resolved to go beyond the advisory capacity, to assist WHO-AFRO through collaborating with other partners in terms of shaping the research agenda and ensure the quality of ongoing research around COVID 19.
8. Encourage participation of African countries (and communities) in vaccine trials.
9. Put in place mechanism of accessing vaccines once available and in collaboration with partners (e.g. Africa CDC).
10. Encourage regulatory bodies and governments to be engaged actively in trials.
11. Orient research beyond the biomedical and public health areas spheres and address research questions in multiple sectors including social economic status, social sciences/ground realities and advise government based on the evidence.

2. Strengthening national health research systems

12. Develop COVID-19 research agenda for Africa.
13. Conduct deliberative dialogues that will identify topics for policy briefs.
14. Support and strengthen work on policy briefs.
15. Set up standing subcommittee to review policy briefs.
16. Endorse and strengthen work of AVAREF
17. Develop a regional health research directory.
18. Develop guideline for rapid ethics review.
19. Promote multisectoral, transdisciplinary, social science, health (research) systems, implementation and operational research.
20. Develop reports on COVID-19 best practice and research agenda from member states.

1. 3. Harmonisation and co-ordination of research

21. An expansive list was generated; further discussion on prioritising for WHO-Afro while also allowing country specific priorities
22. Consider interventions for prevention that are beyond the health care system.
23. Use of the Health systems building blocks to organise the priorities, as this is widely used as a conceptual framework and is well known.
24. Consider emerging and re-emerging infections.
25. Include social science among research priorities.

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED

1.1. Focus and objectives of the impact assessment

This impact assessment accompanies the Commission proposal for Institutionalised European Partnerships to be funded under Horizon Europe, the 2021-2027 Framework Programme for EU Research and Innovation (R&I).¹ It sets out to **help decide in a coordinated manner the right form of implementation for specific candidate initiatives** based on a common approach and methodology to individual assessments². It also provides an **horizontal perspective on the portfolio of candidate European Partnerships** to identify further efficiency and coherence gains for more impact.

European Partnerships are initiatives where the Union, together with private and/or public partners (such as industry, public bodies or foundations) commit to support jointly the development and implementation of an integrated programme of R&I activities. The rationale for establishing such initiatives is to achieve the objectives of Horizon Europe more effectively than what can be attained by other activities of the programme.³

Based on the Horizon Europe Regulation, European Partnerships may be set up using **three different forms**: “Co-funded”, “Co-programmed” and “Institutionalised”. The setting-up of **Institutionalised Partnerships** involves new EU legislation and the establishment of dedicated implementing structures based on Article 185 or 187 of the Treaty on the Functioning of the EU (TFEU). This requires an impact assessment to be performed.

The Horizon Europe Regulation defines **eight priority areas**, scoping the domains in which Institutionalised Partnerships could be proposed⁴. Across these priority areas, **13 initiatives** have been identified as **suitable candidate initiatives** for Institutionalised Partnerships because of their objectives and scope. This impact assessment aims to identify whether 12 of these initiatives⁵ need to be implemented through this form of implementation and would not deliver equally well with traditional calls of Horizon Europe or other lighter forms of European Partnerships under Horizon Europe. This means assessing whether each of these initiatives meets the necessity test set in the **selection criteria** for European Partnerships in the Horizon Europe Regulation, Annex III.

This assessment is done **without any budgetary consideration**, as the overall budget of the Multiannual Financial Framework of the EU – and hence of Horizon Europe – for the next financing period is not known at this stage.⁶

¹ Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

² Based on the European Commission Better Regulation framework (SWD (2017) 350) and supported by an external study coordinated by Technopolis Group (to be published in 2020).

³ For further details on these points, see below Section 1.2.2.

⁴ Set out in the Annex Va of the Horizon Europe Regulation (common understanding). <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

⁵ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47).

⁶ EU budget commitments to the European Partnership candidates can only be discussed and decided following the political agreement on the overall Multiannual Financial Framework and Horizon Europe

1.2. The political and legal context

1.2.1. Shift in EU priorities and Horizon Europe framework

European priorities have evolved in the last decades, and reflect the social, economic, and environmental challenges for the EU in the face of global developments. In her Political Guidelines for the new European Commission 2019 – 2024⁷, the new Commission President put forward six overarching priorities, which reach well beyond 2024 in scope⁸. Together with the Sustainable Development Goals (SDGs), these priorities will shape future EU policy responses to the challenges Europe faces, and thus also give direction to EU research and innovation.

As part of the Multi-annual Financial Framework (MFF) 2021-27 the new EU Framework Programme for Research and Innovation **Horizon Europe will play a pivotal role for Europe to lead the social, economic, and environmental transitions needed to achieve these European policy priorities**. It will be more impact driven with a strong focus on delivering European added value, but also be more effective and efficient in its implementation.⁹ Horizon Europe finds its rationale in the daunting challenges that the EU is facing, which call for “*a radical new approach to developing and deploying new technologies and innovative solutions for citizens and the planet on a scale and at a speed never achieved before, and to adapting our policy and economic framework to turn global threats into new opportunities for our society and economy, citizens and businesses.*” While Horizon Europe continues the efforts of strengthening the scientific and technological bases of the Union and foster competitiveness, a more strategic and impact-based approach to EU R&I investment is taken. Consequently, the **objectives of Horizon Europe** highlight the need to *deliver on the Union strategic priorities and contribute to the realisation of EU objectives and policies, contribute to tackling global challenges, including the Sustainable Development Goals by following the principles of the Agenda 2030 and the Paris Agreement*.¹⁰

In this context, **at least 35 % of the expenditure from actions under the Horizon Europe Programme will have to contribute to climate action**. Furthermore, a **Strategic Plan** is co-designed with stakeholders to identify **key strategic orientations for R&I support** for 2021-2024 in line with the EU priorities. In the Orientations towards the first Strategic Plan for Horizon Europe, the need to strategically prioritise and “*direct a substantial part of the funds towards the areas where we believe they will matter the most*” is emphasised. The Orientations specify, that actions under Pillar II of Horizon Europe “Global Challenges and European Industrial Competitiveness” will target only selected themes of especially high impact that significantly contribute to delivering on the political priorities of the Union. Most of the candidate European Partnerships fall under this Pillar.

budgetary envelopes. The level of EU contribution for individual partnerships should be determined once there are agreed objectives, and clear commitments from partners. Importantly, there is a ceiling to the partnership budgets in Pillar II of Horizon Europe (the legal proposal specifies that *the majority of the budget in pillar II shall be allocated to actions outside of European Partnerships*).

¹⁰ Article 3, Common understanding regarding the proposal for Horizon Europe Framework Programme.

1.2.2. Key evolutions in the approach to partnerships in Horizon Europe

Since their start in 1984 the successive set of Framework Programmes uses a variety of instruments and approaches to support R&I activities, address global challenges and industrial competitiveness. Collaborative, competition-based and excellence-driven R&I projects funded through Work Programmes are the most traditional and long-standing approach for implementation. Since 2002, available tools also include **partnerships**, whereby the Union together with private and/or public partners commit to jointly support the development and implementation of a R&I programme. These were introduced as part of creating the European Research Area (ERA) to align national strategies and overcome fragmentation of research effort towards an increased scientific, managerial and financial integration of European research and innovation. Interoperable and integrated national research systems would allow for better flows of knowledge, technology and people. Since then, the core activities of the partnerships consist of building critical mass mainly through collaborative projects, jointly developing visions, and setting strategic agendas.

As analysed in the **interim evaluation of Horizon 2020**¹¹, a considerable repertoire of partnership initiatives have been introduced over time, with 8 forms of implementation¹² and close to 120 partnership initiatives running under Horizon 2020 - without clear exit strategies and concerns about their degree of coherence, openness and transparency. Even if it is recognised that these initiatives allow setting long-term agendas, structuring R&I cooperation between otherwise dispersed actors, and leveraging additional investments, the evaluation points to the complexity generated by the proliferation of instruments and initiatives, and their insufficient contribution to policies at EU and national level.

Box 1 Key lessons from the interim evaluation of Horizon 2020 and R&I partnerships

- The **Horizon 2020 Interim Evaluation** concludes that the overall partnership landscape has become overly complex and fragmented. It identifies the need for rationalisation, improve their openness and transparency, and link them with future EU R&I missions and strategic priorities.
- The **Article 185 evaluation** finds that these public-public partnerships have scientific quality, global visibility and networking/structuring effects, but should in the future focus more on the achievement of policy impacts. From a systemic point of view, it found that the EU public-to-public cooperation (P2P) landscape has become crowded, with insufficient coherence.
- The **Article 187 evaluation** points out that Public-Private Partnership (PPP) activities need to be brought more in line with EU, national and regional policies, and calls for a revision of the Key Performance Indicators. As regards the **contractual PPPs (cPPPs)** their reviews identified challenges of coherence among cPPPs and the need to develop collaborations and synergies with other relevant initiatives and programmes at EU, national and regional level.

Over 80% of respondents to the Open Public Consultation (OPC) indicated that a significant contribution by future European Partnerships is 'fully needed' to achieve climate-related goals, to develop and effectively deploy technology, and for EU global competitiveness in specific sectors/domains. Views converged across all categories of respondents, including citizens, industry and academia.

¹¹ Interim evaluation of Horizon 2020, Commission Staff Working Document, SWD(2017)221 and 222 Interim evaluation of the Joint Undertakings operating under Horizon 2020 (Commission Staff Working Document, SWD(2017) 339); Evaluation of the Participation of the EU in research and development programmes undertaken by several Member States based on Article 185 of the TFEU, Commission Staff Working Document, SWD (2017)340)

¹² E.g. initiatives based on Article 187 (Joint Technology Initiatives), Article 185 TFEU, Contractual Public-Private Partnerships (cPPPs), Knowledge & Innovation Communities of the European Institute of Innovation & Technology (EIT-KICs), ERA-NETs, European Joint Programmes, Joint Programming Initiatives.

The impact assessment of Horizon Europe identifies therefore the need to **rationalise the EU R&I funding landscape**, in particular with respect to partnerships, as well as to **re-orient partnerships towards more impact** and delivery on EU priorities. To address these concerns and to realise the higher ambition for European investments, Horizon Europe puts forward **a major simplification and reform for the Commission’s policy on R&I partnerships**¹³. Reflecting its pronounced systemic nature aimed at contributing to EU-wide ‘transformations’ towards the sustainability objectives, Horizon Europe indeed intends to make a more effective use of these partnerships with a **more strategic, coherent and impact-driven approach**. Key related changes that apply to all forms of European Partnerships encapsulated in Horizon Regulation are summarised in the Box below.

Box 2 Key features of the revised policy approach to R&I partnerships under Horizon Europe based on its impact assessment

- ✓ **Simpler architecture & toolbox** by streamlining 8 partnership instruments into 3 implementation forms (Co-Funded, Co-Programmed, Institutionalised), under the umbrella ‘European Partnerships’
- ✓ **More systematic and transparent approach** to selecting, implementing, monitoring, evaluating and phasing out all forms of partnerships (**criteria** for European Partnerships):
 - The selection of Partnerships is embedded in the strategic planning of Horizon Europe, thereby ensuring coherence with the EU priorities. The selection criteria require that partnerships are established with stronger ex-ante commitment and higher ambition.
 - The implementation criteria stipulate that initiatives adopt a systemic approach in achieving impacts, including broad engagement of stakeholders in agenda-setting and synergies with other relevant initiatives to promote the take-up of R&I results.
 - A harmonised monitoring & evaluation system will be implemented, and ensures that progress is analysed in the wider context of achieving Horizon Europe objectives and EU priorities.
 - All partnerships need to develop an exit strategy from Framework Programme funding. This new approach is underpinned by principles of openness, coherence and EU added value.
- ✓ **Reinforced impact orientation:**
 - Partnerships are established only if there is evidence they support achieving EU policy objectives more effectively than other Horizon Europe actions, by demonstrating a clear vision and targets (**directionality**) and corresponding long-term commitments from partners (**additionality**).
 - European Partnerships are expected to provide mechanisms – based on a concrete roadmap - to join up R&I efforts between a broad range of actors towards the development and uptake of innovative solutions in line with EU priorities, serving the economy and society, as well as scientific progress.
 - They are expected to develop close synergies with national and regional initiatives, acting as dynamic change agents, strengthening linkages within their respective ecosystems and along the value chains, as well as pooling resources and efforts towards the common EU objectives.

Under Horizon Europe, a ‘European Partnership’¹⁴ is defined as *“an initiative where the Union, prepared with early involvement of Member States and/or Associated Countries, together with private and/or public partners (such as industry, universities, research organisations, bodies with a public service mission at local, regional, national or international level or civil society organisations including foundations and NGOs), commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”*

The Regulation further specifies that European Partnerships shall adhere to the *“principles of Union added value, transparency, openness, impact within and for Europe, strong leverage effect on sufficient scale, long-term commitments of all the involved parties, flexibility in implementation, coherence, coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions.”*

¹³ Impact assessment of Horizon Europe, Commission Staff Working Document, SWD(2018)307.

¹⁴ Article 8 and Annex III of the Horizon Europe Regulation (common understanding))

1.3. Why should the EU act

1.3.1. Legal basis

Proposals for Institutionalised European Partnerships are based on:

- 1) Article 185 TFEU which allows the Union to make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; or
- 2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes.¹⁵

1.3.2. Subsidiarity

The EU should act only in areas where there is demonstrable advantage that the action at EU level is more effective than action taken at national, regional or local level. Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the EU can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas. The candidate initiatives focus on areas where there is a demonstrable value added in acting at the EU level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national activities in the same area. Overall European Partnerships find their **rationale in addressing a set of systemic failures**¹⁶:

- Their primary function is to create a platform for a strengthened **collaboration** and knowledge exchange between various actors in the European R&I system and an enhanced **coordination** of strategic research agendas and/or R&I funding programmes. They aim to address **transformational failures** to better align agendas and policies of public and private funders, pool available resources, create critical mass, avoid unnecessary duplication of efforts, and leverage sufficiently large investments where needed but hardly achievable by single countries.
- The concentration of efforts and pooling of knowledge on common priorities to solve multi-faceted societal and economic challenges is at the core of these initiatives. Specifically, enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems are among the key objectives of these instruments. In the light of Horizon Europe, the aim is to **drive system transitions and transformations towards EU priorities**.
- Especially in fast-growing technologies and sectors such as ICT, there is a need to **react to emerging opportunities** and address systemic failures such as shortage in skills or critical mass or cross-sectoral cooperation along the value chains that would hamper attainment of future European leadership and/or strategic autonomy.
- They also aim to address **market failures** predominantly to enhancing industry investments thanks to the sharing of risks.

¹⁵ Both Articles are under Title XIX of the TFEU - Research and Technological Development and Space.

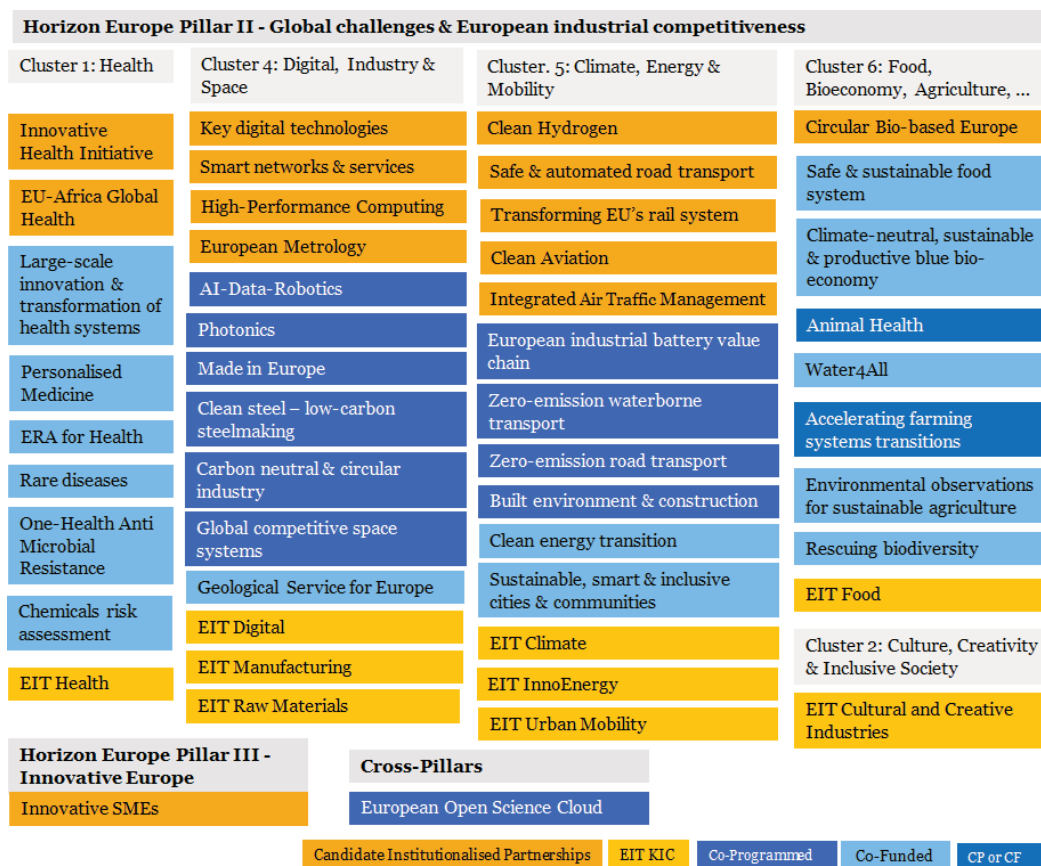

¹⁶ The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide qualitative and quantitative evidence on these points. Sections 1 and 2 of each impact assessment on candidate European Partnerships include more detail on the necessity to act at EU level in specific thematic areas.

2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED

2.1. Portfolio of candidates for Institutionalised European Partnerships

The new approach for more objective-driven and impactful European Partnerships is reflected in the way candidate Partnerships have been identified. It involved a co-design exercise aiming to better align these initiatives with societal needs and policy priorities, while broadening the range of actors involved. Taking into account the 8 areas for Institutionalised European Partnerships set out in the Horizon Europe Regulation¹⁷, a co-design exercise as part of the Strategic Planning process of Horizon Europe lead to the identification of **49 candidates for Co-Funded, Co-Programmed or Institutionalised European Partnerships**¹⁸. Out of these, **13 were identified as suitable candidate Institutionalised Partnerships because of their objectives and scope**¹⁹. Whilst the Co-Funded and Co-Programmed Partnerships are linked to the comitology procedure (including the adoption of the Strategic Plan and the Horizon Europe Work Programmes), Institutionalised Partnerships require the adoption of legislation and are subject to an impact assessment. The figure below gives an overview of all candidate European Partnerships according to their primary relevance to Commission priorities for 2019-2024.

Figure 1 - Overview of the candidates for Co-Funded, Co-Programmed and Institutionalised European Partnerships according to Horizon Europe structure

Source: Technopolis group (2020)

¹⁷ Horizon Europe Regulation (common understanding), Annex Va.

¹⁸ Shadow configuration of Strategic Programme Committee for Horizon Europe. The list of candidate European Partnerships is described in “Orientations towards the Strategic Plan of Horizon Europe” - Annex 7

¹⁹ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47)

There are only three partnerships for which implementation as an Institutionalised Partnership under Article 185 is an option, i.e. European Metrology, the EU-Africa Global Health partnership, and Innovative SMEs. Ten partnerships are candidates for Institutionalised Partnerships under Article 187. Overall the initiatives can be categorised into ‘horizontal’ partnerships and ‘vertical’ partnerships.

The ‘**horizontal**’ partnerships have a central position in the overall portfolio, as they are expected to develop methodologies and technologies for application in the other priority areas, ultimately supporting European strategic autonomy in these areas as well as technological sovereignty. These ‘horizontal’ partnerships are typically proposed as Institutionalised or Co-programmed Partnerships, in addition to a number of EIT KICs, they cover mainly the digital field in addition to space, creative industries and manufacturing, but also the initiative related to Innovative SMEs. ‘**Vertical**’ partnerships are focused on the needs and development of specific application areas, and are primarily expected to support enhanced environmental sustainability thereby addressing Green Deal related objectives. They also deliver on policies for more people centred economy, through improved wellbeing of EU citizen and the economy, like health related candidate European Partnerships.

2.2. Assessing the necessity of a European Partnership and possible options for implementation

Horizon Europe Regulation Article 8 stipulates that Institutionalised European Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

For all candidate Institutionalised European Partnerships the options considered in this impact assessment are the same, i.e.:

- Option 0 – Baseline option – Traditional calls under the Framework Programme
- Option 1 – Co-programmed European Partnership
- Option 2 – Co-funded European Partnership
- Option 3 – Institutionalised Partnership
 - Sub-option 3a Institutionalised Partnerships based on Art 185 TFEU
 - Sub-option 3b Institutionalised Partnerships based on Art 187 TFEU

2.2.1. Option 0 - Baseline option – Traditional calls

Under this option, strategic programming for R&I in the priority area will be done through the mainstream channels of Horizon Europe. The related priorities will be implemented through **traditional calls** of Horizon Europe covering a range of actions, mainly R&I and/or innovation actions but also coordination and support actions, prizes or procurement. Most actions involve consortia of public and/or private actors in ad hoc combinations, while some actions are single actor (mono-beneficiary). There will be no dedicated implementation structure and no support other than what is foreseen in the related Horizon Europe Work Programme. This means that discontinuation costs/benefits of predecessor initiatives should be factored in for capturing the baseline situation when relevant.

Under this option, strategic planning mechanisms in the Framework Programme will allow for a high level of flexibility in the ability of traditional calls to respond to particular needs over time, building upon additional input in co-creation from stakeholders and programme committees involving Member States. The Union contribution to addressing the priority covers the full duration of the initiative, during the lifetime of Horizon Europe. Without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual commitments and contributions outside their participation in funded projects.

2.2.2. European Partnerships

Under this set of options, three different forms of implementation are assessed: Co-funded, Co-Programmed, Institutionalised European Partnerships. These have **commonalities that cannot serve as a distinguishing factor in the impact assessment process**. They are all based on agreed objectives and expected impacts and underpinned by Strategic Research and Innovation Agendas / roadmaps that are shared and committed to by all partners in the partnership. They all have to follow the same set of criteria along their lifecycle, as defined in the Horizon Europe Regulation (Annex III), including ex ante commitment from partners to mobilise and contribute resources and investments. The Union contribution is defined for the full duration of the initiative for all European Partnerships. The Horizon Europe legal act introduces few additional requirements for Institutionalised Partnerships, e.g. the need for long-term perspective, strong integration of R&I agendas, and financial contributions.

Figure 2 - Key differences in preparation and implementation of European Partnerships

Type	Legal form	Implementation
Co-Programmed	Contractual arrangement / MoU	Division of labour , whereby Union contribution is implemented through Framework programme and partners' contributions under their responsibility.
Co-Funded	Grant Agreement	Union provides co-funding for an integrated programme with distributed implementation by entities managing and/or funding national research and innovation programmes
Institutionalised based on Article 185/187 TFEU	Basic act (Council regulation, Decision by European Parliament and Council)	Integrated programme with centralised implementation

The main differences between the different forms of European Partnerships are in their preparation and in the way they function, as well as in the overall impact they can trigger. The Co-Programmed form is assessed as the simplest, and the Institutionalised the most complex to prepare and implement. The functionalities of the different form of Partnerships – compared to the baseline option – are presented in Figure 3. They relate to the types of actors Partnerships can involve and their degree of openness, the types of activities they can perform and their degree of flexibility, the degree of commitment of partners and the priority setting system, and their ability to work with their external environment (coherence), etc. These key distinguishing factors will be at the basis of the comparison of each option to determine their overall capacity to deliver what is needed at a minimised cost.

Figure 3 Overview of the functionalities provided by each form of European Partnerships, compared to the traditional calls of Horizon Europe (baseline)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Type and composition of actors (including openness and roles)				
<p><u>Partners:</u> N.A., no common set of actors that engage in planning and implementation</p> <p><u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules</p>	<p><u>Partners:</u> Suitable for all types: private and/or public partners, foundations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules</p>	<p><u>Partners:</u> core of national funding bodies or governmental research organisations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> limited, according to national rules of partner countries</p>	<p><u>Partners:</u> National funding bodies or governmental research organisation</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations</p>	<p><u>Partners:</u> Suitable for all types: private and/or public partners, foundations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations</p>
Type and range of activities (including additionality and level of integration)				
<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions</p> <p><u>Additionality:</u> no additional activities and investments outside the funded projects</p> <p><u>Limitations:</u> No systemic approach beyond individual actions</p>	<p><u>Activities:</u> Horizon Europe standard actions that allow broad range of individual actions, support to market, regulatory or policy/ societal uptake</p> <p><u>Additionality:</u> Activities/investments of partners, National funding</p> <p><u>Limitations:</u> Limited systemic approach beyond individual actions</p>	<p><u>Activities:</u> Broad, according to rules/programmes of participating States, State-aid rules, support to regulatory or policy/ societal uptake</p> <p><u>Additionality:</u> National funding</p> <p><u>Limitations:</u> Scale & scope depend on participating programmes, often smaller in scale</p>	<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach</p> <p><u>Additionality:</u> National funding</p>	<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach (portfolios of projects, scaling up of results, synergies with other funds).</p> <p><u>Additionality:</u> Activities/investments of partners/ national funding</p>
Priority-setting process and directionality				
<p><u>Priority setting:</u> Strategic Plan and annual work programmes, covering max. 4 years.</p> <p><u>Limitations:</u> Fully taking into account existing or to be developed SRIA/ roadmap</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Input to FP annual work programme drafted by partners, finalised by EC (comitology)</p> <p>Objectives & commitments set in contractual arrangement</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives & commitments set in Grant Agreement</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives & commitments set in legal act</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC (veto-right in governance)</p> <p>Objectives & commitments set in legal act</p>
Coherence: internal (Horizon Europe) & external (other Union programmes, national programmes, industrial strategies)				
<p><u>Internal:</u> Coherence between different parts of the FP Annual Work programme can be ensured by EC</p> <p><u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Limited synergies with other Union programmes & industrial strategies. If MS participate, with national/ regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with national/ regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with national/ regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with other Union programmes and industrial strategies</p> <p>If MS participate, with national/ regional programmes & activities</p>

2.2.2.1. Option 1 - Co-programmed European Partnership

This form of European Partnership is **based upon a Memorandum of Understanding or a Contractual Arrangement** signed by the Commission and the private and/or public partners. Private partners are represented by industry associations, which also support the daily management of the partnership. This type of partnership would allow for a large degree of flexibility for the activities, partners and priorities to continuously evolve. The commitments of partners are political efforts described in the contractual arrangement and the contributions from partners are provided in kind more than financially. The priorities for the calls, proposed by the Partnership's members for integration in the Horizon Europe's Work Programmes, are subject to further input from Member States (comitology) and Commission services. The Union contribution is implemented within the executive agency managing Horizon Europe calls for research and innovation projects proposals. The full array of Horizon Europe instruments can be used, ranging from research and innovation (RIA) types of actions to coordination and support actions (CSA) and including grants, prizes, and procurement.

2.2.2.2. Option 2 – Co-funded European Partnership

The Co-funded European Partnership is **based on a Grant Agreement** between the Commission and a consortium of partners, resulting from a specific call in the Horizon Europe Work Programme. This form of implementation only allows to address public partners at its core. Typically these provide co-funding to a common programme of activities established and/or implemented by entities managing and/or funding national R&I programmes. The recipients of the EU co-funding implement the initiative under their responsibility, with national funding/resources pooled to implement the programme with co-funding from the Union. The expectation is that these entities would cover most if not all EU Member States. Calls and evaluations would be organised centrally, beneficiaries in selected projects would be funded at national level, following national funding rules.

2.2.2.3. Option 3 – Institutionalised European Partnership

This type of Partnership is the most complex and high-effort arrangement, and requires meeting additional requirements. Institutionalised European Partnership are **based on a Council Regulation (Article 187 TFEU or a Decision by the European Parliament and Council (Article 185 TFEU))** and are implemented by dedicated structures created for that purpose. These regulatory needs limit the flexibility for a change in the core objectives, partners, and/or commitments as these would require amending legislation. The basic rationale for this type of partnership is the need for a strong integration of R&I agendas in the private and/or public sectors in the EU in order to address a strategic challenge. It is therefore necessary to demonstrate that other forms of implementation would not achieve the objectives or would not generate the necessary expected impacts, and that a long-term perspective and high degree of integration is needed. For both Article 187 and 185 initiatives, contributions from partners can be in the form of financial and in-kind contributions. Eligibility for participation and funding follows by default the rules of Horizon Europe, unless a derogation is introduced in the basic act.

Option 3a - Institutionalised Partnerships based on Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and limits therefore the scope to **public partners** which are Member States and Associated Third Countries. This type of Institutionalised Partnership aims

therefore at reaching the greatest possible impact through the integration of national and EU funding, aligning national strategies in order to optimise the use of public resources and overcome fragmentation of the public research effort. It brings together R&I governance bodies of most if not all EU Member States (legal requirement: at least 40% of Member States) as well as Associated Third Countries that designate a legal entity (Dedicated Implementation Structure) of their choice for the implementation. By default, participation of non-associated Third Countries is not foreseen. Such participation is possible only if it is foreseen in the basic act and subject to conclusion of an international agreement.

Option 3b - Institutionalised Partnerships based on Article 187 TFEU

Article 187 of the TFEU allows the Union to set up joint undertakings or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes. This type of Institutionalised Partnership brings together a stable set of **public and private partners** with a strong commitment to taking a more integrated approach and requires the set-up of a dedicated legal entity (Union body, Joint Undertaking (JU)) that carries full responsibility for the management of the Partnership and implementation of the calls. Different configurations are possible:

- Partnerships focused on creating strategic industrial partnerships where, most often, the partner organisations are represented by one or more industry associations, or in some cases individual private partners;
- Partnerships coordinating national ministries, public funding agencies, and governmental research organisations in the Member States and Associated Countries;
- Or a combination of the two: the so-called tripartite model.

Participation of non-associated Third Countries is only possible if foreseen in the basic act and subject to conclusion of an international agreement.

2.3. Overview of the methodology adopted for the impact assessment

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines²⁰ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This also integrates **key selection criteria for European Partnerships**.

Box 2 Summary of European Partnerships selection criteria²¹

- **Effectiveness** in achieving the related objectives and impacts of the Programme;
- **Coherence** and synergies of the European Partnership within the EU R&I landscape;
- **Transparency & openness** as regards the identification of priorities and objectives and the involvement of partners & stakeholders from the entire value chain, backgrounds & disciplines;
- Ex-ante demonstration of **additionality** and **directionality**;
- Ex-ante demonstration of the partners' **long term commitment**.

2.3.1. Overview of the methodologies employed

In terms of **methods and evidence used**, the impact assessments draw on an external study covering all candidate Institutionalised European Partnerships in parallel to ensure a high

²⁰ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

²¹ For a comprehensive overview of the selection criteria for European Partnerships, see Annex 6.

level of coherence and comparability of analysis, in addition to an horizontal analysis.²² For all initiatives, the understanding of the overall context of the candidate institutionalised European Partnerships relied on desk research, including among others the lessons learned from previous partnerships. This was complemented by the analysis of a range of quantitative and qualitative evidence, including evaluations of past and ongoing initiatives; foresight studies; statistical analyses of Framework Programmes application and participation data, and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options, as described below. Public consultations (both open and targeted) supported the comparative assessment of the policy options. For each initiative, up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation run between September and November 2019, the consultation of Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of initiatives.

A more detailed description of the methodology and evidence base that were mobilised, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

2.3.2. *Method for identifying the preferred option*

The first step of the assessments consisted in scoping the problems that the initiatives are expected to solve given the overall economic, technological, scientific and social context, including the lessons to be learned from past and ongoing partnerships on what worked well and less well. This supported the identification of the objectives of the initiative in the medium and long term with the underlying intervention logic – showing how to get there.

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has then been adapted to introduce “**key functionalities needed**” - making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options while allowing at the same time a structured comparison of the options not only as regards their effectiveness, efficiency and coherence, but also against a set of

²² Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

other key selection criteria for European Partnerships (openness, transparency, directionality)²³.

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made compared to the baseline. Therefore, for each of these aspects the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. This includes the discontinuation costs/benefits of existing implementation structures when relevant. The policy options are then scored compared to the baseline with a + and – system with a two-point scale, to show a slightly or highly additional/lower performance compared to the baseline. A scoring of 0 of a policy option means that it would deliver as much as the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options²⁴.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach²⁵ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account²⁶. The table below provides an overview of the cost

²³ The criterion on the ex-ante demonstration of partners’ long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

²⁴ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

²⁵ For further details, see Better Regulation Toolbox # 57.

²⁶ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the

categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²⁷ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%), but lead to an additional R&I investment of at least the same amount than the Union contribution²⁸ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution²⁹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution³⁰. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution³¹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²⁷ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

²⁸ Minimum contributions from partners equal to the Union contribution

²⁹ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

³⁰ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

³¹ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0		↑↑		
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0		↑↑		
Ex-ante Impact Assessment for partnership		0		↑↑↑	
Preparation of EC proposal and negotiation		0		↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0		↑		
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC		0			↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**)³². In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

For the **identification of the preferred option**, the scorecard analysis builds a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

As a last step, the alignment of the preferred option with key criteria for the selection of European Partnerships is described, reflecting the outcomes of the ‘**necessity test**’.³³ The

³² More details on the methodology can be found in Annex 4.

³³ Certain aspects of the selection criteria will be further addressed/ developed at later stages, notably in the context of preparing basic acts (e.g. Openness and Transparency; Coherence and Synergies), in the Strategic Research and Innovation Agendas (e.g. Directionality and Additionality), and by collecting formal commitments (Ex-ante demonstration of partners’ long-term commitment).

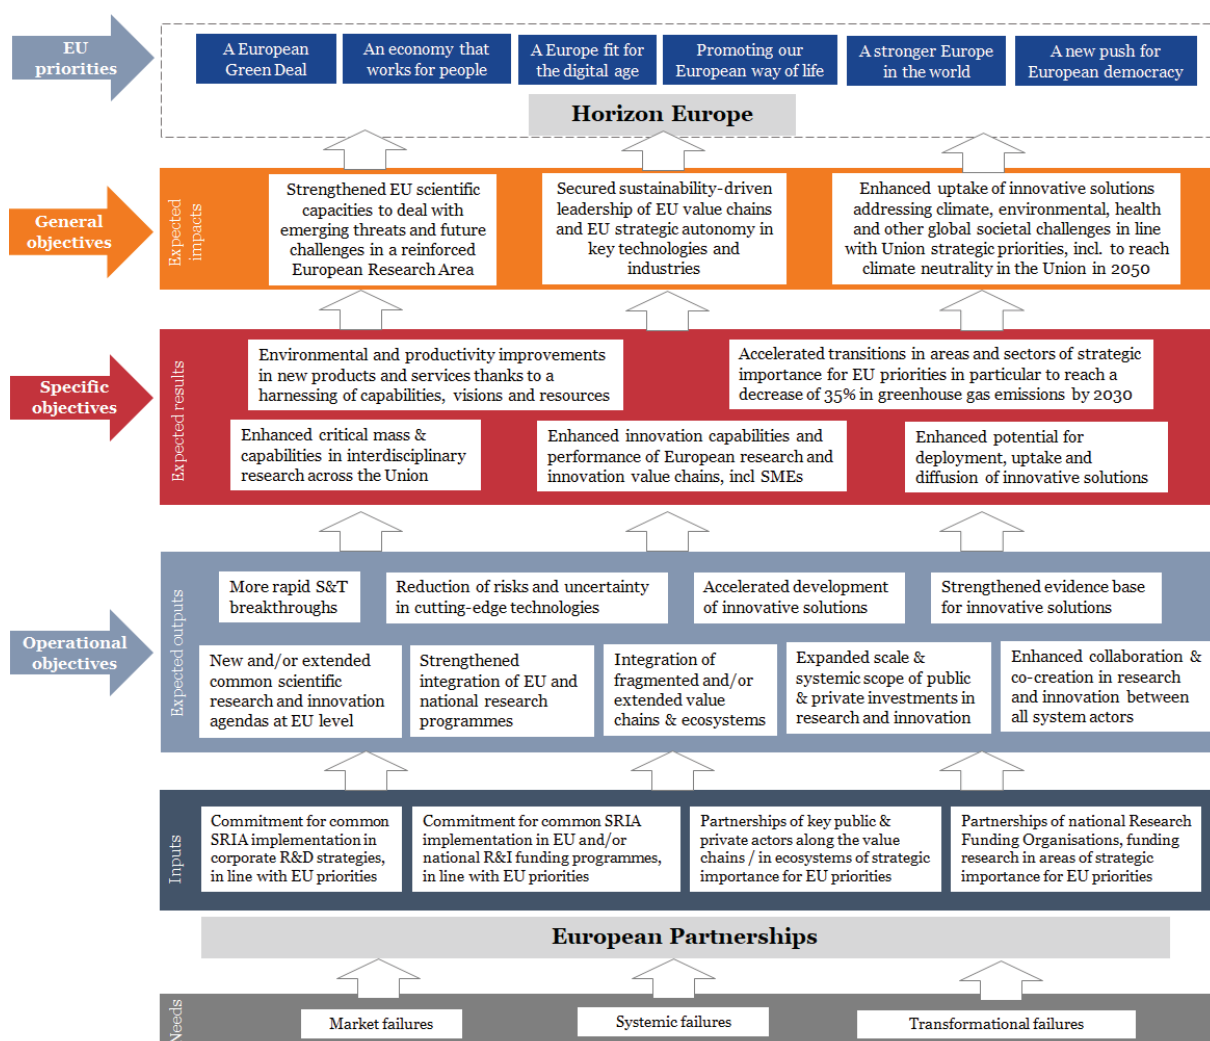

monitoring and evaluation arrangements are concluding the assessment, with an identification of the key indicators to track progress towards the objectives over time.

2.4. Horizontal perspective on candidate Institutionalised European Partnerships

2.4.1. Overall impact orientation, coherence and efficiency needs

The consolidated **intervention logic** for the set of candidate Institutionalised European Partnerships in the Figure below builds upon the objectives as reported in the individual impact assessments.

Figure 5 – Overall intervention logic of the European Partnerships under Horizon Europe

Source: EC, adapted from Technopolis Group (2020)

When analysed as a package the 12 candidate Institutionalised European Partnerships are expected to support the achievement of the European policy priorities targeted by Horizon Europe by pursuing the following joint general objectives:

- Strengthening EU scientific capacities to deal with emerging threats and future challenges in a reinforced European Research Area;

- b) Securing sustainability-driven leadership of EU value chains and EU strategic autonomy in key technologies and industries; and
- c) Enhancing the uptake of innovative solutions addressing climate, environmental, health and other global societal challenges in line with Union strategic priorities, including to reach climate neutrality in the Union in 2050.

In terms of specific objectives, they jointly aim to:

- a) Enhance the critical mass and scientific capabilities in interdisciplinary research and innovation across the Union;
- b) Accelerate the transitions in areas and sectors of strategic importance for EU priorities, in particular to reach a decrease of 35% in greenhouse gas emissions by 2030, and deliver on the digital transition;
- c) Enhance the innovation capabilities and performance of European research and innovation value chains, incl. SMEs;
- d) Enhance the potential for deployment, uptake and diffusion of innovative solutions;
- e) Deliver environmental and productivity improvements in new products and services thanks to a harnessing of EU capabilities and resources.

In terms of their operations, taking a horizontal perspective on all initiatives allows for the identification of further possible collective efficiency and coherence gains for more impact:

- **Coherence for impact:** The extent and speed by which the expected results and impacts will be reached, will depend on the scale of the R&I efforts triggered, the profile of the partners involved, the strength of their commitments, and the scope of the R&I activities funded. To be fully effective it comes out clearly that future partnerships need to operate over their whole life cycle in full coherence with their environment, including potential end users, regulators and standardisation bodies. This relates also to the alignment with relevant EU, national or regional policies and synergies with R&I programmes. This needs to be factored in as of the design stage to ensure a wide take-up and/or deployment of the solutions developed, including their interoperability.
- **Collaboration for impact:** Effectiveness could also be improved collectively through enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems. An adequate governance structure appears in particular necessary to ensure cross-fertilisation between all European Partnerships. This applies not only to initiatives where similar R&I topics are covered and/or the same stakeholders involved or targeted, but also to the interconnections needed between the ‘thematic’ and the ‘vertical’ Partnerships, as these are expected to develop methodologies and technologies for application in EU priority areas. Already at very early stages of preparing new initiatives, Strategic Research and Innovation Agendas and roadmaps need to be aligned, particularly for partnerships that develop enabling technologies that are needed in other Partnerships. The goal should be to achieve greater impacts jointly in light of common challenges.
- **Efficiency for impact:** Potential efficiency gains could also be achieved by joining up the operational functions of Joint Undertakings that do not have a strong context dependency and providing them through a common back-office³⁴. A number of operational activities of the Joint Undertakings are of a technical or administrative

³⁴ See Annex 6 for an overview of key functions/roles that could be provided by a common back office.

nature (e.g. financial management of contracts), or procured from external service providers (e.g. IT, communication activities, recruitment services, auditing) by each Joint Undertaking separately. If better streamlined this could create a win-win situation for all partners leading to better harmonization, economies of scales, and less complexity in supervision and support by the Commission services.

2.4.2. *Analysis of coherence of the overall portfolio of candidate initiatives at the thematic level*

Looking at the coherence of the set of initiatives at the thematic level, the “**digital centric**” initiatives have a strong focus on supporting the digital competitiveness of the EU ecosystem. Their activities are expected to improve alignment and coordination with Member States and industry for the development of world-competitive EU strategic digital technology value chains and associated expertise. Addressing the Key Digital Technologies, the 5G and 6G connectivity needs as part of a Smart Networks and Services initiative and the underlying supercomputing capacities through a European High Performance Computing initiative present potential for synergies that can be addressed through cooperative actions (e.g. joint calls, coordinated support activities, etc.). They may as well profit from and contribute to Partnerships envisaged for Photonics, AI, data, robotics, Global competitive space system and Made in Europe, together with the EIT Digital. Synergies between these initiatives and several programmes (Digital Europe and Connecting Europe as well as cohesion programmes) are needed in areas where EU industry has to develop leadership and competitiveness in the global digital economy. They are expected to impact critical value chains including on sectors where digital is a strong enabler of transformation (health, industrial manufacturing, mobility/transport, etc.).

The **transport** sector face systemic changes linked to decarbonisation and digitalisation. Large scale R&I actions are needed to prepare the transition of these complex sectors to provide clean, safer, digital and economically viable services for citizens and businesses. Past decades have shown that developing and implementing change is difficult in transport due to its systemic nature, many stakeholders involved, long planning cycles and large investments needed. A systemic change of the air traffic network through an Integrated Air Traffic Management initiative should ensure safety and sustainability of aviation, while a Clean Aviation initiative should focus on the competitiveness of tomorrow’s clean aircrafts made in Europe. The initiative for Transforming Europe’s rail system would comprehensively address the rail sector to make it a cornerstone in tomorrow’s clean and efficient door-to-door transport services, affordable for every citizen as well as the most climate-friendly mode of transport for freight. Connected and Automated Mobility is the future of road transport, but Europe is threatened to fall behind other global regions with strong players and large harmonised markets. The initiative Safe and Automated Road Transport would bring stakeholders together, creating joint momentum in digitalising road transport and developing new user-based services. Stronger links and joint actions will be established between initiatives to enable common progress wherever possible. The Clean Hydrogen initiative would be fundamental to that regard. Synergies would also be sought with partnerships driving the digital technological developments.

To deliver a deep decarbonisation of highly emitting industrial sectors such as the steel, transport and chemical industries would require the production, distribution and storage of **hydrogen** at scale. The candidate hydrogen initiative would have a central positioning in terms of providing solutions to the challenges for sustainable mobility and energy, but also is expected to operate in synergies with other industry related initiatives. The initiative would interact in particular with initiatives on the zero emission road and water transport, transforming Europe’s railway system, clean aviation, batteries, circular industry, clean steel

and built environment partnerships. There are many opportunities for collaboration for the delivery and end-use of hydrogen. However, the Clean Hydrogen initiative would be the only partnership focused on addressing hydrogen production technologies.

Metrology, the science of measurement, is an enabler across all domains of R&I. It supports the monitoring of the Emissions Trading System, smart grids and pollution, but also contributes to meeting demands for measurement techniques from emerging digital technologies and applications. More generally, emerging technologies across a wide range of fields from biotechnologies, new materials, health diagnostics or low carbon technologies are giving rise to demands requiring a world-leading EU metrology system.

The initiative for a **Circular Bio-based Europe** is intended to solve a shortage of industry investments in the development of bio-based products whose markets do not have yet certain long-term prospects. The **Innovative Health Initiative** and **EU-Africa Global Health** address the lack of investments in the development of solutions to specific health challenges. The initiative on **Innovative SMEs** supports innovation-driven SMEs in participating in international, collaborative R&I projects with other innovative firms and research-intensive partners. As a horizontal initiative it is expected to help innovative SMEs to grow and to be successfully embedded in global value chains by developing methodologies and technologies for potential application in the other partnership areas or further development by the instruments of the European Innovation Council.

The description of the interconnections between all initiatives for each Horizon Europe cluster is provided in the policy context of each impact assessment and further assessed in the coherence assessment for each option.

PART 2 - THE CANDIDATE EUROPEAN PARTNERSHIP ON INNOVATIVE HEALTH

1. INTRODUCTION: POLITICAL AND LEGAL CONTEXT

According to the EU Charter on Fundamental Rights, ‘Everyone has the right of access to preventive health care and the right to benefit from medical treatment under the conditions established by national laws and practices. A high level of human health protection shall be ensured in the definition and implementation of all Union policies and activities’³⁵.

In the EU, Member States hold primary responsibility for organising and delivering health services and medical care. The EU health policy serves to complement national policies, and to ensure health protection in all EU policies. In particular, EU action shall promote research into the causes, transmission and prevention of major health scourges, in line with Article 168 TFEU³⁶. As regards strengthening the EU scientific and technological bases and for addressing competitiveness, the legal ground is provided by Article 179 TFEU³⁷.

Good health is a major determinant of quality of life, wellbeing and social participation. Along with a vibrant and dynamic health industry, it contributes to shaping a sustainable economy. A status of good health in a society depends on a multitude of actors, including private companies that develop health technologies (such as medicines and vaccines, implantable medical devices or in vitro diagnostics). Since health technologies are applied directly to individuals (for examples, medicines are distributed in the human body, whereas implantable devices are introduced at a specific body site), they are subject to very stringent regulatory mechanisms³⁸. Hence, in order to develop a new health technology³⁹ and make it available to patients, health research and innovation (R&I) follows a long and costly pathway of pre-clinical testing and then clinical investigations on human subjects. This development pathway, which differs for medicines and medical devices, is usually conducted and financed by private companies. After obtaining necessary approvals, these companies can market such a novel development and bring it to the end-users (i.e. health

³⁵ Article 35, Health-Care, Official Journal of the European Union C 303/17 (2007), <https://fra.europa.eu/en/eu-charter/article/35-health-care>

³⁶ [Article](#) 168 TFEU, paragraph 1: ‘Union action, which shall complement national policies, shall be directed towards improving public health, preventing physical and mental illness and diseases, and obviating sources of danger to physical and mental health. Such action shall cover the fight against the major health scourges, by promoting research into their causes, their transmission and their prevention, as well as health information and education, and monitoring, early warning of and combating serious cross-border threats to health. The Union shall complement the Member States' action in reducing drugs-related health damage, including information and prevention’.

³⁷ [Article](#) 179 TFEU, paragraph 1: ‘The Union shall have the objective of strengthening its scientific and technological bases by achieving a European research area in which researchers, scientific knowledge and technology circulate freely, and encouraging it to become more competitive, including in its industry, while promoting all the research activities deemed necessary by virtue of other Chapters of the Treaties’.

³⁸ [Directive 2001/83/EC](#) on the Community code relating to medicinal products for human use, [Regulation \(EC\) No 726/2004](#) laying down Community procedures for the authorisation and supervision of medicinal products for human and veterinary use, [Regulation \(EU\) No 536/2014](#) on clinical trials on medicinal products for human use, [Regulation \(EU\) 2017/745](#) on medical devices and [Regulation \(EU\) 2017/746](#) on in vitro diagnostic medical devices.

³⁹ Health technology refers to a pharmaceutical, a medical technology or medical and surgical/radiation procedures as well as measures for disease prevention, diagnosis or treatment used in health care (Directive 2011/24/EU).

care providers and patients). Decisions on reimbursement⁴⁰ and pricing⁴¹ lie within the competence of Member States⁴². Such decisions are in most cases based on the evaluation of the added value⁴³ brought by the new technology to patients and society.

This document focuses on assessing the most effective, efficient and coherent way of implementing an initiative which would focus on joint European research and innovation activities in health care under Horizon Europe.

1.1. Emerging challenges in the field

Health in the EU faces current and emerging challenges in domains ranging from the social to the economic. These challenges could be addressed, to some extent at least, through research and innovation (R&I).

Europe's health faces major challenges due to an ageing of society and the related health conditions it brings, as well as to the increasing burden of chronic diseases such as cancer, dementia, diabetes, arthritis, and to the threat of infectious diseases with resulting potential pandemics and growing antimicrobial resistance (AMR), as explained in detail in Annex 6 Section 2.1. Health R&I can help to address these demands by working towards better, safe, more effective and cost-effective solutions to promote health, to prevent, early detect, diagnose, treat and manage health conditions and to deliver health care. These opportunities are amplified by new advances in digital technologies, big data, artificial intelligence, the knowledge of human genes and advanced therapies that create opportunities to design solutions tailored to patients' specific health care needs.

However, there are still considerable knowledge and evidence gaps when it comes to understanding the underlying mechanisms of diseases and the determinants of health⁴⁴. In addition, novel therapies, technologies and approaches face specific barriers and hurdles in R&I, implementation and scale-up before they can be useful to patients and health care systems. These barriers stem from a lack of sufficient investment, scientific knowledge and relevant R&I expertise, from the absence of appropriate standards and of frameworks for intellectual property management, as well as from high market prices of the end products.

⁴⁰ Reimbursement refers to covering the cost of health care services, including medicines, by a third-party payer (e.g. a public payer such as a social health insurance fund or national health service). European Observatory of Health Systems (a partnership hosted by WHO) (2018), Ensuring access to medicines: How to redesign pricing, reimbursement and procurement? <http://www.euro.who.int/en/about-us/partners/observatory/publications/policy-briefs-and-summaries/ensuring-access-to-medicines-how-to-stimulate-innovation-to-meet-patients-needs>

⁴¹ Pricing is the act or process of determining a price, be it by a responsible authority, the manufacturer or market forces. Idem.

⁴² Article 168 TFEU, paragraph 7: 'Union action shall respect the responsibilities of the Member States for the definition of their health policy and for the organisation and delivery of health services and medical care. The responsibilities of the Member States shall include the management of health services and medical care and the allocation of the resources assigned to them.' and Directive 89/105/EEC relating to the transparency of measures regulating the pricing of medicinal products for human use and their inclusion in the scope of national health insurance systems.

⁴³ Value in health care is a multidimensional concept as highlighted by the [Expert Panel on effective ways in investing in Health \(EXPH\)](#). Most common elements of existing value frameworks to assess health interventions include: therapeutic benefit, safety, costs, innovation level, health problem (severity of the disease and medical need), organisational aspects, ethical aspects, societal and legal aspects. Those various elements need to be evidence-based informed and combined using an appropriate approach (e.g. cost-effectiveness analysis, multi-criteria decision analysis) so that to inform decision-making on the reimbursement, pricing, adoption, and implementation of health interventions.

⁴⁴ European Commission (2019), Orientations towards the first Strategic Plan implementing the research and innovation framework programme Horizon Europe. Annex: Horizon Europe Cluster 1 Health.

Regulatory, legal and ethical aspects are also crucial elements to consider for a successful development and implementation of technological innovations⁴⁵. For example, unlocking the potential of data and digitalisation for health-related use depends on the capacity to access, collect, distribute, combine and analyse vast amounts of data. This requires long-term investments in existing or future data infrastructure, dealing with ethical and data security concerns, and putting in place frameworks for information sharing⁴⁶. Similarly, appropriate regulatory pathways, as well as new health technology assessment (HTA⁴⁷) methods and tools, are required for the assessment of emerging and converging technologies. Such technologies include e.g. drug-device combination products⁴⁸, nanotechnology-enabled products and medical devices that use digital communication tools or rely on artificial intelligence (AI) or software and are often referred to as “smart” medical devices.

According to a Deloitte report⁴⁹, research and development (R&D) productivity (expected returns on R&D investments) in the biopharmaceutical sector has steadily decreased over the last decade (Figure 1), while the cost of bringing of an asset to market has significantly increased⁵⁰. If this trend persists, the industry will see less and less incentives to invest in the risky and costly search for health innovations, which will endanger their future provision to tackle current and emerging health needs and result in fewer new treatment options being available to patients.

Figure 1. Return on R&D investment in biopharmaceutical sector over time

Health-care expenditure is enormous. It accounts for EUR 1.5 trillion in the EU annually and USD 3.6 trillion in the US or 10.0% and 17.2% of the GDP respectively⁵¹. It also means a vast market for health industry as one fifth of the expenditure is on medical goods⁵². Beyond the EU and US, there is a rapidly growing global market and it is essential that the

⁴⁶ EC (2019), Strengthening strategic value chains for a future-ready EU industry.

⁴⁷ Health technology assessment (HTA) is a multidisciplinary process that summarises information about the medical, social, economic and ethical issues related to the use of a health technology in a systematic, transparent, unbiased, robust manner. Its aim is to inform the formulation of safe, effective, health policies that are patient focused and seek to achieve best value. HTA is primarily used to inform decision-making in Member States by providing a scientific evidence base for decisions on the pricing and reimbursement of health technologies.

EU maintains a world-leading health industry that innovates and contributes to economic growth. The health industry is a key driver for growth through creation of high-value jobs and a positive trade balance, trading not only within Europe but also worldwide. It has the potential to attract foreign direct investment and create global companies that bring revenue to the EU. In addition, developing new solutions to improve prevention of diseases would be key to alleviate the burdens on the health care systems.

1.2. EU relative positioning in the field

The EU has significant monetary resources and is competitive across many industry sectors globally, allowing the EU and its Member States (MS) to make substantial investments in R&I. The EU accounts for one-fifth of the world's R&D spend and 23% of global public R&D⁵³. The EU has more than 1.8 million researchers overall, compared to 1.6 million in China and 1.3 million in the United States. Building on the strengths of its community of researchers and innovators, the EU is in a position to take the lead in developing and deploying scientific breakthrough solutions to improve health and wellbeing, not only within the EU but also globally.

However, the EU has not been able to capitalize fully on its strengths. This is due to lower investment in R&D-intensive businesses and in education and skills development (e.g. ICT and economics skills), coupled with relatively weaker knowledge flows between stakeholders compared to other leading countries⁵⁴. Furthermore, the EU health industry and market are fragmented. The different health industry sectors, e.g. pharmaceuticals, diagnostics, imaging, medical devices, etc. have diverging business models and development timelines, making collaboration difficult. This situation is exacerbated by the EU's own nature of individual Member States with varying regulatory and market access procedures and approaches applicable to health care. The EU health care systems represent a complex network and introduction of new solutions is difficult especially for SMEs that struggle to access new markets and ecosystems. One of the reasons could be a lack of knowledge and experience related to these new markets, and (perceived or real) lack of budget and time to overcome the costs associated with entering into new partnerships and markets⁵⁵. This factor – being beyond the scope of any funding initiative under EU framework programmes – directly affects the willingness of EU companies to invest in cost- and time-intensive R&I in the EU. Hence, other world economies with more uniform health technology approval pathways become a more attractive place for health R&I and subsequent introduction of innovations to the market.

In terms of overall R&D investments, China is quickly overtaking both the EU and the US. This may be one reason why the EU is lagging behind China (and the US) in areas such as e.g. artificial intelligence (AI)⁵⁶, which has the potential to significantly increase productivity in health care. The global health data market is predicted to increase from around USD 14 billion in 2019 to about USD 70 billion in 2025⁵⁷. The EU needs to react

⁵³ European Commission (2018), Science, Research and Innovation Performance of the EU (SRIP) report.

⁵⁶ European Commission (2018), USA-China-EU plans for AI: where do we stand?, <https://ec.europa.eu/growth/tools-databases/dem/monitor/content/usa-china-eu-plans-ai-where-do-we-stand/>.

⁵⁷ Statista 2019, Global healthcare big data market size in 2016 and a forecast for 2025, <https://www.statista.com/statistics/909654/global-big-data-in-healthcare-market-size/>.

strategically to ensure its current health data market (valued at EUR 2 billion⁵⁸) retains sovereignty and at the same time, captures its fair share of this growth to providing European citizens with health solutions designed and produced in Europe.

The medical technology (medtech) and pharmaceutical sectors are two of the main health-related industry sectors in Europe, they are also the crucially affected by the problems described in Section 1.1. Medtech covers many disease areas and includes in vitro diagnostics and imaging. There are about 27,000 medtech companies in Europe (mostly SMEs based in Germany, UK, Italy, Switzerland, Spain and France) directly employing over 675,000 people⁵⁹. By comparison, the US medtech industry employs about 400,000⁶⁰. The medtech industry is an important source of health innovation and in 2017 there were more patent applications (13,000) filed with the European Patent Office in the area of medtech than in the areas of pharmaceuticals (6,300) and biotechnology (6,300) combined. The European medtech market was estimated to be roughly EUR 115 billion in 2017 and is currently estimated to make up 27% of the world market, making it the second largest medtech market after the US (43%) (Figure 2a). Europe has a positive medtech (excluding in vitro diagnostics) trade balance of EUR 19.7 billion (2017) with the US, China and Japan being the major trade partners. In comparison, the US medical devices trade surplus is at EUR 2 billion. However, without sufficient investment in R&D, Europe's leadership position in the area of medtech may change in the future. The predicted annual growth of the industry in Europe is 5% compared to at least 20% in China and 10% in the US (Figure 2b).

Figure 2. (a) Global market share of medtech industry and (b) anticipated annual industry growth. Source: (a) medtech Europe Facts Figures 2019. (b) Technopolis analysis of data reported in Hospodková, P., 2019⁶¹. *Europe includes EU28 + Norway and Switzerland.

The biotech and pharma sector are a cornerstone of Europe's knowledge based economy. The pharmaceutical industry directly employs approximately 750,000 people, and the sector is Europe's second largest R&D investor with an annual EUR 40 billion spending on

⁵⁸ International Data Corporation, 2018. European Data Market Monitoring Tool.

R&D⁶². The innovativeness of the sector translates into high volumes of exports, generating a EUR 91 billion trade surplus⁶³ in 2018 for the EU.

However, this leading position is already being challenged by global competitors, notably by the US and China. Figure 3 shows that while R&D investment in the EU has continuously increased in the last decade, the pace of growth was higher in the US, which also started from a higher base.

Figure 3. Evolution of the R&D investment and number of patents in the pharma and biotech sectors for EU and US companies (base year 2007 = 1.0).

The changing pharmaceutical landscape is also evident in the development of advanced therapy medicinal products (ATMPs). ATMPs represent the new frontier of innovative health solutions; they are based on genes (gene therapy), cells (cell therapy) and tissues (tissue engineering). Cell and gene therapies offer treatments, even cures for patients affected by life-threatening diseases. They not only extend life and improve the quality of life of patients, but at the same time have the potential to reduce medium and long-term the economic burden of care. While it was the EU that pioneered research in ATMPs, other regions in the world, notably the US and China, have gained momentum in the last couple of years and are initiating increasingly more clinical trials involving ATMPs⁶⁴. The number of new clinical trials increased by 32% globally, 36% in North America, 28% in Asia, and less than 2% in Europe (Figure 4).

Figure 4. Clinical trials with ATMPs initiated Jan 2014 – June 2019, by continent and year.

Moreover, private investors have little economic incentives to allocate R&I resources to areas where market prospects are poor or expected return on investment is low. While some areas might indeed provide attractive market prospects, innovation is particularly challenging given the significant gaps in scientific knowledge⁶⁵.

As regards entity size, smaller companies tend to have greater R&I productivities than big companies as the former tend to focus more on new product pipelines, have less costly infrastructure and less organisational complexity (e.g. no mass-scale production facilities). On the other hand, bigger companies have more resources to take forward the costly late-phase development of promising assets, such as candidate new drugs or medical devices.

Box 1 Support for the field in the previous Framework Programmes – key strengths & weaknesses identified

What was/is being done with EU research and innovation funding until now

Under Horizon 2020, the overall budget for the ‘Health, demographic change and wellbeing’ Societal Challenge was EUR 7.5 billion, including Joint Undertakings (JUs).

The Innovative Medicine Initiative (IMI) was one such joint undertaking that supported R&I in the field of pharmaceutical development. For the 2014-2024 period it is named IMI2 JU to distinguish it from its predecessor IMI JU operating under the Seventh Framework Programme (FP7). IMI2 JU’s total budget of up to EUR 3.276 billion makes it the world’s largest public-private partnership in life sciences, with world-wide recognition. The EU’s financial contribution to IMI2 JU was set at up to €1.638 billion to match the contribution of EFPIA (at least €1.425 billion) and other members or associated partners (industrial partners other than pharmaceutical industries e.g. technology providers, diagnostics companies, charities or data handlers). IMI2 JU has managed to attract significant investment from associated partners and from non-EU entities, demonstrating the attractiveness of this programme globally.

IMI contributes to improving citizens’ health by speeding up the development of innovative medicines, particularly in areas where there is an unmet need. In IMI projects, a number of big industry partners (members of the European Federation of Pharmaceutical Industries and Associations, EFPIA) collaborate with public sector partners (such as

⁶⁵ OECD (2018), Pharmaceutical Innovation and Access to Medicines, OECD Health Policy Studies, OECD Publishing, Paris. <https://doi.org/10.1787/9789264307391-en>;

academia) and smaller companies, including SMEs.

These latter partners are funded by the EU, while EFPIA members use their own resources and do not receive EU funding. For more details about IMI, the participation patterns and achievements, please see Annex 6, Sections 2.3-2.4.

What has or is being achieved so far by IMI

Thanks to IMI, positive contributions on the drug development process have been realised.

Quoting IMI2 JU interim evaluation⁶⁶: ‘the main achievement of IMI2 JU on which there was general consensus, was that since the JU started, collaborations between different competing global companies, SME’s and academia became possible’. Together with the available budget and long-term strategy, these collaborations were considered an important asset for European pharmaceutical research’. These collaborations created trust and triggered a mind shift as partners came to understand each other’s needs. The quality of the research emerging from IMI projects is beyond average⁶⁷. The initiative has international visibility and an established positive ‘brand’⁶⁸.

IMI was given as an example of ‘radical collaboration’ where multinational companies work together and share data instead of keeping it secret, which is helping to change the model of the pharmaceutical industry and solve problems more quickly, by Carlos Moedas, the former EU commissioner for research, science and innovation⁶⁹.

IMI created important resources for drug development, used by researchers and helping patients. For example: A vaccine against Ebola Virus Disease was developed, with support by IMI’s Ebola+ programme⁷⁰. The impact of chronic obstructive pulmonary disease (COPD) on how patients experience physical activity was measured, achieving a qualification of European Medicines Agency (EMA) for novel methodologies, which opens the way for the development of more effective treatments⁷¹. A compact, easy-to-use diagnostic device was developed for Ebola infection that delivers results in a little over an hour⁷². Several pan-European clinical platforms were established to build clinical trial readiness, foster clinical R&I in Europe and develop innovative treatments for the European citizens, in challenging areas such as paediatrics⁷³, prevention of Alzheimer’s disease dementia⁷⁴ and autism⁷⁵.

⁶⁶ European Commission (2017) [The Interim Evaluation of the Innovative Medicines Initiative 2 Joint Undertaking \(2014-2016\) operating under Horizon 2020](#). Experts Group Report. Luxembourg: Publications Office of the European Union.

⁶⁷ The citation impact of IMI research is higher than EU and world averages. The field-normalised citation impact for all IMI papers is 1.98, compared to 0.97 for the EU and the baseline of 1 for the world. IMI2 JU Annual Activity Report 2018. https://www.imi.europa.eu/sites/default/files/uploads/documents/reference-documents/AAR2018_final.pdf

⁶⁸ In 2018 only, IMI was mentioned in 4048 articles worldwide, including in the title or opening lines of some 7% of these articles. The tonality of the media coverage was predominantly neutral (90%), with the remaining 10% of articles registering a positive tone. Idem.

What are the key areas for improvement and unmet challenges

The evaluations and experience so far highlighted several ‘areas for improvement’ for a potential future partnership:

- active engagement of other health industry sectors with the pharmaceutical industry should be enabled;
- the public interest, including accessibility of the eventually resulting products to patients, should be better taken into account,
- the transparency of the strategic research agenda and call topics development should be increased;
- the timelines from identifying R&I needs and topics to the start of resulting projects should be shortened;

More detailed information, including recommendations on the design of the present initiative and how they were addressed, can be found in Annex 6, section 2.3.1.

1.3. EU policy context beyond 2021

The von der Leyen Commission’s political priorities for 2019-2024⁷⁶, notably ‘An economy that works for people’ and ‘A Europe fit for the digital age’, are both of high relevance to the Innovative Health Initiative (the ‘European Green Deal’ is also relevant albeit to a lower degree). The specific political guidance for the proposed initiative is provided in the mission letters for Commissioners Gabriel (Innovation, Research, Culture, Education and Youth) and Kyriakides (Health and Food Safety). The mission letter of Mariya Gabriel emphasises that research, policy and economic priorities have to go hand in hand, using missions and industrial strategy as a vehicle⁷⁷. The mission letter of Stella Kyriakides highlights medical devices addressing emerging challenges and the use of e-health to provide high-quality health care, along with Europe’s Beating Cancer Plan and a call for ensuring the supply of affordable medicines to meet Europe’s needs whilst supporting an innovative and world-leading European pharmaceutical industry⁷⁸.

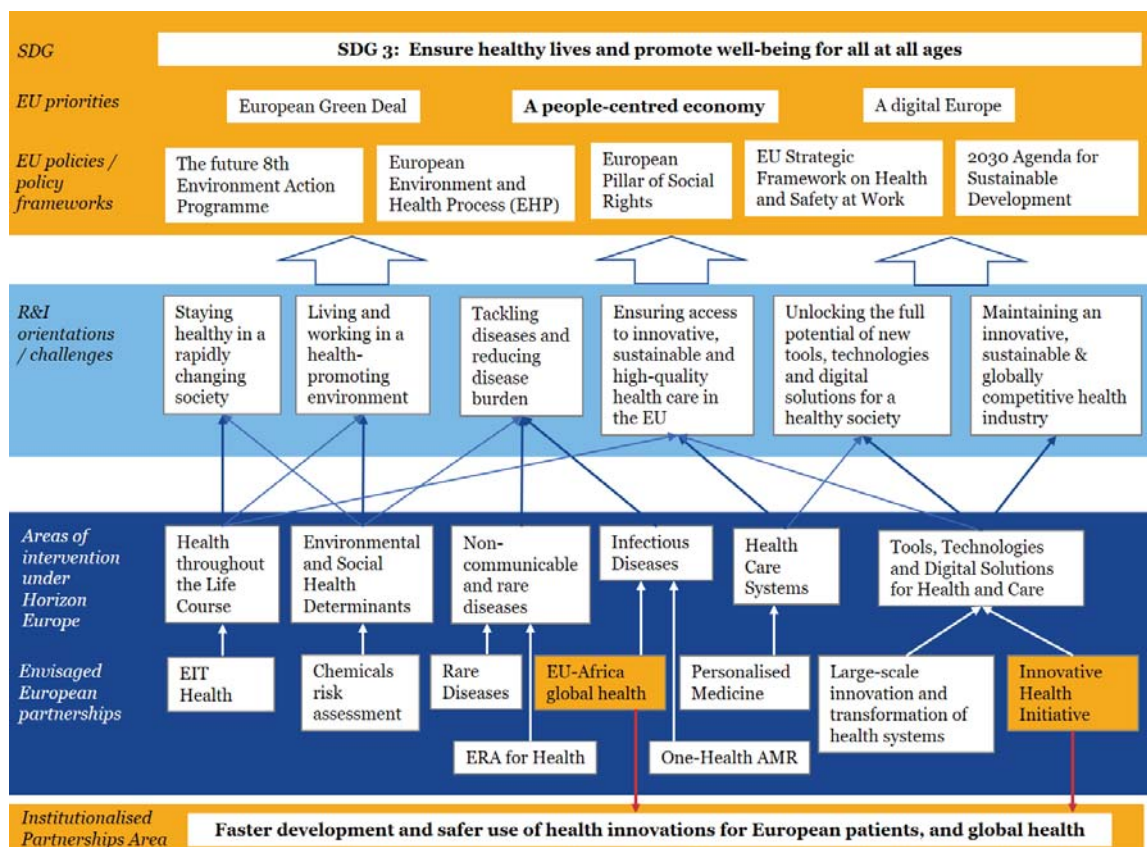

In Horizon Europe, the Innovative Health Initiative (IHI) would be part of R&I activities funded under Pillar II Cluster 1 Health, which is one of the six Horizon Europe clusters addressing global challenges and industrial competitiveness. Cluster Health is supporting the Sustainable Development Goals, notably SDG 3 ‘Ensure healthy lives and promote well-being for all at all ages’.

Figure 5. Innovative Health Initiative in the EU policy context. Source: Technopolis Group

⁷⁶ https://ec.europa.eu/info/priorities_en

⁷⁷ https://ec.europa.eu/commission/commissioners/sites/comm-cwt2019/files/commissioner_mission_letters/mission-letter-mariya-gabriel-2019_en.pdf.

⁷⁸ https://ec.europa.eu/commission/sites/beta-political/files/mission-letter-stella-kyriakides_en.pdf.

In addition to IHI, other initiatives are put forward as possible partnerships under Horizon Europe. Within Cluster Health, the most relevant would be the Partnership on Transforming Health and Care Systems, facilitating the uptake of innovative health solutions so as to improve the quality of delivered health services and to support the sustainability of health care systems. IHI could contribute to developing innovative health products, services and tools, while the candidate public-public partnership (with Member States) on Transforming Health and Care Systems could develop methods to facilitate the rapid implementation of those solutions into health care systems⁷⁹. Conversely, the Partnership on Transforming Health and Care Systems could formulate the needs of the health care systems so as to inform the R&I activities pursued by IHI. Another relevant candidate partnership is on EU-Africa Global Health, aiming to increase health security in sub-Saharan Africa, and globally, by reducing the risk of outbreaks, pandemics or antimicrobial resistance. Some solutions developed in IHI, for example those related to novel diagnostics or to feasibility of new clinical trials methods, could be relevant for, and potentially deployed at larger scale under the EU-Africa Global Health partnership.

Beyond Cluster Health, the proposed partnership on Key Digital Technologies (successor of ECSEL JU⁸⁰), could provide access to the latest digital technologies and data-driven tools, applicable to several fields. Some of them could prove essential for IHI due to the key role of health data for innovative, integrated health technologies.

⁷⁹ It is important to emphasise that IHI would work towards developing goods or services (e.g. medicines, diagnostics, medical devices incl. digital tools etc) rather than organisational solutions. Organisational processes will be in the remit of health care authorities/organisations to consider whether and how these could be deployed in the best way.

⁸⁰ <https://www.ecsel.eu/>

Other relevant initiatives include: the Connecting Europe Facility (addressing the deployment of cross-border exchange of patients' health data in the EU and enabling Cross Border eHealth Information Services as a leading reference to set up international standards) and the Digital Europe Programme (offering opportunities to deploy, implement and upscale the digital health solutions, including those possibly initiated by the proposed initiative at the level of pre-competitive collaborations, for example in the area of modernising the public health services or advancing digital skills for health and care professionals). The potential inter-connections between partnership initiatives in the Health cluster of Horizon Europe are presented in Figure 6.

Horizon Europe has introduced the novelty of missions, with cancer being one of the five mission areas, that will use the full spectrum of European R&I instruments and policies to reach their targets. The Innovative Health Initiative could play an important role in supporting the development of innovations to prevent, faster diagnose and treat cancer and thus significantly contribute to the Europe's Beating Cancer Plan⁸¹

Furthermore, the proposed initiative may foster the concept of 'Smart Health', an area that has been identified as one of the 'strategic value chains'⁸² by a forum of industrial experts⁸³, with potential to drive EU's industrial competitiveness and promote technological sovereignty. Value chains are defined as a set of interdependent economic activities that add value around a product, process or service, involving a group of interlinked economic actors that operate across sectors and borders. The proposed initiative unites these features and has all elements to be considered as "strategic", i.e. revealing systemic importance and making a clear contribution to growth, jobs and competitiveness⁸⁴. The value of IHI to serve as a precursor in this context has been further strengthened by the recently published new Industrial Strategy for Europe⁸⁵. It may demonstrate its full potential when delivering innovative health technologies that integrate digital components, thereby preparing the ground for a potential Important Project of Common European Interest (IPCEI) on Smart Health.

Figure 6. Potential inter-connections between partnership initiatives in the Health cluster of Horizon Europe. Source: Technopolis Group

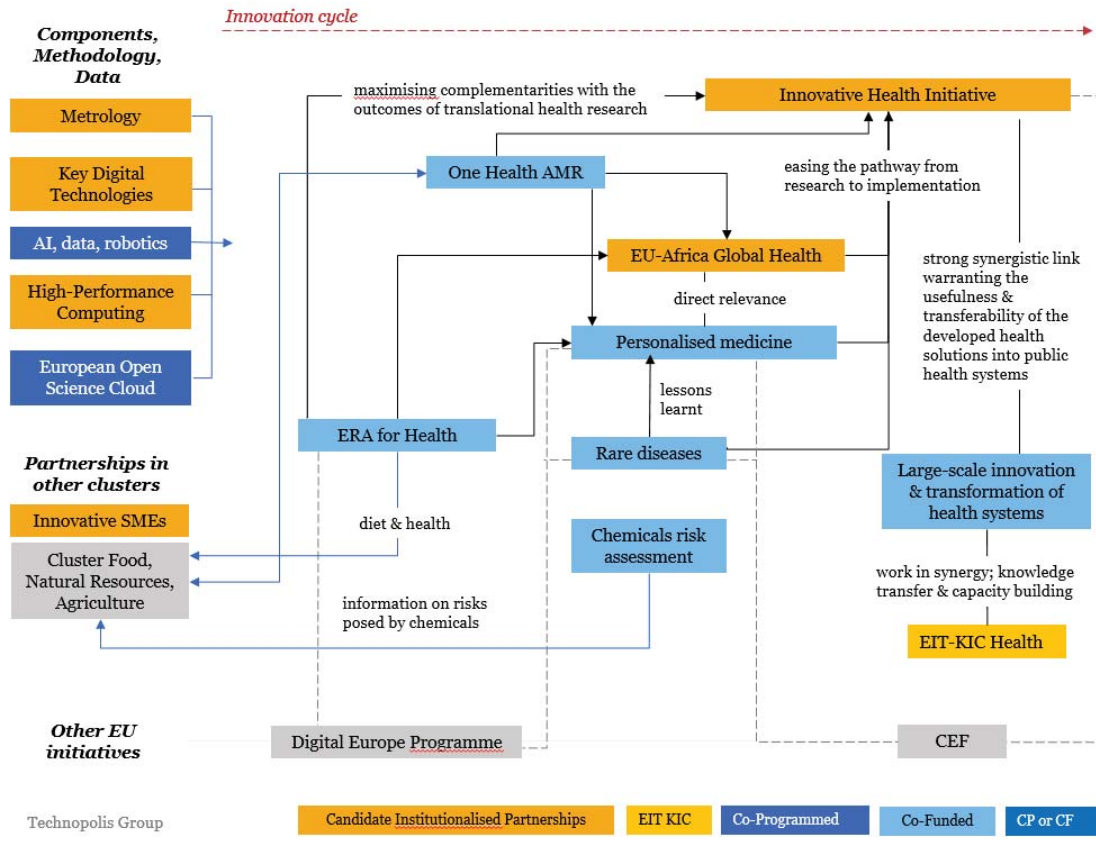

⁸¹ https://ec.europa.eu/health/non_communicable_diseases/cancer_en

⁸² European Commission (2019), Strengthening strategic value chains for a future-ready EU industry. Report and annex available at: <https://ec.europa.eu/docsroom/documents/37824>; factsheet available at: <https://ec.europa.eu/docsroom/documents/37825>

⁸³ Strategic Forum for Important Projects of Common European Interest: <https://webgate.ec.europa.eu/fpfis/wikis/pages/viewpage.action?spaceKey=StrategicForum&title=Strategic+Forum+for+IPCEI>

⁸⁴ In the European political context, strategic value chains are characterised by: i) technological innovativeness; ii) economic and market potential; iii) societal and political importance for Europe; supporting Strategic Value Chains is a political priority at the interface of a number of other EU policies – R&I, industrial and the Green Deal.

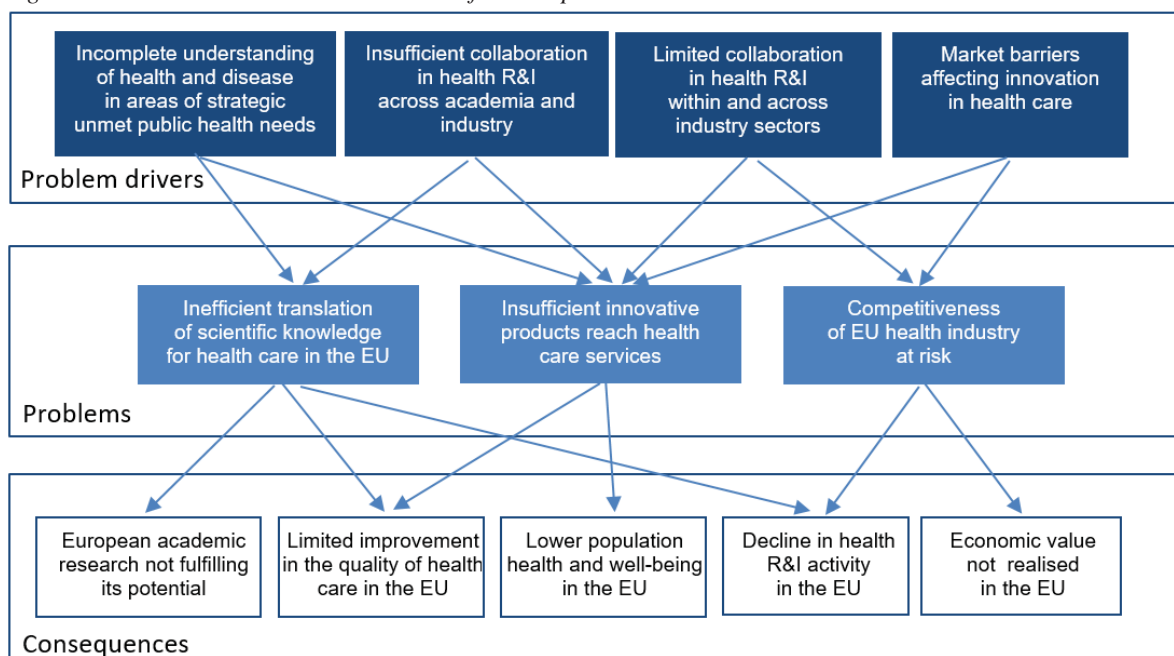

⁸⁵ [COM\(2020\) 102](#) final.

2. PROBLEM DEFINITION

Given the current and anticipated challenges in the health research field and the overarching policy context, a set of problems have been identified where EU R&I in this field would have a specific role to play (Figure 7).

Figure 7. Problem tree behind an initiative for European R&I on Innovative Health

2.1. What are the problems?

The predecessor initiative, IMI2 JU, was set up to address the challenges of increasing cost, lack of incentives and decreasing productivity in drug and vaccine development. Based on the success of IMI in bringing together pharmaceutical companies and the lessons learned explained in Section 1.2, the problem definition reflects the progress in converging of health technology areas (e.g. drug development and diagnostics) and a much more prominent role of digital technologies and data analytics in health research than it was the case when IMI2 JU was established.

2.1.1. Inefficient translation of scientific knowledge for health care in the EU

Despite Europe being a leading region in health research, a gap remains in its ability to translate this excellent health research into products and services that will make a difference to patients and reduce the burdens on health care systems⁸⁶.

The high failure rate is mostly a scientific problem due to, among others: (1) the lack of adequate translational expertise (i.e. the skills and knowledge required to turn research results into products and services under high regulatory scrutiny), (2) insufficient reproducibility of academic research⁸⁷, (3) insufficient understanding of the mechanisms of disease, (4) weak academia-industry and industry-industry collaboration, within and across different industry sectors, (5) market failures (low investment in some health areas, e.g.

⁸⁶ EC (2018) Science, Research and Innovation Performance of the EU (SRIP) report.

⁸⁷ Friedman L.P., et al, (2015). The Economics of Reproducibility in Preclinical Research, PLoS Biol, available at <https://doi.org/10.1371/journal.pbio.1002165>.

infectious diseases, brain disorders and anti-microbial resistance⁸⁸, or market fragmentation).

2.1.2. *Insufficient innovative products reach health care services*

Even when innovation does happen, insufficient early consideration of societal or user needs and preferences acts as barrier to acceptance and uptake of the resulting products or services⁸⁹, which denotes a societal problem. Therefore, better innovation requires better involving patients, users and citizens from project design and specifications to implementation. In addition, access to products (e.g. drugs) and services (e.g. diagnostic procedures or e-health services) by patients and health care professionals may be delayed for reasons such as lack of evidence on relative effectiveness and cost-effectiveness to demonstrate their added value, high prices raising affordability issues⁹⁰, or lack of readiness of health care systems to embed new technologies. The latter aspect depends, among others, on organisational, structural, financial, regulatory and cultural factors⁹¹

For example, tapping the potential of big data, real world data and digitalisation depends on the capacity to access data, to ensure data quality, to collect, combine and analyse vast amounts of heterogeneous data; on the availability of appropriate regulatory frameworks and data infrastructures; on the fulfilment of all ethical and legal requirements⁹² and on workforce skills.

2.1.3. *Competitiveness of EU health industry at risk*

The EU has a large health industry. However, it is struggling to maintain a leadership position in health R&D versus the US and China in many sectors, including the

⁸⁸ European Commission (2017). The Interim Evaluation of the Innovative Medicines Initiative 2 Joint Undertaking (2014-2016) operating under Horizon 2020. Experts Group Report. Luxembourg: Publications Office of the European Union.

⁸⁹ It should be noted that health products and services behave differently than it is the case in most areas of the free-market economy because: (1) the health area is subject to strict regulation at national and/or European level, depending on the actual type of products or services, (2) the pricing of these products or services does not follow the free-trade rules but is subject to reimbursement and pricing decisions which are a national competence, (3) the cost of most health products is partly or fully reimbursed by government or compulsory insurance schemes. Therefore, the aspects of ‘product availability’ and ‘product uptake’ have meanings specific to this particular area. In addition, reimbursement decisions can also include provisions on the conditions of use of the product, e.g. in certain diseases.

⁹⁰ Providing universal access to innovative medicines and other medical technologies creates tremendous social value. However, the rising prices of innovative technologies and, in particular, the proliferation of very expensive medicines in recent years have increased pressures on public health spending. Equitable access to essential, high-quality innovative health technologies depends on affordable and fair pricing and effective financing schemes. According to WHO definition, an “affordable and fair” price is one that can reasonably be funded by patients and health budgets and simultaneously sustains research and development, production and distribution within a country (World Health Organization (2017). Essential medicines and health products. <https://www.who.int/medicines/areas/access/en/>.) Even though reimbursement and pricing are a national competence of EU Member States, research could be done at European level on the development or refinement of pricing and reimbursement instruments. This research could in turn support Member States developing and implementing their national policies. Besides pursuing affordable and fair prices, promoting cost-effective interventions is also seen as central to the achievement of universal health coverage. IHI can play a role here in developing methods and tools to assess the added-value of innovative technologies, and that can be taken-up by health care authorities/organisations if deemed relevant to inform their decisions.

⁹¹ While solutions to these problems are beyond reach of IHI, they would fall in scope of the candidate Partnership on Transforming Health and Care Systems involving Member States who are in charge of organising their health care systems.

⁹² European Commission (2019). Orientations towards the first Strategic Plan implementing the research and innovation framework programme Horizon Europe. Annex: Horizon Europe Cluster 1 Health.

pharmaceutical and medtech (see Section 1.2.1), which is considered an economic/technological problem.

R&I creates new opportunities, supporting sustainable economic growth and the competitiveness of businesses and industries⁹³. However, slow translation of scientific discoveries into tangible innovations and limited technology convergence lead to dwindling innovation pipelines. This puts Europe at risk of becoming dependent on other countries for technological developments and new health care solutions, not only endangering European competitiveness but also putting into question the future sovereignty and preparedness to face issues like e.g. shortage of essential medicines⁹⁴ or emerging pandemics.

In the **open public consultation**, 73% of respondents (77 out of 105) saw the innovation gap in translating the results of health research into the development of innovative health products and services as a very relevant problem. Insufficient consideration of societal or user needs was identified as a relevant barrier to uptake particularly by most respondents from the 15 NGOs, 5 public authorities and 6 small company/business organisations (<250 employees). Academic/research institutes and public authorities reported that ethical issues were also a barrier. Nevertheless, on average, structural and resource problems were reported as more relevant than problems in the uptake of health innovations (assessed as 'very relevant' by 56% vs 34% of all stakeholders, respectively). The need for the partnerships to contribute to EU global competitiveness was supported by most respondents (59%, 63 of 106) in the **open public consultation**, including most of the 6 respondents from business associations, the 20 respondents from industry and the 35 respondents from academic/research organisations. Only among public authorities and 'other', the majority did not cite the contribution to EU competitiveness as a need.

During **interviews**, industry representatives referred to a lack of trust between the public and industry. A positive working relationship between public and private partners could increase public trust, and therefore uptake, of new products developed by industry.

2.2. What are the problem drivers?

2.2.1. *Incomplete understanding of health and disease in areas of strategic unmet public health need*

Many of the diseases that are increasingly affecting the health of EU citizens, are not completely understood in terms of what causes them, how environmental and genetic factors affect the occurrence and course of the diseases, what affects treatment success, etc. Consequently, it is difficult to develop adequate prevention strategies, accurate diagnostics and targeted therapeutic interventions⁹⁵. Further research is urgently needed to understand the causes and factors affecting development of these complex diseases⁹⁶. Understanding of diseases should also link better to health promotion, disease prevention, prediction and staying in good health longer while aging.

⁹³ European Commission (2019). Orientations towards the first Strategic Plan implementing the research and innovation framework programme Horizon Europe.

⁹⁴ WHO list of essential medicines and health products, available at:
https://www.who.int/topics/essential_medicines/en/

⁹⁵ The top ten leading causes of death in Europe in 2016 included dementia, in particular Alzheimer's disease, and diabetes mellitus. See Annex 6 Section 2.1 for more details.

⁹⁶ WHO data on Disease burden and mortality estimates,
https://www.who.int/healthinfo/global_burden_disease/estimates/en/index1.html.

The predecessor initiative, IMI, has greatly contributed to better understanding of certain diseases (e.g. by elucidating the five subtypes of diabetes rather than only two as known currently, which paves the way for proposing the adequate treatment for patients with individual disease subtypes⁹⁷). Nevertheless, the knowledge gaps remain, due to the inherent complexity of biological processes in the human body. Such knowledge gaps are a roadblock for efficient translation into products or services and one of the root causes why no treatments are available in some therapeutic areas. These knowledge gaps must indeed be addressed by research but as regards human health, unlike in some engineering or IT areas, research can be unsuccessful, despite years of effort. For example, in the case of dementia, there is still a vast market demand as a growing proportion of the ageing population of rich countries are affected, with no available treatment. Despite this, the biggest drug companies pulled out of this area, following a string of repeated failures: between 1998 and 2017, 146 candidate medicines in clinical development for Alzheimer's were halted and did not receive regulatory approval. 18% of the failures occurred in late-stage clinical trials⁹⁸, which by then had consumed 5-10 years of R&D and USD hundreds of million, sometime over a billion in costs each. Science needs to advance and provide new therapeutic targets to industry, and industry needs to be stimulated to continue investing in this field.

Another example is the emergence of infectious diseases, demonstrated by the 2019/2020 SARS-CoV-2 (coronavirus) pandemic of unprecedented scale. Despite existing knowledge about other coronaviruses that caused earlier epidemics⁹⁹, the global spreading of COVID-19 could not be avoided.

The reason for identification of this aspect as a problem for the proposed initiative is that it is a prerequisite for being able to translate research into products. A more efficient use of various research tools or paradigms offered by new industry sectors (e.g. using innovative imaging methods or artificial intelligence) may bring a new stimulus to understanding areas not fully understood today. This persisting problem calls for continued investment into R&I on unmet health needs, intensified collaboration of academia with the main health industry sectors and the use of digital technologies in order to give a new angle to addressing these gaps.

The lack of understanding/knowledge about disease was cited as a very relevant problem by the majority within each group of respondents in the **open public consultation** with the exception of small company/business organisations. In the **feedback to the inception impact assessment**, stakeholders from business, academia, NGOs and 'others' referred specifically to antimicrobial resistance (AMR), brain disorders and neglected diseases.

2.2.2. *Insufficient collaboration in health R&I across academia and industry*

Collaboration between academia and industry is widely considered a key requirement for translating research into innovations but it can be inhibited by a range of factors. These include the compartmentalisation of departments within universities and hospitals; a cultural divide between academic, industry and clinical researchers; and lack of training or experience in multidisciplinary teams working among academics. In combination with these

⁹⁷ IMI's BEAT-DKD and RHAPSODY projects: <https://www.beat-dkd.eu/> and <https://imi-rhapsody.eu/>.

⁹⁸ Researching Alzheimer's medicines (2018), http://phrma-docs.phrma.org/files/dmfile/AlzheimersSetbacksSteppingStones_FINAL_digital.pdf.

⁹⁹ SARS-CoV outbreak started in 2002 and MERS-CoV outbreaks started in 2012

factors is also a university system that rewards individual achievement rather than joint working practices¹⁰⁰.

Unfortunately, in the health area, the majority of European academics do not collaborate with business¹⁰¹. This is exemplified by the fact that less than 8% of participations in Societal Challenge 1 (Health, demographic change and wellbeing) Horizon 2020 collaborative projects from 2014 to 2019 were from non-SME industry partners (Table 1). The joint participation of several industry partners in one project was even less frequent.

Table 1: Proportion of non-SME private sector participation (labelled as Industry participation) in regular Horizon 2020 collaborative health R&I projects (please note that the figures exclude IMI2 JU)

Call year	Total EU funding	EU funding for industry	Total participation	Industry participation	% of industry funding	% of industry participation
2014	EUR 595,619,918	EUR 41,542,476	1609	109	6.97%	6.77%
2015	EUR 584,270,458	EUR 31,235,638	1308	98	5.35%	7.49%
2016	EUR 440,330,074	EUR 20,460,519	1111	83	4.65%	7.47%
2017	EUR 367,686,472	EUR 21,747,256	886	59	5.91%	6.66%
2018	EUR 691,315,336	EUR 51,995,267	1588	156	7.52%	9.82%
2019	EUR 796,496,156	EUR 56,131,198	1459	115	7.05%	7.88%
Total	EUR 3,475,718,414	EUR 223,112,354	7961	620	6.42%	7.79%

Source: European Commission

Differing concerns in industry and academia contribute to this frequent lack of collaboration¹⁰². Industry has concerns about the poor reproducibility of research, high valuation of early intellectual property, and maintaining confidentiality. Academia has concerns about the freedom to publish and about strategic changes at the industrial partner (such as change of the disease area interest, or mergers and acquisitions) which can lead to discontinuation of research projects. Furthermore, academics have less resources to comply with increasingly complex regulatory requirements compared to industry¹⁰³. For instance, analysis of data from the EU's Clinical Trial Register shows that clinical trial results of 90% of clinical trials led by academics in Europe are not reported within a year of ending, while

¹⁰⁰ Fudge, N. et al. (2016) Optimising translational research opportunities: A systematic review and narrative synthesis of basic and clinician scientists' perspectives of factors which enable or hinder translational research. PLoS ONE, 11(8), pp. 1–23.

¹⁰² Freedman, S. and Mullane, K. (2017) The academic–industrial complex: navigating the translational and cultural divide. Drug Discovery Today, 22(7), pp. 976–993.

¹⁰³ Vesper I. (2018). Europe's academics fail to report results for 90% of clinical trials, Nature, Available at: <https://www.nature.com/articles/d41586-018-06676-8>.

70% of industry-sponsored clinical trials have published outcomes within 12 months of completion.

The situation described was significantly alleviated by the activities of IMI, as explained in Section 1.2 and in Annex 6. However, this successful outcome of IMI benefitted the collaboration mostly between academia and the pharmaceutical sector, not covering other sectors of health R&I.

Interviews with industry stakeholders indicate that while there are a few examples of large pharmaceutical companies participating in collaborative projects in Horizon 2020, this remains the exception due to low perceived success rates, small project sizes (by their standards) and time-consuming administrative requirements. In fact they prefer not to receive any funding from the EU, which is seen as a reputational risk, and rather turn to the alternative avenue offered by IMI2 JU, which allows large-scale, strategically oriented collaboration without receiving any monetary funding, while contributing own resources instead.

2.2.3. *Limited collaboration in health R&I within and across industry sectors*

An overarching organisational problem driver holding back the full potential of European creativity is the limited collaboration between various health-related industry sectors including pharmaceuticals, diagnostics, medical devices, imaging, biotech and digital industries¹⁰⁴. Reasons for this are competition and varying definitions of pre-competitive space, different problem solving approaches, diverging business models and varied development timelines across sectors¹⁰⁵, further compounded by varying regulatory requirements across types of products (e.g. drugs vs. medical devices).

In the cross-sectoral digital health sector, which was less prominent at the onset of IMI2 than it is the case today, R&I is also held back by missing data standards, interoperability and accessibility; inadequate or non-existing analytical methods and tools; and issues around ethics, privacy and security¹⁰⁶. All this diminishes the EU's ability to tap the immense potential presented by digitalisation, artificial intelligence (AI) and big data. The capacity to access, collect, combine and analyse large, complex data sets also varies across industry sectors and stakeholder groups resulting in a lack of collaboration¹⁰⁷.

In the **open public consultation**, limited collaboration and pooling of resources between industry sectors was seen as a very relevant problem across stakeholder groups (52%, 55 of 106 respondents) and in particular by business associations. Comparatively, it was more strongly agreed that limited collaborations and pooling of resources across public, private and charity sectors was a problem, with the majority of respondents (59%, 61 of 104) selecting this aspect as very relevant. During the **interviews**, stakeholders from academic/research organisations remarked on this barrier, highlighting, in particular, that the lack of data sharing between the health sector and industry was a major barrier to innovation.

¹⁰⁴ This problem driver for IHI is defined much more broadly than it was the case for IMI that focussed on the pharmaceutical sector only. In preparation for IHI, associations representing several health industry sectors expressed interest to enter into joint pre-competitive collaboration.

¹⁰⁶ European Commission (2019), Strengthening strategic value chains for a future-ready EU industry.

¹⁰⁷ European Commission (2018), Science, Research and Innovation Performance of the EU (SRIP) report.

2.2.4. Market barriers affecting innovation in health care

Market barriers discourage companies from investing in R&D, particularly where a high return on investment is unlikely. This is a significant problem in some areas of high unmet public health need such as infectious diseases and anti-microbial resistance. In the latter area, the problem persists despite the significant and recognised achievements¹⁰⁸ of IMI that, however, without additional pull mechanisms, are not able to improve the attractiveness of the overall market¹⁰⁹.

The issues around market barriers are exacerbated by the fact that complex innovations combining different types of technologies do not easily fit into existing regulatory schemes. In addition, demonstrating their added value for patients and society poses new methodological challenges, partly because technologies converge in ways that alter the delivery of health care in ways not anticipated before and that could not be effectively addressed by predecessor initiatives. For example, mobile health offers potential for more effective and efficient provision of care, which should ultimately translate into better outcomes for patients. Such complex and cross-sectoral innovations require the development of adapted approaches, methods and tools not only to assess their safety and efficacy but also to fully capture the value they create for society and to enable efficient integration into health care systems. These novel methods would be essential for Member States to take the best informed decisions – including as regards the reimbursement and pricing policies – and put them in a stronger position to negotiate affordable prices that would in turn facilitate patient access to high-value innovations.

Health industries, in particular SMEs, may encounter difficulties in accessing the necessary investments from various sources. While IHI could serve as a source of funding to bridge possible gaps in funding between basic research grants and other financial instruments (e.g. loans) this is an issue that could also be addressed by several initiatives at EU level (e.g. by the European Innovation Council¹¹⁰ or by the European Investment Bank¹¹¹), at national level or by venture capital. However, industries may also find it difficult to enter new markets and value chains, or to create partnerships and alliances and this is precisely where IHI would have a unique role to play. Health innovation requires a broader variety of stakeholders to be involved from supply, demand and regulatory side than it would be the case for many other market sectors¹¹².

In the **open public consultation**, there was some disagreement between small and large (>250 employees) company/business organisations about the relevance of market failure,

¹⁰⁸ According to the European Court of Auditors: ‘...despite the general withdrawal of pharmaceutical industries from antimicrobial research, JU IMI together with its partners was overall able to maintain the expected level of public-private collaboration in the ND4BB programme. While this is encouraging, there are concerns about the insufficient commercial incentives for pharmaceutical companies to invest in this field’. European Court of Auditors (2019), Addressing antimicrobial resistance: progress in the animal sector, but this health threat remains a challenge for the EU – special report no 21, findings 60-61. https://www.eca.europa.eu/Lists/ECADocuments/SR19_21/SR_Antimicrobial_resistance_EN.pdf.

¹⁰⁹ Idem.

¹¹⁰ Under Horizon Europe’s innovation pillar, the proposed European Innovation Council (EIC) will offer grants and blended financing (grants and equity) opportunities mainly for small, highly innovative companies from early stage to development and scale-up. <https://ec.europa.eu/research/eic/index.cfm>.

¹¹¹ For example, InnovFin Infectious Diseases Finance Facility (IDFF) from the European Investment Bank (EIB) can provide standard debt to equity-type financing for amounts typically between EUR 7.5 million and EUR 75 million.

¹¹² European Commission (2019), Orientations towards the first Strategic Plan implementing the research and innovation framework programme Horizon Europe. Annex: Horizon Europe Cluster 1 Health.

the adequacy of business models, and ethical concerns over digital tools. Small companies (9 respondents) found these problems less relevant as barriers to uptake of innovations, whereas most of the 12 stakeholders from larger companies reported these as very relevant.

The problems at stake remain valid for both the predecessor initiative, IMI2 JU, and the proposed. However, under IMI2 JU, the problems were more closely related to the process of pharmaceutical development (covering medicines and vaccines). It was also reflected by the constituency of the partnership, with the European Federation of Pharmaceutical Industries and Associations (EFPIA) as the only member industry association. IMI2 was able to indeed progress significantly on addressing the underlying problems and successfully deliver on several of its objectives. However, the problems at stake constantly evolve and therefore, they are going to be addressed by the proposed initiative in a broader than it was the case for IMI: the Innovative Health Initiative (IHI) aims to cover several technology areas of health R&I (medtech, biotech, vaccines, digital), rather than the pharmaceutical sector only. Thanks to this broadening, the Innovative Health Initiative could address the problems at stake from a different angle, capitalising on broadened experience of the new set of industry actors.

2.3. How will the problem(s) evolve?

The problems of Europe's ageing society and prevalence of diseases are unlikely to dissipate over time. As people age, the prevalence of chronic diseases is likely to increase, thus also leading to co-morbidities¹¹³. In addition, in an increasingly global world, as more people continue to travel, the spread of new emerging infections and the possibility of pandemics cannot be ruled out, as clearly demonstrated by the 2019/2020 COVID-19 outbreak. All this would exert pressure on carers and health care systems.

In the baseline scenario of regular Horizon Europe calls and absence of a follow-up partnership to IMI2 JU (which exists until 2024 but launches its last calls in 2020), the problem of insufficient provision and deployment of innovations in health care, which includes both the lack of innovations itself and existing innovations not reaching users quickly enough, will persist or even worsen without intervention. However, if addressed, effective, cost-effective and easy to use innovations responding to the needs of end-users should help reduce the pressure on health care systems.

Without intervention, many of the innovative health technologies will potentially be disruptive for health care systems. They will rely on cross-sectoral collaborations and will therefore necessitate early dialogue between all relevant health care actors (including patients, developers, regulators¹¹⁴, health technology assessment bodies, health authorities

¹¹³ EC Reflection Paper (2019), Towards a sustainable Europe by 2030.

¹¹⁴ In this document, the term 'regulators' refers to the different bodies involved in the processes regulating medical products (e.g., scientific assessment, production of scientific guidelines, scientific advice to manufacturers, granting/refusal/suspension of marketing authorisations, post-market surveillance, withdrawing/recalling of devices put on the market, authorisation and oversight of clinical trials). It includes the European Commission, National Competent Authorities (NCA), the Medical Device Coordination Group (MDCG), and the European Medicines Agency (EMA). Notified Bodies (NB), while designated to perform a regulatory function (verification of medical device/in-vitro diagnostics conformity), cannot be considered as regulators in the strict sense of this definition. However, the potential input and expertise of Notified Bodies may still be relevant for the design and implementation of the activities of the proposed initiative

involved in pricing and reimbursement) to become accessible¹¹⁵ to patients, at fair conditions. In addition, the increasing EU public's expectations about health care – i.e. that health care is high quality, effective, cost-effective, and accessible – is also likely to influence the burden on health care systems and how health care is delivered¹¹⁶.

Overall, if left unaddressed, the problems described will result in:

- not capturing the full potential of European research, with the knowledge created by European academics not translated more efficiently into tangible innovations;
- limited improvement in the quality of health care and unsustainable health care systems that will remain reactive, addressing diseases on incident basis, rather than moving towards preventive, integrated health care that would put the person in the centre, during her/his lifetime;
- negative impact on health and wellbeing in the society (incl. increasing access barriers to novel health solutions), entailing limited preparedness to emerging health threats (such as e.g. the COVID-19 outbreak) where new diagnostics, preventive vaccines or therapeutics need to be developed quickly;
- decline in health-related R&I activity in Europe with jobs and revenue going outside the EU and economic value not being realised in Europe, leading to gradual loss of technological sovereignty and readiness to quickly respond to emerging health threats.

During **interviews**, stakeholders (including those from industry, partnerships and research infrastructures), referred to digitalisation as one of the major needs this initiative could address. This was confirmed during the **open public consultation** where respondents generally agreed (50%, 53 of 105) that insufficient digitalisation was a very relevant problem, particularly according to NGOs, business associations and EU citizens. Feedback to the **inception impact assessment** emphasised the need for integrated solutions, especially with regard to personalised health care.

3. WHY SHOULD THE EU ACT?

3.1. Subsidiarity: Necessity of EU action

The problems described in this document are of a nature and magnitude that EU-level concerted action will be more appropriate than individual Member States developing their own initiatives. This will enable more coherent and coordinated effort, and avoid duplication. To elaborate, EU action is required for the following reasons¹¹⁷:

- Current health challenges and threats are global, respecting no borders. They call for a quick and coordinated response, while health research capabilities and data are dispersed over Europe. No Member State alone could mobilise and engage the diverse range of

¹¹⁵ Access to health care is the result of interactions between different factors, including health system coverage (i.e. who is entitled to health care), depth of coverage (i.e. what citizens are entitled to), availability of health care services and economical accessibility (affordability), based on [Commission Communication on effective, accessible and resilient health systems](#) (2014). Access also includes non-discrimination, physical accessibility, and information accessibility, in line with [General Comment on the Right to Health](#), UN Committee on Economic, Social and Cultural Rights (2000). In addition to financial and organisational aspects, health care access may also be affected by social or cultural barriers that limit the utilisation of services.

¹¹⁶ Weale A. et al. (2011), High Quality, Comprehensive and Without Barriers to Access? The Future of Healthcare in Europe. In: *The Future of Healthcare in Europe* (eds. Chaytor, S. and Staiger, U.), UCL: London.

¹¹⁷ DG RTD (2019), Inception impact assessment of the candidate European Partnership on Innovative Health.

stakeholders and companies individually and reach the required critical mass of expertise and data that are necessary to tackle these challenges.

- Actions at Member State level would be limited in terms of industrial and academic experience available in a given country. An EU-level action is much better positioned to coordinate multiple stakeholders effectively and meet the planned objectives, at the same time avoiding duplication in research.
- Most health-related companies operating in Member States have an EU-wide presence. Their activities and products are governed by EU-wide legal frameworks, e.g. on medicinal products, medical devices and cross-border health care. Therefore, it is logical to have an initiative focused on innovation in health at the EU level. Moreover, the EU is best placed to develop and implement common standards and frameworks related to health innovations applicable for the entire EU internal market.
- Member States alone would not have the legal and financial framework to enable multi-sectoral collaboration with the scope and/or at the scale envisaged.

3.2. Subsidiarity: Added value of EU action

An EU initiative can help bring together a broad spectrum of stakeholders, both private and public in the health field. Industry participation would help to drive academic research efforts towards applicable health innovations, while the EU represented by the European Commission would guarantee that projects address important unmet health needs and deliver innovations that can be taken up by health care systems. An EU-level initiative has the potential to provide the necessary scale and scope of investment to attract additional, or shift existing, investment into R&I into strategic unmet public health needs where industry would not act on its own or where sufficient national funding is not available¹¹⁸. Moreover, an initiative under the aegis of the EU would create a trustful and neutral environment for sharing expertise, resources and knowledge¹¹⁹. In summary, it can provide added value in the following areas¹²⁰:

- creation of critical mass to address global challenges;
- stability in long-term commitment and work towards common goals (directionality);
- increased industry investment into areas of unmet public health needs,
- increased coordination across public and private actors and across Member States;
- increasing the EU's competitive advantage vis-a-vis major competitors;
- creation of new market opportunities;
- leveraging more public and private investment in health-related R&I (additionality).

The proposed initiative does not go beyond what is necessary to achieve its objectives.

¹¹⁸ According to its interim evaluation, "IMI2 JU... leveraged additional funding for medicines research and development at a time when research funding was reduced in most of the European countries". European Commission (2017) [The Interim Evaluation of the Innovative Medicines Initiative 2 Joint Undertaking \(2014-2016\) operating under Horizon 2020](#). Experts Group Report. Luxembourg: Publications Office of the European Union.

¹¹⁹ For example, IMI2 JU AIMS-2-TRIALS project (<https://www.imi.europa.eu/projects-results/project-factsheets/aims-2-trials>) working on autism created a clinical trials network that covers 118 sites across 37 countries with access to over 20 000 new patients per year. The c4c project (<https://www.imi.europa.eu/projects-results/project-factsheets/c4c>) is setting up a paediatric clinical trial network with 19 paediatric national hub trials and national coordinators of trial sites to oversee site activity related to trials. Reaching beyond national borders facilitates the conduct of large clinical trials that would not be possible at national level.

¹²⁰ DG RTD (2018), Horizon Europe Impact Assessment. A New Horizon for Europe.

The legal basis for EU action, the same for every option discussed, is provided by Articles 168 and 179 TFEU (in addition, the legal ground for Option 3 – Institutionalised Partnership – lies in Art 187 TFEU). At the same time, Member States hold the primary responsibility for organising health services and medical care as well as for reimbursement and pricing decisions¹²¹. Therefore, the potential products, solutions or methodologies that might result from IHI would become subject to further independent decisions of relevant authorities and bodies, in line with relevant legislation in place.

The added value of EU action was underlined in the **open public consultation**, especially in terms of responding to: (1) the need to increase the EU's global competitiveness (selected as very relevant by 59% (63 of 106) of respondents) and the problem of limited collaboration between industry sectors (selected as very relevant by 52% (55 of 105) of respondents). Industry **interviewees** commented that investment at EU level was essential to maintain/improve the R&I competitiveness of the European health industry.

4. OBJECTIVES: WHAT IS TO BE ACHIEVED?

4.1. General objectives

Based on the identified problems, the general objectives of an EU action for research and innovation in health care would be to:

1. contribute towards the creation of an EU-wide health R&I ecosystem that facilitates translation of scientific knowledge into innovations, notably by launching at least 30 large-scale, cross-sectoral projects, focussing on health innovations;
2. foster the development of safe, effective, people-centred¹²² and cost-effective innovations that respond to strategic unmet public health needs, by exhibiting, in at least 5 examples, the feasibility of integrating health care products or services, with demonstrated suitability for uptake by health care systems. The related projects should address the prevention, diagnosis, treatment and/or management of diseases affecting the EU population, including contribution to Europe's Beating Cancer Plan;
3. drive cross-sectoral health innovation for a globally competitive European health industry, and contribute to reaching the objectives of the new Industrial Strategy for Europe and the Pharmaceutical Strategy for Europe.

General objective 1 is mainly aimed at addressing current inefficiencies in translating scientific knowledge generated in Europe into health and care innovations, such as new prevention strategies, diagnostics or drugs. **General objective 2** addresses the insufficient innovative products reaching health care services for unmet public health needs. Fostering the development of innovations that are not only safe and effective, but also people-centred and cost-effective will increase the likelihood of innovations being adopted by people and health care systems, and thus providing benefit to EU citizens and also strengthening the

¹²¹ Elaborated in Section 1.

¹²² People-centred care refers to an approach to care that consciously adopts individuals', carers', families' and communities' perspectives and sees them as participants as well as beneficiaries of health care systems that are organised around their needs and preferences rather than individual diseases.. This approach requires that people have the education and support to enable them to make decisions and participate in their own health and care, while also supporting carers. Based on: World Health Organization 2016, Framework on integrated, people-centred health services.

economy, if health care systems become more efficient. Finally, **general objective 3** is mainly aimed at addressing the risk to the global competitiveness of the EU health industry.

The general objectives align with Horizon Europe objectives, and in particular with its objective to ‘strengthen the scientific and technological bases of the Union’ and ‘to foster competitiveness’¹²³. They also align with strategic EU priorities to promote health and wellbeing for all including access to innovative, sustainable and high-quality health care, and with the Sustainable Development Goal 3 of ‘Ensuring healthy lives and promote well-being for all at all ages’¹²⁴. In particular, thanks to these general objectives, the initiative will contribute to ‘Europe’s Beating Cancer Plan’¹²⁵ and the ‘European One Health Action Plan against Antimicrobial Resistance’¹²⁶, as well as the new Industrial Strategy for Europe¹²⁷, the Pharmaceutical Strategy for Europe¹²⁸ and the SME strategy for a sustainable and digital Europe¹²⁹.

4.2. Specific objectives

The proposed partnership is conceived as being agnostic with regard to specific disease areas, while focussing on unmet public health needs¹³⁰. It intends to cover various stages at which it intends to intervene in the health care pathways, including prevention, diagnostics, treatment and disease management¹³¹. This broadened technological and thematic scope compared to IMI2 JU explains the proposed new name, the Innovative Health Initiative (IHI).

With the rapid scientific and technical progress and the digital evolution, new types of products integrate the different components (such as medicines, diagnostics, treatment monitoring) in ways that has never been done before. For example, a new treatment may be accompanied by a sensor and a mobile health solution that monitors the adherence to the prescribed regime, and it may also collect data for monitoring the safety of treatment. The new possibilities for health interventions can benefit patients while offering new market opportunities to companies. At the same time, while the scientific and technical evolution is rapid and provide many new opportunities, merging of technologies must be fostered in an environment that ensures the quality and the safety of the new innovations, respecting the ethical principles. Therefore, in order to achieve the general objectives, five specific objectives are defined, that respond to the problem drivers discussed in Section 2.2.

¹²³ DG RTD (2018), Horizon Europe Impact Assessment. A New Horizon for Europe.

¹²⁴ European Commission (2019), Orientations towards the first Strategic Plan implementing the research and innovation framework programme Horizon Europe. Annex: Horizon Europe Cluster 1 Health.

¹²⁶ https://ec.europa.eu/health/sites/health/files/antimicrobial_resistance/docs/amr_2017_action-plan.pdf

¹²⁷ COM(2020) 102 final

¹²⁸ COM(2020) 761 final

¹²⁹ COM(2020) 103 final

¹³⁰ Unmet public health needs are needs currently not addressed by the health care systems for various reasons, for example if no medicines are known to treat a disease. Areas of public health importance are those where the burden of disease is high for patients and society due to the severity of the disease (in terms of mortality, physical and functional impairment, comorbidities, loss of quality of life, ...) and/or the number of people affected by it. For example, Alzheimer’s disease.

¹³¹ The actual thematic areas of activities will be further defined in the SRA and the resulting annual work programmes.

4.2.1. *Contribute towards a better understanding of the determinants of health and priority disease areas*

By focusing on elucidation of the mechanisms of diseases and factors contributing to health, an initiative on innovative health can provide better targets and approaches to develop new health innovations for prevention, diagnosis and therapy. In this way, this specific objective can lead to more translation of basic research into practical application, covering the priority disease areas, i.e. those of high burden to the society. This objective should result in:

- novel targets for disease prevention, diagnosis and therapy, through improved understanding of disease mechanisms in various disease areas¹³²;
- novel solutions for continued monitoring of health status;
- novel solutions for disease management and for efficient follow-up of treatment.

4.2.2. *Integrate fragmented health R&I efforts bringing together health industry sectors and other stakeholders, focussing on unmet public health needs, to enable the development of tools, data, platforms, technologies and processes for improved prediction, prevention, interception, diagnosis, treatment and management of diseases, meeting the needs of end users*

This specific objective is related to breaking down barriers to cross-sectoral collaboration. This applies not only between academia and industry, and between different health industry sectors of different sizes, but also across all health care actors. The expected integration of actors would thus extend to patients and civil society, health care professionals, health care providers, regulators, health technology assessment bodies and health care payers. This objective should lead to:

- demonstrated feasibility of developing combination products (e.g. diagnostics + treatment), in various disease areas, focussing on unmet public health needs;
- harmonised approaches for clinical evidence generation of products combining different technologies.

To give an example, on average 10,000 substances are tested to develop one safe and efficacious medicine that can be used in health care, taking about 10-15 years using traditional approaches¹³³. It is expected that the drug development process can be accelerated by using novel approaches, afforded e.g. by bespoke medical devices and machine learning algorithms¹³⁴.

4.2.3. *Demonstrate the feasibility of people-centred, integrated health care solutions*

Innovative health care solutions¹³⁵ integrating various technologies, coupled with complementary tools and services promise breakthrough solutions to tackle health issues

¹³² Examples of disease areas: cardiovascular, neurological, respiratory etc.

¹³³ Chakravarthy R et al (2016), Public- and private-sector contributions to the research and development of the most transformational drugs in the past 25 years. *Therapeutic Innovation and Regulatory Science*, 50(6) 759-768. <http://dx.doi.org/10.1177/2168479016648730>.

¹³⁴ For example, it was recently shown that pre-clinical development of candidate medicinal products can be dramatically accelerated using AI techniques: Zhavoronkov A., Ivanenkov YA., Aliper A. et al. (2019) Deep learning enables rapid identification of potent DDR1 kinase inhibitors. *Nat. Biotechnol.* 37, 1038–1040, doi:10.1038/s41587-019-0224-x.

¹³⁵ Health care solution refers here to a medical product, ancillary service or tool used either alone or in combination in order to address a specific health care need, be it a medical need or an organisational need.

that cannot be effectively tackled today. Those products and services should be centred around people needs and preferences across the health care pathway, so that can be taken up by individuals and health care systems, thereby addressing the problem of insufficient knowledge translation. This objective should result in:

- demonstrated feasibility of developing people-centred, integrated health care solutions along the health care pathway, in various disease areas;
- health care solutions ready to be implemented by health care authorities or organisations.

For example, this could cover the integration of the following interventions in the case of chronic diseases, such as asthma or diabetes: (1) prevention programmes supported by apps to help people manage their health and to identify those at high risk for certain chronic diseases, (2) diagnostic tools to early detect those diseases, (3) personalised treatment for people with the disease, (4) solutions to help improve patient's adherence to treatment, (5) tools, e.g. wearables to monitor patients' health status, (6) solutions to detect and/or report adverse events, and (7) products and services supporting efficient workflows along the health care pathway, e.g. digital health solutions to facilitate communication between health care providers.

4.2.4. Exploit the full potential of digitalisation and data exchange in health care

Harnessing the full potential of big data¹³⁶ and real-world data¹³⁷ requires the digitalisation of health services, finding new ways to observe health and disease states, collecting the relevant digital biomarkers using health technologies, and developing advanced analytics/artificial intelligence approaches and software to convert data into valuable knowledge. These aspects are at the heart of data-focused approaches and could help innovators to develop more effective tools and products, including innovative, integrated solutions for preventing, diagnosing, treating and managing health conditions (e.g. tools to support real-time shared decision-making between patients and their health care providers using big data analytics platform). This objective should lead to:

- successful application of digital and data-driven solutions for health care, integrating various public and private data sources.

Health care solutions to be developed within this partnership do not include organisational innovation (also known as management innovation or administrative innovation). Organisational innovation encompasses a wide range of processes, from changing professional practices and roles, to changing organisational structures and governance arrangements. While industry can propose solutions (mostly concrete goods) on organisational processes, these remain in the remit of health care authorities/organisations to consider whether and how they could be deployed in the best way.

¹³⁶ Big Data refers to extremely large datasets which may be complex, multi-dimensional, unstructured and heterogeneous, which are accumulating rapidly and which may be analysed computationally to reveal patterns, trends, and associations. In general, big data sets require advanced or specialised methods to provide an answer within reliable constraints.

¹³⁷ Real world data are data regarding the effects of health interventions that are not collected in the context of conventional randomised controlled trials but prospectively and retrospectively from observations in routine clinical practice from many sources including patient registries, electronic medical records, and observational studies.

4.2.5. *Enable the development of new and improved methodologies and models for a comprehensive assessment of the added value of innovative and integrated health care solutions*

There is a need for new approaches to assess the added value of novel health care solutions, thereby strengthening the overall conditions for R&I to target strategic unmet public health needs in areas where industry has traditionally been less active, due to perceived high risk and/or low return on investment.

The advent of complex and integrated solutions necessitates the development of adapted methodological approaches and tools to assess the value that these products will bring to the patient, the health care system and the society as a whole (see footnote 39 for the explanation on “value” in this context). This specific objective envisages the development of methods and tools by working transparently and collaboratively across academia, industry, regulatory and health technology assessment (HTA) bodies, health care professionals and providers, patients, informal carers and citizens. As a result of reaching this objective, health care authorities and organisations should avail of:

- methodological toolbox for the comprehensive assessment of the added value of combined products;
- methodological toolbox for assessing the added value of novel, integrated health care solutions;

The actual deployment of products or solutions in health care settings are in the remit of individual health care organisations and in the national competence of Member States according to Art. 168 TFEU. Moreover, while outputs of certain actions are supposed to serve as input to regulators, health technology assessment bodies or health care organisations to optimise their internal processes, implementation of these inputs will remain at full discretion of the bodies concerned as they need to remain independent, objective and free of conflicts of interest. The IHI objectives are focussed on pre-competitive space, therefore not infringing EU competition- and state-aid rules.

There is risk that the proposed objective would be seen as a ‘push’ from industry and therefore public authorities and health technology assessment bodies would be hesitant to engage. However, such approaches – if ultimately implemented in real life settings – would result in a win-win for the public and private sectors, and would lead to a shift into new areas of health innovation and eventually deployment of innovative solutions.

Interviewees were overall supportive of the initially defined specific objectives, in particular respondents coming from industry and research infrastructures. Patient associations expressed the most concern, feeling the objectives were not sufficiently patient-centric. These views were taken into account when formulating the specific objectives presented above. There were some comments across stakeholder groups that the objectives were too broad, but it was understood by stakeholders, primarily in industry and research infrastructures, that it was not possible to define specific disease areas at this stage.

In the **feedback to the inception impact assessment**, non-private actors (NGOs, academics/research institutions, and public authorities) were calling for broader stakeholder involvement. This point was stressed in particular by NGOs including patient organisations and public authorities. This was also repeated by **interviewees** who emphasised the need to include additional stakeholders beyond industry and academia.

Fulfilling the specific objectives will indeed help to address the underlying problems, improving the industry competitiveness, health status of the citizens and preparedness for future health threats. This would be achieved by focussing on pre-competitive collaboration in areas that are of strategic interest for the EU, based on the public health needs but also based on the positioning of the EU industry in the global health value chains.

IMI has delivered innovations in the pharmaceutical domain, therefore they were mainly focussed on therapy, while IHI could address health challenges in a much broader manner, with more focus on prevention strategies, preparedness and diagnostics. Compared to the scope of IMI: SO1 which was partly addressed by the predecessor initiatives from the point of view of the action of drugs but less so from the point of view of prevention; SO2 is far broader as it covers improved prediction, prevention and diagnosis; SO3 will work explicitly towards integration of various health technologies (for example, medicines and diagnostics); SO4 expects to harness new digital solutions to improve health and health care, not available to a significant extent at the time of establishing IMI2 JU; SO5 reflects the regulatory and uptake needs stemming from the emergence of combination products (e.g. medicines and mobile apps) that do not easily fit into current regulatory schemes.

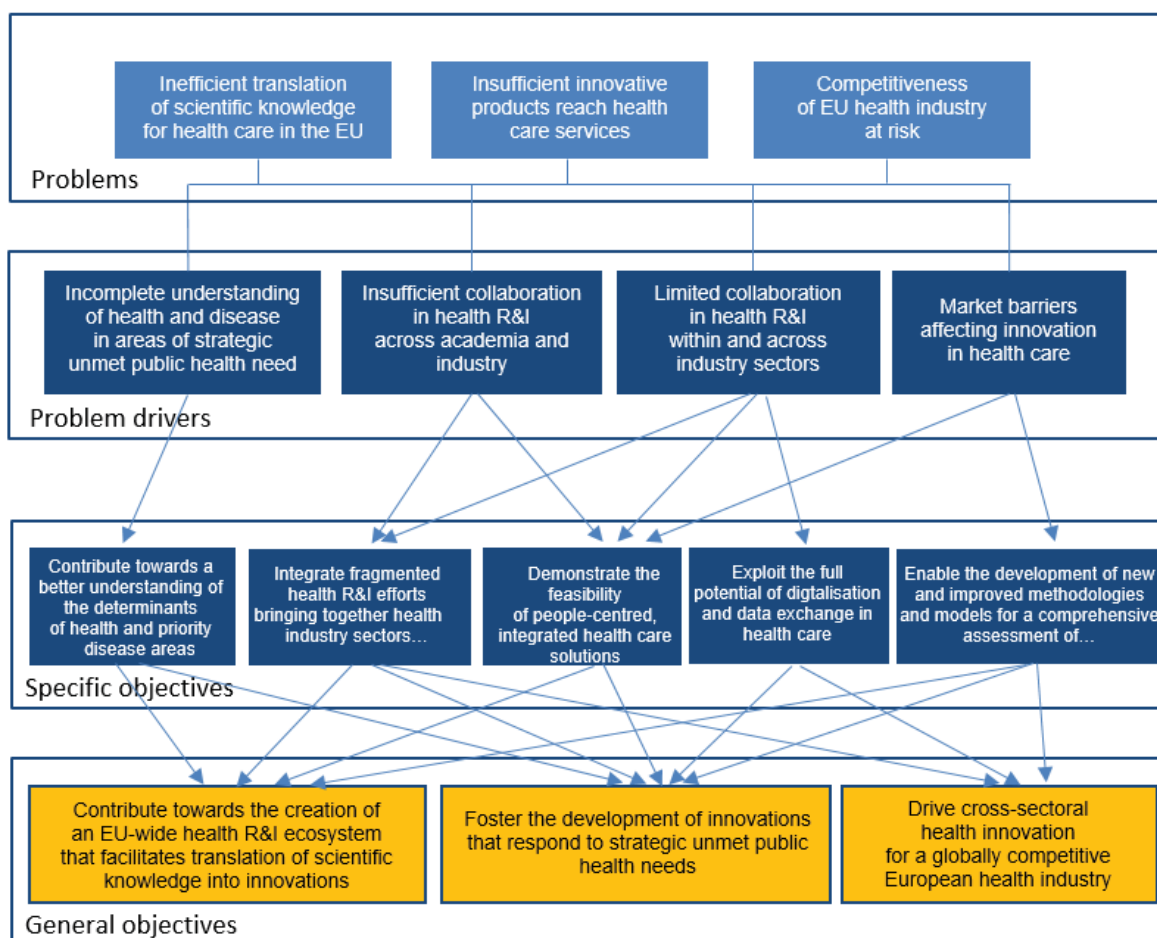

The COVID-19 crisis, as earlier the Ebola and Zika crises, have confirmed the need to address health challenges at multiple entry points, but in an agile and coordinated manner, encompassing data collection and analysis, diagnostics, prevention including by mobile health approaches, development of therapeutics and long-term prevention by vaccination – taking into account the specificities of the EU health research systems and industrial value chains.

By targeting these objectives, IHI would (a) address clear public health needs, (b) contribute to alleviate market barriers, such as those related to insufficient regulatory convergence, (b) increase the uptake of innovations by better reflecting the needs of the end-users and (d) fulfil industries' expectations in terms of return on investment in the early phases of research. The principal value of the proposed partnership for its stakeholder would be access to novel multisector collaborations at pre-competitive stage. This goes together with sharing new skills and data necessary to tackle new objectives and ultimately increasing the future competitive edge of participating companies. This opportunity is not offered at this scale by any other EU funding instrument.

4.3. Intervention logic of the initiative

The relationship between the general and specific objectives of the potential Innovative Health Initiative is shown in Figure 8.

Figure 8: Intervention logic for the initiative on Innovative Health

The translation of health R&I into products is a complex phenomenon that – beyond understanding the molecular basis of certain diseases – also depends on successful demonstration of safety and efficacy during the clinical phases of development, followed by regulatory steps and pricing & reimbursement decisions before innovations can reach the market and end-users, such as patients and health care professionals. In that respect, health R&I differs from a purely engineering or technological development where one outcome (e.g. a working prototype that can be up-scaled for market uptake) could directly result from one underlying intervention (e.g. a certain number of clearly defined technological improvements). For this initiative, specific objectives can be interlinked and address jointly one or more problem drivers.

For example, integrating health R&I efforts across actors and technology sectors (specific objective 2) and exploiting data and digital tools (specific objective 4), will facilitate understanding the causes of disease (specific objective 1), e.g. by more efficient use of data in clinical trials. It can also contribute to accelerated development of integrated health solutions (specific objective 3), for example by introducing mobile health solution to monitor the efficacy of treatment. Providing regulators with adequate data and methodological toolboxes to speed up regulatory uptake (specific objective 5), will also support the accelerated development of relevant health innovations (specific objective 3) by shortening the time to market and thus increasing the return on initial investment.

In particular, specific objective 4 relating to the use of data and digitalisation in health care was presented separately because it is key for linking all health industry sectors and it can

give a new angle to the process of developing new prevention or treatment strategies. Various companies indeed need and want to avail of and share consistent and interoperable data to successfully perform translational R&I but this cannot be done efficiently without inter-operable data standards, reliable data analytics tools or addressing privacy concerns. This is the reason why this initiative intends to enable a more effective, safer and ethical use digital technologies and data analytics in health research (for example, by the definition of common data exchange standards for electronic health records such that can be efficiently combined with data obtained during clinical trials of new medicines). In this way, this specific objective will help address the problems of lower R&I productivity and inefficient translation of research results into clinical practice.

The development of integrated people-centred solutions (specific objective 3) would be based on the integration of products and services developed by different industry sectors (specific objective 2), which would trigger collaboration between those sectors, thus responding to problem driver 2 “insufficient collaboration within and across industry sectors” but also problem driver 4 “market barriers affecting innovation in health care”. It would indeed require addressing existing barriers to collaboration such as, for example, developing common definition of precompetitive space, looking for convergence of business models, alignment of regulatory requirements (in particular for clinical evidence generation) and developing new methodologies to assess the value of those complex and cross-sectoral health solutions.

People-centred solutions are those developed around the needs and preferences of patients, their carers (formal and informal) and citizen at large rather than individual diseases (see footnote 122 for a full definition). This approach aims at limiting siloed approaches across health care services but also across industry sectors. In this respect, specific objective 3 would also respond to problem driver 2. In addition, development of people-centred approaches implies taking into account, from the start, the needs and preferences of the patients and health care professionals. This would in turn increase the probability of better responding to the needs people and health care systems, thus lowering market barriers to innovation (problem driver 4).

Specific objective 5, related to delivering new methodologies for assessing the added value of health innovations, is indeed linked to market barriers affecting innovation in health care (identified as problem driver 4) that are partly due to the lack of methods to assess the added value for patients and society of novel, cross-sectoral health solutions. Such methods are used by the industry to demonstrate the benefit brought by an innovative solution and by health care authorities/institutions to inform their decision on reimbursement and pricing. A lack of such methods has consequences on both availability and accessibility of health innovations. It negatively impacts R&I investment decisions due to increased uncertainty around the future reimbursement by health systems. It also has an impact on implementation of innovations in health care systems because such methods are essential for the public health actors to assess the added value for patients and society, decide on coverage decisions, negotiate prices with industry and determine the conditions under which to implement those innovations in order to maximise health benefit for society.

Unmet public health needs result from a lack of availability or accessibility to health care in areas of public health importance. Specific objective 5 would imply developing solutions able to tackle either availability of health care technologies (e.g., by stimulating their development and providing the necessary conditions for it) or their accessibility (e.g., by providing the support to efficiently implement those technologies in health care systems so that they are available to people). Developing methods to assess the added value of

integrated, cross-sectoral innovations would indeed help to tackle both availability and accessibility issues, thus reducing barriers to market for those innovations (problem driver 4).

How would success look like?

Should the initiative deliver on its specific objectives, it is expected that it would translate in practice into the following expected impacts:

Scientific impacts

If successful, the initiative is expected to demonstrate various types of scientific impacts:

- Strengthened EU skills and capacity in academic and industrial health R&I;
- A thriving EU-wide cross-sectoral health R&I ecosystem created;
- New scientific paradigms established in areas of unmet public health needs.

Overall the initiative would strengthen the scientific base for the development of new prevention strategies, diagnostics and treatments. Additionally, integrating the main biomedical industry sectors is expected to lead to improved mutual understanding of particular knowledge needs of the different industry sectors and improved cost-effectiveness of R&I investment by reducing inefficiencies due to boundaries between disciplines. In the long run, this would result not only in an increased cross-sectoral collaboration at research level, but could also stimulate changes of paradigms for the actual translation of scientific findings into concrete health and care approaches. Moreover, knowledge creation and skills development through collaborative projects, especially across public and private actors, is set to strengthen Europe's human capital in health R&I.

Economic/technological impacts

If successful, the initiative is expected to demonstrate a set of economic/technological impacts:

- More productive and globally competitive EU health industries that create jobs and growth and are able to quickly respond to health threats;
- Better, safe, effective and cost-effective health technologies, tools and digital solutions;
- Increased level of public and private investments into strategic unmet public health needs, providing the foundation for innovative technologies to address these areas.

If successful, the initiative would further lead to reduced investment risk in R&I, due to collaborations and the involvement of several industrial sectors; increased access to industrial data for academic researchers; increased efficiency of R&I investments through targeted use of biomedical research resources, both public and private. In doing so, the initiative could contribute to strengthening the competitiveness of Europe's health industry, a cornerstone of Europe's knowledge-based economy, to an increased economic activity in the production, distribution and sales of health technologies, and thus serve as a tool for increasing technological sovereignty. It could directly and indirectly create highly skilled jobs, both in academia and industry.

Societal and environmental impacts

If successful, the initiative is expected to demonstrate a set of societal impacts:

- Improved health and wellbeing of EU citizens;
- Reduced health inequalities and improved access to high-quality health care in priority disease areas, thereby addressing unmet public health needs;
- Strengthening circular economy and mitigating the negative health impacts of climate change.

Overall, if successful, the initiative is likely to contribute to improved health outcomes for European citizens, expressed as more life-years in good health thanks to more effective prevention, a lower burden of disease, improved patient experience of care, better diagnoses and more efficient therapies. It is expected to constitute an incentive for industry to invest in unmet public health needs, such as brain disorders. More effective, affordable and easily implementable solutions for health care, would allow more patients to be treated more effectively and potentially with fewer resources thus further reducing operational and financial burden on health systems in the longer term.

The scope of the proposed initiative would also cover innovation in manufacturing, including green manufacturing, a circular economy approach to the product lifecycle and the overall environmental footprint, thus leading to a positive effect on the climate and the ecosystem in general. Moreover, a more wide-spread use of digital solutions in medicine should lead to better health or disease monitoring in real life and to reduced need for travel to health care centres.

However, whether these impacts will actually be achieved and to what extent, will depend on the types of projects funded through the initiative. Digital health technologies that can be used remotely are likely to result from the initiative, leading to lowering greenhouse emissions in the long term. At the same time, the increased use of energy related to more wide-spread use of data-intensive approaches and digital tools (e.g. using energy to store, process, analyse and exchange data), may counterbalance this benefit, depending on the proportion of energy from renewable sources used to power health care.

4.4. What is needed to achieve the objectives – key functionalities needed

Given the focus of the impact assessment on comparing different forms of implementation, the identification of “key functionalities needed” allows making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. These functionalities relate to the type and composition of actors that have to be involved, the type of range of activities that should be performed, the degree of directionality needed and the linkages needed with the external environment.

4.4.1. Type and composition of actors to be involved

The initiative needs to involve all type of actors along the health value chain in priority setting and in funded projects:

- Key actors: researchers from academia and various industry sectors, to ensure the best opportunity for generating new scientific ideas and successful R&I activities (and thus for reaching specific objectives 1, 2 and 3 that lead to expected scientific and economic/technological impacts);
- Users: patients and citizens, health care professionals and health care providers to provide input into the strategic design and activities of the initiative, ensuring that it addresses the needs of end-users (necessary to reach specific objectives 2 and 3, and consequently the scientific/technological and societal impacts);

- EU-wide and national regulatory authorities, HTA bodies and health care payers to provide early input to the activities of IHI. Given that health products and services are subject to evaluation of safety, effectiveness and in many cases, cost-effectiveness before being placed on the market, this early input would help avoid wasted research and would increase likelihood that the results of IHI actions will meet regulatory requirements necessary for uptake (via reaching specific objectives 3 and 5, ultimately leading to societal impacts).

Based on the interim evaluation of IMI2 JU (see Annex 6 for details), a lesson to be learned is the need to ‘enable the active engagement of other industry sectors with the pharmaceutical industry to capitalise on their expertise in the development of new health care interventions’. Therefore, the industry sectors need to cover the biopharmaceutical, biotechnology and medical technology sectors, including companies active in the digital area. These actors are necessary (to a varying degree, though) to achieve each of the specific objectives. As an overarching requirement, better early engagement with regulatory bodies would likely limit wasteful or inefficient research and speed up deployment, at the same time addressing a weakness identified in IMI2 JU interim evaluation (explained in Annex 6) and a recommendation from IMI2 JU Scientific Committee¹³⁸.

Member States overall (except one) did not express the wish for a tripartite partnership involving the industry, Member States and the EU¹³⁹.

Openness and flexibility to integrate players from emerging and/or adjacent technologies is vital, notably to reach specific objectives 2 and 3 to demonstrate feasibility of people centred, integrated health care solutions, as well as objective 4 aiming at harnessing the full potential of data and digitalisation for health innovations that rely on data use and on the rapidly changing field of digital technologies. Therefore, new entities should be able to join the initiative as members if emerging health challenges would so require, in this way also responding to input from targeted stakeholder consultation. This openness and flexibility should also be reflected in the participation into IHI-funded actions, notably to ensure the agility and ability to quickly mobilise all actors in the health value chain, in order to respond to newly emerging health threats, including pandemics¹⁴⁰.

Furthermore, it is essential to facilitate the participation of innovative SMEs in projects (thus addressing another weakness identified for IMI2 JU) to ensure reaching specific objective 2 aimed at integration of fragmented R&I across technology sectors and other stakeholder, and to help achieve the scientific and economic/technological impacts.

There are areas of health technology, data analytics and expertise in certain health conditions that are more advanced in non-EU countries (or where a higher number of people

¹³⁸ Early dialogue with regulators was identified by IMI2 JU Scientific Committee as desirable for a successful public-private collaboration. IMI2 JU Scientific Committee recommendations regarding public private partnership funding – what makes a topic ultimately suitable for this kind of funding model, https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/Governance/sc/SCrecommendations_PPPfunding.pdf; IMI2 JU Scientific Committee recommendations regarding involvement of regulators and regulatory science, https://www.imi.europa.eu/sites/default/files/SC%20Recommendation_Involvement%20of%20regulators%20and%20regulatory%20science_FINAL.docx.pdf.

¹³⁹ Specific reasons were not provided in the structured consultation of the Member States.

¹⁴⁰ In the case of COVID-19 pandemic, IMI2 JU was able to – within a few weeks only – mobilise the investment of EUR 72 million of EU contribution accompanied by EUR 45 million in-kind investment from pharmaceutical companies, aimed at development of treatments and rapid diagnostic tests useful in the fight against the current and/or future outbreak. <https://www.imi.europa.eu/apply-funding/open-calls/imi2-call-21>.

are affected by a certain disease that also threatens EU population). Therefore, a certain openness of the initiative and participation by these international academic, industrial and regulatory actors is also desirable, in order to be able to benefit from this expertise, to respond to emerging health threats and thus realise the necessary societal impact, notably of improved health outcomes for EU citizens.

4.4.2. Type and range of activities needed

The fundamental building blocks of an initiative on innovative health would need to be collaborative R&I actions that foster academia-industry, industry-industry and cross-sectoral collaborations, particularly important for specific objectives 1, 2 and 3 (related to better understanding the determinants of health and disease, integration of R&I efforts and fostering the development of integrated health solutions). Some actions may also advance assets¹⁴¹ to technology validation and the building of technology prototypes, thus benefitting from more focussed pilots, validation and demonstration activities, notably to demonstrate the feasibility of integrated health care solutions, exploit the potential of digitalisation and deliver methodologies and models for the assessment of added value of health innovations (covered by specific objectives 3, 4 and 5). The involvement of a broader set of actors, including users, is necessary, to ensure that the initiative accelerates the development of people-centred products as defined in specific objective 3. Coordination and support actions can provide useful means to conduct policy dialogues around ethics, standardisation and regulation, in line with specific objective 5.

The activities would need to focus on pre-competitive R&I, thus creating a safe space for collaboration between potential market competitors, such as pharmaceutical companies active in the same therapeutic area, e.g. cardiology or oncology, or diagnostic companies developing related technologies, e.g. for improved imaging or for rapid viral infection testing. This range of activities is important for better understanding the determinants of health and disease, integration of R&I efforts over technology areas and for making it possible to develop integrated health solutions (in line with specific objectives 1, 2 and 3), as well as for reaching the impacts of strengthened health R&I capacity in a cross-sectoral, EU-wide ecosystem. This proposed range of activities builds on the positive experience from IMI2 JU¹⁴² that should now be expanded to cover more health industry sectors.

4.4.3. Priority setting system and level of directionality required

Reaching all the objectives requires a long-term strategic vision and committed partners working in collaborative R&I projects, aiming to achieve more than would be possible to achieve if working in isolation, in order to make a step change in accelerating the development of innovations in specific health and disease areas, for the benefit of patients, health care providers and systems. A jointly agreed strategic research agenda is therefore needed so that the shared vision aligns with the individual goals of the members of the initiative, and so that all actors have a clear understanding of how the various elements of the initiative will fit together in a coherent manner, building commitment and trust and contributing to reaching the jointly agreed objective and thus impacts. The strategic vision

¹⁴¹ “Assets” may be e.g. new drug or diagnostic candidates, drug targets, biomarkers, health research tools, clinical trial methodologies, industrial processes, services etc.

¹⁴² According to IMI2 JU interim (2014-2016) evaluation: ‘the main achievement of IM2 JU on which there was general consensus, was that since the JU started, collaborations between different competing global companies, SME’s and academia became possible. These collaborations created trust and new links [and] were considered an important asset for European pharmaceutical research.’

should be shared and implemented as much as possible by the key stakeholders along the whole value chain.

The EU contribution is expected to mobilise an additional (at least 100%) private sector contribution¹⁴³ (in-kind or financial) that the industry would not have otherwise spent in strategic unmet public health areas, in particular in cross-sectoral collaboration. This type of commitment to pool resources only happens beyond the scope of individual projects and requires long-term predictability and commitment to the jointly accepted strategic research agenda. Thanks to these additional resources, the initiative would ensure the necessary leverage to be able to successfully tackle its objectives and deliver on its impacts.

4.4.4. Coherence needed with the external environment

The initiative would need to seek synergies with other Horizon Europe initiatives and partnerships in the health domain, in particular with the planned Partnership on Transforming Health and Care Systems (potential interdependencies were explained in Section 1.3). Beyond health, the ‘Key Digital Technologies’ initiative would likely offer complementary approaches to promote the digital transformation of the health sector, at the same time ensuring the protection of privacy and sensitive human data (relevant in particular for specific objective 4 and 5).

The EU policies on clinical trials, market authorisation of pharmaceuticals, ATMPs and medical devices would need to frame the activities from the regulatory side. The new Industrial Strategy for Europe¹⁴⁴, the EU Pharmaceutical Strategy for Europe¹⁴⁵ and the SME strategy for a sustainable and digital Europe¹⁴⁶ will provide an additional policy guidance for the initiative.

On digitalisation (linked in particular to specific objective 4 on exploiting the potential offered by digitalisation in health innovations), the initiative should be linked with the Digital Europe programme as regards the necessary test and experimentation infrastructures and advanced digital skills for the validation and initial deployment and uptake of digital health innovations. The initiative should be linked with the Connecting European Facility, with its eHealth Digital Service Infrastructures (eHDSI), as regards the capacities to scale up these digital health services across EU Member States via cross-border (interoperable) health data exchange and related international standards.

Effort to ensuring internal and external coherence would reflect a lesson learned from one the weaknesses identified in IMI2 JU, i.e. insufficient coherence and alignment with regional and national policies and strategies (see Annex 6).

5. WHAT ARE THE AVAILABLE POLICY OPTIONS?

This section describes the specific functionalities that could be provided under the baseline scenario of traditional calls and the different options of different types of European partnerships.

¹⁴³ The leverage of IMI2 JU reached 99% in 2018, according to IMI2 JU Annual Activity Report 2018 (private commitment vs EU funding).

¹⁴⁴ COM(2020) 102 final

¹⁴⁵ COM(2020) 761 final

¹⁴⁶ COM(2020) 103 final

5.1. Option 0: Horizon Europe calls (baseline)

The baseline scenario used in this impact assessment is a situation without a partnership and only traditional calls of Horizon Europe. Given that there is a predecessor partnership (IMI2 JU) as well as other funding sources in the area, these will continue generating effects even if there is no new partnership. These already existing initiatives are expected to create longer-term effects on health innovations. This is taken into account in the effectiveness assessment.

IMI2 JU was established by on a Council regulation and is time-bound, without a mechanism for automatic renewal of the initiative. With no action, 2020 is the last year of launching calls and IMI2 JU will cease to exist in 2024. This justifies the choice of regular Horizon Europe calls as the baseline. Therefore, in the baseline situation, the current implementation structure of the Article 187 would be closed, which bears winding down and social discontinuation costs. There would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular (analysed in more detail in Section 6.2). This is also taken into account in the efficiency assessment.

Table 2: Key characteristics of the baseline situation - Horizon Europe calls

	What is feasible under this option - Functionalities of option
Enabling appropriate profile of participation	<ul style="list-style-type: none"> - Given the broad range of activities and actors envisaged, the Commission would need to consult extensively with a wide range of stakeholders to translate the strategic R&I agenda for health into annual work programmes. However, under this option, the setting of scientific priorities and definition of call topics would follow the usual Commission comitology procedure that does not involve formal consultation of the industry and hence tends to be more academically oriented. - The feasibility of engaging key actors: researchers from academia and various industry sectors users (patients, health care professionals, health care providers) and regulatory authorities would be low since traditional calls do not offer a structured mechanism for such engagement. Regarding specifically the necessary industry sectors (pharmaceuticals, medtech, biotech, imaging, vaccines), the likelihood of engaging the various industry participants jointly would be very low¹⁴⁷
Supporting implementation of R&I agenda	<ul style="list-style-type: none"> - All types of funding instruments could be used. - Implementing the strategic research agenda would require the mobilisation, expertise and support of the health care industry. The calls are very open and flexible, though, enabling participation of actors along the health value chain in ad-hoc combinations, on a project basis. - Calls for proposals would be published in the work programmes of Horizon Europe. Implementation would thus rely on standard infrastructure underpinning the open calls, drawing on resources of the Commission or relevant executive agency and Commission IT systems. - Additional administrative costs for the European Commission would be low. - Dissemination of knowledge and sharing of practice would happen predominantly among partners within the project consortia.
Ensuring alignment with	<ul style="list-style-type: none"> - Annual work programmes developed through the comitology process are expected to cover a broad range of health issues, with fundamental discovery research prioritised.

¹⁴⁷ See details in Section 2.2.2.

R&I agenda	<ul style="list-style-type: none"> - Receiving the necessary input from representatives of all relevant stakeholders (including industry and end-users) is unlikely, in absence of a dedicated mechanism for that. - Projects delivered within and across calls may not synergise and critical mass for addressing priorities may be limited. - Annual work programmes could respond to emerging R&I needs and new technological developments in health over time but the process is less agile to adapt to unforeseen changes in a coordinated manner. - Commission input into specification and oversight of calls would help to ensure alignment with overarching policy objectives, even if full integration with other programmes would require additional coordination. In the absence of a dedicated implementing structure, traditional calls would offer less effective alignment with other key initiatives and organisations in the global health R&I arena.
Securing effective leveraging of resources	<ul style="list-style-type: none"> - EU grant funding would be the dominant financial contribution to projects, attracting mainly academic and SME researchers and other public sector organisations. - Traditional calls are not capable of attracting additional funds from industry; rather, the calls provide funding for industry partners. - Participation of big pharmaceutical companies would be unlikely or limited, due – among others – to those companies’ aversion to accepting such public funding.
Key differences compared to the current situation	<ul style="list-style-type: none"> - Discontinuation of IMI2 JU without a successor, entailing the winding down costs and losing a large amount of intangible assets, such as the brand, networks and partly also the know-how built up since 2008, when IMI started to operate. - Potential applicants and the general public would lose the targeted communication activities and various forms of support offered by the Programme Office after it has closed operations. - The pharmaceutical sector would lose a ‘neutral platform’ of collaboration in pre-competitive space.

5.2. Option 1: Co-Programmed European Partnership

Table 3: Key characteristics of Option 1 – Co-Programmed European Partnership

	What is feasible under this option - Functionalities of option
Enabling appropriate profile of participation	<ul style="list-style-type: none"> - The initiative would be based on a memorandum of understanding or a contractual arrangement between the European Commission and the private partners. - The partnership would need to consult with industry representatives and a wide range of stakeholders, including end-users, to ensure that the strategic research agenda (and ultimately the annual work programmes) is aligned with industry needs, is feasible and that it addresses strategic unmet public health needs. - It would enable participation in projects by all key public and/or private stakeholders along the entire health and care innovation pathway, across communities and technology sectors and/or value chains and where the actors have widely differing capacities and capabilities. - The composition of partners can change over time, allowing for flexibility and adaptation to emerging needs in the health R&I arena.
Supporting	<ul style="list-style-type: none"> - All types of funding instruments could be used.

implementation of R&I agenda	<ul style="list-style-type: none"> - Calls for proposals would be published in the work programmes of Horizon Europe. Implementation would thus rely on standard infrastructure underpinning the open calls, drawing on resources of the Commission or relevant executive agency and Commission IT systems. - Progress in the delivery of the R&I programme would depend on the willingness of stakeholders to support individual projects, rather than on longer term, firm commitments. - Other stakeholders would have limited control over the precise definition of the calls, limiting the extent to which calls can be adapted to the specific needs of certain end-users.
Ensuring alignment with R&I agenda	<ul style="list-style-type: none"> - Under the co-programmed option, a strategic roadmap is agreed between the EC and the partners involved. The work programmes are developed through a comitology process. - R&I activity would be likely to focus on the medium-term needs of partners. - This option allows for the creation of a dedicated small office to manage the initiative, financed via a Coordination and Support Action. However, this option would not allow for creation of a dedicated implementation structure and a broader coordination of programmes.
Securing effective leveraging of resources	<ul style="list-style-type: none"> - This option could mobilise additional private sector resources, with the likely low level of 'additionality'. Lower level industry contribution would probably be reflected in smaller overall EU commitment. - Aspirations for partners' contributions would need to be clearly defined at the outset, in line with the level of predictability of open call topics. - Projects under this option are funded under the same rules as in option 0, and thus are not attractive for certain big companies, including from the pharmaceutical sector. These firms play a key role in the targeted industry-academia and industry-industry collaborations and are the most capable of providing additional resources (in-kind or in-cash).
Key differences compared to the current situation	<ul style="list-style-type: none"> - Discontinuation of IMI2 JU without a successor, entailing the winding down costs and losing a large amount of intangible assets, such as the brand, networks and partly also the know-how built up since 2008, when IMI started to operate. - Potential applicants and the general public would lose the targeted communication activities and various forms of support offered by the Programme Office after it has closed operations. - The pharmaceutical sector would, to a large extent, lose a 'neutral platform' of collaboration in pre-competitive space.

5.3. Option 3: Institutionalised European Partnership under Article 187 TFEU

Table 4: Key characteristics of Option 3 – Institutionalised European Partnership (Article 187 TFEU)

	What is feasible under this option - Functionalities of option
Enabling appropriate profile of participation	<ul style="list-style-type: none"> - A membership structure clearly defined from the outset allows for a binding engagement of the necessary industry partners. - Participation would be less flexible than under other options, but it might nevertheless be possible to change the composition of founding partners over time, to support new

	<p>areas of activity in response to emerging challenges and evolving priorities.</p> <ul style="list-style-type: none"> - It would provide a platform for consulting stakeholders on R&I priorities and the work programmes, ensuring that they are aligned with industry, research and end-user needs and with the agenda of other partnerships. - The integration of the needs of all relevant industry sectors and public actors would be reflected in the specification and expected delivery of the strategic research agenda. - Eligibility for participation and funding would follow Horizon Europe rules by default, the basic act may include, e.g. certain adaptations of intellectual property rules and broader participation, e.g. of international actors from non-EU countries. This has particular relevance in health R&I, since many world-leading industrial players, particularly from the UK, US and Japan, have extensive R&I activities in the EU.
<p>Supporting implementation of R&I agenda</p>	<ul style="list-style-type: none"> - Legally binding funding arrangements and dedicated administrative resources would ensure implementation of the strategic research agenda for the whole duration of Horizon Europe. - A dedicated legal entity would be created with responsibility to coordinate the implementation of the jointly agreed strategic research agenda, manage implementation of calls, monitor key indicators and report on the results. - Dissemination of knowledge and share of practices would happen among the stakeholders of the community, with potential diffusion activities managed by the Programme Office. A dedicated administrative structure would be established to coordinate the specification of R&I activity, manage implementation and report on the results (with administrative expenditure limited to a percentage of the budget).
<p>Ensuring alignment with R&I agenda</p>	<ul style="list-style-type: none"> - The partnership would be responsible for specifying work programmes in line with strategic research agenda. - The work programme would reflect the medium- and long-term needs of industry, the EU policy needs as well as the needs of end-users represented in the governance structures. - Commission participation in the partnership governance arrangements and approval of the work programme would help to ensure alignment with overarching policy objectives and enable integration with other programmes and initiatives.
<p>Securing effective leveraging of resources</p>	<ul style="list-style-type: none"> - Legally binding funding requirements would be clearly defined at the outset. - High possibility for leveraging funding from industry partners as their contributions can be matched by the EU. - Risk sharing, new collaborations and EU co-financing would likely stimulate additional industry investment, not mobilised otherwise.
<p>Key differences compared to the current situation</p>	<ul style="list-style-type: none"> - Building on the current partnership albeit with a significantly broadened scope, enlarged partner composition and revised objectives to better harness cross-sectoral collaborations and the new opportunities they may offer. - Extensive explanation of similarities and differences is provided in a tabular format in Section 6.4.

This partnership type could build on the lessons learnt and achievements of the IMI's almost 15-years long history. Associations of medtech, biotech, imaging and vaccine industry sectors have indicated a strong preliminary interest in becoming members of such an Institutionalised Partnership, along with EFPIA's continued interest. The new associations have a large number of SME partners, across various geographies, which could help address

three issues of the current IMI2 JU¹⁴⁸: (1) low participation of industry sectors other than pharma such as imaging, diagnostics, medical technology and ICT; (2) limited SME participation; (3) geographic disparities in participation patterns.

For big companies, this option could allow participation while refraining from receiving EU-funding, which would increase their willingness to engage. An Article 187 partnership offers strong, long-term strategic steer (directionality) and the highest additional private sector resources to reach the objectives (additionality). A pre-requisite for such a significant additional investment is that industry partners have a role in co-developing and executing the strategic research agenda (SRA), in programme supervision (via membership in the governing board with voting rights) and in communications. All these conditions are fulfilled if the initiative is implemented as an Institutionalised Partnership.

5.4. Options discarded at an early stage

A Co-Funded Partnership and an Institutionalised Partnership created under Article 185 TFEU are not considered relevant for this candidate partnership. As the initiative's objectives include facilitating innovation and boosting competitiveness of European industry, this naturally requires participation from industry at its core. The discarded options focused on public-to-public cooperation and thus would not be appropriate for this initiative.

6. HOW DO THE DIFFERENT POLICY OPTIONS COMPARE TO ACHIEVE THE EXPECTED IMPACTS?

Based on the objectives pursued by the initiative and the key functionalities identified to be able to achieve them, each option for implementation is assessed in terms of effectiveness, efficiency and coherence compared to the baseline scenario of traditional calls. The analysis is primarily based on the degree to which the different options would cater for the key needed functionalities. All options are compared to the baseline situation of traditional calls, which is thus consistently scored at 0 to serve as reference point.

6.1. Effectiveness

To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into 'expected impacts' – how success would look like – differentiating between scientific, economic/ technological, and societal (including environmental) impacts. This section considers to which extent the different policy options would allow delivering these expected impacts – confronting what is needed (functionalities) with what each form of implementation can provide in practice. The assessments in this section set the basis for the comprehensive comparative assessment of all retained options against all dimensions in Section 6.4, based on a scoring system¹⁴⁹.

Scientific impacts

The baseline option is expected to result in many discovery science projects, leading to the elucidation of mechanisms of various health and disease conditions, and likely to major fundamental discoveries. However, by themselves, these calls would likely not be focused on clinical development nor would deliver implementable complex health solutions. For that

¹⁴⁸ European Commission (2017), The Interim Evaluation of the Innovative Medicines Initiative 2 Joint Undertaking (2014-2016) operating under Horizon 2020. Experts Group Report. Luxembourg: Publications Office of the European Union.

¹⁴⁹ A more in depth and detailed analysis of each policy option is provided in Technopolis Group (2020)

to happen, a more strategic approach is needed, with a broader ‘portfolio-level’ thinking, strategic steer (directionality) towards common objectives, alignment of individual projects and the joint participation of industrial partners.

Multi-company and multi-sector collaborations are infrequent in research projects funded through regular calls so far¹⁵⁰ and the same is likely in the future. Horizon Europe calls would therefore miss out on the opportunity to link up SMEs, academia or public research organisations having innovative concepts with large companies that have the resources to develop these concepts further and ultimately bring solutions to market.

Moreover, under the baseline option, neither the Commission nor the partners make an upfront budgetary commitment. This also implies less political commitment and reduced visibility to the field compared to an initiative under a partnership approach. Therefore, the impact on increasing the scientific leadership in the EU, readiness to respond to new health threats and technological sovereignty would be significantly lower than in a partnership.

Stakeholder opinion

Interviews indicated that regular calls would be effective at achieving scientific impacts but would have a more limited scope due to budget and timeline constraints. Many smaller projects under regular calls could potentially result in duplication of efforts and limited internal coherence, and would be unlikely to enable the establishment of large research platforms. No respondent from the consultation on the inception impact assessment mentioned Horizon Europe regular calls as a preferred option to implement IHI.

Option 1 (Co-Programmed Partnership, CPP) would be able to attract broader communities and a diverse set of actors with differing capacities and capabilities. It is conducive to working across the public/private divide and to engagement with health professionals, health authorities, patient organisations and standards bodies to work towards common objectives (directionality). SMEs, some larger companies and other strategic partners could be engaged to some extent due to the medium-term strategic research direction. However, industry stakeholders would have more limited contribution to the detailed definition of the calls, hence restricting their interest to participate at full scale and commit financially to the initiative (especially the larger companies). The absence of an established mechanism to value private entities’ contributions, such for in-kind on additional activities (established only at the level of Council regulation for Art. 187 initiatives) that increase the leverage and bring valuable resources to projects, would leave large industries’ involvement and investment in projects at a very moderate level. This option therefore provides a similar potential as the baseline to lead to *strengthened EU skills and capacity in academic and industrial health R&I*, without reaching the full potential of this impact dimension. A CPP would likely focus on creating new cross-sectoral networks and opportunities for sharing expertise, resources and new knowledge. Therefore it has a similar potential as the baseline to *create a thriving EU-wide cross-sectoral health R&I ecosystem*.

The CPP would likely succeed in exploring some major scientific questions, including those that advance regulatory science to a great extent. Therefore, this option would offer similar potential as the baseline to *establish new scientific paradigms in areas of unmet public health needs*, therefore scored as 0.

¹⁵⁰ The main beneficiaries of the 7th Framework Programme (FP7) and Horizon 2020 health areas were academia and public research organisations. The private sector made up about one fifth of all participants, mainly SMEs plus some large companies, albeit sporadically. Further analysis of this situation can be found in the impact assessment study report Section 6.1.1.

Stakeholder opinion

Interviews indicated that a Co-Programmed Partnership was preferred to Horizon Europe regular calls in particular due to the longer term focus. However, it was felt that the commitment under the CPP option would not deliver the security needed to invest in truly innovative and risky ideas and may therefore not be attractive to some partners. Establishing common research agendas was seen as valuable but insufficient to overcome the barriers of different sectors working in isolation from one another, and the CPP would therefore not benefit from the full set of outcomes stemming from the cross-pollination of skills and knowledge under a partnership

Option 3 would have its long-term priorities enshrined in the SRA developed after broad stakeholder consultation, with the possibility to amend it when needed following a transparent process. The Institutionalised Partnership would have full responsibility for developing and implementing the annual work programmes without using the formal comitology process (the Member States' input would be secured via representation in IHI governance structures).

This option ensures the highest level of integration of stakeholders and the highest level of focus on strategic R&I questions to meet the desired specific objectives. With a high level of directionality, the strategic and potentially 'portfolio-level' approach would increase the chances of (1) integrating the currently disparate technologies of the various industry sectors and (2) creating a multi-stakeholder initiative that shares expertise, resources and knowledge for disruptive ideas of health innovation, necessary for addressing specific objectives, notably 1 and 2. In addition, option 3 offers stability with regard to funding members and financial commitments which will in turn support long-term scientific commitments. This option would thus offer a unique opportunity to bring academia, public research bodies and other actors (SMEs, but also regulators and health technology assessment bodies as well as end-users) closer to industrial partners. This would translate into good potential compared to the baseline for both *strengthened EU skills and capacity in academic and industrial health R&I* and contribute to the *creation of a thriving EU-wide cross-sectoral health R&I ecosystem* and facilitate uptake by health care systems. These two aspects would therefore be scored as +, compared to the baseline of 0 (of note, creating an R&I ecosystem is considered an endeavour of a very long time horizon, dependent on external factors such as the tax incentives or economic situation in general, preventing this option from receiving an even higher score).

This should, in principle, result in an increase in the relevance, quality and coherence of the portfolio of projects. There is, however, also a certain risk that the partnership calls for proposals will be 'over-specified' and, as a result, they will not attract the broadest array of applicants or any 'unorthodox' scientific proposals. On the other hand, this potential risk would be mitigated by the involvement of the EU in the decision-making process and ensuring sufficient openness of the call topics, and also compensated by the access of academic consortia to additional scientific expertise and valuable dataset held by the industrial partners. This would lead to equal impact potential *in establishing new scientific paradigms in areas of unmet public health needs* as the baseline¹⁵¹. Its score would therefore

¹⁵¹ The citation impact of IMI research is higher than EU and world averages. The field-normalised citation impact for all IMI papers is 1.99, compared to 1.10 for the EU and the baseline of 1 for the world. IMI is also compares favourably with similar organisations such as the Wellcome Trust, the Medical Research

also be 0. At the same time, the resulting developments would likely be of higher direct relevance for the end-users, including EU citizens, health care practitioners and health care systems.

Stakeholder opinion

The proposed use of Article 187, and the establishment of a Joint Undertaking, was supported by 73% of Member States.

In the **inception impact assessment** consultation, 17 of the 18 respondents who spontaneously expressed their views on the mode of implementation were in favour of an Institutionalised Partnership, without any difference of views between the categories of respondents. Reasons cited for preferring this option were that it would enable long-term commitment of key stakeholders and ensure continuity of research ideas.

The majority of **stakeholders interviewed** felt that an Institutionalised Partnership would be the most effective means of delivering scientific impact. Stakeholders from industry saw this option as attractive because it would offer industry opportunity to co-develop research agendas. Similarly, stakeholders from other groups felt that having a diverse range of players would enable the development of research agendas that are more balanced across the needs of all actors, leading to more realistic and holistic research goals. The legally binding arrangement was seen as an advantage by providing a level of confidence to the stakeholders involved, hence facilitating the sharing of data required to achieve impact.

As for the **public consultation** on the 12 candidate Institutionalised Partnerships, respondents viewed long term commitment and long-term funding as major advantages for IHI. 55% of respondents indicated that IP was the best fit (with no difference between the views of citizens and other respondents), while only 9% supported a Co-Programmed Partnership (the remainder preferred either regular calls or a Co-Funded Partnership, a discarded option).

Economic/technological impacts

The baseline option would entail limited private sector involvement, as explained in Table 2 and in Section 6.1. Industry participation (by small, medium and large enterprises) is, however, essential to the process of advancing innovative assets (e.g. new candidate drugs or diagnostics) closer to deployment in the health care sector and international markets. The primary goal of IHI, namely to integrate the currently disjointed components of drugs, devices and software into real integrated health solutions (and thereby the specific objective 3) would not be achieved.

Under **Option 1**, the SRA could have industry contribution and therefore the Horizon Europe work programmes would be expected to have some technology focus mobilising interests from across the value chain, including the private sector.

Still, Option 1 would not offer dedicated support for managing the programme at a required scale, which is needed to ensure the proper budgetary control over industry contributions, ensuring consistency with other funding programmes, safeguard the establishment and

implementation of potential intellectual property arrangements that may stem from public-private collaborations, and to offer targeted communication activities (incl. to support SMEs participation). Therefore, the longer term prize of *more productive and globally competitive EU health industries that create growth and jobs and are able to quickly respond to health threats* would be beyond reach due to low integration of stakeholders (especially across industry sectors) and hence the likely impact for these aspects remains similar to the baseline, also receiving the score of 0.

The CPP's reliance on Horizon Europe calls would place some limitation on its directionality, as discussions on its strategic direction would be conducted through the comitology process. From this perspective, the impact on developing *better, safe, effective and cost-effective health technologies* is likely to be good compared to the baseline but still missing greater directionality facilitated by a dedicated implementation structure. Its score would therefore be + compared to the baseline of 0.

At the same time, openness under this option would likely favour collaborative working between the private sector and various public authorities, HTA bodies and end-users, thus contributing to improved conditions for health R&I, new adapted tools and models for value assessment and de-risking in strategic areas (notably, addressing specific objective 5). These would offer a good potential (scored as +) compared to the baseline (scored as 0) to translate into an *increased level of public and private investments into strategic unmet public health needs, providing the foundation for innovative technologies to address these needs*.

Option 3 would result in the closest alignment of research agendas, pooling of resources (including those from non-EU countries where the additional funds mobilised might be to a certain extent matched with the EU funding) and strong oversight of its project portfolio. Through a dedicated implementation structure, participants (including SMEs) would be able to benefit from adapted project support from set-up to post-R&I project activities. This should increase the likelihood of all actions delivering to their full potential.

The EU funding, combined with the high degree of directionality, would most likely attract commitment and financial leverage from the private sector supporting long-term challenges and priorities. The balance of private and public interest should be ensured through extensive stakeholder consultations prior to launching the initiative. During the partnership's lifetime, this balance would be supported by the governance structures with 50% voting rights for the EC and consultation processes to gather input from other public authorities, health care professionals and patients.

Industry could gain the long-term horizon and certainty needed to tackle risky projects in a safe environment. An Institutionalised Partnership therefore has high potential (++) compared to the baseline to develop *better, safe, effective and cost-effective health technologies, tools and digital solutions* through significant technology convergence, via fulfilling the specific objectives 2 and 3. A key element for the linking of the industry sectors is the necessity to avail of and share consistent and interoperable data, involving a wider use of innovative digital tools, leading to *more productive and globally competitive EU health industries that create jobs and growth and are able to quickly respond to health threats* and justifying the high potential (++) of option 3 to contribute to this impact, compared to the baseline. This assessment is supported by prior experience with public-private partnerships through the Innovative Medicines Initiative (IMI JU and IMI2 JU) and ECSEL where public and private stakeholders could innovate in a safe environment. IMI and IMI2 demonstrated the capacity to mobilise resources quickly to respond to emerging

challenges, such as the Ebola outbreak¹⁵² or COVID-19 outbreak¹⁵³. In the biomedical research field, IMI has international visibility and ‘brand’ that opens doors to new collaborations; an Institutionalised Partnership on Innovative Health could achieve the same or even more, given its envisaged broader composition.

There is also a question as to whether, in the longer term, the initiative would result in an *increased level of public and private investments into strategic unmet public health needs, providing the foundation for innovative technologies to address these needs*. On one hand, under option 3, the industrial partners would provide an up-front, legally binding commitment to the jointly agreed strategic research agenda. Thanks to risk sharing with other partners, new collaborations and EU co-financing of the resulting projects, this would likely stimulate additional industry investment, not mobilised otherwise. On the other hand, the initiative would be co-financed from the part of EU research budget devoted to health, therefore attributing a ‘good’ potential in this impact area (scored as +), compared to the baseline of 0.

Stakeholder opinion

Interviewees indicated that investors would have more confidence contributing to a partnership with a higher degree of integration as seen in the Institutionalised Partnership. This was particularly discussed in relation to industry, whose participation would precipitate essential market knowledge needed to achieve economic impacts. It was reported that this option would enable more detailed discussion around intellectual property upfront, further increasing confidence in the partnership from the outset. The majority of feedback to the **inception impact assessment** from business associations stated that Institutionalised Partnership would be the most effective option to guarantee commitment from the different partners, in particular SMEs for which a legal framework respecting intellectual property ownership requirements was seen critical for their involvement. This point was also highlighted by public authorities.

Out of the listed economic impacts in the **public consultation**, the largest number of respondents (81%) across all stakeholder groups indicated that the Institutionalised Partnership was very relevant to ‘better, safe, effective and cost-effective health technologies, tools and digital solutions for health’. This was also the case for ‘highly skilled jobs’ (54%), with the exception of ‘other’ stakeholders who generally felt this was less relevant. There was some disagreement between stakeholders from industry (business associations, company/business organisation) and non-private actors with regard to the partnership’s relevance to the economic impact of ‘more innovative, sustainable and globally competitive health industries’, with higher rates of industry stakeholders finding this ‘very relevant’ compared to non-private actors whose responses were more varied.

Societal impacts

¹⁵²<https://www.imi.europa.eu/projects-results/project-factsheets/ebola;>
https://ec.europa.eu/commission/presscorner/detail/en/ip_20_1248

¹⁵³ IMI2 JU was able to – within a few weeks only – mobilise the investment of EUR 72 million of EU contribution together with EUR 45 million commitment from industry, aimed at development of treatments and rapid diagnostic tests useful in the fight against the current and/or future outbreak of COVID-19. 8 project were selected from funding out of 144 proposals submitted. <https://www.imi.europa.eu/apply-funding/open-calls/imi2-call-21>.

Under the **baseline option**, the scale and size of these individual projects would not allow for the ‘pull through’ and valorisation of breakthrough discoveries in a timely manner. As discussed before, scientific breakthroughs in themselves do not create technological, economic and societal impacts. Individual projects under regular calls are unlikely to lead to significant change without strong consistency (external coherence) and the involvement of key actors, including from industry, over a more extended period of time. In the absence of strategic steer and outside contributions (directionality and additionality), the baseline option would translate to low potential for achieving societal impacts even in the longer term. In the absence of a dedicated implementation structure, traditional calls would not allow creating a common platform for large-scale collaboration between industry sectors (inherent to specific objective 2), which in turn would not allow the society to benefit from potential faster availability of new drugs or diagnostics (as targeted by specific objectives 2 and 3). This is because the ‘intermediary’ health technologies are not well-placed on their own to improve health promotion and disease prevention. Consequently, this option would not lead to *improved health and wellbeing of EU citizens, reduced health inequalities and improved access to high-quality health care in priority disease areas* or *strengthening circular economy and mitigating the negative health impacts of climate change*, all these impacts being scored at 0, like the baseline.

Option 1, as discussed above, offers openness and potential for engaging the entire health value chain likely favours dialogue between private sector and various public authorities and HTA bodies. As a result, option 1 offers a higher potential (scored as +) than baseline to contribute to *improved health and wellbeing of EU citizens* that would gain prominence through working more closely with public sector organisations. However, those health innovation aspects that require a longer term horizon and stronger integration of partners would not progress sufficiently towards reaching some of the more challenging types of impact sought, including *reduced health inequalities and improved access to high-quality health care in priority disease areas* and *strengthening circular economy and mitigating the negative health impacts of climate change*. This justifies only a good potential compared to the baseline in these two impact areas, hence scored at +.

Under **option 3**, the significant scale and size of Institutionalised Partnership projects have the potential to enable faster ‘pull through’ of breakthrough discoveries, their valorisation and translation into societal impacts. An Institutionalised Partnership offers greater strategic steer (directionality) and greater potential for outside contribution (additionality). Through the development of better health technologies and the combination of health technologies, this option offers high potential (in the long-term, compared to the baseline) to impact on *improved health and wellbeing of EU citizens*, receiving the score of ++. This is likely to happen thanks to the co-designed (public and private, including end-users) development of better health technologies and combination of health technologies, the focus of specific objective 3. This could also lead to scaling-up of health technologies that are currently of limited availability to patients and, thanks to higher efficiency of these improved health technologies, to liberating medical personnel in clinics for priority activities, e.g. in intensive care units. In addition, exploiting health data, using digital tools and rolling out the resulting digital health innovations (under specific objective 4) in areas of unmet public health needs would offer good potential for *reduced health inequalities and improved access to high-quality health care in priority disease areas, thereby addressing unmet public health needs*, thus scored as + compared to the baseline scored 0. Another beneficial impact of digital health solutions includes a reduced need to travel (e.g. to hospital) and the possibility to receive care remotely. This latter point was acutely demonstrated during the 2019/2020 COVID-19 pandemic when many non-coronavirus patients were delaying seeking medical advice or even emergency care (in fear of contracting the SARS-CoV-2

coronavirus when contacting other, potentially infected persons), while health care authorities were also suggesting to postpone certain visits or interventions. All this led to worsening of their health condition as a collateral effect of the pandemic. Wider availability and use of remote care, such as remote diagnostics, would also lead to reduced burden on health care systems (and last but not least, less emissions). At the same time, decreasing the environmental footprint of health industries and promoting circular economy could contribute to the greening of health care. All that would lead to good potential for *strengthening circular economy and mitigating the negative health impacts of climate change*. This effect might be even stronger if the targeted R&I collaborations incentivise industries to increase their production capacities in the EU, which then in turn would improve Europe's technological sovereignty. Its score would therefore be + versus the baseline of 0.

Expected impact on fundamental rights

R&I activities leading to creation of new technologies and solutions for health care can be expected to contribute to the right to health and right to health care, the right of equitable access to preventive and treatment-related health care for all, including marginalised groups. Advances in data-based products and tools including those based on electronic health records and real-world health data could have implications on the privacy rights of citizens. The use of digital technologies in health care could make diagnosis and treatment more accessible, less invasive and accessible to all individuals, including those living in remote areas, or across borders. Digital technologies could thus contribute to access rights to preventive health care and to benefit from medical treatment as well as to a high level of human health protection¹⁵⁴.

Stakeholder opinion

Interviewees indicated that achieving societal impact required the involvement of a broad range of stakeholders and that an Institutionalised Partnership would be the most effective platform to create and sustain such a collaboration. In **all consultation activities**, there was a general call from respondents from the public sector for the partnership to involve a broad scope of stakeholders beyond industry and academics, including in the partnership's governance. Examples of broader stakeholders include patients' organisations, health care payers, regulators, HTA bodies, health and social care professionals, health care providers, national health care system actors and public authorities, research and technology organisations. To a lesser extent, NGOs, civil society organisations and citizens' groups were also mentioned. Respondents explicitly asked for a balance between relevant stakeholders in strategic decision-making so that research priorities would be set according to public health needs while ensuring commitment from industry. This was considered one of the key requirements to delivering impact in relation to unmet health needs.

Out of the listed societal impacts in the **public consultation**, the largest number of respondents across all stakeholder groups indicated that the Institutionalised Partnership was very relevant to 'improved access to innovative, sustainable and high-quality health care' and 'effective health services'. An 'improved patient experience' was found to be less relevant by stakeholders from academic/research institutes, small company/business organisations and 'other' respondents.

Summary

¹⁵⁴ Charter of Fundamental Rights of the European Union (2012/C 326/02). Article 8 Protection of personal data, and Article 35 Health care.

Table 5 lists the scores for each of the policy options, based upon the assessments above, while also taking into account the support expressed by the different stakeholders.

Table 5: Overview of the options' effectiveness compared to the baseline

	Baseline: Horizon Europe calls	Option 1: Co- Programmed European Partnership	Option 3: Institutionalised European Partnership Art 187
Scientific impacts			
Strengthened EU skills and capacity in academic and industrial health R&I	0	0	+
A thriving EU-wide cross-sectoral health R&I ecosystem created	0	0	+
New scientific paradigms established in areas of unmet public health needs	0	0	0
Economic/technological impacts			
More productive and globally competitive EU health industries that create jobs and growth and are able to quickly respond to health threats	0	0	++
Better, safe, effective and cost-effective health technologies, tools and digital solutions	0	+	++
Increased level of public and private investments into strategic unmet public health needs, providing the foundation for innovative technologies to address these needs	0	+	+
Societal impacts			
Improved health and wellbeing of EU citizens	0	+	++
Reduced health inequalities and improved access to high-quality health care in priority disease areas, thereby addressing unmet public health needs	0	+	+
Strengthening circular economy and mitigating the negative health impacts of climate change	0	+	+

Notes: Score ++ : Option presenting *high* potential compared to baseline; Score +: Option presenting *good* potential compared to baseline; Score 0: Potential of the baseline.

6.2. Efficiency

In order to compare the policy options consistently in terms of their efficiency, a standard cost model was developed for the external study supporting the impact assessment for the set of candidate Institutionalised Partnerships. The model and the underlying assumptions and analyses are set out in the Common Part of this impact assessment, Section 2.3.2 and in the Methodology Annex 4. A dedicated Annex 3 also provides more information on who is affected and how by this specific initiative in line with the Better Regulation framework. The scores related to the costs set out in this context allow for a “value for money” analysis (cost-effectiveness) in the final scorecard analysis in Section 6.4.

In addition, for this specific initiative under the baseline scenario or under option 1, there would be winding down and discontinuation costs for the existing IMI2 JU Programme

Office. While IMI2 JU is expected to launch its last calls in 2020¹⁵⁵, the Programme Office as the implementation structure would be in place until the end of 2024 as set out in the Council regulation. The yearly cost of functioning of IMI2 JU Programme Office amounts to approximately EUR 10 million per year¹⁵⁶, hence for the period of 2021-2024 the administrative cost would likely reach approximately EUR 40 million¹⁵⁷. This amount is divided equally between the EU and EFPIA, the private partner, therefore the administrative cost to the EU budget would be in the range of EUR 20 million in total until 2024. The cost savings related to the closing of the Programme Office would become visible only as of 2025¹⁵⁸.

On the other hand, setting up a dedicated implementation structure would require additional costs compared to the baseline option. If implemented under option 3, IHI would likely entail yearly administrative costs comparable to those of IMI2 JU (depending on several parameters, such as the operational budget of the initiative and the potential use of a common back office). The additional administrative cost would be moderate if the implementation structure is built on the existing IMI2 JU Programme Office that, with some adaptations to account for a broader industry composition or revisited governance structure, could serve IHI. Nevertheless, it is estimated that the savings on administrative costs from using option 0 instead of an existing IMI2 JU Programme Office would – in the long term – exceed the costs incurred for winding down. The score of the baseline scenario (traditional Horizon Europe calls) is therefore set to 0 as a reference point. Running costs and winding-down costs of the current JU under the future Option 1 would be similar to the baseline option. Under the future Option 3, the running costs would be the highest, hence receiving the score of (-)(-).

On this basis, the scores for the costs of the different options range from a value of 0, in case an option does not entail any additional costs compared to the baseline, to a score of (-) when an option introduces limited additional costs when compared to the baseline and a score of (-)(-) when substantial additional costs are expected in comparison with the baseline. In case the scores are lower than for the baseline scenario, (+) is used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy option – and the least cost-efficient – the Institutionalised Partnership

¹⁵⁵ In duly justified cases, calls for proposals may also be launched in 2021.

¹⁵⁶ For years 2014-2019, the real administrative costs of IMI2 JU ranged between EUR 8.8 and 11.2 million per year, as reported in respective IMI2 JU Annual Activity Reports. <https://www.imi.europa.eu/about-imi/reference-documents>.

¹⁵⁷ This assumption does not take into account the situation in which some staff would be released because of lower workload due to no news calls being launched, which could bring certain savings. However, the workload related to new calls being launched is only one element among many others to consider, such as the tasks related to monitoring projects launched in previous years – there are 11 IMI JU and 79 IMI2 JU projects active at the moment of writing, with approx. 20 new projects expected to be launched in 2020. The IMI Programme Office needs to maintain all the staff functions necessary for its functioning (e.g. human resources, IT, legal, audit) and cover all related costs (IT equipment, renting of premises, communications etc) that are not directly linked to the actual number of new calls launched and need to be borne until the end of existence of the Programme Office.

¹⁵⁸ Certain residual costs would still have to be borne by the Commission or its executive agencies to manage the “legacy” projects after 2024, as some projects IMI2 JU are expected to run until 2026-2027.

option. Indeed, in terms of cost-efficiency, the Co-Programmed Partnership (Option 1) is 2 percentage points more efficient than the baseline; and an Article 187 Partnership is 2 percentage points less cost-efficient than the baseline. However, looking at the different options in terms of their ability to attract additional private sector resources and thus leverage the EU action's investment and impact, there are significant differences.

Option 0 does not warrant a significant (or even any) in-kind or financial contribution from industry; on the contrary, in these projects industry participation would be largely financed by EU grant funding.

Under **option 1**, in-kind industry contribution is expected but its exact level would only be set in the annual work programmes. Memoranda of understanding would probably give an indication of the total contribution upfront, but such agreements have weak legal power to enforce these commitments. Stakeholder interviews also revealed that several big pharmaceutical companies would stay away from this type of partnership as the calls might not automatically offer participation without receiving EU funding (which would be preferred e.g. by large pharma industry, so as to facilitate reporting obligations and not to complicate potential pricing considerations on innovations that could ultimately result from the partnership; it is already the case in IMI where EFPIA members do not receive funding). Due to these factors, additionality in option 1 would be far smaller than in option 3.

Option 3 offers a legally binding funding arrangement laid down at the outset, with the EU providing 50% of resources to R&I activities through a financial contribution and private sector partners providing (at least) 50% of the resources, mainly through in-kind contribution but potentially also financial resources. In practice, 1 Euro of EU commitment to the initiative would bring in (at least) an additional 1 Euro from private sector partners¹⁵⁹. This offsets the higher overall operating costs by orders of magnitude and thus offers the most cost-efficient option¹⁶⁰. The set-up under Option 3 would also allow for leveraging the additional investment of entities other than member industries, such as charities, similarly to the 'associated partner' status already successfully implemented by IMI2 JU. While Option 3 could potentially create complexities for accessing funding, notably by start-ups and SMEs, they could be mitigated by the activities of the future JU Programme Office offering support to applicants and project beneficiaries.

Of note, Option 1 and even more so Option 0 would imply the discontinuation of IMI2 JU without a successor. Apart from the winding down cost, these options would entail losing a large amount of intangible assets, such as the brand, networks and partly also the know-how built up since 2008, when IMI started to operate. These factors were also taken into account when assessing the effectiveness of the options above.

Table 6: Matrix on 'overall costs' and 'adjusted cost scoring'

¹⁵⁹ The leverage of IMI2 JU reached 99% in 2018, according to IMI2 JU Annual Activity Report 2018 (private commitment vs EU funding).

¹⁶⁰ Note that the planned EU investment for this initiative is unknown at the moment of writing the impact assessment, and depends on several factors (e.g. the Horizon Europe budget, final decisions on strategic R&I priorities and the related industry commitment). For the sake of comparison, the same EU investment was used throughout the different policy options and this is correct when comparing to the baseline. However, for a Co-Programmed Partnership (option 1) it is probable that less EU funds would be dedicated to the partnership than in the case of an Institutionalised Partnership (option 3), likely creating less prominent impacts, and the remaining funds would be deployed through traditional calls.

	Option 0: Horizon Europe calls	Option 1: Co-Programmed	Option 3: Institutionalised
Administrative, operational and coordination costs	0	0	(-)(-)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. cost-efficiency)	0	+	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to the baseline; score (-)(-) = substantial additional costs compared to the baseline; score +: Option presenting *good* cost-efficiency compared to baseline.

The analysis above remains equally valid independent of the development of COVID-19 pandemic. The reason is that IHI was designed from the start as a collaboration of several health industry sectors, including diagnostics, pharmaceutical and vaccine areas. Providing an R&I response to emerging health threats would fall naturally in its scope.

6.3. Coherence

6.3.1. Internal coherence

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with other actions, programmes and initiatives under Horizon Europe, in particular European Partnerships.

For the initiative to deliver on its ambitious specific objectives, it needs to show a high degree of internal coherence, from developing a research agenda and coordination of stakeholders to developing linkages to other initiatives within Horizon Europe.

Under the **baseline option**, it would be challenging for individual Research and Innovation Actions to identify linkages, opportunities for coordination and communication, or to make steady progress on enabling the uptake of health innovation from the actions' limited budget. In addition, Horizon Europe would not provide dedicated support to these individual health R&I projects to put their outputs on the pathway to impact. This limitation is significant if the initiative's emphasis is on achieving shorter term impacts. Coordination and Support Actions could, to some extent, create a dedicated R&I collaborative platform that is necessary to create a 'learning' health care ecosystem but these would need to be closely linked to the collaborative research actions so that the fledging network can test innovative ideas and experiment in a safe environment. The latter is, however, hard to achieve across a multiplicity of uncoordinated calls.

Under **option 1**, a Co-Programmed Partnership would draw up its strategy in consultation with key stakeholders across the public and private sectors to ensure a high degree of internal coherence within the strategic research agenda and through linkages to other initiatives within Horizon Europe. In addition, implementation through regular calls means that it may align with and link to important parallel activities within other parts of the Horizon Europe programme. It is likely that Coordination and Support Actions could create a dedicated R&I collaborative platform that is necessary to create a 'learning' health care ecosystem and link to the (more strategic) collaborative research actions. This could also help cross-project activities to further exploit synergies and enhance potential for impacts.

Hence, this option offers good potential (score of +) to achieve internal coherence compared to the baseline (score of 0).

Under **option 3**, the Institutionalised Partnership's structure enables a high degree of internal coherence: from developing a research agenda and coordination of stakeholders to creating and/or strengthening linkages to other initiatives within Horizon Europe. This would minimise duplication and wasted research. There are a number of other candidate partnerships in the Health cluster that are closely related to innovative health but with a more thematic or geographical focus: personalised medicine, rare diseases, One Health AMR and EU-Africa Global Health partnerships. Results emerging from an Institutionalised Partnership on innovative health could be implemented and scaled up in a complex European health environment where other health initiatives (candidate Partnership on Transforming Health and Care or EIT Health) may prove complementary. Finally, the environment also seems conducive to helping the partnership achieve its goals with candidate partnerships on (1) Key Digital Technologies; (2) Artificial Intelligence, Data and Robotics; and (3) High Performance Computing. The IHI Programme Office would lead all coordination activities to ensure internal coherence, translating into high potential of option 3 (scored as ++) on this aspect versus the baseline (score of 0).

Stakeholder opinion

During the **public consultation**, the majority of respondents from all stakeholder groups reported that it would be possible to rationalise the candidate Innovative Health Initiative and its activities, and/or to better link it with other comparable initiatives. This response was less uniform among EU citizens, where a large proportion selected that they did not feel it would be possible. Of respondents who provided details for selecting 'no', a common response was that it could increase the complexity of the partnership.

Nevertheless, the overall opinion of respondents was positive: in the feedback on the **inception impact assessment**, business associations encouraged the generation of synergies between the different partnership initiatives. Similarly, there was general consensus among **interviewees** on the need for links between the partnerships including development of similar data management methodologies and establishing a flexible set of rules to facilitate collaboration.

6.3.2. External coherence

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with their external environment, including EU-level programmes and initiatives beyond the Framework Programme and/or national and international programmes and initiatives, but as well as with overarching framework conditions, such as regulation, standardisation, etc.

Under **the baseline option**, Horizon Europe's work programmes are developed through a comitology process that involves several iterations of consultation with various key stakeholders, within other Commission Directorates-General and EU Member States. Health calls can also be framed to maximise their complementarity with initiatives in the wider landscape. For IHI, they would include other programmes under the 2021-2027 multiannual financial framework (e.g. Digital Europe Programme, Connecting Europe Facility) other key EU stakeholders (e.g. EUnetHTA, Heads of Medicines Agencies, Competent Authorities for Medical Devices) and research infrastructures (e.g. Elixir, BMBRI, EATRIS, ECRIN). However, it is unlikely those external programmes and networks could effectively

interact with a health initiative under Horizon Europe regular calls without the presence of a long-term dedicated strategy and central programme office.

Under **option 1**, Horizon Europe's work programmes are developed through a comitology process. A major difference compared to the baseline option is that the CPP can interact with external programmes and networks via a central administrative infrastructure (financed via a Coordination and Support Action) to bolster its long-term strategy. In addition, individual partners at a national level may have the ability to improve coherence between activities supported within the partnership and those outside of it. However, alignment with globally operating initiatives would be difficult in the absence of a dedicated implementing structure. Hence, under this option there is good potential to achieve internal coherence (scored as +), compared to the baseline option (score of 0).

Under **option 3**, the interaction with actors listed under the baseline option would be greatly enhanced by the creation of a programme management office to act as a single point of contact for all external programmes and networks. Indeed, for the partnership to meet its objectives (especially specific objective 4 'Strengthen the conditions for R&I for strategic unmet public health needs' that should lead to novel methods to assess the value of combined products and integrated health care solutions) it needs to interact with other European and international actors in the health arena, including from the regulatory side. Hence, this option offers high potential (scored as ++), to achieve external coherence compared to the baseline (score of 0).

We have also analysed the extent to which various options would lead to higher participation and larger contribution from companies active in health research, as a necessary ingredient of a successful public-private partnership.

Under **the baseline option** (regular calls of Horizon Europe), the setting of scientific priorities and definition of call topics would be done by the Commission services followed by the usual comitology procedure. This does not involve any formal step of consultation of the industry and hence tends to be more academically oriented. The limited interest of large private industries in regular calls is reflected in the limited participation in collaborative projects of large industrial entities under Horizon 2020 Societal Challenge 1 (Health, demographic change and wellbeing), with only few projects where several large companies would collaborate. Horizon Europe calls also use standard intellectual property rules that in some situations do not fully cater for all possible setups of collaborations between academia and industry, including SME.

Under **Option 1**, the implementation of programmes would follow a similar procedure as under the baseline option, differing in the industry partners would provide input on call topics to the relevant sections of the work programmes. Option 1 would not offer a dedicated staff for managing the programme at a required scale, which is needed to ensure the proper budgetary control over industry contributions, ensuring consistency with other funding programmes, safeguard the establishment and implementation of the intellectual property arrangements that may stem from public-private collaborations, and to offer targeted communication activities (incl. to support SMEs participation). Because of the limited contribution of private stakeholders to the definition of the calls, they would have only a limited interest to commit financially to the initiative. The absence of an established mechanism to value private entities' contributions, such as for in-kind on additional activities (established only at the level of Council regulation for Art. 187 initiatives) that increase the leverage and bring valuable resources to projects, would leave the investment and involvement of large industries in projects at a moderate level.

In contrast, under **Option 3**, scientific priorities would be identified by the health industries jointly with the Commission services and other stakeholders involved in health care, including end-users. The support of the Programme Office and the system of voting rights in the Governing Board would help maintain the balance of interests. Structured involvement of Member States via the States Representatives Group would help ensure consistency with national priorities and initiatives. The final decisions on the scientific priorities would be in the hands of the Governing Board, with equal representation of private (industry) and public (EU) interest. These elements, together with matching of private commitment with EU funding, would cater for the firm commitment of private industries and hence be the base for strong additionality. For example, the leverage (private commitment vs EU funding) under IMI2 JU reached 99% in 2018.

Under option 3, the industry would have a safer environment for exchanging knowledge and translating it to future products, also in case of possible adaptations of intellectual property rules, not available under option 0 and 1. The set-up under Option 3 would also allow for leveraging the additional investment of entities other than pharmaceutical industries such as charities, via the mechanism of associated partners to a future Joint Undertaking.

Stakeholder opinion

The majority of respondents from all stakeholder groups during the public consultation reported that the candidate Innovative Health Initiative would be able to link its activities with other comparable initiatives. It was discussed in both the interviews and public consultation that having a more aligned research agenda would reduce duplication and would further advancements in specific areas of research, e.g. priority disease areas. Interviewees also noted how cooperation between initiatives could enhance learning and outputs, e.g. the ECSEL Joint Undertaking (predecessor of the candidate partnership on Key Digital Technologies) could provide digital support to ensure uniform data standards and methods. It was also stated that establishing a flexible set of rules for the different initiatives could reduce bureaucratic barriers. During the consultation on the inception impact assessment, representatives of research infrastructures stressed the importance of leveraging the power and network of research infrastructures such as BBMRI, EATRIS and ECRIN. This was repeated during the interviews with stakeholders from research infrastructures.

Summary

Table 7 lists the scores for each of the policy options, based on the assessments above, while also taking into account the support expressed by the different stakeholders.

Table 7: Overview of the options' potential for ensuring and maximising coherence

	Option 0: Horizon Europe calls	Option 1: Co-Programmed	Option 3: Institutionalised Art 187
Internal coherence	0	+	++
External coherence	0	+	++

Notes: Score ++ : Option presenting *high* potential compared to the baseline; Score +: Option presenting *good* potential compared to the baseline; Score 0: Potential of the baseline.

6.4. Tabular comparison of the options and identification of the preferred option

Building upon the outcomes of the previous sections, this section compares the options' 'performance' against the three dimensions of effectiveness, efficiency and coherence (Table 8). It should be noted that the process of the preparation of the partnership has not yet been finalised (see also Section 7.1) and some quantitative data are not available, some criteria of this assessment represent a qualitative judgement rather than a full quantitative assessment.

Table 8: Scorecard of the policy options

	Criteria	Baseline: Horizon Europe calls	Option 1: Co- Programmed European Partnership	Option 3: Institutionalised European Partnership Article 187
Effectiveness	Scientific impacts			
	Strengthened EU skills and capacity in academic and industrial health R&I	0	0	+
	A thriving EU-wide cross-sectoral health R&I ecosystem created	0	0	+
	New scientific paradigms established in areas of unmet public health needs	0	0	0
	Economic/technological impacts			
	More productive and globally competitive EU health industries that create jobs and growth and are able to quickly respond to health threats	0	0	++
	Better, safe, effective and cost-effective health technologies, tools and digital solutions	0	+	++
	Increased level of public and private investments into strategic unmet public health needs, providing the foundation for innovative technologies to address these needs	0	+	+
	Societal impacts			
	Improved health and wellbeing of EU citizens	0	+	++
	Reduced health inequalities and improved access to high-quality health care in priority disease areas, thereby addressing unmet public health needs	0	+	+
	Strengthening circular economy and mitigating the negative health impacts of climate change	0	+	+
	Efficiency	Administrative, operational and coordination costs	0	0
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. cost-efficiency)		0	+	-

	Criteria	Baseline: Horizon Europe calls	Option 1: Co- Programmed European Partnership	Option 3: Institutionalised European Partnership Article 187
Coherence	Internal coherence	0	+	++
	External coherence	0	+	++

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to the baseline; score (-)(-) = substantial additional costs compared to the baseline. Score ++ : Option presenting *high* cost-efficiency compared to baseline; Score +: Option presenting *good* cost-efficiency compared to baseline; Score 0: Potential of the baseline.

The scorecard shows that the baseline performs less well against all dimensions and criteria compared to Co-Programmed and Institutionalised Partnership options, except for the net administrative cost. Even though it has a higher score in the efficiency criteria, this does not weigh up against its lower performance in the effectiveness and coherence criteria.

The scorecard also shows that benefits are clearly maximised under the Institutionalised Partnership Art 187 option. In particular, compared with the other options, option 3b would:

- Provide greater effectiveness by maximising leverage effects, allowing for greater strategic alignment among partners, and supporting a broader range of activities in research and innovation.
- Improve coherence by enhancing collaboration and alignment with the other key stakeholders.

As regards **effectiveness** in terms of the scientific impact that can be achieved, Option 3 performs better overall than Option 1 due its ability to better integrate industry sectors and as a result strengthen EU skills and innovation capacity. It also has the highest potential to contribute towards the creation of a health innovation and learning ecosystem. The baseline option, while performing well on purely addressing scientific paradigms, cannot provide a platform for cross-sectoral stakeholder collaboration effectively due to its low directionality and weak industry engagement.

As regards effectiveness in terms of the economic impact that can be achieved, Option 3 performs significantly better than either of the alternative options. This is due to an Institutionalised Partnership's ability to provide strong strategic steer (directionality) and to garner substantial outside contributions (additionality), and thanks to its dedicated implementation mechanism through which industry expertise, resources and knowledge can be best leveraged. As a result, the likelihood is highest for achieving increased productivity and growth in the EU health industry by speeding up development of health innovations in health and priority disease areas. In contrast, Option 3 has only limited benefit in terms of its contribution to a sustainable and efficient health care system.

As regards effectiveness in terms of the societal impact that can be achieved, Option 3 is most likely to deliver on the needs of the public system provided the stakeholder consultation, prioritisation exercises and call implementation mechanism are optimally set up. This is because an Institutionalised Partnership is able to make assets progress much faster and eventually help to integrate them into health products and services that can benefit patients and consumers.

On **coherence**, Option 3 is most likely to develop a coherent project portfolio to address the initiative's specific objectives. Option 3 would also be most likely to ensure the external

coherence with other initiatives, programmes and networks through its dedicated implementation structure and EU partnership.

As for **efficiency**, Option 0 (regular calls under Horizon Europe) requires the lowest administrative cost. This is due to the existence of a large-scale, highly refined overall administrative, IT and professionalised management system delivered by specialised agencies (e.g. the Research Executive Agency). Option 3 would have the highest cost, due to the need to set up a dedicated implementation structure to support the thematic area. Nevertheless, much learning can be transferred from the current IMI2 JU experience. In terms of cost-efficiency however, the higher administrative costs are offset by the additional operational funds that industry would bring to the partnership. These additional funds would leverage EU funds, offering approximately twice as much budget and impact for the same EU investment.

Option 3 would be the only one to allow setting up fully fledged Programme Office that would offer dedicated programme management as well as legal and communication expertise under one roof. The Office functions as a “neutral broker” bringing together the different industries that usually compete, to cooperate around jointly agreed objectives. It would be of particular usefulness to project participants, notably SMEs, as regards e.g. explanation of call rules or handling of intellectual property issues that can prove complex in a multi-stakeholder health research setting. The Programme Office would also offer the necessary support function to the Innovation Panel and as such, help to increase the transparency of call topics definition and to ensure that they genuinely reflect the public health needs.

In function of the **risks** of the options to deliver on the expected impacts, the **baseline option** would offer only a low certainty of delivering on the various expected impacts. A co-programmed partnership (option 1) would qualify as second in this category, while option 3 is preferred thanks to its functionalities. The ultimate success of the initiative would depend on whether the significant commitment of the industrial partners materialises and on whether the initiative is successful in attracting a high number of SMEs and academics, necessary to provide sufficient scientific expertise and innovative ideas, to multi-sector collaborations. Another risk to achieving the expected impact would be linked to the relative novelty of this type of multi-stakeholder collaboration in health and to the need of combining varying R&I development timelines that can be very long in the pharmaceutical sector but much shorter in medtech or even more so, in the digital sector.

An external risk is related to the potential post-COVID-19 slowdown of the economy. If a strong recession scenario materialises, companies’ investments into R&I usually suffers the most. This factor may potentially limit the overall up-front investment of the industry members or it may affect their ability to live up to the initially declared commitment. The impact of this potential risk on the EU funding is mitigated by the fact that EU funds are committed globally on yearly basis and disbursed for individual projects only on the basis of the industry commitment. The agility of adapting the work programmes would also allow reflecting such a situation in the revised scientific priorities for future call topics. Proportionality of the preferred option is demonstrated by the fact that options 0 (baseline) or 1 would not ensure a sufficient level of directionality and additionality, while option 3 is – among the available options – the one that would best allow fulfilling these needs.

In conclusion, the scorecard analysis shows that the benefits are clearly maximised under Option 3, an Article 187 Institutionalised Partnership, and thus it is the single preferred option to deliver on the effectiveness (impacts) and coherence measures.

Comparison between the preferred option and the current partnership (IMI2 JU) taking into account lessons from past evaluations¹⁶¹

What would continue	What would be different
<ul style="list-style-type: none"> • A European public-private partnership based on Article 187 TFEU. • Programme implementation supported by the dedicated Programme Office. • The EU holds 50% of the voting rights and contributes up to 50% of the administrative and operational costs. • Member States (MS) and Associated Countries do not contribute financially. • Member States do not have voting rights in the Governing Board but are represented in the States Representative Group. • A jointly agreed strategic research agenda based on consultation with all stakeholders. • Draft calls for proposals are published by the Programme Office, ensuring maximum transparency to all relevant stakeholders. • The partnership strives to attract investment from outside of the EU. Part of these contributions could be matched by EU funding. • Project results are subject to the same transparency provisions as under regular Horizon Europe calls. 	<ul style="list-style-type: none"> • A cross-sectoral partnership between EU and five health care industry sectors (pharmaceutical, medtech, biotech, imaging, vaccines), rather than only pharmaceutical as in IMI2 JU. • Thematic focus broadened from pharmaceutical to also other areas of health R&I, including digital technologies. • More focus on disease prevention. • Governance structure adapted to better incorporate views of various stakeholders involved in health care. • All types of actors along the health value chain better involved in priority setting and in funded projects. • A new governance body ('Innovation Panel') brings together representatives of EU and member industry associations as well as various other stakeholders involved in health care, to identify and review potential call topics, ensuring that they adequately address public health interest and needs of end users • Industry eligible for funding up to a certain ceiling (including large companies and mid-caps), with individual industry sectors or companies entitled to opt-out from receiving funding at own discretion.

The direct continuation of IMI2 JU as it is today, i.e. a partnership between the EU and pharma sector, was not prioritised because (1) it would not capitalise on the resources, expertise and data of other health industry sectors, now ready to enter into such a collaboration; (2) it would not allow addressing more ambitious objectives of harnessing cross-sectoral collaborations to address the problem of insufficient innovative health solutions (new medicines, devices, diagnostics...) being made available to patients, (3) it would disregard the explicit recommendation of the IMI2 JU interim evaluation for a potential follow-up initiative, i.e. to ensure active engagement of other health industry sectors with the pharmaceutical industry. What was also learned from the past is that for the

¹⁶¹ Working ideas that need further discussion between future partners and validation in the legislative act or any other documents laying down the functioning of the partnership (e.g. statutes, rules of procedure of individual governance bodies etc). A detailed analysis of how lessons learned were reflected in the design of the new partnership can be found in Annex 6.

underlying problems to be addressed more efficiently, the end-users need to be involved in the initiative to a greater extent than in the past.

7. THE PREFERRED OPTION – HOW WILL ACTUAL IMPACTS BE MONITORED AND EVALUATED?

7.1. Description of the preferred option

An Institutionalised Partnership (under Article 187 TFEU) is the preferred option due to its effectiveness in delivering on the initiative’s specific objectives, coherence and efficiency, and thus to achieve highest impacts. It aims to build on and learn from the current IMI2 JU’s management processes and extend its know-how, international visibility and established positive brand. However, the new initiative will also bring about a step change in: (1) facilitating the integration of disparate technologies from several health industry sectors currently not collaborating to a significant extent; and (2) accelerating the development of better, safe, effective and cost-effective health products and solutions for European citizens, as part of Partnership Area 1 of Horizon Europe.

Table 9 depicts how the preferred option aligns with the selection criteria for European partnerships defined in Annex III to the Horizon Europe Regulation. The design process of the candidate Institutionalised Partnerships is not yet concluded and several of the related topics are still under discussion at the time of writing. These include, among others (1) the budget, depending notably on the multiannual financial framework 2021-2027 negotiations, (2) strategic research agenda, planned to be adopted at the first meeting of the future governing board, (3) certain details of the governance structure and the process for call topic generation, (4) inclusion of partners from non-EU countries and the threshold for matching their contributions with EU funding, (5) intellectual property rules and questions related to the access and affordability of the resulting health innovations. Therefore, the criteria of additionality/directionality and long-term commitment are covered in terms of *expectations* rather than *ex-ante demonstration*.

Table 9: Alignment with the selection criteria for European partnerships

Criterion	Alignment of the preferred option
Higher level of effectiveness	An Article 187 Institutionalised Partnership provides the closest integration of key stakeholder groups across the value chain to ensure that the initiative can respond to ambitious objectives corresponding to scientific, technological/economic and societal impacts. The mode of implementation ensures that there is sufficient scale, commitment, leverage and long-term vision for the accelerated development and deployment of health innovations. The partnership has a comprehensive set of objectives that tackle the main challenges identified and which contribute towards the creation of a health R&I ecosystem. An Article 187 Institutionalised Partnership would score significantly higher overall than the baseline option (traditional calls under Horizon Europe) and Option 1 (Co-Programmed Partnership) in terms of effectiveness.
Coherence and synergies	An Article 187 Institutionalised Partnership presents the most coherent choice to maximise synergies internally within the initiative (portfolio approach), within the EU R&I landscape and beyond. The future Programme Office, similar to the Programme Office in the current IMI2 JU, would have thematic competence in programme management and dedicated administrative support for partners and project participants to exploit such synergies and further align roadmaps between initiatives, programmes and networks.
Transparency and	An Article 187 Institutionalised Partnership aims to significantly expand the range of partners involved from health-related industries, covering the full spectrum of pharmaceutical, vaccines,

Criterion	Alignment of the preferred option
openness	<p>biotech and medtech sectors (including diagnostics, medical devices, imaging and digital industries). In this way, relevant but currently disparate technologies (drugs, devices and software) can be usefully integrated into innovative health solutions.</p> <p>The partnership will maximise its impacts by being open and transparent, involving all relevant public actors (including the academic research community, patients, health care regulators, health care payers, health care providers and health care professionals) and private actors along the value chain, and by ensuring a robust governance structure. Other stakeholders may also be philanthropic organisations, charities, research infrastructures and other partnerships. Flexibility is needed in the operational processes to create trust and equity among stakeholders. Using standard Horizon Europe instruments and abiding by all the related processes (including e.g. budgetary controls, access to documents etc) will ensure that the partnership is transparent.</p> <p>Since a seven-year horizon is a relatively long time in a fast-moving technological R&I space, it will be important for the partnership to keep an open mind and allow entry for new actors, including those from outside the EU to allow learning across the best in class. The partnership recognises the need for broad stakeholder consultation to develop the long-term strategic directions and annual priorities. The implementation structures will provide an optimal governance, monitoring and management system.</p>
Additionality and directionality	<p>The legal and financial commitments made by partners at the outset of the partnership are binding and will commit partners to drive the partnership forward over the entire partnership timeframe, which is particularly important in health research with its long development timelines. The approved SRA ensures close alignment of research agendas to achieve a high-level of focus and directionality to meet the strategic unmet public health needs. No other public or private initiative is able to coordinate a similar partnership at the European level above and beyond national interests. In addition, the partnership will provide the ability to leverage other resources for the benefit of the EU.</p>
Long-term commitment	<p>The expectation is that in an Institutionalised Partnership on Innovative Health under Art 187, the EU and partners will be committed to pooling resources for the entire partnership period and that financial and/or in-kind contributions from partners other than the EU will represent at least 50% of the aggregated European partnership budgetary commitment.</p>

7.2. Objectives and corresponding monitoring indicators

7.2.1. Operational objectives

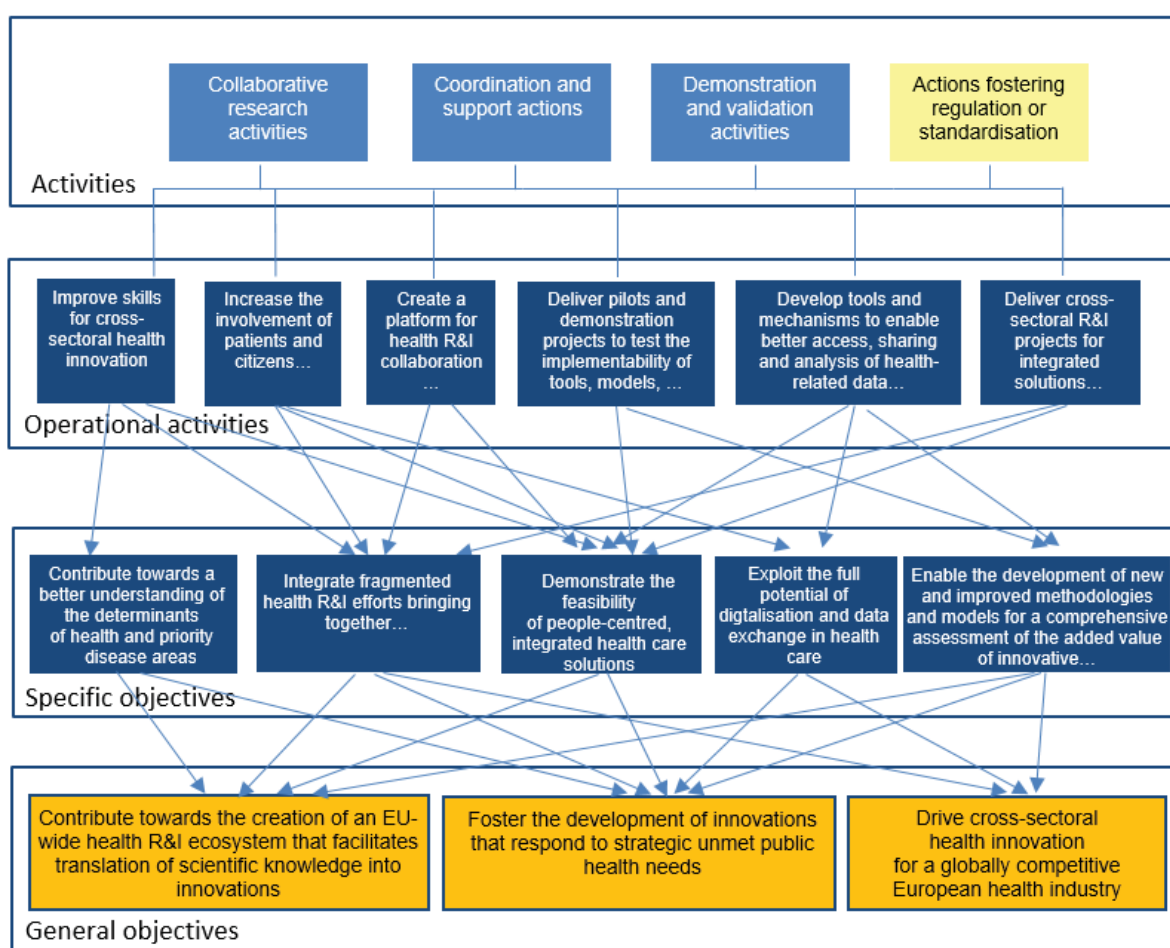

Several operational objectives were identified that would enable the partnership to achieve its specific objectives:

1. improve skills for cross-sectoral health innovation;
2. increase the involvement of patients and citizens in the generation and implementation of health innovations in Europe;
3. create a platform for health R&I collaboration as a safe, pre-competitive space for brokering knowledge exchange, sharing ideas and resources across the various actors in the health care pathway (e.g. academics, health industry sectors, regulators, health technology assessment bodies, health care professionals and providers, payers, patients, informal carers, and citizens);

4. deliver pilots and demonstration projects to test the implementability of tools, models, methodologies and innovations generated by the initiative;
5. develop tools and mechanisms to enable better access, sharing and analysis of health-related data, e.g., ethical frameworks, common standards and protocols;
6. deliver cross-sectoral R&I projects for the development of integrated, people-centred solutions and progress the understanding of the determinants of health and disease.

Figure 9 lists a range of actions and activities, also going beyond the R&I activities that can be implemented under Horizon Europe (highlighted in yellow). This reflects the definition of European Partnerships in the Horizon Europe regulation as initiatives where the Union and its partners ‘commit to jointly support the development and implementation of a programme of R&I activities, including those related to market, regulatory or policy uptake’.

Figure 9: Operational objectives of the initiative in relation to the specific and general objectives

To select focused areas for support by the partnership, two criteria will be considered: (1) the high burden of disease for patients and/or society due to the severity of the disease and/or the number of people affected by it, and (2) the high economic impact of the disease for patients and society.

The selection of detailed areas for support would be done through an inclusive process involving a broad range of stakeholders from the public sector. Drawing on the lessons from IMI2 JU and to increase openness of this process, an improved mechanism would be put in

place with the creation of a dedicated multi-stakeholder governance body (“Innovation Panel”). This body would include not only representatives of the EU and member industry associations but also regulators, national health technology assessment bodies, health care professionals, health care providers, payers and patients as well as representatives of other relevant initiatives. The Innovation Panel would be in charge of identifying and prioritising areas for support so as to reflect needs of end-users (including patients) and public health interest. It would also help avoid overlaps and foster synergies with other programmes or initiatives.

The flexibility of choosing from a range of priorities updated at regular intervals would offer agility to adapt to new situations and needs, including public health emergencies, via adjustment of the Annual Work Programmes in line with the SRA. Such a rapid mobilisation was demonstrated by the ability of IMI to launch a fast-track call for proposals to develop therapeutics and diagnostics for current and future coronavirus outbreaks¹⁶². Thanks to the support of the Programme Office, the call could be designed quickly and coordinated with other global initiatives on COVID-19 to increase synergies while limiting overlaps. Of note, a similar mobilisation was possible to respond to the Ebola virus disease outbreak in western Africa in 2014. The resulting Ebola+ program led to the development of an Ebola vaccine regimen that received market authorisation in July 2020¹⁶³.

The call topics will be based on the SRA and reflect the scientific priorities/workplan as put forward by the Innovation Panel. Its opinions would be validated by the Governing Board, the main decision-making body of the partnership composed of representatives of the Commission and member industry associations. The 50% of voting rights in the Governing Board attributed to the Commission would provide reassurance that the EU public interest would be adequately taken into account.

A majority of activities will be cross-sectoral, thus reflecting the integrative nature of the partnership. The cross-sectoral activities should enable overcoming barriers such as insufficient collaboration of companies active in diagnostics and therapeutics development, or the current scattered nature of large health data sets. At the same time, IHI activities will have to consider the different innovation cycles of pharmaceutical and medical technology industries. While the R&I processes towards novel medicines are very lengthy, the development of medical technologies and even more so, digital solutions, can be much faster. In order to create a safe space for collaboration of companies without affecting their commercial activities, the initiative will primarily address pre-competitive activities, including demonstration pilots.

Compared to the activities implemented by IMI2 JU under Horizon 2020:

¹⁶² IMI2 JU Call 21 topic “Development of therapeutics and diagnostics combatting coronavirus infections” was launched on 3 March 2020 and closed on 31 March 2020. By 12 May 2020, 8 projects were provisionally selected for funding, with the total investment from the EU and from the industry partners reaching EUR 117 million. Of the eight projects, five focus on diagnostics and three on treatments. The diagnostics projects hope to develop devices that can be used anywhere, including a doctor’s surgery or patient’s home, and will deliver results fast (below 1 hour). The treatment projects focus primarily on the current COVID-19 outbreak but they also include efforts to prepare for future coronavirus outbreaks. The projects form part of the European Commission’s wider response to the coronavirus outbreak.

¹⁶³ https://ec.europa.eu/commission/presscorner/detail/en/ip_20_1248

- The scope of IHI activities will be broader, including the areas of medical technologies, imaging, vaccines, Advanced Therapy Medicinal Products (ATMPs) and digital technologies;
- IHI activities will engage a broader set of participants in terms of company sizes as Member industry associations; their national member associations will bring in small- and medium enterprises, in addition to large companies;
- The composition of consortia will be different;
- The activities will more directly respond to the future needs of end-users, such as patients and health care professionals, thanks to increased openness of the initiative and thanks to better involvement of these stakeholders in the definition of scientific priorities and of topic texts.

7.2.2. *Monitoring indicators*

In addition to Key Impact Pathways indicators set centrally in the Regulation of Horizon Europe, additional monitoring indicators have been identified to enable the tracking of progress of the partnership towards meeting its objectives.

Table 10 below represents monitoring indicators proposed to track the initiative's progress towards achieving its specific objectives and targets as defined in Table 2. Health R&I is a complex and lengthy process that does not follow a 'linear' path of development and scale-up, and various intermediate steps are needed before the objectives and end targets can be reached. The proposed indicators reflect parameters that can effectively be measured for an initiative aiming to operate in a pre-competitive space of the health R&I area, during the initiative's lifetime¹⁶⁴. Similarly, the short-term indicators are more activity-driven since the actual outputs of health research projects are unlikely to be visible immediately after initiative's start¹⁶⁵.

These proposed indicators take into account the experience gathered during the definition of IMI2 JU Key Performance Indicators¹⁶⁶ and will be further refined before the start of the initiative to strike a balance between defining parameters that are representative of the initiative's progress, and minimising additional reporting obligations for project participants.

¹⁶⁴ The medical sector is characterised by long development timelines, with uptake dependent on fulfilling stringent regulatory steps and on subsequent reimbursement and pricing decisions that remain the competence of EU Member States. Therefore, the attainment of some of the initiative's objectives would not be appreciated until after the projects have finished. The same is even more true for certain impacts that could be appreciated only long after individual projects end. Additional information is provided in Annex 3, Section 2.

¹⁶⁵ The quantification of expectations for individual indicators, as well as their evolution from shorter to longer term, can be done reliably when the process of defining the strategic research agenda has been advanced further.

¹⁶⁶ IMI2 JU Key Performance Indicators. https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/mission-objectives/IMI2_KPIs_approved_14_DEC_2017.pdf.

Table 10: Monitoring indicators in addition to the Horizon Europe key impact pathway indicators

Specific objective	Short-term indicators (typically as of year 1+)	Medium-term indicators (typically as of year 3+)	Long-term indicators (typically as of year 5+)
1. Contribute towards a better understanding of the determinants of health and priority disease areas	Share of projects covering priority disease areas	Number of international co-authorships and cross-sector publications Number of times that journal articles generated by the partnership are cited in the global literature	Number of new taxonomies of diseases and new methods of stratification Number of new early biomarkers of disease identified and validated Number of validated new targets for preventive or therapeutic strategy
2. Integrate fragmented health R&I efforts bringing together ...	Share of projects bringing together representatives of two or more industry sectors Share of projects bringing together SMEs and large companies	Number of projects sharing data outside of consortia partners for further research Impact factor of international co-authorships and cross-sector and cross-institutions publications generated by IHI projects	Number of new tools shared outside of consortia partners for further research Number and types of innovations in industrial use
3. Demonstrate the feasibility of people-centred, integrated, health care solutions	Share of projects involving patient/citizen associations	Number of assets progressed through key milestones ¹⁶⁷ Number of new or improved guidelines, methodologies, tools, technologies or solutions submitted for acceptance to regulatory authorities for use in the context of R&D, relevant for integrated, people-centred solutions	New standards and common processes adopted in official (regulatory) guidelines and in use Number of integrated health care solutions developed
4. Exploit the full potential of digitalisation and data exchange in health care		Number of projects that integrate data from public and private sectors	Number and type of digital health innovations developed
5. Enable the development of new and improved methodologies and models for comprehensive assessment of the added value of innovative and integrated health care solutions.	Share of projects addressing strategic unmet public health care needs/priority health and disease areas Number of health care stakeholders (e.g. providers, professionals, regulators) involved in projects	Number of projects developing methodological frameworks to assess the cost-effectiveness of innovation. Number of projects developing patient-reported outcome measures and/or patient-reported experience measures	Number of new tools and models ready for implementation in health care

¹⁶⁷ Examples of assets are drug or diagnostic candidates, targets, biomarkers or other tools that can be shown to have reached a significant milestone or pass a significant stage gate.

In addition to the above monitoring framework that will help track progress over the lifetime of the initiative, a set of targets were defined in relation to the specific objectives, against which the success or failure of the initiative could be measured. These targets are based on the experience of IMI2 JU¹⁶⁸ in terms of what could be achieved by an initiative of a similar financial scale and broadened scope. They will be further developed and refined during the preparation of the strategic research agenda before the start of the initiative. The necessary data would be gathered as part of the periodic project reporting as implemented for the whole of Horizon Europe, building upon what is currently done for IMI2 JU.

Table 11. Specific objectives and targets by the end of the initiative

Specific objective	Targets by the end of the initiative
SO1. Contribute towards a better understanding of the determinants of health and priority disease areas	<ul style="list-style-type: none"> • new tools relevant for studying new potential drug targets, e.g. new pharmacological tools, therapeutic modalities and patient-derived assays openly available to the scientific community (tools for 1,000 proteins); • new diagnostically- and/or therapeutically-relevant hypotheses tested in pre-clinical models and/or clinically (100); • new biomarkers of disease (relevant for diagnosis, efficacy, safety or prevention) identified and experimentally validated, new taxonomies of diseases or new stratifications to define patient subpopulations (at least 10 biomarkers).

¹⁶⁸ IMI2 JU Key Performance Indicators, including baselines and target values. https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/mission-objectives/IMI2_KPIs_approved_14_DEC_2017.pdf.

<p>SO2. Integrate fragmented health R&I efforts bringing together health industry sectors and other stakeholders, focussing on unmet public health needs...</p>	<ul style="list-style-type: none"> • demonstrated feasibility of developing combination of products and services, including methods for generation of clinical evidence (5 examples); • new tools for prediction, prevention, surveillance, diagnosis, treatment options (incl. to prepare for major epidemic outbreaks) - development, validation and demonstrated deployment readiness of new tools (10 examples); • publications between European researchers on IHI projects (at least 1000); • share of projects involving civil society, patient organisations, health care professionals' associations or regulators: at least 80%; • share of budget allocated to projects bringing together representatives of two or more technology sectors: 95%.
<p>SO3. Demonstrate the feasibility of people-centred, integrated health care solutions</p>	<ul style="list-style-type: none"> • validated new targets for preventive or therapeutic strategy, in different therapeutic areas (at least 3 biomarkers); • demonstrated feasibility of developing people-centred, integrated health care solutions (5 examples); • projects engaging regulatory acceptance processes to contribute to new or improved guidelines or methodologies (20 examples);
<p>SO4. Exploit the full potential of digitalisation and data exchange in health care</p>	<ul style="list-style-type: none"> • demonstrated integration of data, provided by the public and private sectors (20 examples); • demonstration of feasibility of use of artificial intelligence in health care (3 examples).
<p>SO5. Enable the development of new and improved methodologies and models for a comprehensive assessment of the added value of innovative and integrated health care solutions</p>	<ul style="list-style-type: none"> • methodologies for a comprehensive assessment of the added value of combinations of products/services or combined products (including PROMs/PREMs and statistical methods or tools), submitted to health care authorities and organisations (5 examples).

7.2.3. Evaluation framework

The evaluation of the Partnership will be done in full accordance with the provisions laid out in Horizon Europe Regulation Article 47 and Annex III, with external interim and ex-post evaluations feeding into the overall Horizon Europe evaluations. As set in the criteria for European Partnerships, the evaluations will include an assessment of the most effective policy intervention mode for any future action; and the positioning of any possible renewal of the Partnership in the overall European Partnerships landscape and its policy priorities. In the absence of renewal, appropriate measures will be developed to ensure phasing-out of Framework Programme funding according to conditions and timeline agreed with the legally committed partners ex-ante.

2. ORGANISATION AND TIMING

Institutionalised Partnerships are foreseen in Articles 185 and 187 of the Treaty on the Functioning of the European Union (TFEU). The preliminary agreement on Horizon Europe contained a list of possible areas for Institutionalised Partnerships based on Article 185 and 187. For each of these areas the Commission considered 12 potential Institutionalised Partnerships. Their set up involves new EU legislation and the establishment of dedicated implementing structures and therefore an impact assessment for each of these initiatives.

Following political validation in June 2019, the impact assessment process started with the publication of inception impact assessments for each initiative in August 2019.

An inter-service steering group (ISSG) on research and innovation partnerships under Horizon Europe was set up in May 2019 and held 4 meetings before submission of the Staff Working Document to the Regulatory Scrutiny Board (7 May 2019, 19 June 2019, 5 December 2019, 20 January 2020). The ISSG consisted of representatives of the Secretariat-General, Directorate-General for Budget, Directorate-General for Research and Innovation Directorate-General for Communications Networks, Content and Technology, Directorate-General for Mobility and Transport, Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs, Directorate-General for Energy, Directorate-General for Environment, Directorate-General for Climate Action, and the Legal Service.

An online public stakeholder consultation was launched between September and November 2019, gathering 1635 replies for all 12 initiatives.

3. CONSULTATION OF THE RSB

Two upstream meetings with the Regulatory Scrutiny Board of were held on 10 July 2019 and 30 September 2019.

In accordance with the feedback received from the Regulatory Scrutiny Board on 15 May 2020, the Staff Working Document has been revised as presented in Figure 1. These revisions were endorsed by the Inter Service Steering Group on 20 January 2020.

4. EVIDENCE, SOURCES AND QUALITY

To ensure a high level of coherence and comparability of analysis for all candidate initiatives, an external study was procured to feed into the impact assessments of the 12 candidate Institutionalised Partnerships¹ (Technopolis Group, 2020). It consisted of a horizontal analysis and individual thematic analyses for each of the initiatives under review.

¹ Technopolis Group, 2020, forthcoming.

For all initiatives, the evidence used includes desk research partly covering the main impacts and lessons learned from previous partnerships. A range of quantitative and qualitative data sources complement the evidence base, including evaluations; foresight studies; statistical analyses of Framework Programmes application and participation data and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options. Public consultations (open and targeted) supported the comparative assessment of the policy options. For each initiative up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition the analysis was informed by the results of the Open Public Consultation (Sep – Nov 2019), the consultation of the Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of candidate Institutionalised European Partnerships.

A more detailed description of the methodology and evidence base used, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

Figure 1 Modifications to the draft Staff Working Document based on comments received from the Regulatory Scrutiny Board

Comments from the Regulatory Scrutiny Board – main considerations	Actions taken for the Staff Working Document
(1) The report does not sufficiently explain how the problems and challenges addressed by the new partnership differ from those addressed by the present one.	More information on the problems and challenges was added in Sections 2.2.1 (page 36) and 2.2.4 (page 40), and the differences in scope and activities were further highlighted in Section 7.2.1 (pages 82-83).
(2) The report does not clearly explain to what extent the different partnership types are likely to attract health industry partners (small or big) and why.	More detail on the expected attractiveness of the various forms of partnerships to industry was provided in Sections 5 (page 56) and 6 (notably 6.3.2, pages 61 and 73-74).
(3) The report does not provide sufficient information about how the partnership would be implemented in practice.	Information was added in Section 7.2.1, notably on the selection of the actual areas for support (pages 81/82), practical functioning of the initiative and comparison of IHI activities with those of IMI2 JU (pages 82-83).

Furthermore, the whole text was revised to provide more clarity on the aspects raised in the “Further considerations and adjustment requirements” section of RSB opinion. The main of these revisions are listed below:

- The presentation of stakeholder views in all sections were re-visited (throughout the whole text).
- The reasons for the change of scope from IMI2 JU further were explained (section 6.4, pages 82/83).
- The definitions of specific and general objectives were adjusted to better convey the intended content (Sections 4.1 and 4.2 in pages 43-46, and in related figures).
- The intervention logic was revisited to provide more clarity and to better explain the interdependencies between objectives, problems and their drivers (Sections 4.2 and 4.3, pages 48-50).
- The differences between the various partnership forms considered in the report were explained in more detail, notably for an Institutionalised Partnership (Sections 5 and 6, page 58, 59, 70, 73-74).
- Discrepancies in the scoring of options were removed and further explanation was added to justify certain conclusions and scores (throughout Section 6).
- The analysis of the options is better linked to the objectives (Sections 5 and 6).
- A clear justification for the choice of Horizon Europe calls as baseline, rather than a continuation of the current partnership, was provided in Section 5.1 (page 56).
- The advantages of a dedicated Programme Office were presented in Section 6.4 (page 77).
- The analysis of risks and uncertainties of the final choice was provided in Section 6.4 (page 77).
- Targets by the end of the initiative were presented together with the proposed monitoring indicators in Section 7.2 (pages 84-86).
- A statement was added to clarify that the comparison and choice of the options is a qualitative judgement rather than a quantitation (Section 6.4, page 75).
- Numerous revisions were made to increase readability and strengthen the argumentation, also using more examples, and taking into account various technical comments received from the RSB. The content of the text was also updated to reflect developments in the preparation of the partnership that took place since the RSB assessment (throughout the whole text), including making the general objectives (page 43), the operational objectives (pages 80-81), the indicators and targets (pages 84-86) more measurable and representative of the partnership.

Annex 2 Stakeholder Consultation

1. OVERVIEW FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1.1. Introduction

In line with the Better Regulation Guidelines,² the stakeholders were widely consulted as part of the impact assessment process of the 12 candidates for Institutionalised Partnerships, including national authorities, the EU research community, industry, EU institutions and bodies, and others. These inputs were collected through different channels:

- A feedback phase on the inception impact assessments of the candidate initiatives in August 2019, gathering 350 replies for all 12 initiatives on the “Have your say” web portal during a period of 3 weeks;
- A structured consultation of Member States performed by the EC services over 2019 through the Shadow Strategic Configuration of the Programme Committee of Horizon Europe (in line with the Article 4a of the Specific Programme of Horizon Europe). This resulted in 44 possible candidates for European Partnerships identified as part of the first draft Orientations Document towards the Strategic Plan for Horizon Europe (2021-2024), taking into account the areas for possible Institutionalised Partnerships defined in the Regulation.
- An online public stakeholder consultation administered by the EC, based on a structured questionnaire, open between September and November 2019, gathering 1635 replies for all 12 initiatives;
- A targeted consultation run by the external study contractors with a total of 608 interviews performed as part of the thematic studies by the different study teams between August 2019 and January 2020.

1.2. Horizontal results of the Open Public Consultation

The consultation was open to everyone via the EU Survey online system³. The survey contained two main parts to collect views on general issues related to European partnerships (in Part 1) and specific responses related to one or more of the 12 candidate initiatives (as selected by a participant). The survey was open from 11 September till 12 November 2019. The consultation was available in English, German and French and advertised widely through the European Commission’s online channels as well as via various stakeholder organisations.

1.2.1. Profile of respondents

In total, 1635 respondents filled in the questionnaire of the open public consultation. Among them, 272 respondents (16.64%) were identified to have responded to the consultation as part of a campaign (coordinated responses). Based on the Better Regulation Guidelines, the groups of respondents where at least 10 respondents provided coordinated answers were labelled as ‘*campaigns*’, segregated and analysed separately and from other responses. In total 11 campaigns were identified, the largest of them includes 57 respondents⁴. In addition,

² https://ec.europa.eu/info/files/better-regulation-guidelines-stakeholder-consultation_en

³ <https://ec.europa.eu/eusurvey/runner/ConsultationPartnershipsHorizonEurope>

⁴ The candidate Institutionalised Partnership Clean Hydrogen has the highest number of campaigns, namely 5. A few initiatives, such as Innovative SMEs, Smart Networks and Systems, were not targeted by campaigns. Some campaign respondents decided to provide opinions about several partnerships.

162 respondents in the consultation also display similarities in responses but in groups smaller than 10 respondents. Hence, these respondents were not labelled as campaigns and therefore were not excluded from the general analysis.

Table 1: Country of origin of respondents (N=1635)

Country	Number of respondents	Percentage of respondents
Germany	254	15.54%
Italy	221	13.52%
France	175	10.70%
Spain	173	10.58%
Belgium	140	8.56%
The Netherlands	86	5.26%
Austria; United Kingdom	61	3.73%
Finland	49	3.00%
Sweden	48	2.94%
Poland	45	2.75%
Portugal	32	1.96%
Switzerland	28	1.71%
Czechia	24	1.47%
Greece	23	1.41%
Norway; Romania	22	1.35%
Denmark	20	1.22%
Turkey	19	1.16%
Hungary	14	0.86%
Ireland	12	0.73%
United States	11	0.67%
Estonia; Slovakia; Slovenia	10	0.61%
Bulgaria; Latvia	9	0.55%
Bosnia and Herzegovina	7	0.43%
Lithuania	4	0.24%
Canada; Croatia; Israel	3	0.18%

China; Ghana; Iceland; Japan; Luxembourg; Morocco	2	0.12%
Bhutan; Botswana; Cyprus; Iran; Malta; Mexico; Moldova; Mongolia; Palestine; Russia; Serbia; South Africa; Tunisia; Ukraine; Uruguay	1	0.06%

As shown in Figure 2, the three biggest **categories of respondents** are representatives of companies and business organisations (522 respondents or 31.9%), academic and research institutions (486 respondents or 29.7%) and EU citizens (283 respondents or 17.3%). Among the group of respondents that are part of campaigns, most respondents are provided by the same groups of stakeholders, namely company and business organisations (121 respondents or 44.5%), academic and research institutions (54 respondents or 19.8%) and EU citizens (42 respondents or 15.4%).

Figure 2. Type of respondents (N=1635) - For all candidate initiatives

Among all consultation respondents, 1303 (79.69%) have been **involved in the on-going research and innovation framework programme Horizon 2020** or the preceding Framework Programme 7, while 332 respondents (20.31%) were not. In the group of campaign respondents, the share of those who were involved in these programmes is higher (245 respondents out of 272 or 90.07%) than in the group of non-campaign respondents (1058 out of 1363 or 77.62%). When respondents that participated in the Horizon 2020 or in the preceding Framework Programme 7 were asked to indicate in which capacity they were involved in these programmes, the majority stated they were a beneficiary (1033 respondents) or applicant (852 respondents). The main stakeholder categories, e.g. companies/business organisation, academic/research institutions, etc., show a similar distribution across the capacities in which they ‘have been involved in Horizon 2020 or in the Framework Programme 7’ as the overall population of consultation respondents.

Among those who have been involved in Horizon 2020 or the preceding Framework Programme 7, 1035 respondents (79.43%) are/were **involved in a partnership**. The share of respondents from campaigns that are/were involved in a partnership is higher than for non-campaign respondents, 89.80% versus 77.03% respectively. The list of partnerships under Horizon 2020 or its predecessor Framework Programme 7 together with the numbers, percentages of participants is presented in Table 2, the table also show the key stakeholder categories for each partnership. Most consultation respondents participated in the following partnerships: Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, Clean Sky 2 Joint Undertaking, European Metrology Programme for Innovation and Research (EMPIR) and in Bio-Based Industries Joint Undertaking. The comparison between the non-campaign and campaign groups of respondents shows that the overall distribution is quite similar. However, there are some differences. For the campaign group almost a half of respondents

is/was involved in the Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, a higher share of campaign respondents is/was participating in Clean Sky 2 Joint Undertaking and in Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking.

When respondents were asked in which **role(s) they participate(d) in a partnership(s)**, over 40% indicated that they act(ed) as partner/member/beneficiary in a partnership. The second largest group of respondents stated that they applied for funding under a partnership. The roles selected by non-campaign and campaign respondents are similar.

Table 2: Partnerships in which consultation respondents participated (N=1035)

Name of the partnership	Number and % of respondents from both groups (n=1035)	Number and % of respondents from a non-campaign group (n=815)	Academic/research institutions	Business associations	Company/business organisations (<250)	Company/business organisations (250+)	EU citizens	NGOs	Public authority
Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking	354 (33.33%)	247 (30.31%)	97	9	37	43	41	8	5
Clean Sky 2 Joint Undertaking	195 (18.84%)	145 (17.79%)	57	2	10	27	37	1	7
European Metrology Programme for Innovation and Research (EMPIR)	150 (14.49%)	124 (15.21%)	64	0	13	9	14	2	19
Bio-Based Industries Joint Undertaking	142 (13.72%)	122 (14.97%)	39	8	20	27	14	1	6

Partnership for Research and Innovation in the Mediterranean Area (PRIMA)	28 (2.71%)	26 (3.19%)	15	0	3	1	2	0	2
European and Developing Countries Clinical Trials Partnership	25 (2.42%)	24 (2.94%)	12	0	1	2	3	3	2
Ambient Assisted Living (AAL 2)	22 (2.13%)	21 (2.58%)	11	2	1	1	3	0	3
European High-Performance Computing Joint Undertaking (EuroHPC)	22 (2.13%)	18 (2.21%)	6	0	2	3	5	0	2

For the remaining of the consultation respondents could provide their views on each/several of the candidate initiatives. The majority of respondents (31.4%) provided their views on the Clean Hydrogen candidate partnership. More than 45% of respondents from the campaigns selected this partnership. Around 15% provided their views for European Metrology, Clean Aviation and Circular Bio-based Europe. The share of respondents in the campaign group that chose to provide views on the Clean Aviation candidate partnership is of 20%. The smallest number of respondents provided opinions on the candidate initiative ‘EU-Africa research partnership on health security to tackle infectious diseases – Global Health’.

Table 3: Candidate Institutionalised Partnerships for which consultation respondents provide responses (N=1613)

Name of the candidate Institutionalised European partnership	Number and % of respondents from both groups	Number and % of respondents from a non-campaign
--	--	---

	(n=1613)	group (n=1341)
Clean Hydrogen	506 (31.37%)	382 (28.49%)
European Metrology	265 (16.43%)	225 (16.78%)
Clean Aviation	246 (15.25%)	191 (14.24%)
Circular bio-based Europe	242 (15%)	215 (16.03%)
Transforming Europe's rail system	184 (11.41%)	151 (11.26%)
Key Digital Technologies	182 (11.28%)	162 (12.08%)
Innovative SMEs	111 (6.88%)	110 (8.20%)
Innovative Health Initiative	110 (6.82%)	108 (8.05%)
Smart Networks and Services	109 (6.76%)	107 (7.98%)
Safe and Automated Road Transport	108 (6.70%)	102 (7.61%)
Integrated Air Traffic Management	93 (5.77%)	66 (4.92%)
EU-Africa research partnership on health security to tackle infectious diseases – Global Health	49 (3.04%)	47 (3.50%)

1.2.2. Characteristics of future candidate European Partnerships

Respondents were asked to assess what areas, objectives, aspects need to be in the **focus of the future European Partnerships** under Horizon Europe and to what extent. According to Figure 6, a great number of respondents consider that a significant contribution by the future European Partnerships is 'fully needed' to achieve climate-related goals, to the development and effective deployment of technology and to EU global competitiveness in specific sectors/domains. Overall, respondents' views reflect that many aspects require attention of the Partnerships. The least attention should be paid to responding towards priorities of national, regional R&D strategies, including smart specialisation strategies, according to respondents.

Overall, only minor differences can be found between the main stakeholder categories. Academic/research institutions value the responsiveness towards EU policy objectives and focus on development and effective deployment of technology a little less than other respondents. Business associations, however, find that the future European Partnerships under Horizon Europe should focus a little bit more on the development and effective deployment of technology than other respondents. Furthermore, business associations, large companies as well as SMEs value the role of the future European Partnerships for significant contributions to EU global competitiveness in specific sectors domains a little higher than other respondents. Finally, both NGOs and Public authorities put a little more emphasis on the role of the future European Partnerships for significant contributions to achieving the UN SDGs. The views of citizens (249, or 18.3%) do not reflect significant differences with other types of respondents. However, respondents that are/were directly involved in a

partnership under Horizon 2020 or its predecessor Framework Programme 7 assign a higher importance of the future European Partnerships to be more responsive towards EU policy objectives and to make a significant contribution to achieving the UN’s Sustainable Development Goals.

A qualitative analysis of the “other” answers highlights the importance of collaboration and integration of relevant stakeholders to tackle main societal challenges and to contribute to policy goals against which fragmentation of funding and research efforts across Europe should be avoided. Additionally, several respondents suggested that faster development and testing of technologies, acceleration of industrial innovation projects, science transfer and market uptake are needed. Next to that, many respondents provided answers related to the hydrogen and the energy transition, which corresponds to the high number of respondents that provided answers to the candidate initiative on this topic.

Figure 3: To what extent do you think that the future European Partnerships under Horizon Europe need to (N=1363) (non-campaign replies) For all candidate initiatives

1.2.3. Main advantages and disadvantages of Institutionalised European Partnerships

An open question asked to outline the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe (1551 respondents). The advantages mentioned focus on the development of technology, overall collaboration between industry and research institutions, and the long-term commitment.

Disadvantages mentioned are mainly administrative burdens. An overview is provided below.

Advantages mentioned: Long term commitment, stability, and visibility in financial, legal, and strategic terms; Participation of wide range of relevant stakeholders in an ecosystem (large/small business, academics, researchers, experts, etc.); Complementarity with other (policy) initiatives at all levels EU, national, regional; Efficient and effective coordination and management; High leverage of (public) funds; Some innovative field require high levels of international coordination/standardisation (at EU/global level); Ability to scale up technology (in terms of TRL) through collaboration; Networking between members; Direct communication with EU and national authorities

Disadvantages mentioned: Slow processes; System complexity; Continuous openness to new players should be better supported as new participants often bring in new ideas/technologies that are important for innovation; Lower funding percentage compared to regular Horizon Europe projects; Cash contributions; Administrative burdens; Potential for IPR constraints.

1.2.4. Relevance of EU level to address problems in Partnerships' areas

Respondents were asked to rate the **relevance of research and innovation efforts at EU level efforts to address specific problems in the area of partnerships**. Research and innovation related problems were rated as most relevant across all candidate initiatives, followed by structural and resources problems and problems in the uptake of innovations. Overall, all three areas were deemed (very) relevant across the partnerships, as more than 80% of respondents found these challenges (very) relevant. Only minor differences were found between stakeholder categories. Research and innovation problems were found slightly more relevant by academic/research institutions, yet slight less relevant by large companies and SMEs. Structural and resource problems were indicated as slightly more relevant by NGOs, but slightly less by academic/research institutions. While both NGOs and public authorities find slightly more relevant to address problems in uptake of innovation than other respondents. The views of citizens are not differing significantly. Respondents that are/were directly involved in a current/preceding partnership find, however, the need to address problems related to the uptake of innovations slightly more relevant than other respondents.

Figure 4: To what extent do you think this is relevant for research and innovation efforts at EU level to address the following problems in relation to the candidate partnership in question? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.5. Horizon Europe mode of intervention to address problems

Respondents were asked to indicate how these challenges could be addressed through **Horizon Europe intervention**. Just over 50% of all respondents indicated that Institutionalised Partnerships were the best fitting intervention, with relatively strong differences between stakeholder categories. The use of Institutionalised Partnership was indicated more by business associations and large companies, but less by academic/research institutions and SMEs. While academic/research institutions valued traditional calls more often, this was not the case for business associations, large companies and public authorities. Public authorities indicated a co-programmed intervention more often than other respondents. Citizens indicated slightly less often that Institutionalised Partnerships were the best fitting intervention. Respondents that are/were directly involved in a current/preceding partnership, selected the Institutionalised Partnership intervention in far higher numbers (nearly 70%).

Figure 5: In your view, how should the specific challenges described above be addressed through Horizon Europe intervention? (non-campaign replies) For all candidate initiatives

When asked to reflect on their answers, respondents that pointed to the need for using Institutionalised Partnership mentioned the long-term commitment of collaboration, a common and ambitious R&I strategy as well as the overall collaboration between industry and research institutions. Others shared positive experiences with other modes of interventions:

- Traditional calls, because of their flexibility and integration of a wide range of actors, as long as the evaluation panels do not deviate from the policy focus. This was mentioned by 94 participants, including companies (25), academics (26) and EU citizens (25).
- Co-funded partnership, as a mechanism to ensure that all participants take the effort seriously, while allowing business partnerships to develop. This approach was deemed suitable based on previous experiences with ERANETs. This was raised by 84 participants, 36 of them academic respondents, 18 companies and 16 EU citizens.
- Co-programmed partnerships, to tackle the need to promote and engage more intensively with the private sector. This was mentioned by 97 participants, most of them companies (34), followed by academics (22), business associations (15) and EU citizens (11).

1.2.6. Relevance of a set of elements and activities to ensure that the proposed European Partnership would meet its objectives

Setting joint long-term agendas

Respondents were asked how relevant it is for the proposed European Partnerships to meet their objectives to have a strong involvement of specific stakeholder groups in setting joint long-term agenda. All respondents see stakeholders from industry as the most relevant, followed by academia and governments. The involvement of foundations and NGOs as well as other societal stakeholders were, however, still found to be (very) relevant by more than 50% of the respondents. Most respondents indicated the stakeholder group they belong to themselves or that represent them as relevant to involve.

Figure 6: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives - Setting joint long-term agenda with strong involvement of: (non-campaign replies) For all candidate initiatives

Pooling and leveraging resources through coordination, alignment and integration with stakeholders

Respondents were asked how relevant it is for the proposed European Partnership to meet its objectives to pool and leverage resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with specific groups of stakeholders. Respondents see stakeholders from industry as the most relevant, followed by academia and governments (Member States and Associated Countries). The involvement of foundations and NGOs as well as other societal stakeholders are also still found to be (very) relevant for more than 50% of the respondents. Similarly as described for the question on setting joint long-term agendas, most stakeholder categories valued their own involvement higher than other respondents – although also here differences between stakeholder categories were minor.

Figure 7: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Pooling and leveraging resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with: (non-campaign replies) For all candidate initiatives

Composition of the partnerships

Regarding the composition of the partnership most respondents indicated that for the proposed European Partnership to meet its objectives the composition of partners needs to be flexible over time and that a broad range of partners, including across disciplines and sectors, should be involved (see Figure 6). When comparing stakeholder groups only minor differences were found. Academic/research institutions and public authorities found the involvement of a broad range of partners and flexibility in the composition of partners over time slightly more relevant than other respondents, while large companies found both less relevant. SMEs mainly found the flexibility in the composition of partners over time less relevant than other respondents, while no significant differences were found regarding the involvement of a broad range of partners. Citizens provided a similar response to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, indicated a slightly lower relevance of the involvement of a broad range of partners and flexibility in the composition of partners over time.

Figure 8: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Partnership composition (non-campaign replies) Aggregation of responses of all candidate initiatives

Implementation of activities

Most respondents indicated that implementing activities like a joint R&I programme, collaborative R&I projects, deployment and piloting activities, providing input to regulatory aspects and the co-creation of solutions with end-users are all (very) relevant for the partnerships to be able to meet its objectives. Minor differences were found between the main stakeholder categories, the differences found were in line with their profile. As such, academic/research institutions found joint R&I programme & collaborative R&I projects

slightly more relevant and deployment and piloting activities, input to regulatory aspects and co-creation with end-users slightly less relevant than other respondents. For SMEs an opposite pattern is shown. Large companies, however, also found collaborative R&I projects slightly more relevant than other respondents, as well as input to regulatory aspects. The views of citizens are similar to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, show a slightly higher relevance across all activities.

Figure 9: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Implementing the following activities (non-campaign replies) For all candidate initiatives

1.2.7. Relevance of setting up a legal structure (funding body) for the candidate European Partnerships to achieve improvements

Respondents were asked to reflect on the relevance of setting up a legal structure (funding body) for achieving a set of improvements, as shown in the Figure below. In general, 70%-80% of respondents find a legal structure (very) relevant for these activities. It was found most relevant for implementing activities in a more effective way and least relevant for ensuring a better link to practitioners on the ground, however differences are small.

Figure 10: In your view, how relevant is to set up a specific legal structure (funding body) for the candidate European Partnership to achieve the following? (non-campaign replies) Aggregation of responses of all candidate initiatives

When comparing stakeholder categories there are only minor differences. Academic/research institutions indicated a slightly lower relevance for transparency, better links to regulators as well as obtaining the buy-in and long-term commitment of other partners. SMEs also indicated a lower relevance regarding obtaining the buy-in and long-term commitment of other partners. Large companies showed a slightly higher relevance for implementing activities effectively, ensure better links to regulators, obtaining the buy-in and long-term commitment of other partners, synergies with other EU/MS programmes and collaboration with other EU partnerships. NGOs find it slightly more relevant to implement activities faster for sudden market or policy needs. Public authorities, however, find it slightly less relevant to facilitate collaboration with other European Partnerships than other respondents. The views of citizens show a slightly lower relevance for a legal structure in relation to implementing activities in an effective way. Respondents that are/were directly involved in a current/preceding partnership indicated a higher relevance across all elements presented.

1.2.8. Scope and coverage of the candidate European Partnerships based on their inception impact assessments

Consulted on the scope and coverage for the partnerships, based on their inception impact assessments, the large majority feels like the scope and coverage initially proposed in the inception impact assessments is correct. However, about 11% to 15% of the respondents indicated the scope and coverage to be too narrow. About 11%-17% of respondents answered “Don’t know”. Overall, differences between the main stakeholder categories were found to be minor. Academic/research institutions indicated slightly more often that the

research area was “too narrow” then other respondents. SMEs on the other hand indicated slightly more often that the research area and the geographical coverage were “too broad”. NGOs and public authorities, however, found the geographical coverage slightly more often “too narrow”. Large companies found the range of activities slightly more often “too broad” and the sectoral focus slightly more often “too narrow” when compared to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership more often indicated that the candidate Institutionalised European Partnership have the “right scope & coverage”.

Figure 11: What is your view on the scope and coverage proposed for this candidate institutionalised European Partnership, based on its inception impact assessment? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.9. Scope for rationalisation and alignment of candidate European Partnerships with other initiatives

When asked whether it would be possible to rationalise a specific candidate European Institutionalised Partnership and its activities, and/or to better link with other comparable initiatives, nearly two thirds of respondents answered “Yes” (1000, or 62%), while over one third answered “No” (609, or 39%). Nearly no differences were found between stakeholder categories, only large companies and SMEs indicated slightly more often “Yes” in comparison to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership, indicated “No” more often, the balance is about 50/50 between “Yes” and “No” for this group.

1.2.10. Relevance of European Partnerships to deliver targeted scientific, economic/technological and societal impacts

Finally, respondents were asked to rate the relevance of partnership specific impacts in three main areas: Societal; Economic/technological; and Scientific impacts. All three areas were deemed (very) relevant across the candidate partnerships. Scientific impact was indicated as the most relevant impact, more than 90% of respondents indicated that this as (very) relevant. Only minor difference between stakeholder groups were found. Academic/research institutions found scientific impacts slightly more relevant, while large companies found economic and technological impacts slightly more relevant than other respondents. NGOs found societal impact slightly more relevant, while SMEs found this slightly less important.

Citizens did not a significantly different view when compared to other respondents. Respondents that are/were directly involved in a current/preceding partnership find all impacts slightly more relevant than other respondents.

Figure 12: In your view, how relevant is it for the candidate European Institutionalised Partnership to deliver on the following impacts? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.3. Stakeholder consultation results for the Innovative Health Initiative

An overview of the number and description of participants in each consultation activity targeting this specific initiative is available in Table 2. Participants were clustered into five categories: academic/research institutions, companies/business associations, Non-Governmental Organisations (NGOs), public authorities and European citizens. European patient organisations, health care professionals' organisations, organisations promoting the interest of specific groups of the population (e.g. people aged 60 and above), organisations of social health care payers were included among NGOs. Respondents from companies and business associations covered the various sectors potentially involved in IHI: pharmaceutical, biotech and vaccines, medical devices, imaging, in-vitro diagnostics and digital technologies. In addition to Member States, feedback has been received from the entire scope of all relevant stakeholders, in particular researchers, industry, health care professionals, patients, payers and public authorities.

Table 2. Participation in the various consultation activities

Consultation activity	Consultation period	Participation and profile of participants
Structured consultation of Member States	June 2019	26 Member States (all but Lithuania and Bulgaria), Iceland and Norway
Public consultation on IHI Inception Impact Assessment	July – August 2019	43 respondents: <ul style="list-style-type: none"> - 12 academic/research institutions (28%) - 9 companies/business associations (21%) - 14 NGOs (32%) - 5 public authorities incl. the German government (12%) - 3 EU citizens (7%)
Targeted consultation of stakeholders	September – December 2019	48 interviewees: <ul style="list-style-type: none"> - 8 academic/research institutions/research infrastructures (17%) - 22 companies/business associations (46%) - 4 NGOs: patient associations (8%) - 5 public authorities incl. regulators, HTA bodies and payers (10%) - 7 European Commission officials (15%) - 2 members of the management team of the current public-private partnership (4%)
Open public consultation	September – November	108 respondents:

	2019	<ul style="list-style-type: none"> - 35 academic/research institutions (32%) - 19 companies/business organisations (19%) - 17 EU citizens (16%)
--	------	--

In terms of methods, public consultations were based on structured questionnaires also including open questions and offering the possibility to hand in position papers with additional information. If needed, depending on the number of replies, responses were first scanned using text-mining technique to facilitate further analysis.

1.3.1. Feedback to the inception impact assessment

Following the publication of the inception impact assessment, a feedback phase of 3 weeks allowed any citizen to provide input on the proposed initiatives on the “Have your say” web portal. In total 43 individual feedbacks were collected from NGOs (14; 32%), academic/research institutions (12; 28%), business associations (9; 21%), public authorities including the German government (5; 12%) and EU citizens (3; 7%).

Relevance of the initiative and implementation mode

Three quarters of the respondents (32/43, 74%) explicitly expressed their support to the initiative (around 90% among business associations and academic/research institutions and 60% of public authorities and NGOs). No respondent gave a negative opinion on the proposed roadmap. Among the 18 respondents who explicitly expressed their preference regarding the implementation mode, all but one were in favour of an Institutionalised Partnership and one in favour of a co-programmed partnership.

Comments made from the respondents of the public and private sectors varied in terms of focus:

- public actors called for broader stakeholder involvement, transparency, open access to research results, public return on investment, and increased participation of SMEs;
- business associations called for flexibility in various aspects of the partnership: topic generation process, funding models, in-kind contributions from industry, legal framework for intellectual property management, and better involvement of SMEs.

This feedback is presented below according to the following categories: stakeholder involvement (in governance including priority setting, and in programme implementation), involvement of SMEs, transparency issues, participation from third countries, funding models, open access to research results, intellectual property right management, public return on investment, synergies with other initiatives, ethics and data privacy issues, sustainability of projects’ results, and comments related to the R&I content of the potential partnership.

Stakeholder involvement

There was a general call from respondents of the public sector for the involvement of a broader variety of stakeholders in the partnership beyond industry and academics: patients’ organisations, health care payers, regulators, health and social care professionals, health care providers, national health system actors and public authorities, Research and Technology

Organisations, and to a lesser extent, civil society organisations and citizens' groups were mentioned. A broader stakeholder involvement is expected at different levels: in the governance of the partnership, including in research priority setting, and in the implementation of the programme itself, including topic generation and participation in projects.

Regarding governance and priority setting, respondents from the public sector requested a model that would enable multi-stakeholder collaboration with a balance of relevant stakeholders in strategic decision-making and a stronger role of the Commission and national authorities. Respondents highlighted the need to put in place mechanisms ensuring that priorities will be set according to public health needs.

Regarding programme implementation including generation of call topics, there was a call for an inclusive process of topic generation involving patients, health care providers, health care professionals, and regulatory agencies. Respondents indicated the need for a balanced role of partners within the projects, in particular in projects addressing highly sensitive areas (e.g. projects on regulatory research).

Involvement of SMEs

Improved involvement of SMEs was strongly supported, in particular by business associations. The unique contribution of SMEs to the development of innovative health solutions was stressed by several respondents. To facilitate the participation of SMEs, the following measures were suggested: a legal framework respecting intellectual property ownership requirements for SMEs, a limitation of the administrative burden (and therefore a limitation of topics' scopes to limit consortia sizes), and process simplification (simple formats for proposals, fast feedback, simple reporting).

Transparency

Respondents from the public sector and in particular NGOs explicitly called for greater transparency with regard to decision-making processes (including in agenda-setting process) and in-kind contribution related to operational activities provided by the industry.

Participation of third countries

Business associations strongly advocated for eligibility of in-kind contributions without limitation for non-EU legal entities while the German government argued that the core of the activities and of the industry contributions needed to remain in Europe, even though international partners could provide valuable input to the initiative especially in the field of global health.

Industry contribution and funding models

Business associations asked for a funding model that encourages diverse in-kind contributions. Some companies were in favour of a flexible funding model where industry could be eligible for receiving funding, including large companies and mid-caps. Financial contribution from industry partners was suggested by some respondents from the public sector (NGO and public authority).

Open access to research results

Respondents from the public sector and in particular NGOs strongly called for open access to research results (mandatory and free) with derogations restricted to rare circumstances.

Intellectual property rights management

Some NGOs asked that ownership of publicly funded R&I results be driven by public interest and that various forms of intellectual property management and licensing be explored, including equitable licensing. Other respondents including business associations, and the German government, advocated for a revision of the rules for intellectual property rights to facilitate the involvement of the new industrial sectors with different business models and to offer better opportunities for SMEs to participate.

Public return on investment

Some NGOs called upon public return on investment by ensuring complete transparency regarding the costs of research, development and production and by safeguarding equitable access to publicly funded biomedical R&I: “Parties receiving EU biomedical R&I funding should agree on provisions to tackle the end product’s affordability, accessibility, availability and efficiency along all the R&I stages”.

Ethics and data privacy issues

Respondents highlighted the importance of addressing ethics and data privacy issues in the programme. One respondent called for ethical debates on the limits of digitalization, robotisation and the use of AI in the provision of health care so that to pave the way for a human-centred use of new technologies.

Synergies with other initiatives

Respondents highlighted the need for alignment, synergies and collaborations with i) national and regional initiatives and ii) other EU funded programmes, especially other candidate partnerships such as EU-Africa Global Health, Health and Care Systems Transformation, Personalised Medicine and Rare Diseases.

Sustainability of project results

The issue around sustainability of project results beyond the lifetime of individual projects was mentioned at several occasions. Solutions were asked in particular for sustainability of data infrastructures (e.g., through models of financing large equipment and data access handling).

Comments related to the R&I content of the partnership.

Specifically, respondents requested a better focus on and consideration of the following:

- health promotion and preventive interventions including personalised prevention, and early diagnostics in healthy population;
- sex and gender aspects (e.g. impact of digitalisation of services, implementation of artificial intelligence) as well as specific needs of subgroups of the population;
- improved cooperation between research and clinical practice;
- regulatory research;
- implementation research: methodologies to achieve large scale deployment of health care solutions and technologies;

- research in health economics;
- implementation of “green technology solutions” in the manufacturing of drugs and European Union Strategic Approach to Pharmaceuticals in the Environment.

In addition, comments were received on specific disease areas that should be considered as priorities (e.g. neglected diseases, paediatric cancer, asthma, brain disorders).

1.3.2. Structured consultation of the Member States

A structured consultation of Member States through the Shadow Strategic Configuration of the Programme Committee Horizon Europe in May/June 2019 provided early input into the preparatory work for the candidate initiatives (in line with the Article 4a of the Specific Programme of Horizon Europe). This resulted in 44 possible candidates for European Partnerships identified as part of the first draft Orientations Document towards the Strategic Plan for Horizon Europe (2021-2024), taking into account the areas for possible Institutionalised Partnerships defined in the Regulation.

The feedback provided by 30 countries (all Member States, Iceland and Norway) was analysed and summarised in a report, with critical issues discussed at the Shadow Strategic Programme Committee meetings.

During the structured consultation of Member States, there was overall a strong endorsement of the Innovative Health Initiative, including the proposed implementation via the Institutionalised Partnership with the participation of several industry sectors.

Relevance and positioning in a national context

Overall the results of the Member States consultation confirmed the relevance of the proposed Innovative Health Initiative, with 89% considering it very relevant and 7% somewhat relevant for national policies and priorities. Equally there was a very strong confirmation of the overall relevance for research organisations, including universities, as well as for industry (Figure 1).

Figure 1. Relevance of the Innovative Health Initiative in the national context

On the question of existing national/regional R&I strategies, plans and/ or programmes in support of the proposed Innovative Health Initiative, 28 countries (93 %) reported to have relevant elements in place. National R&I strategies or plans were identified most frequently (89%), followed by national economic, sectoral strategy and/or plan with a strong emphasis on research and/or innovation (79%) and regional R&I and/or smart specialisation strategies (75%). Dedicated funding programmes exist in 57% of the countries.

Delegations identified a number of aspects that could be reinforced in the proposal for this partnership that would increase its relevance for national priorities. There was a general call for better SME participation, including more favourable intellectual property rights for them. Other comments address e.g.:

- stronger role of national authorities in the governance to address the public health need and to allow for synergies with national programs;
- inclusion of health care providers;
- clear link to national health systems and an early dialogue with regulatory bodies;
- structured coordination with academia to support the translational process;
- reinforcement of the European digital industry with regard to global competitors;
- need to ensure that the agenda setting supports joint, converging industry collaboration;
- including research on vaccines, including method development for the quality control of vaccines, as well as the implementation of “green technology solutions” in the manufacturing of drugs;
- education and training of users, incentives for health care providers.

A majority of countries, 17, have expressed an interest to participate (it should be noted that the question did not allow to draw conclusion on the exact nature of participation – see also

below under ‘Views on partners, contributions and implementation), and only 3 countries at this stage expressed no national interest to participate. Identified elements for their participation covered broadly existing or planned national R&I programmes, governmental research organisations, research infrastructures, as well as regional R&I and/or smart specialisation strategies (Figure). All countries expressed interest in having access to results produced in the context of the partnership.

Figure 2. Possible participation and contribution to the Innovative Health Initiative, from the 17 countries that have expressed an interest to participate.

Objectives and impacts

Overall there was a strong agreement (82%) on the use of a partnership approach for innovative health issues. There was broad agreement (89%) that the partnership was more effective in achieving the objectives and delivering clear impacts for the EU and its citizens, and there was agreement (53%) that it would contribute to improving the coherence and synergies within the EU R&I landscape. No country expressed any disagreement.

Countries indicated good agreement with the proposed objectives at short, medium and long term (96% agree or strongly agree) and the expected scientific, economic and societal impacts at European level (93% agree or strongly agree), with the rest remaining neutral. The vast majority of countries (85%) considered the impacts very relevant in the national context. There was agreement (56%) with the envisaged duration of the proposed partnership, but an important share (22%) considered the duration too long and requested clear exit strategies.

Additional comments supported a clearer articulation between the Innovative Health Initiative and other partnerships, and the need to clarify the role of IT aspects. A request was made to better focus on the sustainability of health care systems and on health promotion and preventive interventions.

Views on partners, contributions and implementation

The majority (66%) agrees on the type and composition of partners, and 15% disagreed. Many comments supported the shift towards other industrial sectors and would welcome better inclusion of health care providers. Most countries (65%) would need more information on contributions and level of commitments expected from partners, while 31% agreed with the proposal. Individual comments related to the following issues:

- the role of Member States in the agenda setting and governance should be strengthened;
- ensure realistic commitments from industry, including meaningful financial contributions, with regards to the scale and budget of the initiative;
- support industries in jointly addressing common and growing operational, regulatory and economic challenges;
- ensure sufficient representation of health ICT companies and research organisations;
- impact on promoting EU competitiveness should be at the forefront of the initiative, by limiting contributions from non-EU legal entities, or even limiting it to EU and Associated Countries;
- funding to industry in accepted projects should be possible, to allow for peer-to-peer collaborations between academia, RTOs and industry partners;
- important to strengthen the role of health care providers in the agenda setting.

The proposed use of Article 187, and the establishment of a Joint Undertaking, was supported by the majority (73%), while one country disagreed, with the rest expecting more details in order to be able to make an informed decision. One country would support a tripartite partnerships with industry, Member States and the Union, while another country explicitly excluded any national co-funding. Furthermore, the issue was raised of how to ensure sufficient Member State and stakeholder involvement in the agenda setting and set-up of the programme in order to achieve people-centred health care.

1.3.3. Targeted consultation of stakeholders

In addition to the consultation exercises coordinated by EC services, the external study thematic team performed a targeted consultation with key stakeholders on different aspects of the Innovative Health Initiative. The objective of the programme of interviews was to provide an insight into the views of these key stakeholders on the context, problem definition, objectives, policy options, impact analysis, coherence and monitoring of the new initiative. Semi-structured interviews were conducted using a tailored interview topic guide and were subsequently transcribed/summarised and analysed.

Forty-eight interviews were conducted with representatives from industry (22; 46%), the European Commission (7; 15%), academic and research institutes (5; 10%), research infrastructures (3; 6%), patient associations (4; 8%), members of the management team of existing partnerships (2; 4%), regulators, HTA bodies and payers (5; 10%).

Key results/messages from the targeted consultation are presented below.

Problems and problem drivers

Several interviewees shared their thoughts on what problems could be addressed with this investment. These included antimicrobial resistance, ageing populations and skills migration to other countries. It was felt that Europe was struggling to maintain its leadership position in health R&I compared to US and China.

It was discussed that the fragmentation of the health care systems including differences in capacities, standards of care and cultural expectations leads to challenges implementing health innovations uniformly across Europe and may act as a barrier to uptake. In particular, it was mentioned that uneven IT literacy across Europe and poor public perception of industry were hindering uptake.

Other points were the need to reference ethics along with digitalisation and data exchange as areas where barriers need to be overcome and the need to include “standardisation” of the methodologies and models to better assess market value.

Objectives

Interviewed stakeholders expressed an overall support for IHI general objectives. A large proportion of interviewees were satisfied with the specific objectives with positive feedback around the push for a people-centred approach. There was some discussion around the broad nature of the objectives and the potential difficulty of measuring the associated outcomes. Nevertheless, it was generally agreed as a strategic decision to encompass the needs of the variety of stakeholders likely to be involved.

Expected impacts

- In terms of **scientific impacts**, bringing together a broad range of expertise and actors from across the innovation value chain was seen as instrumental for the majority of interviewees. In their opinion, such a configuration would allow: i) to support the development of innovations that would meet patients and health systems needs while having a realistic transition to market, ii) to drive cross-pollination of ideas and creativity leading to innovative health solutions that would not be possible from a more siloed approach, and iii) to foster scientific advancements by overcoming barriers of data exchange.
- According to the majority of interviewees, **economic impacts** would result from more efficient development processes, thus reducing the cost of development that may in turn contribute to lower innovation cost to the end users. It was also discussed that the development of digital platforms and technologies coupled with effective data exchange would also have economic benefits to the health care system (e.g. eHealth platforms containing diagnostic data would reduce the need to duplicate diagnostic tests across multiple health care sites). Regarding the impact on job growth, some interviewees felt that any boost in the economy would lead to a general growth in jobs, while others referred to jobs that would be created as a direct result of carrying out IHI or from the products that would be created. This was particularly discussed in reference to start-ups and SMEs. Skill development, in particular data skills, was a key aspect of this growth and a number of interviewees suggested that education or training activities within the partnership project would enhance this impact. Many interviewees indicated that due to the synergies that would be developed as part of the partnership, the economic benefits of the investment would be felt by all stakeholders along the value chain. Nevertheless,

SMEs were identified as key beneficiaries and the business growth of SMEs was considered as a driver for innovation and global competitiveness in health R&I.

- In terms of **societal impacts**, the majority of interviewees agreed that IHI would lead to improved health and wellbeing. Many of the discussions were general in nature suggesting that the specific impacts would be determined by the nature of the actual IHI projects. Societal impact would also be achieved through increased uptake of innovations. This would be primarily driven by engaging end-users, ensuring the relevance of innovations to the target groups and sufficient training of end-users to benefit from the innovations. It was also discussed that inequality in health care access could be partially addressed in the partnership by developing innovations that account for variations in digital literacy, ageing and geographical diversity.
- Positive **environmental impacts** were discussed primarily with regard to reduced need for travel (via advancements in remote testing and monitoring) and less/better waste management (e.g. via enhanced data exchange replacing the need to duplicate tests). Some interviewees raised concern that there are also negative environmental impacts of digital technologies e.g. energy consumption of datacentres and extraction of raw materials, suggesting that the net environmental impact would be important to consider.

Stakeholder involvement

It was strongly felt that a broad range of stakeholders alongside academia and industry was required to make the partnership a success. In particular the involvement of regulators, patient representatives, and representatives of health care systems to strengthen the impact and uptake of innovations was encouraged.

Synergies with other EU initiatives

In general, there was strong support for working synergistically with other EU initiatives, in particular since health is complex and feeds into many aspects of other initiatives. Developing similar data management methodologies or use of similar platforms was discussed as a key way to ensure that findings can be shared between initiatives. It was also discussed that cooperation between initiatives could enhance learning. Establishing a flexible set of rules for the different initiatives would reduce bureaucratic barriers that have prevented past collaborations. An opportunity was noted for projects, partners or ideas to flow between different funding initiatives such as Horizon Europe regular calls and IHI in order to exploit the sequential needs of the project.

Transparency

Interviewees were in favour of increased transparency of the initiative in terms of decision-making, financing and activities, as a means to increase public confidence in the initiative.

Broadening the membership of the partnership

It was generally felt that a broader membership would be a positive change, but it was discussed that membership should be based on research/knowledge excellence rather than geographical representation. There was strong support for keeping membership open to potential future partners as a token of flexibility and to help address gaps in membership that may develop later in the partnership.

Dissemination of results and re-use by others across Europe

This notion was supported as it was felt that better dissemination would enable more efficient future research. At the same time, sharing of results should not compromise the development of intellectual property. There were also some concerns around GDPR and patient data.

Increased level of private partners' contributions

Some interviewees supported the increased level of private partners' contributions provided there was a strong agreement across industry. On the other hand, it was felt that it may make IHI less attractive to industry and that a true partnership should have a 50/50 contribution ratio. There were also some concerns about the public perception and the shift in balance to industry in determining the research agendas.

Increased level of private partners' financial contributions

Interviewees were asked whether they would support an increased level of private partners' contributions, ideally to a point where around 10% of all private members' contributions are financial rather than in-kind. This question led to a mix of responses. Some interviewees felt that in-kind was a more valuable contribution than cash as the knowledge and expertise of industry is where the true value of the partnership lies. Others felt that a financial contribution would lead to a stronger commitment from industry partners. Some others felt that a flexible, case-by-case approach would be most suitable suggesting that commitments may change over time once industry has the opportunity to assess the value of the partnership.

Implementation mode

The majority of interviewees felt that Institutionalised Partnership would be the most effective option of delivering scientific, economic and societal impacts. Commonly given reasons for this were the broader range of stakeholders engaged, stronger commitment from all parties, flexibility on setting research agendas and the longer-term outlook.

- Horizon Europe Regular Calls

It was generally felt that Horizon Europe has an important place in the funding landscape through regular calls and is effective in achieving impacts in smaller projects and enhancing academic excellence. However, it was discussed that the structure would not be able to enable large-scale collaboration between a broad range of stakeholders as required to achieve the abovementioned impacts. There were concerns that it would not be very attractive to industry due to a reduced role in setting research priorities and a potentially less binding agreement. Projects under Horizon Europe were viewed as having a smaller scope so would not be able to holistically evaluate digital platforms or comparable technologies. This would have to be accomplished by combining many smaller Horizon Europe projects, leading to fragmentation and inefficiencies. The timeframe of regular calls was also discussed as being insufficient to adequately achieve the objectives.

- Co-Programmed Partnership

Co-programmed partnerships were preferred to Horizon Europe Regular Calls in particular due to their longer-term focus. Co-programming was seen as suitable for a partnership structure where a more flexible arrangement was desirable such as involving pre-existing partnerships or for projects of a smaller scope. There were, however, concerns over co-

programming delivering an in-depth partnership of diverse stakeholders. It was felt that the commitment under this option would not deliver the security needed to invest in truly innovative and risky ideas and may therefore not be attractive to some partners. Furthermore, some interviewees felt that industry would have less input in developing research agendas under this option. Establishing common research agendas was seen as valuable but insufficient to overcome the barriers of different sectors working in silos and would therefore not benefit from the full set of outcomes stemming from the cross-pollination of skills and knowledge under a partnership. For these reasons, it was felt that a co-programmed partnership would not be as effective in delivering the impacts described above.

- Institutionalised Partnership

Institutionalised Partnerships were generally seen as more integrated partnership structures. The most frequently discussed advantage of Institutionalised Partnerships over the other policy options was that this structure would attract and enable a broader set of actors to engage. Diversity of stakeholders along the value chain was seen as an essential component to achieve impacts. Similar to a co-programmed partnership model, the longer-term outlook was also seen as a key advantage of this option.

It was discussed that this arrangement would be attractive to industry because there would be the opportunity to co-develop research agendas. Similarly, stakeholders from other groups felt that having a diverse range of players would enable the development of research agendas that are more balanced across the needs of all actors, leading to more realistic and holistic research goals.

The legally binding arrangement was seen as an advantage because it provided a level of confidence to the stakeholders involved and it was also viewed as an important conduit to facilitate the sharing of data required to achieve the impacts. It was discussed that this integrated approach would also enable a more detailed discussion around intellectual property upfront, further increasing confidence in the partnership from the outset. This in turn could lead to greater commitments from private partners since the risk of investment is shared, leading to more innovative and potentially more impactful outcomes.

It was discussed that Institutionalised Partnerships may suffer from a large administrative burden. However, it was also felt to be a necessary component of such a complex arrangement and that the administrative burden of Horizon Europe and co-programmed partnership was likely to be similar. Nevertheless, it was suggested that this could be a barrier to smaller companies, i.e. SMEs and start-ups, that may not have the capacity to meet the administrative needs.

Key Performance Indicators (KPIs)

In general, KPIs such as publications and patents were seen as easy to measure but limited in showcasing the partnership's impact. Instead, it was suggested to focus on indicators such as adoption into health care systems, uptake of citizens and ultimately a change in health outcomes or the burden of disease.

It was discussed that health and economic KPIs would be difficult to measure and would require a well-defined baseline at the start of the project, tailored to the specific project objectives.

Some proposed KPIs were:

- health and wellbeing: disease prevalence, Quality Adjusted Life Years (QALYs), probability of treating disease, life expectancy, time in hospital, cost of treatment;
- economic: job growth, number of new SMEs/start-ups, business performances, product development, follow-up on funding;
- scientific: publications (but acknowledged as insufficient alone).

There was also a discussion on monitoring the success of IHI overall. This could be measured by examining the number of stakeholder types involved, meeting timeline goals, and development of products.

A number of interviewees stressed it was important to focus on a small number of high quality KPIs. Some even suggested establishing a small project dedicated to defining the most effective KPIs for each project and IHI overall.

1.3.4. Open Public Consultation

This section outlines the results of the Open Public Consultation for the candidate European Partnership on Innovative Health Initiative.

There were 108 respondents who provided views about the Innovative Health Initiative Partnership. Among them, 35 respondents (32%) are representatives of academic and research institutions, 19 respondents (19%) are company/business organisations, and 17 respondents (16%) are citizens. The majority of respondents, namely 77 (71%), have been involved in the on-going research and innovation framework programme, while 49 respondents (64%) were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7.

Relevance of efforts of the Innovative Health Initiative to address problems

At the beginning of the consultation, the respondents indicated their views regarding the needs of the future Innovative Health Initiative (Figure 3). Overall, respondents indicated that many of the options presented were relevant. The option where most respondents indicated this, was “be more responsive towards societal needs” (76; 70%). No statistical differences were found between the views of citizens and other respondents. Other needs indicated were those around investment in long term European partnership, extensive support and the value chain.

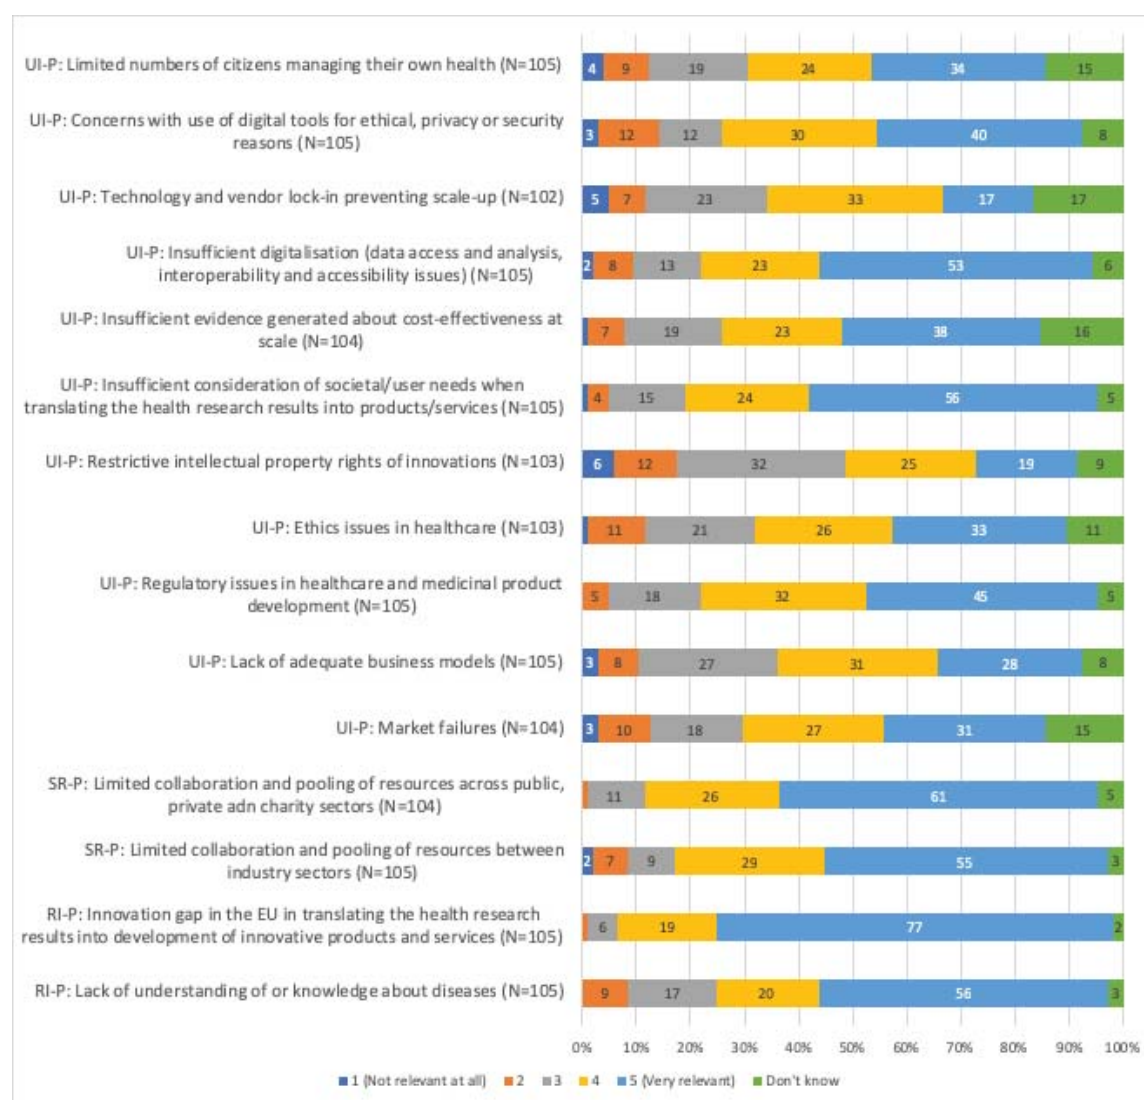

Figure 3. Views of the respondents in regard to the needs of future Innovative Health Initiative under Horizon Europe (N=108)

Relevance of R&I efforts at the EU level to address problems in relation to health and health care innovation

Respondents were asked to provide their view on the relevance of R&I efforts at EU level to address three types of problems: problems in uptake of health innovations (UI-P), structural and resource problems (SR-P) and research and innovations problems (RI-P). Responses are presented in Figure 4.

Figure 4. Views of respondents on relevance of research and innovation efforts at the EU level to address problems in relation to health and health care innovation

With regard to uptake of health innovations (UI-P), the issue for which EU-level R&I efforts were considered very relevant by the greatest amount of respondents (56; 53%) is “insufficient consideration of societal or user needs when translating the results of health research into better health products and services”. This option was closely followed by “Insufficient digitalisation (data access and analysis, interoperability and accessibility issues)” (53; 50%).

With regard to structural and resource problems (SR-P), the answers to the two proposed options (“Limited collaboration and pooling of resources - across public, private and charity sectors or - between industry sectors”) are fairly similar, with the majority of respondents considering those two problems as very relevant to be addressed at EU-level.

With regard to R&I problems (RI-P), “Innovation gap in the EU in translating the results of health research into the development of innovative health products and services” was considered by the greatest number of respondents (77; 73%) as a very relevant issue to be addressed at EU-level.

No statistical differences were found between the views of citizens and other respondents.

Horizon Europe interventions to address problems

As shown in Figure 5, 57% of respondents indicated that Institutionalised Partnerships were the best fitting intervention. No statistical differences were found between the views of citizens and other respondents.

Figure 5. Assessment of Horizon Europe intervention

People who stated that an Institutionalised Partnership was the best fitting answer mentioned long term collaboration, global health issues and financial commitment. Respondents who did not select Institutionalised Partnership as their preferred intervention (N=47) mentioned traditional calls, industry partners and collaborative research as crucial for innovation.

Involvement of actors in setting joint long-term agenda

A higher number of respondents consider that the involvement of academia and industry is highly relevant for reaching the objectives of the Innovative Health Initiative Partnership. In contrast, the importance of involvement of foundations and NGOs in setting joint long-term agenda is considered lower, with 47 respondents (48%) viewing them as highly relevant actors for setting the agenda. Respondents that are/were involved in a current/preceding partnership (Horizon 2020 or Framework Programme 7) find industry a more important stakeholder to involve in joint long-term agenda setting than other respondents. No statistical differences were found between the views of citizens and other respondents.

Figure 6. Views of respondents on relevance of actors in setting joint long-term agenda

Relevance of actors in pooling and leveraging resources

The role of Member States and Associated Countries is perceived as relevant or very relevant by 86% of respondents. The importance of involvement of other actors, such as

industry and academia, is also considered high by 81% and 80% of respondents, respectively. The role of foundations and NGOs as well as other stakeholders in pooling and leveraging resources, is seen as less relevant (74% and 64%, respectively).

A slight statistical difference was found between the views of citizens and other respondents. Citizens show slightly less relevance for industry, for other categories the views show no statistical differences.

Figure 7. Views of respondents on relevance of actors for pooling and leveraging resources

Partnership composition

The involvement of a broad range of partners is considered more relevant to meet the objectives of the Partnership than the flexibility in composition of partners over time, as 73 respondents (72%) versus 52 (50%) respectively consider them very relevant.

Figure 8. Views of respondents on relevance of partnership composition elements

Implementation of activities

Over 67% of respondents consider collaborative and joint R&I projects very relevant for reaching the objectives of the Partnership. The least number of respondents, namely 44 (42%), view the input to regulatory aspects as relevant for meeting the objectives. No statistical differences were found between the views of citizens and other respondents.

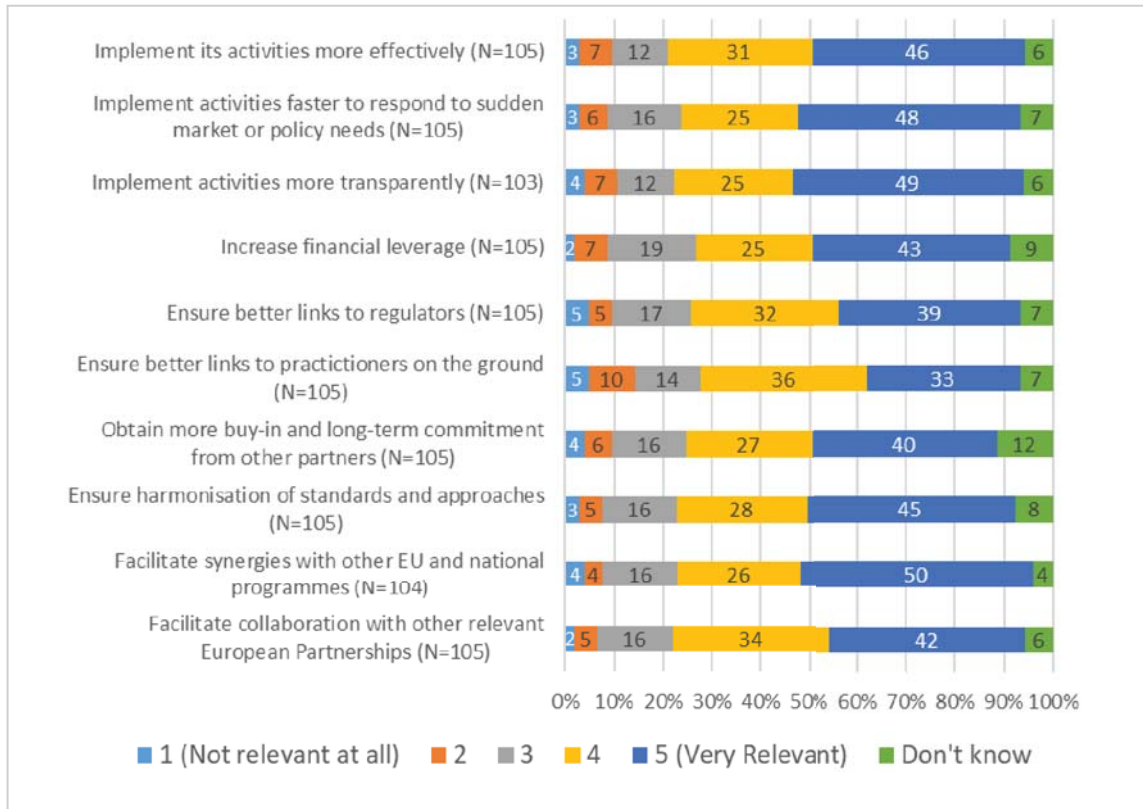

Figure 9. Views of respondents on relevance of implementation of the following activities

Relevance of a legal structure (funding body) to achieve specific objectives

Respondents were asked to assess the relevance of a specific legal structure (funding body) for the candidate European Partnership to achieve several objectives. The opinions of respondents reveal that the legal structure would be equally beneficial for most listed activities, as Figure 10 reflects a similar pattern of responses. However, the least number of respondents suggest that the legal structure would be very relevant for ensuring better links to practitioners on the ground and to regulators. No statistical differences were found between the views of citizens and other respondents.

Figure 10. Views of respondents on relevance of a specific legal structure

Scope and coverage

Respondents were asked to assess the scope and coverage of the proposed Innovative Health Initiative, based on its inception impact assessment. As presented in Figure 11, 73 respondents (72%) consider that the coverage and scope of technologies is right, while the least number of respondents, namely 51 (50%), think that the proposed sectoral and geographical coverage and scope are right. Moreover, 20 respondents (20%) indicated that the research areas covered are too narrow. No statistical differences were found between the views of citizens and other respondents.

Figure 11. Views of respondents on the scope and coverage proposed for the Innovative Health Institutionalised Partnership

Aside from this multiple choice question, the respondents were also asked to provide comments on the proposed scope and coverage for this candidate Institutionalised Partnership. The keyword analysis showed the respondents used this open question to talk about infectious diseases, the scope of the partnership with regard to global health, the health systems and public health.

Alignment of the European Partnership with other initiatives

Out of 91 respondents, 78 (86%) think that it is possible to rationalise the candidate Innovative Health Initiative and its activities, and/or to better link it with other comparable initiatives. Respondents mentioned other programmes, complementary initiatives, health systems partnerships and digital technology.

Relevance of the Candidate European Partnership to deliver impacts

According to Figure 12, the candidate Partnership is expected to be ‘very relevant’ for “improved access to innovative, sustainable and high-quality health care”, for ensuring “effective health services to tackle diseases and reduce the burden of disease”, and for ensuring that there are “healthy citizens in a rapidly changing society”. Among listed economic and technological impacts, a greater number of respondents (81; 77%) indicated that the candidate Partnership would make a significant contribution towards “better, safe and affordable health technologies, tools and digital solutions for health”. The results for listed scientific impacts are very similar and positive, reflecting high expectations about potential impacts of the candidate Partnership. The economic and technological impact regarding “more and de-risked innovations available for healthcare investors” was found more relevant by respondents that are/were involved in a current/preceding partnership (Horizon 2020 or Framework Programme 7). No statistical differences were found between the views of citizens and other respondents for most of the discussed impacts.

Figure 12. Views of respondents on the relevance of the candidate European Institutionalised Partnership to various impacts

1.3.5. Integration of feedback received in the preparation of the partnership⁵

- Stakeholder involvement

To address the request for broader involvement of stakeholders in IHI governance, a separate body ('Innovation Panel') is envisaged. It would be composed of the representatives of EU and member industry associations, as well as of various other stakeholders such as representatives of patients, health care professionals, patients, health care providers, academia, research and technology organisations, research infrastructures, other partnerships and ad-hoc members as necessary. One of the major tasks of the Innovation Panel will be to identify and review potential areas and topics, ensuring they are suitable for the scope of IHI, they adequately address public health interest and needs of end users, and that they have a chance of securing sufficient in-kind commitment from the industry. The members of the Innovation Panel will be expected to be in close contact with their respective constituencies and to seek expert opinion in advance, thus maintaining openness of the initiative and at the same time, ensuring smooth operation.

⁵ This chapter provides information on various measures and solutions that could be proposed to address the feedback received. It should be noted that these ideas need validation in the legislative act or any other legal documents laying down the functioning of the partnership (e.g. statutes or rules of procedure of individual governance bodies).

Member States and Associated Countries would be represented in the States Representatives Group. Its task will be to provide opinions on the activities of the partnership and information on related activities at national level. The proposed partnership will thus benefit both industrial and public partners and the governance system will ensure representation of the views of all key stakeholders.

- **Involvement of SMEs**

To encourage SMEs involvement in the partnership, dedicated support and communication actions and could be offered by the Programme Office, benefitting from the implementation mode as an Institutionalised Partnership.

- **Transparency**

Regarding the transparency of research priority setting and the topic generation process, the revised governance structure would better incorporate views of various stakeholders involved in health and care thanks to the Innovation Panel. As regards the transparency of in-kind contribution provided by the industry in relation to operational activities, detailed requirements for its valuation would be defined in documents laying down the functioning of the initiative. The project results are going to be subject to the same transparency provisions as under regular Horizon Europe calls. Access to the information about the initiative will be ensured through communication activities and publication of relevant documents on its website. Additionally, appropriate partnering/promotion events and communication campaigns may be organised.

- **Participation of industry from third countries**

EU Member States expressed a strong wish to strengthen competitiveness of Europe's health technology industry. At the same time, health research goes beyond national borders and the necessary global dimension of the partnership should be ensured. The partnership will aim to attract investments also from outside Europe to increase its international footprint, capture resources of global companies and benefit from other previous international investments or address specific scope (such as e.g. disease prevalence in non-EU countries, with relevance for EU population). In order to balance these needs, in-kind contributions committed out of EU or Horizon Europe Associated Countries might be accounted for and eligible for matching with EU funds, albeit to a certain extent. If formalised in the relevant legal provisions, this approach would follow the practice established under IMI2 JU.

- **Funding models**

To address the need for financial flexibility requested by some industrial sectors, industry could be eligible for funding up to a certain ceiling (including large companies and mid-caps), and could also be entitled to opt-out from receiving funding at their discretion. The detailed arrangements will be laid down in the relevant legal provisions.

- **Open access to research results**

As a principle, general Horizon Europe provisions will apply.

- **Intellectual property rights management**

As a principle, general Horizon Europe provisions will apply.

- **Public return on investment**

The proposed partnership is set to work in the pre-competitive R&I area of unmet health needs and as such will aim at fostering collaborations between public and private stakeholders in order to accelerate the future development of health innovations. As a principle, the partnership does not envisage engaging mechanisms to influence pricing and reimbursement as these are a national competence. Nevertheless, in case the partnership would conduct research at a significant scale in the competitive area, a mechanism could be foreseen so that products or services developed by the partnership are accessible at fair conditions.

- **Synergies with other initiatives**

The partnership will be operating in connection with several other relevant initiatives at various levels so that synergies can be strengthened and waste in research minimised. Duplication of efforts with other partnerships could be avoided by consultation and potential direct representation in the IHI governance structures (the Innovation Panel) of representatives of other relevant initiatives, such as e.g. the potential future public-public partnership on “Health and Care Systems Transformation”. Draft topic texts will be consulted with the relevant services of the European Commission and approved by the Governing Board that will include EC members. To ensure coherence with national/regional initiatives, the States Representatives Group (composed of representatives of relevant national ministries) is foreseen to be represented in the Innovation Panel, will be consulted on future call topics and will provide advice on potential complementarities and overlaps with relevant national initiatives.

- **R&I content of the partnership**

The comments related to the content of the partnership were taken into account when designing the proposed objectives and are going to be further considered during the elaboration of the Strategic Research Agenda.

Annex 3

Who Is Affected And How?

1. PRACTICAL IMPLICATIONS OF THE INITIATIVE

The Institutionalised Partnership implementing the Innovative Health Initiative will be offering funding and collaboration opportunities to those interested in it, on a voluntary basis. As a result, it will not impose any obligations generally applicable to citizens, businesses including SMEs or administrations. Certain obligations will be imposed, though, on industry associations who will become formal Members of the initiative as enshrined in the legislative act, and on stakeholders directly involved in the funded actions because of obligations resulting from signed grant agreements.

The impact on national public administrations will be limited to the allocation of human and financial resources to attend the States Representatives Group meetings (approx. 3-4 per year, in Brussels) and ensuring the flow of information at national level between stakeholders, notably between the relevant ministries. These processes are similar to those required for attending various Horizon Europe programme committees but an additional effort will be needed for a separate channel of communication activities to national stakeholders. Such activities are usually organised by National Contact Points as the main structure existing at the Member States level to provide guidance, practical information and assistance on all aspects of participation in EU funding programmes. A similar impact can be expected on various stakeholder groups such as health care professionals, providers, patient associations or research and technology organisations, to ensure their potential input into the governance and priority setting process.

Industry associations who are formal members of the Partnership will be bound by the various obligations stemming from the Regulation establishing the initiative. Due to their representation in the partnership's Governing Board, these associations will need to organise their internal workflows for efficient decision making and allocate representatives to attend Board meetings, and to follow-up on the Governing Board's decisions taken by written procedures.

For all other enterprises active in health R&I, some limited additional costs may be linked to understanding the rules of the new funding programme and allocating staff to follow up calls as they are prepared and published, and to networking and finding collaboration opportunities. SMEs might find these costs to be proportionally higher (versus their overall staff effort) as such activities are not directly linked to the entity size. Overall, these costs and effort will be lower for those already familiar with other private-public partnerships, such as ECSEL or IMI Joint Undertakings.

As the major positive impact, all stakeholders interested to take part in the initiative and respond to calls for proposals will stand a chance of benefiting from funding opportunities and access to new scientific ideas, intellectual property and collaborators beyond their usual interlocutors. For industries – including SMEs – this will enhance business viability and speed up the path of designing products or services that better respond to the needs of end-users: patients, health care professionals and health care systems.

2. SUMMARY OF COSTS AND BENEFITS

It is not possible to quantify – with an acceptable level of confidence – how this initiative would lead to the reduction or increase of costs of developing health innovations, or to the health status of EU citizens.

The development cost and timelines in the field of health play a crucial role. In the pharmaceutical area, successful development of a new drug takes on average 10 to 15 years, far beyond the typical duration of projects seen e.g. in IMI2 JU (usually 4-6 years). The cost of development is, in most cases, shared between various funding sources, such as private investors and governments that complement various phases of product development pathway⁶. While the success of drug development process is variable between areas, such as oncology versus infectious disease vaccine development⁷, a common feature is that the cost of failures needs to be factored in the cost (and ultimately, market price) of products that will successfully enter the market.⁸

Furthermore, the funding made available by this initiative can only make a partial contribution to the important development costs of medical interventions. A recent independent analysis⁹ demonstrates that (after accounting for the costs of failed trials) the median capitalized R&D investment to bring a new drug to market was estimated at approx. USD 985 million (mean investment approx. USD 1.3 billion). The figures vary greatly between therapeutic areas: median between USD 765.9 million for nervous system agents and USD 2.7 billion for antineoplastic and immunomodulating agents. Earlier estimates – based on different type of input data – suggested that out-of-pocket cost per approved new drug reached approx. USD 1.4 billion (2013), with fully capitalised costs reaching approx. USD 2.6 billion¹⁰.

This analysis gets inevitably more complex in the case of a cross-sector partnership such as IHI that will bring together the several technology sectors: medical devices, pharmaceuticals, biotechnology, imaging and vaccines. Indeed, it is expected that the majority – if not all – projects funded under IHI will operate in the thematic areas of two or more sectors. Moreover, various sectors have varying development timelines and disparate definitions of pre-competitive space, where this partnership actually intends to intervene. The combination products (such as e.g. diagnostics + treatment) that could result from the partnership in the long term, would also reflect these underlying complexities.

The direct monetary benefit for citizens cannot be quantified, either, because the status of health is influenced by numerous factors, such as e.g. income and social status, education, environment, social support networks, genetic factors, the place where one lives, access to

health care services and many others¹¹. Majority of these factors are beyond the control of any funding initiative, including this one.

For all these reasons, the ensuing analysis will provide a qualitative assessment and some estimates, while refraining from computing potential gains or loss values, as these would be based on too many assumptions to warrant credibility.

<i>I. Overview of Benefits (total for all provisions) – Preferred Option</i>		
<i>Description</i>	<i>Estimation</i>	<i>Comments</i>
<i>Direct benefits</i>		
Strengthened EU skills and capacity in academic and industrial health research and innovation	New scientific paradigms, new high-impact publications ¹² .	
EU-wide cross-sectoral health research and innovation ecosystem created	Easier interactions between potential new collaborators: across stakeholder types (e.g. industry with academia, SMEs with large industry...) and across sectors (e.g. pharma with medtech). A neutral platform created for interactions between academia, industry, end-users and regulators.	
New scientific paradigms established providing the foundation for innovative health technologies	New health solutions (e.g. drugs, diagnostics, combination products) available to citizens. Potential new business opportunities for industry, incl. SMEs	Potential new solutions might be entering the market in the future, thus changing the competitive position of companies, incl. SMEs.
<i>Indirect benefits</i>		
More productive and globally competitive EU health industries that create jobs and growth	Positive impacts on European economy, including access to new markets for companies.	Potential salary increase for highly-skilled jobs and/or increase of high-salary employment in health sectors.
Better, safe, effective and cost-effective health technologies, tools and digital solutions for health	EU citizens will benefit.	Companies may need to adapt to changing landscape and new business models.
Increased level of public and private investments into strategic unmet public health	EU citizens will benefit.	For companies, need to adapt to new business models and areas.

¹¹ <https://www.who.int/hia/evidence/doh/en/>

¹² The citation impact (which measures how many times a paper is cited in subsequent papers) for all IMI papers is 2.03 (compared to 1.14 for the EU and the baseline of 1 for the world).
https://www.imi.europa.eu/sites/default/files/news/Brochure_ResultsImpact.pdf

needs		
Improved health outcomes and wellbeing in priority disease areas (SDG3)	EU citizens will benefit.	Health care systems might need to shift focus from treatment to prevention.
Reduced health inequalities and improved access to high quality health care in priority disease areas (SDG 10)	EU citizens will benefit.	For companies, need to adapt to new business models and areas.
Reduced need for travel impacting on climate (SDG 13)	EU citizens will benefit.	Lowered revenues for certain enterprises active in the travel sector.

(1) Estimates are relative to the baseline for the preferred option as a whole (i.e. the impact of individual actions/obligations of the preferred option are aggregated together); (2) Please indicate which stakeholder group is the main recipient of the benefit in the comment section; (3) For reductions in regulatory costs, please describe details as to how the saving arises (e.g. reductions in compliance costs, administrative costs, regulatory charges, enforcement costs, etc.; see section 6 of the attached guidance).

II. Overview of costs – Preferred option							
		Citizens/Consumers		Businesses		Administrations	
		One-off	Recurrent	One-off	Recurrent	One-off	Recurrent
Management/ Administrative costs	Direct costs						EUR 4,7 million ¹³
	Indirect costs						
Personnel costs	Direct costs						EUR 6.3 million ¹⁴ to cover the cost of 56 staff
	Indirect costs						

¹³ Figure for IMI2 JU in 2019, based on IMI2 JU Annual Activity Report 2019, Title 2 expenditure. Under IMI2 JU, this amount is covered jointly by the EU and by the private JU Member. This value is given as illustration only since the administrative/personnel costs of IHI will depend several factors, including the total budget of the initiative, organisation of the programme office and the number of staff.

¹⁴ Figure for IMI2 JU in 2019, based on IMI2 JU Annual Activity Report 2019, Title 1 expenditure. Under IMI2 JU, this amount is covered jointly by the EU and by the private JU Member. This value is given as illustration only since the administrative/personnel costs of IHI will depend several factors, including the total budget of the initiative, organisation of the programme office and the number of staff.

(1) Estimates to be provided with respect to the baseline; (2) costs are provided for each identifiable action/obligation of the preferred option otherwise for all retained options when no preferred option is specified; (3) If relevant and available, please present information on costs according to the standard typology of costs (compliance costs, regulatory charges, hassle costs, administrative costs, enforcement costs, indirect costs; see section 6 of the attached guidance).

All these individual costs and benefits are likely to contribute to, or even trigger, changes in the health care systems. For individual citizens, this could mean that the health care will shift from disease/incident-based treatments to more holistic care throughout the lifetime.

REFIT Cost savings table

Not applicable for the proposed Innovative Health partnership. The initiative will build on the existing implementation structure (the Programme Office) already in place for IMI2 JU. There are no additional regulatory costs associated, and no specific simplification measures apply in this case.

Annex 4 Analytical Methods

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines¹⁵ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This is complemented by integrating the **conditions and selection criteria for European Partnerships**, as well as requirements for setting up Institutionalised Partnerships.¹⁶

1. OVERVIEW OF THE METHODOLOGIES EMPLOYED

In terms of **methods and evidence used**, the set of impact assessments for all candidate Institutionalised European Partnerships draw on an external study covering all initiatives in parallel to ensure a high level of coherence and comparability of analysis¹⁷ (Technopolis Group, 2020).

All impact assessment mobilised a mix of qualitative and quantitative data collection and analysis methods. These methods range from desk research and interviews to the analysis of the responses to the Open Consultation, stakeholder analysis and composition/portfolio analysis, bibliometrics/patent analysis and social network analysis, and a cost-effectiveness analysis.

The first step in the impact assessment studies consisted in the definition of the context and the problems that the candidate partnerships are expected to solve in the medium term or long run. The main data source in this respect was desk research. This includes grey and academic literature to identify the main challenges in the scientific and technologic fields and in the economic sectors relevant for the candidate partnerships, as well as the review of official documentations on the policy context for each initiative.

In the assessment of the problems to address, the lessons to be learned from past and ongoing partnerships were taken into account, especially from relevant midterm or ex-post evaluations.

The description of the context of the candidate Institutionalised European Partnerships required a good understanding of the corresponding research and innovation systems and their outputs already measured. Data on past and ongoing Horizon 2020 projects, including the ones implemented through Partnerships, served as basis for descriptive statistic of the numbers of projects and their respective levels of funding, the type of organisations participating (e.g. universities, RTOs, large enterprises, SMEs, public administrations, NGOs, etc.) and how the funding was distributed across them. Special attention was given to analysing the participating countries (and groups of countries, such as EU, Associated Countries, EU13 or EU15) and industrial sectors, where relevant. The sectoral analysis required enriching the eCORDA data received from the European Commission services with sector information extracted from ORBIS, using the NACE codification up to level 2. These data enabled the identification of the main and, where possible, emerging actors in the

¹⁵ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

¹⁶ A pivotal element of the present analysis is the so-called two-step ‘necessity test’ for European Partnerships, used to establish: step 1) the need for a partnership approach in the first place, followed by step 2) a justification for the form of Institutionalised Partnership. The necessity test is described in Annex 6. This impact assessment focuses on the second step of the test.

¹⁷ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe

relevant systems, i.e. the organisations, countries and sectors that would need to be involved (further) in a new initiative.

A Social Network Analysis was performed by the contractors using the same data. It consisted in mapping the collaboration between the participants in the projects funded under the ongoing R&I partnerships. This analysis revealed which actors – broken down per type of stakeholders or per industrial sector – collaborate the most often together, and those that are therefore the most central to the relevant research and innovation systems.

The data provided finally served a bibliometric analysis run by the contractor aimed at measuring the outputs (patents and scientific publications) of the currently EU-funded research and innovation projects. A complementary analysis of the Scopus data enabled to determine the position and excellence of the European Union on the international scene, and identify who its main competitors are, and whether the European research and innovation is leading, following or lagging behind.

A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options.

The conclusions drawn from the data analysis were confronted to the views of experts and stakeholders collected via three means:

- The comments to the inception impact assessments of the individual candidate institutionalised European Partnerships;
- The open public consultation organised by the European Commission from September to November 2019;
- The interviews (up to 50) conducted by each impact assessment study team conducted between August 2019 and January 2020 (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others).

The views of stakeholders (and experts) were particularly important for determining the basic functionalities (see further below) that the future partnerships need to demonstrate to achieve their objectives as well as their most anticipated scientific, economic and technological, and societal impacts. The interviews allowed more flexibility to ask the respondents to reflect about the different types of European Partnerships. Furthermore, as a method for targeted consultation, it was used to get insights from the actors that both the Study Teams and the European Commission were deemed the most relevant. For the comparative assessment of impacts, the external contractors confronted the outcomes of the different stakeholder consultation exercises to each other with a view of increasing the validity of their conclusions, in line with the principles of triangulation.

Annex 2 includes also the main outcomes of the stakeholder consultation exercises.

2. METHOD FOR ASSESSING THE EFFECTIVENESS, EFFICIENCY AND COHERENCE OF EACH OPTION - THE USE OF FUNCTIONALITIES

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has been adapted to introduce “**functionalities**”. These are

used to reflect *what is needed in terms of implementation* for each candidate initiative to be able to deliver on its objectives. The functionalities are the **distinguishing factors** between the different options and are directly linked to the European Partnerships' selection criteria of openness and transparency, additionality and directionality (see Annex 6). Based on the objectives identified and the targeted impact, functionalities describe what this requires in terms of implementation. Each form of implementation is then assessed to establish to which degree it would allow for these functionalities to be covered, e.g. the type and composition of actors that can be involved ('openness'), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of stakeholders' R&I strategies¹⁸; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with other EU, national or regional policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options and allows a structured comparison of the options against the selection criteria for European Partnerships.

Figure 1. Overview of key functionalities of each form of implementation of European Partnerships

Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 2: Co-funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
Type and composition of actors (including openness and roles)				
<u>Partners:</u> N.A., no common set of actors that engage in planning and implementation <u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> core of national funding bodies or governmental research organisations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> limited, according to national rules of partner countries	<u>Partners:</u> National funding bodies or governmental research organisation <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations

Coherence: internal (Horizon Europe) and external (other Union programmes, national programmes, industrial strategies)				
<p><u>Internal:</u> Between different parts of the Annual Work programme can be ensured by COM</p> <p><u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Limited synergies with other Union programmes and industrial strategies</p> <p>If MS participate, with national/ regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with national/ regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with national/ regional programmes and activities</p>	<p><u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM</p> <p><u>External:</u> Synergies with other Union programmes and industrial strategies</p> <p>If MS participate, with national/ regional programmes and activities</p>

On the basis of the evidence collected, the thematic impact assessments evaluate the **effectiveness** of the various policy options along three dimensions corresponding to the

different categories of likely impacts: scientific, economic and technological, and societal (including environmental). Each impact assessment considers to which extent the different policy options fulfil the desirable ‘functionalities’ and are therefore likely to produce the targeted impacts. In addition, where specific impacts (e.g. on fundamental rights) are relevant for a candidate Partnership, these are assessed in the corresponding report and according to the Better Regulation Guidelines and Toolbox. This analysis results in a scoring of the policy options with a three-point scale. Scores vary from + to +++, where + refers to low potential for reaching the likely impacts, ++ to a good potential, and +++ to a high potential. The effectiveness assessment of the different options does not use a compound score but concludes on as many scores as there are expected impacts. This is done to increase transparency and accuracy in the assessment of options. Qualitative and quantitative evidence is provided to motivate each score.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence corresponds to the consistency between a given implementation mode and the other actions under Horizon Europe. External coherence refers instead to the alignment with other initiatives at EU, national and international level beyond Horizon Europe that are relevant to a thematic area. Each option (implementation mode) is assessed following a three-point qualitative scale.

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach¹⁹ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account²⁰. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²¹ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for

¹⁹ For further details, see Better Regulation Toolbox # 57.

²⁰ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²¹ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

the overall investment).

- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%),²² but lead to an additional R&I investment of at least the same amount than the Union contribution²³ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution²⁴. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).²⁵
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution²⁶. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution²⁷. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 2 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0			↑↑	
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0			↑↑	
Ex-ante Impact Assessment for partnership		0		↑↑↑	
Preparation of EC proposal and negotiation		0		↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0			↑	

²² Specifically, some additional set-up costs linked for example to the creation of a strategic research and innovation agenda (SRIA) and additional running costs linked with the partners role in the creation of the annual work programmes and the Commission's additional supervisory responsibilities. A CPP will have lower overall costs than each of the other types of European Partnership, as it will function with a smaller governance and implementation structure than will be required for a Co-Funded Partnership or an Institutionalised Partnership and – related to this – its calls will be operated through the existing HEU agencies and RDI infrastructure and systems.

²³ Minimum contributions from partners equal to the Union contribution.

²⁴ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

²⁵ These costs reflect set-up costs and additional running costs for partners, and the Commission, of the distributed, multi-agency implementation model.

²⁶ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

²⁷ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC	0				↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

3. METHOD FOR IDENTIFYING THE PREFERRED OPTION – THE SCORECARD ANALYSIS

For the **identification of the preferred option**, a scorecard analysis is used to build a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

This scorecard approach also relies on a standard cost model developed for the external study supporting the impact assessment, as illustrated in Figure 3. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

These costs essentially refer to the administrative, operational and coordination costs of the various options. The figure shows how the scoring of costs range from a value of 0, in case an option does not entail any additional costs compared to the baseline (traditional calls), to a score of (-) for options introducing limited additional costs relative to the baseline and a score of (- -) when substantial additional costs are expected in comparison with the baseline. Should the costs of a policy option be lower than those of the baseline, (+) and (+ +) are used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common

Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed and Co-Funded options, a score of 0 to the Article 185 option and a score of (-) for the Article 187 Institutionalised Partnership policy option²⁸.

Figure 3: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3a: Institutionalised 185	Option 3b: Institutionalised 187
Administrative, operational and coordination costs	0	(0)	(-)	(--)	(--)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. <i>cost- efficiency</i>)	0	(+)	(+)	(0)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to baseline; score (--) = substantial additional costs compared to baseline. ; score (+) = lower costs compared to baseline

²⁸ The baseline (traditional calls) is scored 0, as explained above.

Annex 5 Subsidiarity Grid

1. Can the Union act? What is the legal basis and competence of the Unions' intended action?
1.1 Which article(s) of the Treaty are used to support the legislative proposal or policy initiative?
<p>This proposal is based on (1) Article 185 TFEU which stipulates that in implementing the multiannual framework programme, the Union may make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; and (2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes (both Articles are under Title XIX of the TFEU - Research and Technological Development and Space).</p> <p>The proposal aims to implement Article 8 of the Commission proposal for Horizon Europe - the future EU research and innovation (R&I) programme for 2021-2027, according to which, “<i>European Partnerships shall be established for addressing European or global challenges only in cases where they will more effectively achieve objectives of Horizon Europe than the Union alone and when compared to other forms of support of the Framework programme</i>”. The Horizon Europe proposal has received the political agreement of the Council and the European Parliament.</p>
1.2 Is the Union competence represented by this Treaty article exclusive, shared or supporting in nature?
<p>Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the European Union can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas.</p> <p><i>Subsidiarity does not apply for policy areas where the Union has exclusive competence as defined in Article 3 TFEU²⁹. It is the specific legal basis which determines whether the proposal falls under the subsidiarity control mechanism. Article 4 TFEU³⁰ sets out the areas where competence is shared between the Union and the Member States. Article 6 TFEU³¹ sets out the areas for which the Unions has competence only to support the actions of the Member States.</i></p>
2. Subsidiarity Principle: Why should the EU act?

²⁹ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E003&from=EN>

³⁰ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E004&from=EN>

³¹ <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E006:EN:HTML>

2.1 Does the proposal fulfil the procedural requirements of Protocol No. 2³²:

- Has there been a wide consultation before proposing the act?
- Is there a detailed statement with qualitative and, where possible, quantitative indicators allowing an appraisal of whether the action can best be achieved at Union level?

This proposal and the accompanying impact assessment were supported by a wide consultation of stakeholders, both during the preparation of the Horizon Europe proposal and - later on, all the candidates for European Partnerships. Member States were consulted via the Shadow Strategic configuration of the Horizon Europe Programme Committee. On candidates for institutionalised Partnerships based on Article 185/187 of the TFEU, an Open Public Consultation (OPC) was held between 11 September and 6 November 2019. Over 1 600 replies were received. In addition, targeted consultation activities were undertaken to prepare the present impact assessment. In particular, for each of the candidate partnerships, an external consultant interviewed a representative sample of stakeholders. The need for EU action as well as its added value were covered in those interviews.

The explanatory memorandum and the impact assessment (horizontal part, Section 3) contain a dedicated section on the principle of subsidiarity, as explained in question 2.2 below.

2.2 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the conformity with the principle of subsidiarity?

The impact assessment accompanying the proposal features a horizontal part on relevant common elements to all the candidate partnerships, including the conformity of the proposed initiative with the principle of subsidiarity (Section 3). Moreover, the individual assessments of each candidate partnership include additional details on subsidiarity, touching in particular on the specificities of a candidate partnership that could not be adequately reflected in the horizontal part of the impact assessment. This will also be reflected in the explanatory memorandum.

2.3 Based on the answers to the questions below, can the objectives of the proposed action be achieved sufficiently by the Member States acting alone (necessity for EU action)?

National action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives, to deliver on the EU's strategic policy priorities (including the climate and energy goals set out in the Paris Agreement, and the European Green Deal), and to contribute to tackling global challenges and meeting the Sustainable Development Goals (SDGs).

³² <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12016E/PRO/02&from=EN>

(a) Are there significant/appreciable transnational/cross-border aspects to the problems being tackled? Have these been quantified?

The thematic areas covered by the candidate partnerships feature a series of challenges in terms of cross-border/transnational aspects, need to pool resources, need for a critical mass to meet intended policy objectives, need to coordinate different types of actors (e.g. academia, industry, national and regional authorities) across different sectors of the economy and society, which cannot be tackled to the same degree by Member States alone. This is particularly true for the research and innovation (R&I) dimension of the proposed initiative: the importance of a multi-centre and interdisciplinary approach, cross-country data collection and research, and the need to develop and share new knowledge in a timely and coordinated manner to avoid duplication of efforts are key to achieve high quality results and impact. The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide extensive qualitative and quantitative evidence on the above points. In addition, Sections 1 and 2 of the individual impact assessments on the candidate partnerships include more detail on the necessity to act at EU-level in specific thematic areas. Finally, it is worth noting that not all Member States have the same capacity or R&I intensity to act on these challenges. As the desired policy objectives can be fully achieved only if the intended benefits are widespread across the Member States, this requires action at the EU-level.

(b) Would national action or the absence of the EU level action conflict with core objectives of the Treaty³³ or significantly damage the interests of other Member States?

As per Article 4(3) TFEU, national action does not conflict with core objectives of the Treaty in the area of R&I. The absence of EU level action in this area would however prevent the achievement of core objectives of the Treaty. Indeed, national action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives on e.g. competitiveness, to deliver on the EU's strategic policy priorities, and to contribute to tackling global challenges and meet the Sustainable Development Goals (SDGs).

(c) To what extent do Member States have the ability or possibility to enact appropriate measures?

As foreseen by Article 4(3) TFEU, this proposal does not hamper Member States' ability to enact appropriate measures in the field of R&I. However, the scale and complexity of the policy objectives pursued by the present initiative cannot be fully addressed by acting at national level alone.

(d) How does the problem and its causes (e.g. negative externalities, spill-over effects) vary across the national, regional and local levels of the EU?

³³ https://europa.eu/european-union/about-eu/eu-in-brief_en

As described in the horizontal part of the impact assessment accompanying the present proposal, several problems (e.g. on competitiveness, global challenges, demographic change) and their underlying causes affect the EU as a whole rather than individual Member States. Where important differences between Member States are present, these are described in Sections 1 and 2 of the individual impact assessments.

(e) Is the problem widespread across the EU or limited to a few Member States?

The problem of coordinating R&I efforts in the thematic areas covered by the candidate partnerships affects all Member States, albeit to different degrees. However, from a general EU perspective, available evidence shows that the EU as a whole needs to step up efforts and investments in thematic areas that are crucial to tackle present and future policy challenges on several fronts, e.g. ageing population, global technological trends, and climate change to name a few. The way these problems affect the EU and its Member States is described in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual impact assessments.

(f) Are Member States overstretched in achieving the objectives of the planned measure?

As indicated in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual assessments, the sheer scale, speed and scope of the needed support to R&I would overstretch national resources, without guaranteeing the achievement of the intended objectives. Acting at EU-level would achieve greater impact in a more effective and efficient manner.

(g) How do the views/preferred courses of action of national, regional and local authorities differ across the EU?

No specific differences between the views of national, regional and local authorities emerged from the stakeholder consultation.

2.4 Based on the answer to the questions below, can the objectives of the proposed action be better achieved at Union level by reason of scale or effects of that action (EU added value)?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national initiatives in the same area.

(a) Are there clear benefits from EU level action?

Quantitative and qualitative evidence of the benefits of EU level action are available in the interim evaluation of Horizon 2020 and in the impact assessment of Horizon Europe, among others. An analysis of the emerging challenges in each thematic areas, of the EU's competitive positioning, as well as feedback gathered from different types of stakeholders for the present impact assessment indicate that EU level action remains appropriate also for the present proposal. In addition, the benefits of acting at EU-level have been illustrated by the success and the impact achieved by the predecessors to the proposed initiative.

(b) Are there economies of scale? Can the objectives be met more efficiently at EU level (larger benefits per unit cost)? Will the functioning of the internal market be improved?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. This is the case both in terms of effectiveness in achieving intended policy objectives, but also in terms of efficiency. Positive impact is also visible in terms of competitiveness: recent data on EU funded R&I activities indicate that EU-funded teams grow 11.8% faster and are around 40% more likely to be granted patents or produce patents applications than non-EU funded teams. Efficiency gains are also visible in terms of dissemination of results to users beyond national borders, including SMEs and citizens. EU funded R&I is more effective in leveraging private investment. Finally, there are clear additionality benefits (i.e. EU R&I funding does not displace or replace national funding), as the EU focuses on projects that are unlikely to be funded at national or regional level. Overall, this is beneficial to the functioning of the internal market in several respects, including human capital reinforcement through mobility and training, the removal of barriers to cross-border activity for economic players including SMEs, easier access to finance and to relevant knowledge and research, and increased competition in the area of R&I.

(c) What are the benefits in replacing different national policies and rules with a more homogenous policy approach?

A homogeneous policy approach in the various thematic areas covered by the present proposal would reduce fragmentation and increase efficiency and effectiveness in meeting the intended policy objectives. Indeed fragmentation, persisting barriers in the internal market and differences in the resources available to Member States are some of the key problems that stand in the way of fully achieving the intended policy objectives and reaching the required critical mass to obtain tangible results. Specific detail on how these issues differ in each thematic area are illustrated in Sections 1 and 2 of the individual impact assessments, so as to reflect the specificities of each case.

(d) Do the benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities (beyond the costs and benefits of acting at national, regional and local levels)?

The proposed initiative does not lead to a loss of competence of the Member States. In fact,

the proposed initiative should be seen as complementary and reinforcing national and sub-national initiatives in the same area. Previous quantitative and qualitative assessments of Horizon Europe and Horizon 2020 have shown that the proposed EU-level action do not displace national ones and tend to concentrate on initiatives that would not have been funded by the Member States themselves, or would not have reached the same scale and ambition without EU-level intervention, due to their complexity and trans-national nature.

(e) Will there be improved legal clarity for those having to implement the legislation?

Yes. The proposed initiatives will be implemented in line with the Horizon Europe single set of rules for participation; this will ensure increased clarity and legal certainty for end beneficiaries, other stakeholders and programme administrators. It will also reduce the administrative burden for beneficiaries, and for the Commission services. In addition, the accessibility and attractiveness of the broader Horizon Europe programme, in particular for applicants with limited resources, would be sustained.

3. Proportionality: How the EU should act

3.1 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the proportionality of the proposal and a statement allowing appraisal of the compliance of the proposal with the principle of proportionality?

The principle of proportionality underpins the entire analysis of the candidate partnerships. Specifically, the analysis included in the accompanying impact assessment is structured along the following logic: 1. Justification of the use of a partnership approach in a given area (including considerations on additionality, directionality, link with strategic priorities) instead of other forms of intervention available under Horizon Europe; 2. If the partnership approach is deemed appropriate, proportionality considerations guide the assessment of which type of partnership intervention (collaborative calls, co-programmed, co-funded or institutionalised partnership) is most effective in achieving the objectives. This will also be reflected in the explanatory memorandum.

3.2 Based on the answers to the questions below and information available from any impact assessment, the explanatory memorandum or other sources, is the proposed action an appropriate way to achieve the intended objectives?

The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the present proposal leaves full freedom to the Member States to pursue their own actions in the policy areas concerned. This will also be reflected in the explanatory memorandum.

(a) Is the initiative limited to those aspects that Member States cannot achieve

<p>satisfactorily on their own, and where the Union can do better?</p>
<p>The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments.</p>
<p>(b) Is the form of Union action (choice of instrument) justified, as simple as possible, and coherent with the satisfactory achievement of, and ensuring compliance with the objectives pursued (e.g. choice between regulation, (framework) directive, recommendation, or alternative regulatory methods such as co-legislation, etc.)?</p>
<p>For each of the candidate partnerships, the analysis carried out in the accompanying impact assessment has explored several options for implementation. A comparative assessment of the merits of each option also included an analysis of the simplicity of the intervention, its proportionality and effectiveness in achieving the intended objectives. This is reflected in the fact that a tailored approach has been suggested for each candidate partnership, ranging from looser forms of cooperation to more institutionalised ones, depending on the intended policy objectives, specific challenges, and desired outcome identified in each case.</p>
<p>(c) Does the Union action leave as much scope for national decision as possible while achieving satisfactorily the objectives set? (e.g. is it possible to limit the European action to minimum standards or use a less stringent policy instrument or approach?)</p>
<p>The proposed approach leaves full freedom to the Member States to pursue their own actions in the policy areas covered by the present proposal.</p>
<p>(d) Does the initiative create financial or administrative cost for the Union, national governments, regional or local authorities, economic operators or citizens? Are these costs commensurate with the objective to be achieved?</p>
<p>The proposed initiatives do create financial and administrative costs for the Union, national governments and, depending on the chosen mode of implementation, for regional and local authorities. In addition, economic operators and other stakeholders potentially involved in the candidate partnerships will also incur some costs linked to implementation. The financial cost of the proposed initiative is covered under the Horizon Europe programme. Its exact amount is still subject to political decision. As regards the candidate partnerships and the different modes of implementation (co-programmed, co-funded, institutionalised), the relevant costs and benefits are assessed in the individual impact assessments covering each candidate partnership. The additional administrative costs of implementation via partnerships are limited, when compared to the administrative costs of implementation through traditional calls. As indicated by comparable experience with previous initiatives and in feedback provided by a variety of stakeholders, these costs are expected to be fully justified by the benefits expected from the proposed initiative. Where available, additional details on costs are provided in Annex 3 of the impact assessment.</p>

(e) While respecting the Union law, have special circumstances applying in individual Member States been taken into account?

Where relevant, differences between Member States in capacity and stage of advancement of R&I in specific thematic areas have been taken into account in the individual impact assessments.

Annex 6 Additional background information

1. BACKGROUND INFORMATION FOR ALL INITIATIVES

1.1. Selection criteria of European Partnerships

Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

The necessity test for a European Partnership (as set out in the Horizon Europe regulation) has two levels:

1. **The justification for implementing a priority with a European Partnership** to address Horizon Europe and EU priorities. This is linked to demonstrating that a European Partnership can produce added value beyond what can be achieved through other Framework Programme modalities, notably traditional calls in the work programmes (Option 0 – Baseline).
2. **The justification for the use of the form of Institutionalised Partnership:** Once it has been demonstrated that a partnerships approach is justified, co-programmed and/or co-funded forms are considered for addressing the priorities as they are administratively lighter, more agile and easier to set-up (Options 1 and/or 2). As Institutionalised Partnerships require setting up a legal framework and the creation of a dedicated implementation structure, they have to justify higher set-up efforts by demonstrating that it will deliver the expected impacts in a more effective and efficient way, and that a long-term perspective and high degree of integration is required (Option 3).

The outcomes of the ‘necessity test’ is presented together with the preferred option.

Figure 1. Horizon Europe selection criteria for the European Partnerships

Common selection criteria & principles	Specifications
1. More effective (Union added value) clear impacts for the EU and its citizens	Delivering on global challenges and research and innovation objectives
	Securing EU competitiveness
	Securing sustainability
	Contributing to the strengthening of the European Research and Innovation Area
	Where relevant, contributing to international commitments
2. Coherence and synergies	Within the EU research and innovation landscape
	Coordination and complementarity with Union, local, regional, national and,

Common selection criteria & principles	Specifications
	where relevant, international initiatives or other partnerships and missions
3. Transparency and openness	<p>Identification of priorities and objectives in terms of expected results and impacts</p> <p>Involvement of partners and stakeholders from across the entire value chain, from different sectors, backgrounds and disciplines, including international ones when relevant and not interfering with European competitiveness</p> <p>Clear modalities for promoting participation of SMEs and for disseminating and exploiting results, notably by SMEs, including through intermediary organisations</p>
4. Additionality and directionality	<p>Common strategic vision of the purpose of the European Partnership</p> <p>Approaches to ensure flexibility of implementation and to adjust to changing policy, societal and/or market needs, or scientific advances, to increase policy coherence between regional, national and EU level</p> <p>Demonstration of expected qualitative and significant quantitative leverage effects, including a method for the measurement of key performance indicators</p> <p>Exit-strategy and measures for phasing-out from the Programme</p>
5. Long-term commitment of all the involved parties	<p>A minimum share of public and/or private investments</p> <p>In the case of Institutionalised European Partnerships, established in accordance with article 185 or 187 TFEU, the financial and/or in-kind, contributions from partners other than the Union, will at least be equal to 50% and may reach up to 75% of the aggregated European Partnership budgetary commitments</p>

1.2. Overview of potential functions for a common back office among Joint Undertakings

Functions	Current situation	Option of joint back-office	Comments
Organising calls for grant and proposal evaluations	Each JU organises this independently.	<p>A central organisation of evaluation, logistics, contracting evaluators, managing the data of the evaluation results</p> <p>Central database of potential evaluators with domain expertise in thematic areas of partnerships</p>	The evaluations would still need to be supervised by the Scientific staff of the individual Joint Undertakings (consensus meetings of expert evaluators etc)
Human Resources related matters	<p>Each JU has own HR policy and resources</p> <p>Quite some resources spent on</p>	More generic resources and expertise for HR matters	Ensuring consistency with EC HR policies is already in place

	<p>recruitment in some JUs</p> <p>Some HR facilities are procured from external contractors</p> <p>Some JUs have a Service Level Agreement with COM for HR</p>	<p>More consistency in HR policy</p> <p>Shared HR investment for specialised expertise (IP and legal)</p>	
Financial management	<p>Each JU conducts own financial contract management; differences between JUs</p> <p>Each JU is audited separately.</p> <p>Auditing at project level more frequent than in other Horizon 2020 parts and outsourced by JUs thus differences</p> <p>ECA: too many audits on JUs</p>	<p>Financial management by one core team of financial staff</p> <p>Would reduce the number of interfaces for audits and simplifies the auditing of the all JUs</p> <p>Harmonisation of project auditing</p>	<p>Simplifies the harmonisation of financial management across JUs in line with Horizon Europe</p>
Communication (internal and external)	<p>Each JU has a separate communication strategies, teams and resources</p>	<p>A common back-office can support activities such as event organisation, dissemination of results, setting up website communication</p> <p>Can help create a more visible Partnership brand</p>	<p>A considerable share of communication activity is partnership specific (addressing particular target groups, synthesising project results) however there are generic communication activities that can be shared</p> <p>Needs to avoid duplication of efforts</p>
Data management on calls, project portfolios, information on project results	<p>Most JUs but not all use e-Corda for project data</p> <p>Overall IT integration of JUs still difficult</p>	<p>Harmonised data management</p> <p>Reduction of IT systems and support that is procured</p>	<p>This will need to happen regardless of the common back office but will likely be more smooth if managed centrally</p>

2. BACKGROUND INFORMATION FOR THIS SPECIFIC INITIATIVE

2.1. Health status in the EU and related main challenges

This Annex describes the health status of EU citizens based on the analysis provided in the most recent “Health at a Glance: Europe” report (2018)¹ developed by the Organisation for Economic Co-operation and Development (OECD) in cooperation with the European Commission. It includes recent trends in life expectancy, the main causes of death, health inequalities by gender and socioeconomic status, the occurrence of communicable and chronic diseases as well as the main challenges to improving the health of EU citizens.

HEALTH STATUS

Trends in life expectancy

Life expectancy² reaches 81 years on average across EU countries, exceeding 80 years in two-thirds of EU countries (Figure 1). Women live nearly 5 ½ longer than men although this gap has narrowed by one year since 2000. This gender gap is partly due to greater exposure to risk factors among men (tobacco consumption, excessive alcohol consumption and less healthy diet) resulting in higher death rates from heart diseases, various types of cancer and other diseases.

Figure 1. Life expectancy at birth, by gender, 2016

1. Three-year average (2014-16).
Source: Eurostat Database.

Until recently, life expectancy was rising fairly rapidly and steadily across EU countries, but since 2011, the gains in life expectancy have slowed down markedly in several Western European countries, with even some reductions in certain years. This appears to have been driven by a slowdown in the rate of reduction of deaths from circulatory diseases and periodical increases in mortality rates among elderly people, due partly to bad flu seasons in some years. More than 80% of all deaths in the EU occur after the age of 65. The main cause of death for people under 65 is cancer, particularly among women (Eurostat, 2018).

¹ https://ec.europa.eu/health/sites/health/files/state/docs/2018_healthatglance_rep_en.pdf

² Life expectancy measures the average number of remaining years of life for people at a specific age based on current mortality conditions

Inequalities in life expectancy

Large inequalities in life expectancy persist not only by gender but also by socioeconomic status. On average across EU countries, 30-year-old men with a low education level can expect to live about 8 years less than those with a university degree or the equivalent. The “education gap” among women is smaller, of about 4 years. This education gap in life expectancy is due to higher mortality rates among the least educated at different ages (Figure 2). A substantial part of the education gap in mortality is due to higher smoking rates, a very important risk factor for both circulatory diseases and different types of cancer.

Figure 2. Mortality rates by education level and causes, 10 European countries, 2011 (or nearest year)

Note: Countries covered are Belgium, the Czech Republic, Denmark, Finland, Hungary, Latvia, Norway, Poland, Slovenia and the United Kingdom (England).
Source: Murtin, F. et al. (2017).

Healthy life expectancy

Healthy life expectancy indicates whether any gains in life expectancy are lived in good health or with some health problems and disabilities. The main indicator of healthy life years used in the European Union is the number of years lived free of activity limitations due to health problems. On average across EU countries, people can expect to live about 80% of their lives free of disability (Figure 3). Whereas the gender gap in life expectancy at birth is about 5,5 years on average across EU countries, there is virtually no gender gap in healthy life expectancy (64,2 years for women compared with 63,5 years for men). Women in EU countries can expect to live over 19 years of their lives with some disabilities compared with less than 15 years for men. This is explained by the fact that women report more activity limitations due to health problems at any given age and also because women live longer.

Figure 3. Life expectancy and healthy life years at birth, by gender, 2016 (or nearest year)

1. Three-year average (2014-16 except for Iceland: 2013-15).

Note: Data comparability is limited because of cultural factors and different formulations of question in EU-SILC.

Source: Eurostat Database.

Main causes of mortality

The main causes of deaths across EU countries remain circulatory diseases, mainly heart attacks and strokes (over 1.8 million deaths in 2016) and cancers (1.3 million deaths), which together account for over 60% of all deaths (Figure 4). Indeed, diseases of the cardiovascular system were the main cause of deaths in all EU Member States, except in Denmark, France, the Netherlands and the United Kingdom where cancer was the main killer.³

also shows that the third main cause of death in the EU was diseases of the respiratory system, killing 422 000 (8% of all deaths in the EU). A significant share of deaths happened due to other external causes which include accidents, suicides, homicides and other violent causes of death (237 000 deaths, 5% of all deaths in the EU), diseases of the digestive system (222 000 deaths, 4%), mental and behavioural diseases such as dementia (220 000 deaths, 4%) and diseases of the nervous system including Alzheimer's (219 000 deaths, 4%)³⁶.

Figure 4. Causes of death in the EU by type, 2016 (as % of all deaths)

SOURCE EUROSTAT ICD10 2016 all deaths of residents in or outside their home country

Burden of diseases in the EU

Circulatory diseases

Circulatory diseases comprise a range of illnesses related to the circulatory system, including ischaemic heart diseases (notably heart attacks) and cerebrovascular diseases (such as strokes). Ischaemic heart diseases (IHD) and strokes caused more than one-fifth of all deaths in EU Member States in 2015.

Death rates for IHD are over 80% higher for men than for women across EU countries, because of a greater prevalence of risk factors among men, such as smoking, hypertension and high cholesterol. Since 2000, mortality rates from IHD have declined in all countries, with an overall reduction of over 40% on average across the EU, although the reduction has slowed down in recent years. Reductions in risk factors such as tobacco consumption have contributed to reducing the incidence of IHD and consequently mortality rates. Improvements in medical care have also played an important role.

Strokes were responsible for some 430 000 deaths across the EU in 2015, accounting for about 8% of all deaths. In addition to being an important cause of mortality, the disability burden from stroke is substantial. The gender gap in mortality rates from stroke is not as large as for IHD (less than 20%). As with IHD, there are wide variations in stroke mortality rates across countries. Since 2000, stroke mortality rates have decreased by nearly 50% across the EU, although the gains have slowed down over the past five years. Again, as with IHD, the reduction in stroke mortality can be attributed at least partly to both a reduction in risk factors and improvements in medical treatments. Looking ahead, further progress in reducing mortality rates from IHD, strokes and other circulatory diseases may be hampered by a rise in certain risk factors such as obesity and diabetes (OECD, 2015).

Cancer

Cancer is the second leading cause of mortality after cardiovascular diseases, accounting for 25% of all deaths in 2015. Figure shows the main causes of cancer mortality among men and women.

Figure 5. Main causes of cancer mortality among men and women in EU countries, 2015

Source: Eurostat Database.

In all countries, mortality rates from cancer are greater among men than women. Death rates from all types of cancer combined among men and women have declined at least slightly in most EU Member States since 2000, although the decline has been more modest than for circulatory diseases, explaining why cancer now accounts for a larger share of all deaths. In 2018, 3 million new cases of cancer were expected to be diagnosed in the EU (actual figures not yet available)⁴. Large variations in cancer incidence exist across EU countries, with Hungary, Ireland, Denmark, Belgium and France with the highest expected age-standardised incidence rate in 2018. Such variations in incidence rates mirror the variations in the real number of new cancers each year, but also variability in national screening policies to detect different types of cancer as soon as possible.

Respiratory diseases

Mortality from respiratory diseases is the third main cause of death in EU countries, accounting for 8% of all deaths in 2015. Most of these deaths (90%) were among people aged 65 and over. The main causes of death from respiratory diseases are chronic obstructive pulmonary disease (COPD), pneumonia, asthma and influenza. Death rates from respiratory diseases are on average 85% higher among men than among women in all EU countries. This is partly due to higher smoking rates among men. The prevalence and mortality from respiratory diseases are likely to increase in the coming years as the population ages and presently unreported cases of COPD begin to manifest, whether alone or in co-morbidity with other chronic diseases.

⁴ Joint Research Centre (2018), Dataset Collection: European Cancer Information System, <https://ec.europa.eu/jrc/en/publication/dataset-collection-european-cancer-information-system>.

Diabetes

About 32.7 million adults were diabetics in the EU in 2017, up from an estimated 18.3 million adults in 2000 (Figure). In addition, some 12.8 million people were estimated to have undiagnosed diabetes in 2017. Diabetes is more common among older people. These upward trends are partly due to the rise in obesity and physical inactivity, and their interactions with population ageing.

Figure 6. Number of people with diabetes in EU28, 2000 and 2017.

Note: Data include people aged 20-79 with Type 1 or Type 2 diagnosed diabetes. The number of peoples with diabetes in 2000 has been estimated for some countries do to data gaps. Source IDF Atlas, 8th edition, 2017 and OECD estimates.

The economic burden of diabetes is substantial. People with diabetes are at greater risk of developing cardiovascular diseases such as heart attack and stroke if the disease is left undiagnosed or poorly controlled. They also have higher risks of sight loss, foot and leg amputation, and renal failure. The health expenditure allocated to treat diabetes and prevent complications are estimated at about EUR 150 billion in 2017 in the European Union. Type 2 diabetes is largely preventable. A number of risk factors, such as overweight and obesity, nutrition and physical inactivity, are modifiable. However, the prevalence of overweight and obesity is increasing in most countries.

Dementia

In 2017, Alzheimer's disease and other dementia represented 9.6% of all deaths in the EU, expressing an increase of 2.2% in annual change in comparison with 2016.⁵ In 2018 alone, an estimated 9.1 million people aged over 60 (around 7%) were living with dementia in the EU Member States, a significant increase from 5.9 million in 2000. Ageing populations mean that this number will continue to substantially grow in the future.⁶ Estimations indicate that in 2040, 14.3 million people aged over 60 could be living with dementia (Figure 7).

⁵ GHB Compare <https://vizhub.healthdata.org/gbd-compare/>

⁶ OECD (2018), Care needed: Improving the lives of people with dementia, OECD Health Policy studies, OECD publishing, Paris, <https://doi.org/10.1787/9789264085107-en>

Figure 7. Estimated number of people with dementia in EU countries by age group, 2000, 2018, and 2040

Source: OECD analysis of data covering 28 EU countries from the World Alzheimer Report 2015 and the United Nations.

However, there is some evidence that the risk of dementia could be reduced through healthier lifestyles and preventive interventions. If such efforts are successful, the rise in prevalence may be less dramatic than these numbers suggest. Nonetheless, dementia will undoubtedly pose a growing challenge to all EU countries.

Communicable diseases

Communicable diseases, such as measles, hepatitis B and many others, pose major threats to the health of European citizens, although vaccination can efficiently prevent these diseases. 13 475 cases of measles were reported across the 30 EU/EEA countries from May 2017 to May 2018, up by nearly 60% over the preceding 12-month period. In most countries where vaccination coverage is high, very few cases of measles were reported.

CURRENT AND FUTURE CHALLENGES TO IMPROVING THE HEALTH OF EU CITIZENS

Ageing of the EU population

Population projections (Figure 8) suggest that there will be 66.1 million very old persons — defined here as those aged 80 years and over — in the EU-28 by 2080. This means the more than double the 2016 figure, which was 27.3 million very old persons. More so, the latest projections indicate that age dependency ratios (indicator which gives insight into the number of people of nonworking age) are likely to continue increasing. This highlights challenges for public expenditure in relation to pensions, health care and long-term care costs⁷.

⁷ Eurostat: People in the EU: who are we and how do we live? 2015 edition

Figure 8. Population pyramids (% of population), EU-28, 2016 (estimates) and 2080 (projections)

Source: Eurostat

In a context of an ageing society, non-communicable diseases are an active threat to public health. Even more so timely access to health care, prevention interventions and curative measures are of critical importance. Overall, the ageing process in the EU, allied with a substantial demand for health care, has been estimated to result in a significant increase in health care spending of 1–2 % of GDP in the EU Member States in total by 2050. On average, this would amount to an increase of 25% in health care spending⁸.

Health care spending in the EU

Increasing numbers of people living with dementia, as well as other chronic diseases, will bring new challenges to the national, regional and local health systems. This will impact the organisation of services, fiscal sustainability of the systems and financial protection of the populations they serve.

Across the EU as a whole, health spending per capita increased by around 1.9% each year between 2013 and 2017, compared with an annual growth rate of only 0.6% between 2009 and 2013. In 2017, spending in health care in the EU stood at 9.6% of gross domestic product (GDP) ranging from over 11% in France and Germany to less than 6% in Romania (Figure 9).

⁸ Eurostat: Morbidity statistics – methodology – statistics explained 2015

Figure 9. Health expenditure as a share of GDP, 2017 (or nearest year)

Source: OECD Health Statistics 2018, <https://doi.org/10.1787/health-data-en>; Eurostat Database; WHO Global Health Expenditure Database

In 2016, EU Member States spent 60% of their health expenditure on curative and rehabilitative care services (inpatient⁹ and outpatient care), 20% on medical goods (mainly pharmaceuticals) while 13% were spent on health-related long-term care and the remaining 7% on collective services, such as prevention and public health (Figure 10).

⁹ Inpatient care refers to care for a patient who is formally admitted (or ‘hospitalised’) to an institution for treatment and/or care and stays for a minimum of one night in the hospital or other institution providing in-patient care [Source: OECD Health Data 2001: A Comparative Analysis of 30 Countries, OECD, Paris, 2001, data sources, definitions and methods]

Figure 10. Health expenditure by function, 2016 (or nearest year)

* Refers to curative-rehabilitative care in inpatient and day care settings.

** Includes home care and ancillary services.

Note: Countries are ranked by the sum of inpatient and outpatient care as a share of current health expenditure.

Source: OECD Health Statistics 2018, <https://doi.org/10.1787/health-data-en>; Eurostat Database.

Pharmaceuticals (excluding those used in hospitals) represented the third largest item of health care spending, accounting for a sixth of health expenditure in 2016. Differences in distribution channels, prevalence of generic drugs, as well as relative prices in different countries, can highly influence spending in this category. The total retail pharmaceutical bill across the EU was more than EUR 210 billion in 2016 and an increase of around 5% since 2010. Spending on pharmaceuticals used during hospital care can typically add another 20% to a country's pharmaceutical bill. The cost of pharmaceuticals is predominantly covered by government or compulsory insurance schemes. These schemes cover around 64% of all retail pharmaceutical spending, with out-of-pocket payments (34%) and voluntary private insurance (1%) financing the remaining part.

The challenge of unmet needs for medical care. Unmet needs for medical care demonstrate issues in health care accessibility for a number of reasons including cost, distance to the closest health facility and waiting times¹⁰. Unmet care needs may result in poorer health for people forgoing care and may increase health inequalities if such unmet needs are concentrated among poor people. There is significant variation in the EU regarding the percentage of people reporting unmet medical needs both across countries and income levels with the burden falling mostly in low-income groups (Figure 11).

¹⁰ The share of persons declaring an unmet need for medical examination is also a core indicator for accessibility in the "[social scoreboard](#)" underpinning the European Pillar of Social Rights.

Figure 11. Unmet needs vary across countries and income groups.

Source: Adapted from OECD/European Observatory on Health Systems and Policies (2019), Country Health Profiles 2019, State of Health in the EU (data refer to 2017).

Out of the fourteen EU Member States with a reported level of unmet medical needs above the EU average, half revealed costs as the prominent reason.¹¹ Across the EU, about 1.7% of citizens self-reported to have forgone treatment primarily for financial reasons.⁴⁴ Of note, out-of-pocket spending¹² varies across the EU, reaching more than twice the EU average in Bulgaria, Cyprus, Latvia, Greece, Malta and Lithuania (Figure 12):

Figure 12. Out-of-pocket payments by expenditure type

Source: Adapted from OECD/European Observatory on Health Systems and Policies (2019), Country Health Profiles 2019, State of Health in the EU (data refer to 2017). NOTE: Indicator captures how the out-of-pocket expenditure as a share of current expenditure on health is broken down by particular services and goods.

Figure also shows that out-of-pocket spending is highly driven by pharmaceutical expenditure, being the largest single cost component in the majority of the EU Member

¹¹ State of Health in the EU: Companion report 2019 https://ec.europa.eu/health/sites/health/files/state/docs/2019_companion_en.pdf

¹² Out-of-pocket payments are expenditures borne directly by a patient where neither public nor private insurance cover the full cost of the health good or service. At an aggregate level, the share of out-of-pocket spending in total health spending reflects the degree of financial protection in a country.

States. More so, the emergence of new medical technologies is having an important impact on the determinants for access to these pharmaceuticals in national contexts.

2.2. Information about IMI JU & lessons learnt

In 2007, the European Commission released a proposal for the creation of the Innovative Medicines Initiative¹³ Joint Undertaking (IMI JU), a public-private partnership (PPP) between the European Community, represented by the European Commission, and the European Federation of Pharmaceutical Industries and Associations, EFPIA. The proposal was based on an article in the EU treaties (now Article 187 TFEU) allowing the EU to set up joint undertakings ‘for the efficient execution of Union research, technological development and demonstration programmes’.

Under the Seventh Framework Programme (FP7), IMI JU had a budget of EUR 2 billion. Half of it came from the EU and the rest came in the form of in-kind contributions from EFPIA and its member companies who did not receive any EU funding. The overall goal of the IMI JU programme was to ‘significantly improve the efficiency and effectiveness of the drug development process with the long-term aim that the pharmaceutical sector produce more effective and safer innovative medicines’.

IMI delivered 59 projects of approx. EUR 1.919 million total budget¹⁴ (cut-off date of the analysis: December 2019). The three most funded health areas were: ‘infectious diseases’ (EUR 719 million), ‘drug discovery’ (EUR 232 million) and ‘other’ (EUR 221 million) as shown in Figure 1.

Stakeholder analysis

Based on the analysis of IMI JU funded projects, overall 29.6% of the participants were private companies while 51.9% were academia, secondary and higher education establishments, and non-profit research organisations. 11.2% of beneficiaries receiving EU funding were SMEs, 5.7% came from an entity categorised as other and 1.6% represented patient organisations (see Table 1 below for types of organisations and the budget distribution for the 59 projects).¹⁵ It should be noted again in this context that EFPIA members did not receive EU funding.

¹³ For clarity, the term ‘IMI JU’ is used when referring to Innovative Medicines Initiative JU that started in 2007 under FP7, and the term ‘IMI2 JU’ is used to denote its successor initiative, operating under Horizon 2020. The term ‘IMI’ is used when the two predecessors initiative are meant jointly.

¹⁴ Jointly, for the EU financial contribution and the contribution of private JU Member, i.e. members of EFPIA or its constituent entities or their affiliated entities.

¹⁵ The Final Evaluation of the Innovative Medicines Initiative Joint Undertaking (2008-2016) operating under the 7th Framework Programme Experts Group Report.

Table 1. Types of organisations and the budget distribution for the 59 IMI JU projects

Type of organisation	Number of participations in IMI	Requested EU Contribution (EUR)	EFPIA in-kind contribution (EUR)
Academia, Research Organisations	888	802,395,744	0
EFPIA	507	0	953,144,739
Patient Organisations	26	5,672,638	0
SMEs	192	127,994,480	0
Others	98	29,793,249	0
Grand Total	1711	965,730,983	953,144,739

Figure 1. Total amounts (in million EUR) invested by IMI JU per scientific area

The total EU contribution (% share) to participations distributed over the different country categories was:

- EUR 907.3 million (93.9%) for EU-15;
- EUR 45.6 million (1.3 %) for Associated Countries;
- EUR 12.1 million (1.3%) for EU-13; and

- EUR 0.7 million (0.1%) for third countries.

An experts' analysis of IMI's first projects revealed that they were generating socio-economic impacts on a number of fronts: making concrete improvements to pharmaceutical R&D; leveraging funding; creating new knowledge and tools; and making Europe an attractive place to carry out research. The report noted that many of the projects' achievements would not have been possible without IMI. Feedback from project participants has also highlighted the benefits of taking part in IMI projects for all participants, including large pharmaceutical companies, universities, SMEs, and patient organisations¹⁶.

IMI JU projects in general contributed to novel scientific insights. The number of publications was impressive with 1,678 unique Web of Science publications linked to the Thomson Reuters citation databases (published between 2009 and 2015). There were 1,661 papers (articles and reviews; 99%); 17 other document types (13 editorials, two meeting abstracts, one letter and one news-item; 1%). Between 2009 and 2015, the citation impact for IMI project papers (1.93) was nearly twice the EU's citation impact (1.1) in similar journal categories.¹⁷

2.2.1. IMI JU Interim & Final evaluations

The Final Evaluation of the IMI JU⁵⁰ (published in June 2017) set out to address specific evaluation questions under the individual criteria of effectiveness, efficiency, relevance, coherence and added value. The expert group concluded that the IMI JU programme was relevant and justified and positive contributions on the drug development process have been realised. According to the final evaluation (similarly to IMI2 JU), "the main achievement of IMI JU on which there was general consensus, was that under IMI JU **collaborations between different competing global companies, SME's and academia became possible**. These collaborations created trust and new partnerships, including partners from different areas of expertise, such as with regulatory bodies, or with patient's representatives groups. Together with the available budget and long term strategy, this was considered an important asset for European pharmaceutical research". The evaluation recognised that since its origin in 2008, 'IMI may have contributed to **resilience of the European pharmaceutical industry** at the time of the crisis, as the number of clinical trials and research remained stable across Europe in the period following the crisis of 2008'. IMI actions have also contributed to access to research infrastructure. A major success was the development of an **antimicrobial resistance infrastructure** that provided access to external companies or the European Lead Factory (ELF) project, providing access to libraries of medicinal compounds.

One of the main criticisms, found both in the interim¹⁸ and final evaluations of IMI JU⁵⁰ was the lack of a performance measuring system with SMART (Specific, Measurable, Achievable, Relevant, Time-phased) Key Performance Indicators (KPIs) to measure not

¹⁶ [IMI Socio-economic Impact Assessment Expert Group Final Report](#) (May 2016).

¹⁷ The Final Evaluation of the Innovative Medicines Initiative Joint Undertaking (2008-2016) operating under the 7th Framework Programme. https://ec.europa.eu/research/health/pdf/imi_final_evaluation.pdf.

¹⁸ Second Interim Evaluation IMI - Innovative Medicines Initiative Joint Undertaking. <https://www.imi.europa.eu/sites/default/files/uploads/documents/reference-documents/2ndInterimEvaluationIMI.pdf>

only scientific output, but also socio-economic impacts. A finally agreed set of KPIs was introduced in 2017, during the lifetime of IMI2 JU.

The second interim evaluation of IMI JU (published in July 2013) also provided recommendations for the future initiative, i.e. the IMI2 JU:

Recommendation 1: Baseline data should be obtained in parallel with the launch of IMI2 in order to allow for better benchmarking and assessment of IMI2 performance.

Recommendation 2: Industrial participants from other healthcare related sectors should be involved in IMI2. An integrated approach to healthcare will be required including prevention and diagnosis.

Recommendation 3: The Commission should ensure that IMI2 is transparent and has increased flexibility in terms of governance. It should be ensured that the roles and mandates of the governance and advisory bodies (in particular the Scientific Committee and the States Representatives Group) are clearly defined and the membership configured with the appropriate expertise to execute their mandate.

These recommendations have resulted, among others, in the following developments:

Ad 1) A set of ten SMART KPIs was introduced for IMI2 JU in December 2017¹⁹.

Ad 2) A small improvement has been achieved in involving other health care related sectors, mainly in diagnostics and medical technology companies (e.g. IMI2 JU Call 20 topic on ‘Proton therapy’). However, under IMI2 JU, only the pharmaceutical sector was represented as the founding member and therefore, sizeable involvement of non-pharmaceutical entities under the current IMI2 JU structure and rules is unlikely to be achieved by the end of the IMI2 JU programme. The main reasons seem to consist in difficulties to attract big non-pharma industries to IMI2 topics because of the various current rules in place, including the intellectual property rules not responding to the needs of these industries. IHI is going to address this recommendation as it is designed to involve five health care industry sectors (pharma, medtech, biotech, imaging, vaccines) from the start.

Ad 3) IMI2 JU has generally improved definitions of its governance structures and advisory bodies and its communication between them. The governance structure was enshrined in the Regulation establishing IMI JU and as such, it was not modified during the lifetime of the initiative. The composition of the Scientific Committee and the States Representatives Groups was considered adequate for the tasks performed.

2.3. Information about IMI2 JU & lessons learnt

Under Horizon 2020, the overall budget for the Societal Challenge “Health, demographic change and wellbeing” was EUR 7.5 billion which included Joint Undertakings (JUs). The Innovative Medicine Initiative was one such JU that supported R&I in the health field, named as IMI2 JU for the period 2014-2020 to distinguish it from its predecessor, IMI JU, operating under FP7.

¹⁹ IMI2 JU Key Performance Indicators. https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/mission-objectives/IMI2_KPIs_approved_14_DEC_2017.pdf.

IMI2 JU's total budget of up to EUR 3.276 billion makes it the world's largest public-private partnership in life sciences. IMI has become a renowned brand, recognised globally. Half of its budget comes from Horizon 2020 and most of the rest comes from the European Federation of Pharmaceutical Industries and Associations (EFPIA) and its member companies in the form of in-kind contributions, for example time of staff working on joint projects (other minor contributors include technology providers, diagnostics companies, charities or data handlers). It is important to emphasise that EFPIA companies do not receive any EU funding via IMI; the EU funding goes to universities, research centres, small and medium-sized enterprises (SMEs), mid-sized companies, patient groups, and regulators²⁰.

In each IMI project, a number of big industry players (EFPIA members) participate and collaborate with public sector partners and smaller companies. The IMI office coordinates the selection of the most suitable public consortium (including mostly public research organisation and SMEs) for the projects through open, competitive calls. These partners are funded by the EU, while EFPIA members use their own resources.

A novelty of IMI2 JU compared to its predecessor was the introduction of Associated Partners (AP) that can support and contribute to (both financially and in-kind) the objectives of IMI. The AP category was created with the goal of expanding IMI2 JU activities to a wider range of stakeholders to address the entire life science research and innovation value chain and to actively involve organisations other than pharmaceutical companies (therefore also following the recommendations of the predecessor IMI JU evaluation). Examples of organisations that have become AP include philanthropic organisations and charities that run their own health research programmes, as well as organisations working in sectors related to health care such as ICT, imaging, diagnostics, etc. IMI2 JU already attracted several global players as APs, such as the Bill and Melinda Gates Foundation, the Wellcome Trust and the Coalition for Epidemic Preparedness Innovations (CEPI)²¹. In fact, the category of AP has been so successful in leveraging contributions to IMI2 JU, that the reserved maximum amount of EUR 213 million as set out in the regulation is expected to be fully used. The category of AP is expected to continue in the future IHI.

Calls under IMI2 JU resulted in more than 84 projects (figure based on the number of grant agreements signed by end December 2019). Some of these projects focus on specific health issues such as neurological conditions, diabetes, oncology, Ebola vaccine development and antimicrobial resistance. Others focus on broader challenges in drug development such as drug and vaccine safety, knowledge management, drug behaviour in the body, and research and clinical data sharing platforms. In addition to research projects, IMI2 JU supported a number of education and training projects.

IMI projects delivered scientific breakthroughs that would not have been possible without IMI's public-private partnership model (see success stories below). Thomson Reuters is tracking the research papers coming out of IMI, revealing a rapid growth of scientific output (Figure 1), matched with high quality: the citation impact of IMI papers is twice the world average and significantly higher than the EU average. Articles accounted for the majority of publications (73.2%), followed by reviews (14%) and other (12.7%) in 2018. IMI projects

²⁰ Council of the European Union (2014), Council regulation (EU) No 557/2014 of 6 May 2014 establishing the Innovative Medicines Initiative 2 Joint Undertaking. Official Journal of the European Union 169, p. 54-76.

²¹ [IMI2 JU full list of Associated Partners.](#)

produced more publications in Pharmacology & Pharmacy than in other journal categories, followed by Neurosciences and Biochemistry & Molecular Biology²².

Figure 1. Number of Web of Science publications stemming from IMI.

IMI2 project participant analysis

In terms of number and total budget of projects, the following data are available (up to December 2019):

- 84 projects of approx. EUR 1,832 million total budget²³

The three most funded health areas for IMI2 are: ‘infectious diseases’ (EUR 708 million), ‘data, knowledge management, digital health’ (EUR 386 million) and ‘brain disorders’ (EUR 232 million), as shown in Figure 2.

Figure 2. Total amounts (in million EUR) invested by IMI2 JU per scientific area

²² [Bibliometric analysis of ongoing IMI projects](#) (September 2019).

²³ Corresponding to IMI2 JU calls up to Call 14 (with further eight calls remaining to be signed/launched).

Stakeholder analysis

IMI2 JU project participants spanned a wide range of organisations including private companies (including SMEs), higher education institutions, public-funded research centres, public bodies and others (e.g. non-profit organisations, patient associations, etc.). Based on the analysis of IMI2 JU funded projects (until 2018), overall 39.20% of the participants were private companies while 33.65% were higher education institutions, 17.25% were research performing organisations and 3.53% were public bodies (see Figure 3). 15.4% of beneficiaries receiving EU funding are SMEs²⁴. It should be noted that EFPIA members do not receive EU funding.

Figure 3. Overview of participants and participations per organisation type in IMI2 (2014-2018)

In terms of the size of funding, higher education institutions accounted for most of the received funding, totalling around EUR 447 million or 55% of the total net requested EU contributions between 2014 and 2018²⁵. This was followed by EUR 222 million (27%) for research centres, EUR 87 million (11%) for private companies, EUR 23 million (3%) for public bodies and EUR 40 million (5%) for other types of organisations. Since constituent and affiliated entities of EFPIA that participated in projects did not receive any reimbursement from the JU, their costs are not represented among these figures.

The highest number of participants (including all public and private sector participants and non-EU participants) were from the UK (19.95%, n=339) followed by Germany (13.83%, n=235), France (11.77%, n=200), the Netherlands (9.95%, n=169) and Belgium (8.18%, n=139) (see Figure 4). The EU15 Member States dominated the participation, accounting for 87% of participations and 90% of the total net requested EU contributions. In turn, EU13 accounted for only 2% of the participations and 1% of the total EU contributions. There was also participation from associated Member States (7% of participations, receiving 3% of contributions) and other international partners (4% of participations, receiving 5% of contributions).

https://www.imi.europa.eu/sites/default/files/uploads/documents/reference-documents/AAR2018_final.pdf

²⁵ Technopolis analysis of IMI2 JU data

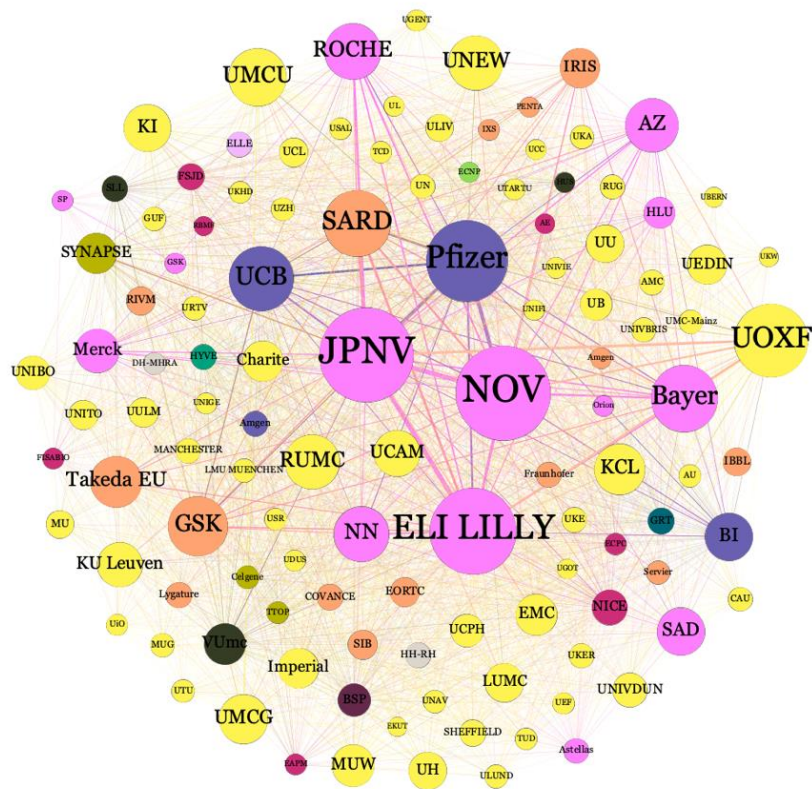

Figure 4: Overview of participants per EU MS in IMI2 JU (2014-2018) by organisation type

Based on IMI2 JU participation data, the level of participation of individual organisations was mapped. Figure 5 outlines a preliminary mapping of the IMI2 JU network according to organisations' NACE²⁶ industry sector (classified according to colour) with the bubble size indicating the frequency of participation (the bigger the bubble, the more frequent participation). The lines ('ties') between two organisations display the frequency of collaboration among the concerned organisations. The private companies, Janssen Pharmaceutica NV, Novartis Pharma AG, Eli Lilly and Company and Pfizer participated in the highest number of IMI2 JU projects (see JPNV, NOV, ELI LILLY and PFIZER in Figure 5 below). Again, it should be noted that as EFPIA members, these companies did not receive EU funding.

²⁶ NACE (Nomenclature of Economic Activities) is the European statistical classification of economic activities. NACE groups organisations according to their business activities. Statistics produced on the basis of NACE are comparable at European level and, in general, at world level in line with the United Nations' [International Standard Industrial Classification \(ISIC\)](#).

Figure 5: Preliminary mapping of the network structure of IMI2 JU by NACE sector

2.3.1. IMI2 JU Interim evaluation and recommendations for a future partnership

The interim evaluation of the IMI2 JU²⁷ (published in September 2017) came to the following main findings:

- The main achievement of IMI2 JU on which there was general consensus, was that since the joint undertaking started, collaborations between different competing global companies, SME's and academia became possible. These collaborations created trust and new partnerships, including partners from a number of expertise areas, such as patient representative groups or regulatory bodies, which are essential stakeholders for medicines to enter the market with quality, safety and efficacy guarantees and in the shortest possible time. Together with the available budget and long term strategy, these collaborations were considered an important asset for European pharmaceutical research.
- The large scale and ambition of the IMI2 JU projects, their long-term vision and strategy were viewed positively.
- The reasons to create a public-private partnership to strengthen the European pharma industry were valid and the goals were justified.
- Thanks to the joint undertaking, for the first time competing companies were collaborating in precompetitive research and deciding together, which call topics should be launched to address challenges that a single company could not tackle.
- IMI2 JU was considered to be a unique initiative that has no counterpart elsewhere.
- The process of developing the SRA and call topics was considered by many stakeholders to lack transparency and to be dominated by EFPIA partners.
- The added value for patients or society in general was hard to demonstrate at the time of mid-term evaluation, because of the early stage of IMI2²⁸.

Therefore, the experts drafting the evaluation identified several recommendations for a potential future partnership that were taken into consideration in the design of IHI (Table 2).

²⁷ European Commission (2017) [The Interim Evaluation of the Innovative Medicines Initiative 2 Joint Undertaking \(2014-2016\) operating under Horizon 2020](#). Experts Group Report. Luxembourg: Publications Office of the European Union.

²⁸ This finding could be attributed to the fact that mid-term evaluation report was published in 2017, only three years after the launch of the initiative in 2014.

Table 2. Recommendations of IMI2 JU interim evaluation for a future initiative and how they were used to design IHI

Recommendation	How it was taken into consideration in the design of IHI
<p>Recommendation 1: Make a substantial adaptation to the collaborative and funding model to enable the active engagement of other industry sectors with the pharmaceutical industry to capitalise on their expertise in the development of new health care interventions.</p>	<p>IHI is designed as a cross-sectoral partnership between EU and five industry sectors (pharma, medtech, biotech, imaging, vaccines), rather than only pharmaceuticals as in IMI2 JU. The respective industry associations have indicated a strong preliminary interest in becoming members of such an Institutionalised Partnership.</p>
<p>Recommendation 2: Increase the transparency of in-kind contributions as well as the Strategic Research Agenda (SRA) and call topics generation to reflect European interest and interests of stakeholders other than EFPIA. Transparency on these issues will open up the programme for more creative and innovative thinking and trust amongst the potential participants and stakeholders.</p>	<p>Transparency of the initiative was maintained from the design phase, including via several public consultations (detailed in Annex 2).</p> <p>To address the request for broader involvement of stakeholders in IHI governance and for more openness, a separate body is planned to be created in its governance ('Innovation Panel'). It would be tentatively composed of the representatives of EU and member industry associations, as well as of various other stakeholders such as representatives of patients, health care professionals, patients, health care providers, academia, research and technology organisations, research infrastructures, other partnerships and ad-hoc members as necessary.</p> <p>The reporting of in-kind contribution will be handled according to the conditions laid down in the relevant legal texts.</p>
<p>Recommendation 3: Change the rules on the calculation of the in-kind contributions from non-European entities. To be consistent with the goal of increasing investments in Europe, in-kind contributions from activities that occur outside of the EU should not be accepted to match with the public funding, but may be accounted as additional contributions or leveraging effects.</p>	<p>During consultations on IHI, EU Member States expressed a strong wish to strengthen the competitiveness of Europe's health technology industry (more information in Annex 2 section 1.3.2). At the same time, the necessary global dimension of the partnership should be ensured. Therefore, the partnership should strive to attract and partially match investments from outside Europe to increase its international footprint, capture resources and expertise of global companies, benefit from other previous international investments or address a specific scope (such as e.g. disease prevalence in non-EU countries, with relevance for EU population), while maintaining a majority of activities in the EU.</p>

The experts also identified a number of recommendations to improve effectiveness, efficiency, coherence and added value of the existing partnership. Even though these recommendations were meant to help in the final phase of IMI2 JU execution, they were also used as lessons learned to better design the Innovative Health Initiative (Table 3).

Table 3. Findings of IMI2 JU interim evaluation that could be implemented towards the end of IMI2 JU, and how they were used to design the Innovative Health Initiative.

Recommendation	How it was taken into consideration in the design of IHI
<p>Recommendation 1: A renewed and stronger effort should be made to attract and integrate other industries than the pharmaceutical industry in the collaborative projects.</p>	<p>IHI will involve several industry sectors as founding members.</p>
<p>Recommendation 2: Create a better eco-system to attract more SMEs.</p> <ul style="list-style-type: none"> - Expand the scope of projects to attract SMEs developing innovative technologies to capture novel trends in the development of healthcare of the future; - Make topic description less prescriptive and allow more flexibility for SMEs to come with creative ideas. 	<p>Associations of medtech, biotech, imaging and vaccine industry sectors have indicated a strong preliminary interest in becoming members of such an Institutionalised Partnership, along with EFPIA’s continued interest. The new associations have a larger number of SME partners, across various geographies.</p> <p>It is expected that a majority of topic will be less prescriptive single-stage, allowing a more bottom-up approach with more space for ideas coming from applicants.</p>
<p>Recommendation 3: An accountable Performance Measurement Framework, using SMART KPIs should be developed to assess the impacts and socio-economic benefits of the joint undertaking.</p>	<p>A set of KPIs aligned with the specific objectives of IHI is going to be in place from the start of the initiative.</p>
<p>Recommendation 4: Review the IP policy and make it more flexible to respond to the needs allowing negotiations on exclusive rights.</p>	<p>As a default, general Horizon Europe provisions will apply.</p>
<p>Recommendation 5: Improve and broaden access to project outcomes and assure their sustainability to increase impact.</p> <ul style="list-style-type: none"> - Develop a platform for open dialogue with and between the different groups in the governance structure of the joint undertaking; - Develop a brokerage platform to stimulate that results from IMI2 projects and from other programmes are leading to applications. - Ensure communication to a wider audience to increase awareness of the programme results and outputs. 	<p>The measures to ensure the sustainability of project outcomes remain to be discussed. The initiative will strive to consider recommendations from IMI2 JU Scientific Committee on this matter²⁹.</p> <p>The process of future topic generation is foreseen to be made more transparent by revised governance structure with the Innovation Panel that will better incorporate the voice of various stakeholders, as explained above (Table 2, recommendation 2).</p> <p>The details of communication activities will be discussed later in the partnership preparation process.</p>

²⁹ IMI Scientific Committee Recommendation. Sustainability solutions are important criteria determining project quality and output in IMI (2018). https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/Governance/sc/SC_Sustainability_June2018.pdf.

The recommendations referred to above have resulted, among others, in a set of ten SMART KPIs introduced in December 2017³⁰. The KPIs focus on the following elements:

- 1) the coverage of the research portfolio, showing adequate implementation of the annual scientific priorities;
- 2) the achievements of the assets during the course of the IMI programmes;
- 3) the impact of the IMI programmes on the regulatory framework;
- 4) the ability of the IMI programs to set new standards (i.e. new taxonomies, new stratifications)
- 5) the rate of contribution of non-pharma actors to the IMI programmes (e.g. non-pharma industries, foundations, charities, professional organisations);
- 6) the accessibility of the resources/outputs beyond the IMI consortia partners;
- 7) the level of co-authorships and cross-sector publications between European researchers;
- 8) the adoption of the novelty generated by the IMI programmes by the industrial partners;
- 9) the level of involvement of patients groups or healthcare professional association;
- 10) the level of collaboration and SME participation.

Data from IMI2 JU Annual Activity Report 2019³¹ demonstrate that IMI2 JU has already reached or almost reached the desired targets in more than half of the KPIs.

2.4. IMI Success stories

IMI has resulted in a range of outcomes and impacts on health care, health systems and patient wellbeing³². A selection of these success stories is presented below, followed by a case example from an SME.

Empowering patients

IMI2 made a significant step towards patient empowerment: the Patient Expert Training Course trained almost 100 patients from 32 countries across 58 disease areas, and the R&D toolbox has been used by more than 500,000 people worldwide. These were outputs of the European Patients' Academy on Therapeutic Innovation³³ project (EUPATI, budget EUR 10.9 million) that has helped address a key gap in patient and public knowledge by providing information on how medical R&D is conducted. Other outputs include guidance documents for the engagement of patient organisations, and annual conferences and workshops.

Responding to emerging health threats

In November 2014, IMI responded to the West Africa outbreak of Ebola by launching a comprehensive Ebola+ programme³⁴ to tackle a wide range of challenges in Ebola research,

³⁰ IMI2 JU Key Performance Indicators. https://www.imi.europa.eu/sites/default/files/uploads/documents/About-IMI/mission-objectives/IMI2_KPIs_approved_14_DEC_2017.pdf.

³¹ IMI (2020) Annual Activity Report 2019. Available at: https://www.imi.europa.eu/sites/default/files/events/IMI%20AAR%202019_FINAL.pdf.

³² An up-to-date list of success stories can be found at <https://www.imi.europa.eu/projects-results/success-stories-projects>.

³³ <https://www.imi.europa.eu/projects-results/project-factsheets/eupati>.

³⁴ <https://www.imi.europa.eu/projects-results/project-factsheets/ebola>.

including vaccines development, clinical trials, storage and transport, as well as diagnostics. Today, the Ebola+ programme has 12 projects with a total budget (joint EU and EFPIA / Associated Partner contributions) of close to EUR 300 million. In July 2020, the European Commission granted marketing authorisations to Janssen, a Johnson & Johnson company, for their vaccine against Ebola virus disease, whose development was supported by IMI's Ebola+ programme.

Better use of big data

20 years of clinical research on knee replacement were reviewed and analysed in just 5 days. It demonstrated the power of using electronic health data in replicating clinical trials, to generate information that could help patients and doctors make better decisions about their care (EHDEN project, budget EUR 28.9 million)³⁵. This was done as part of IMI's Big Data for Better Outcomes programme aiming to integrate detailed personal and biological data to uncover insights that will improve outcomes for patients.

Years of clinical research data on Alzheimer's earliest stages were made securely available to the scientific community – a move that can help go further with knowledge sharing and discovery of treatments. This was done through the 'European prevention of Alzheimer's dementia consortium', looking into innovative designs of clinical trials to deliver better results, faster and at lower cost³⁶ (EPAD project, budget EUR 59.9 million).

Faster diagnostics

Lengthy diagnostic was a major problem during the 2014-15 West Africa Ebola outbreak. To remedy this, a compact, easy-to-use diagnostic device was developed that deliver results in a little over an hour³⁷. The device is now validated and commercially available. The test can be used to diagnose Ebola and other *Filoviridae* such as Marburg virus. In the future, it may be expanded to other WHO priority pathogens such as dengue and Lassa fever. This was done under IMI's Mofina project (EUR 4.4 million), where partners reported that the collaboration between public and private stakeholders was key to their success.

Greener pharmaceuticals

A new tool was designed to embed 'green chemistry' in chemical development, for use in the early stages of drug development³⁸. The toolkit assesses how green a chemical reaction is by using a combination of qualitative and quantitative criteria. A range of new, cleaner catalysts were also delivered, now used by several pharmaceutical companies. This was done thanks to CHEM21 project (budget EUR 26.7 million) that addresses inefficiencies and sustainability in the manufacturing processes of pharmaceuticals.

Accelerating the development of new drugs and new treatments

Using patient reported outcomes and tools, the impact of chronic obstructive respiratory disease (COPD) on how patients experience physical activity was measured, achieving a qualification of European Medicines Agency (EMA) for novel methodologies. This opens

³⁸ <https://www.imi.europa.eu/projects-results/project-factsheets/chem21>.

the way for the development of more effective treatments (PRO-active project, budget EUR 15.6 million).

Pharmaceutical companies – who are market competitors – started to share their data on the toxicity of drug-like compounds, for the first time on a large scale. This happened through the creation of a large database, which can be mined, e.g. to try to predict whether or not a particular candidate drug is likely to have an adverse effect on patients. This data sharing can lower the failure rate in later phases of pharmaceutical development, significantly reduce the number of animal tests needed, and accelerate the development of new drugs³⁹ (eTOX project, budget EUR 18.7 million).

Stakeholder opinion

Dr Tamas Letoha, CEO
Pharmacoidea Ltd

Pharmacoidea Ltd. is a Hungarian biotech SME specialising in preclinical drug discovery, founded in the 2000s' by a handful of talented scientists. The early years were characterized by struggling at a little domestic market until the company got into an IMI project as part of an international consortium. IMI was a game-changer for Pharmacoidea, it gained hands-on knowledge of the pharmaceutical R&D process, partnering with leading industry players and academic institutes. By understanding the industrial requirements of pharmaceutical drug discovery, the company acquired the skills for world-class pharmaceutical innovation. As a result, Pharmacoidea's drug discovery platform was advanced, innovative target-specific bioassays and analytical methods were developed and Pharmacoidea established an advanced informatics platform and filed several novel patents. All strengthening the company's industrial capacities, business perspectives and improving its competitiveness within the biotech and pharmaceutical industry. IMI also opened up a vast network of potential clients, and the IMI participation put a quality stamp on the company. Pharmacoidea's revenues increased almost ten-fold from EUR 114,600 in 2012 (before joining IMI) to EUR 961,366 in 2018 and created several highly skilled jobs.

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED

1.1. Focus and objectives of the impact assessment

This impact assessment accompanies the Commission proposal for Institutionalised European Partnerships to be funded under Horizon Europe, the 2021-2027 Framework Programme for EU Research and Innovation (R&I).¹ It sets out to **help decide in a coordinated manner the right form of implementation for specific candidate initiatives** based on a common approach and methodology to individual assessments². It also provides an **horizontal perspective on the portfolio of candidate European Partnerships** to identify further efficiency and coherence gains for more impact.

European Partnerships are initiatives where the Union, together with private and/or public partners (such as industry, public bodies or foundations) commit to support jointly the development and implementation of an integrated programme of R&I activities. The rationale for establishing such initiatives is to achieve the objectives of Horizon Europe more effectively than what can be attained by other activities of the programme.³

Based on the Horizon Europe Regulation, European Partnerships may be set up using **three different forms**: “Co-funded”, “Co-programmed” and “Institutionalised”. The setting-up of **Institutionalised Partnerships** involves new EU legislation and the establishment of dedicated implementing structures based on Article 185 or 187 of the Treaty on the Functioning of the EU (TFEU). This requires an impact assessment to be performed.

The Horizon Europe Regulation defines **eight priority areas**, scoping the domains in which Institutionalised Partnerships could be proposed⁴. Across these priority areas, **13 initiatives** have been identified as **suitable candidate initiatives** for Institutionalised Partnerships because of their objectives and scope. This impact assessment aims to identify whether 12 of these initiatives⁵ need to be implemented through this form of implementation and would not deliver equally well with traditional calls of Horizon Europe or other lighter forms of European Partnerships under Horizon Europe. This means assessing whether each of these initiatives meets the necessity test set in the **selection criteria** for European Partnerships in the Horizon Europe Regulation, Annex III.

This assessment is done **without any budgetary consideration**, as the overall budget of the Multiannual Financial Framework of the EU – and hence of Horizon Europe – for the next financing period is not known at this stage.⁶

¹ Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

² Based on the European Commission Better Regulation framework (SWD (2017) 350) and supported by an external study coordinated by Technopolis Group (to be published in 2020).

³ For further details on these points, see below Section 1.2.2.

⁴ Set out in the Annex Va of the Horizon Europe Regulation (common understanding). <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

⁵ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47).

⁶ EU budget commitments to the European Partnership candidates can only be discussed and decided following the political agreement on the overall Multiannual Financial Framework and Horizon Europe budgetary envelopes. The level of EU contribution for individual partnerships should be determined once there are agreed

1.2. The political and legal context

1.2.1. Shift in EU priorities and Horizon Europe framework

European priorities have evolved in the last decades, and reflect the social, economic, and environmental challenges for the EU in the face of global developments. In her Political Guidelines for the new European Commission 2019 – 2024⁷, the new Commission President put forward six overarching priorities, which reach well beyond 2024 in scope⁸. Together with the Sustainable Development Goals (SDGs), these priorities will shape future EU policy responses to the challenges Europe faces, and thus also give direction to EU research and innovation.

As part of the Multi-annual Financial Framework (MFF) 2021-27 the new EU Framework Programme for Research and Innovation **Horizon Europe will play a pivotal role for Europe to lead the social, economic, and environmental transitions needed to achieve these European policy priorities**. It will be more impact driven with a strong focus on delivering European added value, but also be more effective and efficient in its implementation.⁹ Horizon Europe finds its rationale in the daunting challenges that the EU is facing, which call for “*a radical new approach to developing and deploying new technologies and innovative solutions for citizens and the planet on a scale and at a speed never achieved before, and to adapting our policy and economic framework to turn global threats into new opportunities for our society and economy, citizens and businesses.*” While Horizon Europe continues the efforts of strengthening the scientific and technological bases of the Union and foster competitiveness, a more strategic and impact-based approach to EU R&I investment is taken. Consequently, the **objectives of Horizon Europe** highlight the need to *deliver on the Union strategic priorities and contribute to the realisation of EU objectives and policies, contribute to tackling global challenges, including the Sustainable Development Goals by following the principles of the Agenda 2030 and the Paris Agreement.*¹⁰

In this context, **at least 35 % of the expenditure from actions under the Horizon Europe Programme will have to contribute to climate action**. Furthermore, a **Strategic Plan** is co-designed with stakeholders to identify **key strategic orientations for R&I support** for 2021-2024 in line with the EU priorities. In the Orientations towards the first Strategic Plan for Horizon Europe, the need to strategically prioritise and “*direct a substantial part of the funds towards the areas where we believe they will matter the most*” is emphasised. The Orientations specify, that actions under Pillar II of Horizon Europe “Global Challenges and European Industrial Competitiveness” will target only selected themes of especially high impact that significantly contribute to delivering on the political priorities of the Union. Most of the candidate European Partnerships fall under this Pillar.

objectives, and clear commitments from partners. Importantly, there is a ceiling to the partnership budgets in Pillar II of Horizon Europe (the legal proposal specifies that *the majority of the budget in pillar II shall be allocated to actions outside of European Partnerships*).

¹⁰ Article 3, Common understanding regarding the proposal for Horizon Europe Framework Programme.

1.2.2. Key evolutions in the approach to partnerships in Horizon Europe

Since their start in 1984 the successive set of Framework Programmes uses a variety of instruments and approaches to support R&I activities, address global challenges and industrial competitiveness. Collaborative, competition-based and excellence-driven R&I projects funded through Work Programmes are the most traditional and long-standing approach for implementation. Since 2002, available tools also include **partnerships**, whereby the Union together with private and/or public partners commit to jointly support the development and implementation of an R&I programme. These were introduced as part of creating the European Research Area (ERA) to align national strategies and overcome fragmentation of research effort towards an increased scientific, managerial and financial integration of European research and innovation. Interoperable and integrated national research systems would allow for better flows of knowledge, technology and people. Since then, the core activities of the partnerships consist of building critical mass mainly through collaborative projects, jointly developing visions, and setting strategic agendas.

As analysed in the **interim evaluation of Horizon 2020**¹¹, a considerable repertoire of partnership initiatives have been introduced over time, with 8 forms of implementation¹² and close to 120 partnership initiatives running under Horizon 2020 - without clear exit strategies and concerns about their degree of coherence, openness and transparency. Even if it is recognised that these initiatives allow setting long-term agendas, structuring R&I cooperation between otherwise dispersed actors, and leveraging additional investments, the evaluation points to the complexity generated by the proliferation of instruments and initiatives, and their insufficient contribution to policies at EU and national level.

Box 1 Key lessons from the interim evaluation of Horizon 2020 and R&I partnerships

- The **Horizon 2020 Interim Evaluation** concludes that the overall partnership landscape has become overly complex and fragmented. It identifies the need for rationalisation, improve their openness and transparency, and link them with future EU R&I missions and strategic priorities.
- The **Article 185 evaluation** finds that these public-public partnerships have scientific quality, global visibility and networking/structuring effects, but should in the future focus more on the achievement of policy impacts. From a systemic point of view, it found that the EU public-to-public cooperation (P2P) landscape has become crowded, with insufficient coherence.
- The **Article 187 evaluation** points out that Public-Private Partnership (PPP) activities need to be brought more in line with EU, national and regional policies, and calls for a revision of the Key Performance Indicators. As regards the **contractual PPPs (cPPPs)** their reviews identified challenges of coherence among cPPPs and the need to develop collaborations and synergies with other relevant initiatives and programmes at EU, national and regional level.

Over 80% of respondents to the Open Public Consultation (OPC) indicated that a significant contribution by future European Partnerships is 'fully needed' to achieve climate-related goals, to develop and effectively deploy technology, and for EU global competitiveness in specific sectors/domains. Views converged across all categories of respondents, including citizens, industry and academia.

¹¹ Interim evaluation of Horizon 2020, Commission Staff Working Document, SWD(2017)221 and 222 Interim evaluation of the Joint Undertakings operating under Horizon 2020 (Commission Staff Working Document, SWD(2017) 339); Evaluation of the Participation of the EU in research and development programmes undertaken by several Member States based on Article 185 of the TFEU, Commission Staff Working Document, SWD (2017)340)

¹² E.g. initiatives based on Article 187 (Joint Technology Initiatives), Article 185 TFEU, Contractual Public-Private Partnerships (cPPPs), Knowledge & Innovation Communities of the European Institute of Innovation & Technology (EIT-KICs), ERA-NETs, European Joint Programmes, Joint Programming Initiatives.

The impact assessment of Horizon Europe identifies therefore the need to **rationalise the EU R&I funding landscape**, in particular with respect to partnerships, as well as to **re-orient partnerships towards more impact** and delivery on EU priorities. To address these concerns and to realise the higher ambition for European investments, Horizon Europe puts forward **a major simplification and reform for the Commission’s policy on R&I partnerships**¹³. Reflecting its pronounced systemic nature aimed at contributing to EU-wide ‘transformations’ towards the sustainability objectives, Horizon Europe indeed intends to make a more effective use of these partnerships with a **more strategic, coherent and impact-driven approach**. Key related changes that apply to all forms of European Partnerships encapsulated in Horizon Regulation are summarised in the Box below.

Box 2 Key features of the revised policy approach to R&I partnerships under Horizon Europe based on its impact assessment

- ✓ **Simpler architecture & toolbox** by streamlining 8 partnership instruments into 3 implementation forms (Co-Funded, Co-Programmed, Institutionalised), under the umbrella ‘European Partnerships’
- ✓ **More systematic and transparent approach** to selecting, implementing, monitoring, evaluating and phasing out all forms of partnerships (**criteria** for European Partnerships):
 - The selection of Partnerships is embedded in the strategic planning of Horizon Europe, thereby ensuring coherence with the EU priorities. The selection criteria require that partnerships are established with stronger ex-ante commitment and higher ambition.
 - The implementation criteria stipulate that initiatives adopt a systemic approach in achieving impacts, including broad engagement of stakeholders in agenda-setting and synergies with other relevant initiatives to promote the take-up of R&I results.
 - A harmonised monitoring & evaluation system will be implemented, and ensures that progress is analysed in the wider context of achieving Horizon Europe objectives and EU priorities.
 - All partnerships need to develop an exit strategy from Framework Programme funding. This new approach is underpinned by principles of openness, coherence and EU added value.
- ✓ **Reinforced impact orientation:**
 - Partnerships are established only if there is evidence they support achieving EU policy objectives more effectively than other Horizon Europe actions, by ensuring alignment with an R&I agenda (**directionality**) and securing leveraging effects (**additionality**).
 - European Partnerships are expected to provide mechanisms – based on a concrete roadmap - to join up R&I efforts between a broad range of actors towards the development and uptake of innovative solutions in line with EU priorities, serving the economy and society, as well as scientific progress.
 - They are expected to develop close synergies with national and regional initiatives, acting as dynamic change agents, strengthening linkages within their respective ecosystems and along the value chains, as well as pooling resources and efforts towards the common EU objectives.

Under Horizon Europe, a ‘European Partnership’¹⁴ is defined as *“an initiative where the Union, prepared with early involvement of Member States and/or Associated Countries, together with private and/or public partners (such as industry, universities, research organisations, bodies with a public service mission at local, regional, national or international level or civil society organisations including foundations and NGOs), commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”*

The Regulation further specifies that European Partnerships shall adhere to the *“principles of Union added value, transparency, openness, impact within and for Europe, strong leverage effect on sufficient scale, long-term commitments of all the involved parties, flexibility in implementation, coherence, coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions.”*

¹³ Impact assessment of Horizon Europe, Commission Staff Working Document, SWD(2018)307.

¹⁴ Article 8 and Annex III of the Horizon Europe Regulation (common understanding)

1.3. Why should the EU act

1.3.1. Legal basis

Proposals for Institutionalised European Partnerships are based on:

- 1) Article 185 TFEU which allows the Union to make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; or
- 2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes.¹⁵

1.3.2. Subsidiarity

The EU should act only in areas where there is demonstrable advantage that the action at EU level is more effective than action taken at national, regional or local level. Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the EU can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas. The candidate initiatives focus on areas where there is a demonstrable value added in acting at the EU level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national activities in the same area. Overall European Partnerships find their **rationale in addressing a set of systemic failures**¹⁶:

- Their primary function is to create a platform for a strengthened **collaboration** and knowledge exchange between various actors in the European R&I system and an enhanced **coordination** of strategic research agendas and/or R&I funding programmes. They aim to address **transformational failures** to better align agendas and policies of public and private funders, pool available resources, create critical mass, avoid unnecessary duplication of efforts, and leverage sufficiently large investments where needed but hardly achievable by single countries.
- The concentration of efforts and pooling of knowledge on common priorities to solve multi-faceted societal and economic challenges is at the core of these initiatives. Specifically, enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems are among the key objectives of these instruments. In the light of Horizon Europe, the aim is to **drive system transitions and transformations towards EU priorities**.
- Especially in fast-growing technologies and sectors such as ICT, there is a need to **react to emerging opportunities** and address systemic failures such as shortage in skills or critical mass or cross-sectoral cooperation along the value chains that would hamper attainment of future European leadership and/or strategic autonomy.
- They also aim to address **market failures** predominantly to enhancing industry investments thanks to the sharing of risks.

¹⁵ Both Articles are under Title XIX of the TFEU - Research and Technological Development and Space.

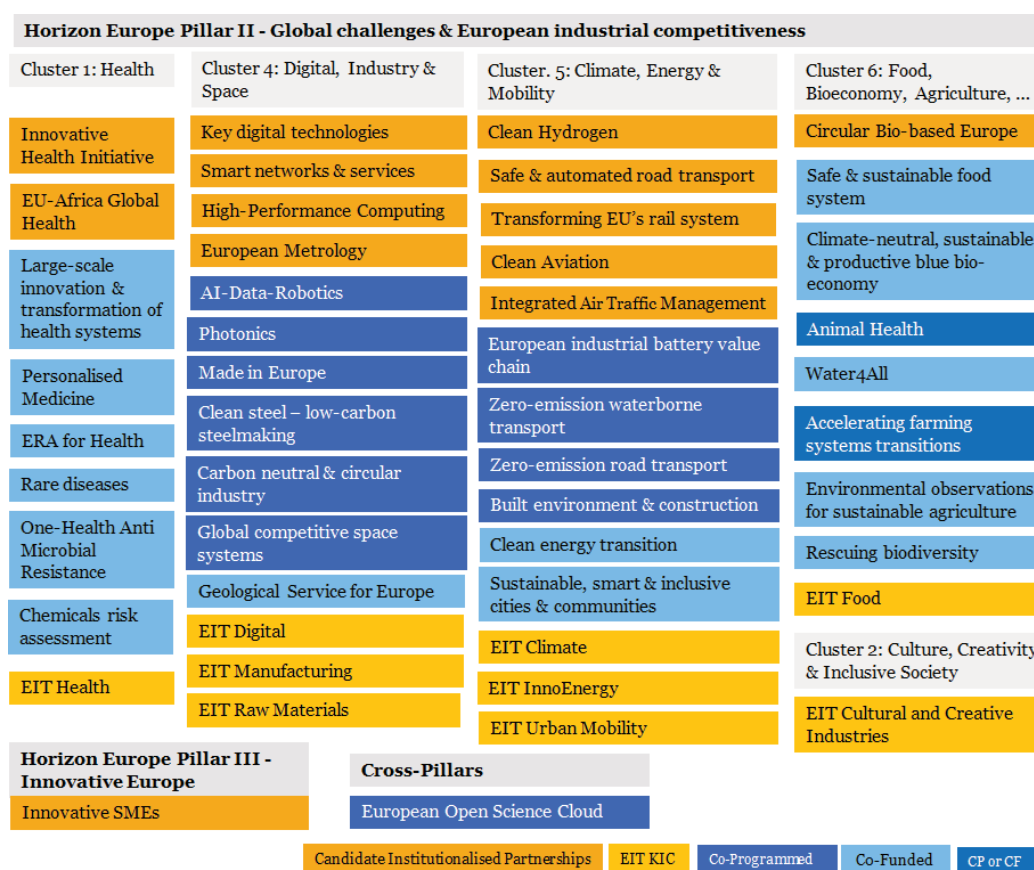

¹⁶ The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide qualitative and quantitative evidence on these points. Sections 1 and 2 of each impact assessment on candidate European Partnerships include more detail on the necessity to act at EU level in specific thematic areas.

2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED

2.1. Portfolio of candidates for Institutionalised European Partnerships

The new approach for more objective-driven and impactful European Partnerships is reflected in the way candidate Partnerships have been identified. It involved a co-design exercise aiming to better align these initiatives with societal needs and policy priorities, while broadening the range of actors involved. Taking into account the 8 areas for Institutionalised European Partnerships set out in the Horizon Europe Regulation¹⁷, a co-design exercise as part of the Strategic Planning process of Horizon Europe lead to the identification of **49 candidates for Co-funded, Co-programmed or Institutionalised European Partnerships**¹⁸. Out of these, **13 were identified as suitable candidate Institutionalised Partnerships because of their objectives and scope**¹⁹. Whilst the Co-Funded and Co-Programmed Partnerships are linked to the comitology procedure (including the adoption of the Strategic Plan and the Horizon Europe Work Programmes), Institutionalised Partnerships require the adoption of legislation and are subject to an impact assessment. The Figure below gives an overview of all candidate European Partnerships according to their primary relevance to Commission priorities for 2019-2024.

Figure 1 - Overview of the candidates for Co-Funded, Co-Programmed and Institutionalised European Partnerships according to Horizon Europe structure

Source: Technopolis group (2020)

¹⁷ Horizon Europe Regulation (common understanding), Annex Va.

¹⁸ Shadow configuration of Strategic Programme Committee for Horizon Europe. The list of candidate European Partnerships is described in “Orientations towards the Strategic Plan of Horizon Europe” - Annex 7

¹⁹ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47)

There are only three partnerships for which implementation as an Institutionalised Partnership under Article 185 is an option, i.e. European Metrology, the EU-Africa Global Health partnership, and Innovative SMEs. Ten partnerships are candidates for Institutionalised Partnerships under Article 187. Overall the initiatives can be categorised into ‘horizontal’ partnerships and ‘vertical’ partnerships.

The ‘horizontal’ partnerships have a central position in the overall portfolio, as they are expected to develop methodologies and technologies for application in the other priority areas, ultimately supporting European strategic autonomy in these areas as well as technological sovereignty. These ‘horizontal’ partnerships are typically proposed as Institutionalised or Co-programmed Partnerships, in addition to a number of EIT KICs, they cover mainly the digital field in addition to space, creative industries and manufacturing, but also the initiative related to Innovative SMEs. ‘Vertical’ partnerships are focused on the needs and development of specific application areas, and are primarily expected to support enhanced environmental sustainability thereby addressing Green Deal related objectives. They also deliver on policies for more people centred economy, through improved wellbeing of EU citizen and the economy, like health related candidate European Partnerships.

2.2. Assessing the necessity of a European Partnership and possible options for implementation

Horizon Europe Regulation Article 8 stipulates that Institutionalised European Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

For all candidate Institutionalised European Partnerships the options considered in this impact assessment are the same, i.e.:

- Option 0 – Baseline option – Traditional calls under the Framework Programme
- Option 1 – Co-programmed European Partnership
- Option 2 – Co-funded European Partnership
- Option 3 – Institutionalised Partnership
 - Sub-option 3a Institutionalised Partnerships based on Art 185 TFEU
 - Sub-option 3b Institutionalised Partnerships based on Art 187 TFEU

2.2.1. Option 0 - Baseline option – Traditional calls

Under this option, strategic programming for R&I in the priority area will be done through the mainstream channels of Horizon Europe. The related priorities will be implemented through **traditional calls** of Horizon Europe covering a range of actions, mainly R&I and/or innovation actions but also coordination and support actions, prizes or procurement. Most actions involve consortia of public and/or private actors in ad hoc combinations, while some actions are single actor (mono-beneficiary). There will be no dedicated implementation structure and no support other than what is foreseen in the related Horizon Europe Work Programme. This means that discontinuation costs/benefits of predecessor initiatives should be factored in for capturing the baseline situation when relevant.

Under this option, strategic planning mechanisms in the Framework Programme will allow for a high level of flexibility in the ability of traditional calls to respond to particular needs over time, building upon additional input in co-creation from stakeholders and programme committees involving Member States. The Union contribution to addressing the priority covers the full duration of the initiative, during the lifetime of Horizon Europe. Without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual commitments and contributions outside their participation in funded projects.

2.2.2. European Partnerships

Under this set of options, three different forms of implementation are assessed: Co-funded, Co-Programmed, Institutionalised European Partnerships. These have **commonalities that cannot serve as a distinguishing factor in the impact assessment process**. They are all based on agreed objectives and expected impacts and underpinned by Strategic Research and Innovation Agendas / roadmaps that are shared and committed to by all partners in the partnership. They all have to follow the same set of criteria along their lifecycle, as defined in the Horizon Europe Regulation (Annex III), including ex ante commitment from partners to mobilise and contribute resources and investments. The Union contribution is defined for the full duration of the initiative for all European Partnerships. The Horizon Europe legal act introduces few additional requirements for Institutionalised Partnerships, e.g. the need for long-term perspective, strong integration of R&I agendas, and financial contributions.

Figure 2 - Key differences in preparation and implementation of European Partnerships

Type	Legal form	Implementation
Co-Programmed	Contractual arrangement / MoU	Division of labour , whereby Union contribution is implemented through Framework Programme and partners' contributions under their responsibility.
Co-Funded	Grant Agreement	Union provides co-funding for an integrated programme with distributed implementation by entities managing and/or funding national research and innovation programmes
Institutionalised based on Article 185/187 TFEU	Basic act (Council regulation, Decision by European Parliament and Council)	Integrated programme with centralised implementation

The main differences between the different forms of European Partnerships are in their preparation and in the way they function, as well as in the overall impact they can trigger. The Co-Programmed form is assessed as the simplest, and the Institutionalised the most complex to prepare and implement. The functionalities of the different form of Partnerships – compared to the baseline option – are presented in Figure 3. They relate to the types of actors Partnerships can involve and their degree of openness, the types of activities they can perform and their degree of flexibility, the degree of commitment of partners and the priority setting system, and their ability to work with their external environment (coherence), etc. These key distinguishing factors will be at the basis of the comparison of each option to determine their overall capacity to deliver what is needed at a minimised cost.

Figure 3 Overview of the functionalities provided by each form of European Partnerships, compared to the traditional calls of Horizon Europe (baseline)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Type and composition of actors (including openness and roles)				
<p><u>Partners:</u> N.A., no common set of actors that engage in planning and implementation</p> <p><u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules</p>	<p><u>Partners:</u> Suitable for all types: private and/or public partners, foundations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation, Member States in comitology</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules</p>	<p><u>Partners:</u> core of national funding bodies or governmental research organisations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> limited, according to national rules of partner countries</p>	<p><u>Partners:</u> National funding bodies or governmental research organisation</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations</p>	<p><u>Partners:</u> Suitable for all types: private and/or public partners, foundations</p> <p><u>Priority setting:</u> Driven by partners, open stakeholder consultation</p> <p><u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations</p>
Type and range of activities (including additionality and level of integration)				
<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions</p> <p><u>Additionality:</u> no additional activities and investments outside the funded projects</p> <p><u>Limitations:</u> No systemic approach beyond individual actions</p>	<p><u>Activities:</u> Horizon Europe standard actions that allow broad range of individual actions, support to market, regulatory or policy/ societal uptake</p> <p><u>Additionality:</u> Activities/investments of partners, National funding</p> <p><u>Limitations:</u> Limited systemic approach beyond individual actions</p>	<p><u>Activities:</u> Broad, according to rules/programmes of participating States, State-aid rules, support to regulatory or policy/ societal uptake</p> <p><u>Additionality:</u> National funding</p> <p><u>Limitations:</u> Scale & scope depend on participating programmes, often smaller in scale</p>	<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach</p> <p><u>Additionality:</u> National funding</p>	<p><u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach (portfolios of projects, scaling up of results, synergies with other funds).</p> <p><u>Additionality:</u> Activities/investments of partners/ national funding</p>
Priority-setting process and directionality				
<p><u>Priority setting:</u> Strategic Plan and annual work programmes, covering max. 4 years.</p> <p><u>Limitations:</u> Fully taking into account existing or to be developed SRRIA/ roadmap</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Input to FP annual work programme drafted by partners, finalised by EC (comitology)</p> <p>Objectives & commitments set in contractual arrangement</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives & commitments set in Grant Agreement</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives & commitments set in legal act</p>	<p><u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution</p> <p>Annual work programme drafted by partners, approved by EC (veto-right in governance)</p> <p>Objectives & commitments set in legal act</p>
Coherence: internal (Horizon Europe) & external (other Union programmes, national programmes, industrial strategies)				
<p><u>Internal:</u> Coherence between different parts of the FP Annual Work programme can be ensured by EC</p> <p><u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Limited synergies with other Union programmes & industrial strategies. If Member States participate, with national/regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with national/ regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with national/ regional programmes & activities</p>	<p><u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC</p> <p><u>External:</u> Synergies with other Union programmes and industrial strategies</p> <p>If Member States participate, with national/regional programmes & activities</p>

2.2.2.1. Option 1 - Co-programmed European Partnership

This form of European Partnership is **based upon a Memorandum of Understanding or a Contractual Arrangement** signed by the Commission and the private and/or public partners. Private partners are represented by industry associations, which also support the daily management of the partnership. This type of partnership would allow for a large degree of flexibility for the activities, partners and priorities to continuously evolve. The commitments of partners are political efforts described in the contractual arrangement and the contributions from partners are provided in kind more than financially. The priorities for the calls, proposed by the Partnership's members for integration in the Horizon Europe's Work Programmes, are subject to further input from Member States (comitology) and Commission services. The Union contribution is implemented within the executive agency managing Horizon Europe calls for research and innovation projects proposals. The full array of Horizon Europe instruments can be used, ranging from research and innovation (RIA) types of actions to coordination and support actions (CSA) and including grants, prizes, and procurement.

2.2.2.2. Option 2 – Co-funded European Partnership

The Co-funded European Partnership is **based on a Grant Agreement** between the Commission and a consortium of partners, resulting from a specific call in the Horizon Europe Work Programme. This form of implementation only allows to address public partners at its core. Typically these provide co-funding to a common programme of activities established and/or implemented by entities managing and/or funding national R&I programmes. The recipients of the EU co-funding implement the initiative under their responsibility, with national funding/resources pooled to implement the programme with co-funding from the Union. The expectation is that these entities would cover most if not all EU Member States. Calls and evaluations would be organised centrally, beneficiaries in selected projects would be funded at national level, following national funding rules.

2.2.2.3. Option 3 – Institutionalised European Partnership

This type of Partnership is the most complex and high-effort arrangement, and requires meeting additional requirements. Institutionalised European Partnership are **based on a Council Regulation (Article 187 TFEU or a Decision by the European Parliament and Council (Article 185 TFEU))** and are implemented by dedicated structures created for that purpose. These regulatory needs limit the flexibility for a change in the core objectives, partners, and/or commitments as these would require amending legislation. The basic rationale for this type of partnership is the need for a strong integration of R&I agendas in the private and/or public sectors in the EU in order to address a strategic challenge. It is therefore necessary to demonstrate that other forms of implementation would not achieve the objectives or would not generate the necessary expected impacts, and that a long-term perspective and high degree of integration is needed. For both Article 187 and 185 initiatives, contributions from partners can be in the form of financial and in-kind contributions. Eligibility for participation and funding follows by default the rules of Horizon Europe, unless a derogation is introduced in the basic act.

Option 3a - Institutionalised Partnerships based on Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and limits therefore the scope to **public partners** which are Member States and Associated Third Countries. This type of Institutionalised Partnership aims therefore at reaching the greatest possible impact through the integration of national and EU

funding, aligning national strategies in order to optimise the use of public resources and overcome fragmentation of the public research effort. It brings together R&I governance bodies of most if not all EU Member States (legal requirement: at least 40% of Member States) as well as Associated Third Countries that designate a legal entity (Dedicated Implementation Structure) of their choice for the implementation. By default, participation of non-associated Third Countries is not foreseen. Such participation is possible only if it is foreseen in the basic act and subject to conclusion of an international agreement.

Option 3b - Institutionalised Partnerships based on Article 187 TFEU

Article 187 of the TFEU allows the Union to set up joint undertakings or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes. This type of Institutionalised Partnership brings together a stable set of **public and private partners** with a strong commitment to taking a more integrated approach and requires the set-up of a dedicated legal entity (Union body, Joint Undertaking (JU)) that carries full responsibility for the management of the Partnership and implementation of the calls. Different configurations are possible:

- Partnerships focused on creating strategic industrial partnerships where, most often, the partner organisations are represented by one or more industry associations, or in some cases individual private partners;
- Partnerships coordinating national ministries, public funding agencies, and governmental research organisations in the Member States and Associated Countries;
- Or a combination of the two: the so-called tripartite model.

Participation of non-associated Third Countries is only possible if foreseen in the basic act and subject to conclusion of an international agreement.

2.3. Overview of the methodology adopted for the impact assessment

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines²⁰ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This also integrates **key selection criteria for European Partnerships**.

Box 3 Summary of European Partnerships selection criteria²¹

- **Effectiveness** in achieving the related objectives and impacts of the Programme;
- **Coherence** and synergies of the European Partnership within the EU R&I landscape;
- **Transparency & openness** as regards the identification of priorities and objectives and the involvement of partners & stakeholders from the entire value chain, backgrounds & disciplines;
- Ex-ante demonstration of **additionality** and **directionality**;
- Ex-ante demonstration of the partners' **long term commitment**.

2.3.1. Overview of the methodologies employed

In terms of **methods and evidence used**, the impact assessments draw on an external study covering all candidate Institutionalised European Partnerships in parallel to ensure a high level of coherence and comparability of analysis, in addition to a horizontal analysis.²² For all initiatives, the understanding of the overall context of the candidate institutionalised

²⁰ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

²¹ For a comprehensive overview of the selection criteria for European Partnerships, see Annex 6.

²² Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

European Partnerships relied on desk research, including among others the lessons learned from previous partnerships. This was complemented by the analysis of a range of quantitative and qualitative evidence, including evaluations of past and ongoing initiatives; foresight studies; statistical analyses of Framework Programmes application and participation data, and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometric and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options, as described below. Public consultations (both open and targeted) supported the comparative assessment of the policy options. For each initiative, up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation run between September and November 2019, the consultation of Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of initiatives.

A more detailed description of the methodology and evidence base that were mobilised, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

2.3.2. *Method for identifying the preferred option*

The first step of the assessments consisted in scoping the problems that the initiatives are expected to solve given the overall economic, technological, scientific and social context, including the lessons to be learned from past and ongoing partnerships on what worked well and less well. This supported the identification of the objectives of the initiative in the medium and long term with the underlying intervention logic – showing how to get there.

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has then been adapted to introduce “**key functionalities needed**” - making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options while allowing at the same time a structured comparison of the options not only as regards their effectiveness, efficiency and coherence, but also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)²³.

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made compared to the baseline. Therefore, for

²³ The criterion on the ex-ante demonstration of partners' long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

each of these aspects the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. This includes the discontinuation costs/benefits of existing implementation structures when relevant. The policy options are then scored compared to the baseline with a + and – system with a two-point scale, to show a slightly or highly additional/lower performance compared to the baseline. A scoring of 0 of a policy option means that it would deliver as much as the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options²⁴.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach²⁵ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account²⁶. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs

²⁴ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

²⁵ For further details, see Better Regulation Toolbox # 57.

²⁶ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

of each candidate initiative.²⁷ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%), but lead to an additional R&I investment of at least the same amount than the Union contribution²⁸ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2, 3 times the Union contribution²⁹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution³⁰. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution³¹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0		↑↑		
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0		↑↑		
Ex-ante Impact Assessment for partnership		0		↑↑↑	
Preparation of EC proposal and negotiation		0		↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0		↑		

²⁷ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

²⁸ Minimum contributions from partners equal to the Union contribution

²⁹ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

³⁰ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

³¹ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Call and project implementation	0	0 In case of Member States contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC	0				↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**)³². In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

For the **identification of the preferred option**, the scorecard analysis builds a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

As a last step, the alignment of the preferred option with key criteria for the selection of European Partnerships is described, reflecting the outcomes of the ‘**necessity test**’.³³ The monitoring and evaluation arrangements are concluding the assessment, with an identification of the key indicators to track progress towards the objectives over time.

2.4. Horizontal perspective on candidate Institutionalised European Partnerships

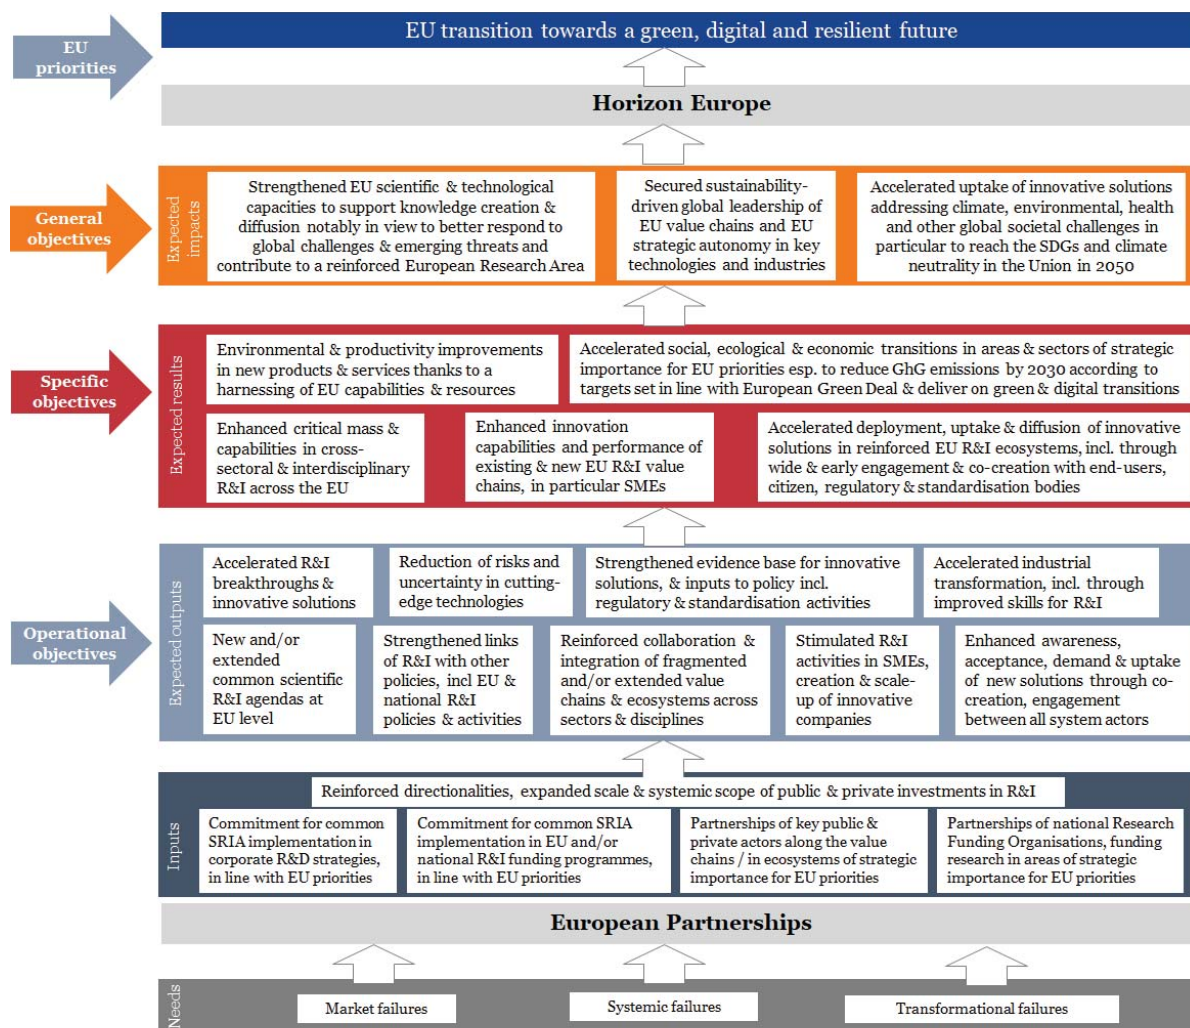

Overall impact orientation, coherence and efficiency needs

The consolidated **intervention logic** for the set of candidate Institutionalised European Partnerships in the Figure below builds upon the objectives as reported in the individual impact assessments.

³² More details on the methodology can be found in Annex 4.

³³ Certain aspects of the selection criteria will be further addressed/ developed at later stages, notably in the context of preparing basic acts (e.g. Openness and Transparency; Coherence and Synergies), in the Strategic Research and Innovation Agendas (e.g. Directionality and Additionality), and by collecting formal commitments (Ex-ante demonstration of partners’ long-term commitment).

Figure 5 – Overall intervention logic of the European Partnerships under Horizon Europe

Source: European Commission, DG Research & Innovation, Unit A2 Programme Analysis and Regulatory Reform, adapted from Technopolis Group (2020)

When analysed as a package the 12 candidate Institutionalised European Partnerships are expected to support the achievement of the European policy priorities targeted by Horizon Europe by pursuing the following joint general objectives:

- Strengthening and integrating EU scientific and technological capacities to support knowledge creation and diffusion notably in view to better respond to global challenges and emerging threats and contribute to a reinforced European Research Area;
- Securing sustainability-driven global leadership of EU value chains and EU strategic autonomy in key technologies and industries; and
- Accelerate the uptake of innovative solutions addressing climate, environmental, health and other global societal challenges contributing to Union strategic priorities, in particular to reach the Sustainable Development Goals and climate neutrality in the Union in 2050.

In terms of specific objectives, they jointly aim to:

- Enhance the critical mass and scientific capabilities in cross-sectoral and interdisciplinary research and innovation across the Union;
- Accelerate the social, ecological and economic transitions in areas and sectors of strategic importance for Union priorities, in particular to reduce greenhouse gas

emissions by 2030 according to the targets set in line with the European Green Deal, and deliver on the green and digital transition;

- c) Enhance the innovation capabilities and performance of existing and new European research and innovation value chains, in particular SMEs;
- d) Accelerate the deployment, uptake and diffusion of innovative solutions in reinforced European R&I ecosystems, including through wide and early engagement and co-creation with end-users, citizen and regulatory and standardisation bodies;
- e) Deliver environmental and productivity improvements in new products and services thanks to a harnessing of EU capabilities and resources.

In terms of their operations, taking a horizontal perspective on all initiatives allows for the identification of further possible collective efficiency and coherence gains for more impact:

- **Coherence for impact:** The extent and speed by which the expected results and impacts will be reached, will depend on the scale of the R&I efforts triggered, the profile of the partners involved, the strength of their commitments, and the scope of the R&I activities funded. To be fully effective it comes out clearly that future partnerships need to operate over their whole life cycle in full coherence with their environment, including potential end users, regulators and standardisation bodies. This relates also to the alignment with relevant EU, national or regional policies and synergies with R&I programmes. This needs to be factored in as of the design stage to ensure a wide take-up and/or deployment of the solutions developed, including their interoperability.
- **Collaboration for impact:** Effectiveness could also be improved collectively through enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems. An adequate governance structure appears in particular necessary to ensure cross-fertilisation between all European Partnerships. This applies not only to initiatives where similar R&I topics are covered and/or the same stakeholders involved or targeted, but also to the interconnections needed between the ‘thematic’ and the ‘vertical’ Partnerships, as these are expected to develop methodologies and technologies for application in EU priority areas. Already at very early stages of preparing new initiatives, Strategic Research and Innovation Agendas and roadmaps need to be aligned, particularly for partnerships that develop enabling technologies that are needed in other Partnerships. The goal should be to achieve greater impacts jointly in light of common challenges.
- **Efficiency for impact:** Potential efficiency gains could also be achieved by joining up the operational functions of Joint Undertakings that do not have a strong context dependency and providing them through a common back-office³⁴. A number of operational activities of the Joint Undertakings are of a technical or administrative nature (e.g. financial management of contracts), or procured from external service providers (e.g. IT, communication activities, recruitment services, auditing) by each Joint Undertaking separately. If better streamlined this could create a win-win situation for all partners leading to better harmonization, economies of scales, and less complexity in supervision and support by the Commission services.

2.4.1. Analysis of coherence of the overall portfolio of candidate initiatives at the thematic level

Looking at the coherence of the set of initiatives at the thematic level, the “**digital centric**”

³⁴ See Annex 6 for an overview of key functions/roles that could be provided by a common back office.

initiatives have a strong focus on supporting the digital competitiveness of the EU ecosystem. Their activities are expected to improve alignment and coordination with Member States and industry for the development of world-competitive EU strategic digital technology value chains and associated expertise. Addressing the Key Digital Technologies, the 5G and 6G connectivity needs as part of a Smart Networks and Services initiative and the underlying supercomputing capacities through a European High Performance Computing initiative present potential for synergies that can be addressed through cooperative actions (e.g. joint calls, coordinated support activities, etc.). They may as well profit from and contribute to Partnerships envisaged for Photonics, AI, data, robotics, Global competitive space system and Made in Europe, together with the EIT Digital. Synergies between these initiatives and several programmes (Digital Europe and Connecting Europe as well as cohesion programmes) are needed in areas where EU industry has to develop leadership and competitiveness in the global digital economy. They are expected to impact critical value chains including on sectors where digital is a strong enabler of transformation (health, industrial manufacturing, mobility/transport, etc.).

The **transport** sector face systemic changes linked to decarbonisation and digitisation. Large scale R&I actions are needed to prepare the transition of these complex sectors to provide clean, safer, digital and economically viable services for citizens and businesses. Past decades have shown that developing and implementing change is difficult in transport due to its systemic nature, many stakeholders involved, long planning cycles and large investments needed. A systemic change of the air traffic network through an Integrated Air Traffic Management initiative should ensure safety and sustainability of aviation, while a Clean Aviation initiative should focus on the competitiveness of tomorrow's clean aircrafts made in Europe. The initiative for Transforming Europe's rail system would comprehensively address the rail sector to make it a cornerstone in tomorrow's clean and efficient door-to-door transport services, affordable for every citizen as well as the most climate-friendly mode of transport for freight. Connected and Automated Mobility is the future of road transport, but Europe is threatened to fall behind other global regions with strong players and large harmonised markets. The initiative Safe and Automated Road Transport would bring stakeholders together, creating joint momentum in digitalising road transport and developing new user-based services. Stronger links and joint actions will be established between initiatives to enable common progress wherever possible. The Clean Hydrogen initiative would be fundamental to that regard. Synergies would also be sought with partnerships driving the digital technological developments.

To deliver a deep decarbonisation of highly emitting industrial sectors such as the steel, transport and chemical industries would require the production, distribution and storage of **hydrogen** at scale. The candidate hydrogen initiative would have a central positioning in terms of providing solutions to the challenges for sustainable mobility and energy, but also is expected to operate in synergies with other industry related initiatives. The initiative would interact in particular with initiatives on the zero emission road and water transport, transforming Europe's railway system, clean aviation, batteries, circular industry, clean steel and built environment partnerships. There are many opportunities for collaboration for the delivery and end-use of hydrogen. However, the Clean Hydrogen initiative would be the only partnership focused on addressing hydrogen production technologies.

Metrology, the science of measurement, is an enabler across all domains of R&I. It supports the monitoring of the Emissions Trading System, smart grids and pollution, but also contributes to meeting demands for measurement techniques from emerging digital technologies and applications. More generally, emerging technologies across a wide range of fields from biotechnologies, new materials, health diagnostics or low carbon technologies are giving rise to demands requiring a world-leading EU metrology system.

The initiative for a **Circular Bio-based Europe** is intended to solve a shortage of industry investments in the development of bio-based products whose markets do not have yet certain long-term prospects. The **Innovative Health Initiative** and **EU-Africa Global Health** address the lack of investments in the development of solutions to specific health challenges. The initiative on **Innovative SMEs** supports innovation-driven SMEs in participating in international, collaborative R&I projects with other innovative firms and research-intensive partners. As a horizontal initiative it is expected to help innovative SMEs to grow and to be successfully embedded in global value chains by developing methodologies and technologies for potential application in the other partnership areas or further development by the instruments of the European Innovation Council.

The description of the interconnections between all initiatives for each Horizon Europe cluster is provided in the policy context of each impact assessment and further assessed in the coherence assessment for each option.

PART 2 - THE CANDIDATE EUROPEAN PARTNERSHIP ON KEY DIGITAL TECHNOLOGIES

1. INTRODUCTION: POLITICAL AND LEGAL CONTEXT

Digital technologies are transforming the world at unprecedented speed. They have changed how we communicate, live and work. They have changed our societies and our economies: they contribute to productivity and efficiency as well as to broader socio-economic development. The digital transformation affects all sectors of the economy and it will continue to expand and deepen. It will further determine our capacity to address key societal challenges, from the respect of fundamental rights to our environmental objectives. The digital transformation has been empowered by exponentially growing computing power, through what we call ‘key digital technologies’. Key Digital Technologies, in this document, refers to **electronic components and systems** that underpin all digital products and services today. They are viewed as **key** because they are the **basic building blocks** of digital systems.

Electronic components refer to miniaturised physical devices (chips) that fulfil precise functions. They are based on semiconductor technology and come in many families (microprocessors, microcontrollers, memory chips, sensors).

Electronic systems³⁵ refer to sets of interconnected chips that perform more complex functions (various forms of sensing and actuating, process control, navigation etc).

Electronic components and systems include software for enhanced functionality and flexibility.

Electronic components and systems are **the fundamental enablers of innovation** in a number of “vertical” economic sectors such as automotive, manufacturing, healthcare, aerospace and defence, and can be the determinant of first mover advantage for companies active in those sectors. Crucially, they also play a foundational role in shaping how digital transformation unfolds. The Commission has made it a top priority for Europe to lead a digital transformation that goes hand in hand with a green transformation, that delivers to European values such as privacy and trust, security and safety, and that does not threaten citizens’ well-being or disrupt critical infrastructures and wider security interests.³⁶

Often in need of working in close collaboration with segments of vertical industries, the value chain of electronic components and systems is complex and R&I intensive. It spans a significant number of specialised tasks performed by a variety of companies. Strengthening **the relevant industrial fabric** is crucial to **pursuing the digital transformation in a European way** and will require, amongst others, improving Europe’s capabilities in the design and production of the most critical parts of the supply chain, and thereby reducing dependencies on other parts of the globe.

This document focuses on assessing the most effective, efficient and coherent way of implementing an R&I initiative which would focus on joint European research and innovation activities in electronics components and systems under Horizon Europe.

³⁵ A simple electronic system is the anti-lock brake system (ABS) in a car. ABS combines a sensing component that measures acceleration (accelerometer), a microprocessor that analyses the changes in acceleration over time and a hydraulic valve that acts on the car brakes. Sudden changes in acceleration (e.g. braking sharply in front of a close obstacle) are detected and trigger the system to act intermittently on the brakes, assisting the driver to be in control of the car. Similar systems are used to trigger airbag deployment in case of car collision.

³⁶ Shaping Europe’s Digital Future. COM(2020) 67

1.1. Emerging challenges in the field

The production of electronic components and systems counts among the most R&I-intensive activities (see Fig 6). Over the last 20 years, the annual R&I expenditure as a percent of revenues has been consistently between 15 and 20%.^{37,38} They are characterised by rapid technological change fuelled by constant R&I at all stages of the value chain, from the materials, fabrication equipment and design tools, through the processes of chip and system **design** and **manufacturing**, to the **test and packaging** of chips and **assembly into** systems. As components and systems become increasingly complex, the trade-off between the use of hardware and software to meet performance requirements has also become an important R&I challenge.

Figure 6. Research and Development % share of company revenue

This elaborate process translates to a complex and global supply chain and high investment costs with large economies of scale: the cost of designing and developing an advanced chip can be on the order of 1 B€, a leading-edge fab (where fabrication takes place) costs up to 20 B€. No single country or company dominates all of the stages of the value chain.

In recent years, and with the entry of China as an ever more prominent actor in the semiconductor business, global competition has intensified. This is evidenced in part by the growing numbers of **acquisitions** by companies, serving to build up the capacities they need to capture new markets.³⁹

Global trade has increasingly been affected by measures serving national or regional policy agendas.⁴⁰ The COVID-19 pandemic has further ignited **geopolitical tensions**, stirring up competition between regions and unleashing measures to support local industrial ecosystems

³⁷ The annual R&I expenditure as a percent of revenues has been consistently between 15 and 20% over the last 20 years: Semiconductor Industry Association - Factbook 2020

³⁸ Measuring distortions in international markets: The semiconductor value chain. OECD Dec 2019

³⁹ Industrials Executive Mergers and Acquisitions Report. Kearny. 2019

⁴⁰ Illustrative cases include the US-China trade dispute over the licensing of Android operating system to Huawei, the US's prohibition on exports of critical electronic components to Iran, export control of essential semiconductor materials from Japan to South Korea, and more recently, the recent US intervention to block the export of critical EU semiconductor manufacturing equipment to China.

while minimising dependencies on imports.⁴¹ While China is investing 150 B\$ in the semiconductor industry over a 10 year period, including for R&I, until 2025, the US has recently⁴² announced subsidies of 25 B\$ to strengthen domestic production, including R&I into “cutting edge semiconductor” production.

The global **demand for electronic components and systems**⁴³ is being increasingly **shaped by digital transformation** as these technologies penetrate more and diverse sectors of the economy. While applications in automotive, manufacturing, healthcare, consumer, aerospace and defence account nowadays for roughly 40% of the semiconductor market, **growth rates are forecast to be higher** than for the computing and communications segments. This translates into a diversity of challenges to be met by electronics components and systems, such as computing speed, low energy consumption, security, real-time constraints and others.

As explained in the European data strategy⁴⁴, the **volume of data** produced in the world is growing rapidly, by a factor of five from 2018 to 2025. Processing such data at the speed needed to capture widely its benefits will require an important shift in the way we conceive and produce electronic components and systems. Scaling up the computing performance with today’s component technologies will simply make computing one of the biggest energy consuming activities. Future components and systems should therefore exhibit radically **lower energy consumption** to be able to harness the benefits of data growth. Electronic components and systems delivering on energy efficiency will help the digital sector reduce carbon emissions⁴⁵ and contribute to the green transformation of the using sectors.

Moreover, safety, security and respect of privacy are fundamental objectives in the development of technologies permeating sectors such as healthcare. During the COVID-19 pandemic, for example, it has become clear that the costs associated with the health service infrastructure can be alleviated by remote medical assistance and personal health-monitoring. Wearable devices will require low-power consumption and **secure electronic components** and systems will be instrumental in ensuring that **privacy is preserved**. **Security, privacy and safety** have therefore become increasingly important challenges in the EU digitised society. Secure hardware and software components will need further development to cater for increasing use of online digital identity, to prevent hacking and manipulation of data, and to ensure GDPR compliance in future networked systems⁴⁶. Computing systems that are increasingly embedded in all types of artefacts will be often operating under real-time constraints⁴⁷ and have to be **highly dependable and safe**.

To satisfy these challenges there are two main technological trends, **miniaturisation** and **emerging computing paradigms**, including edge computing.

For decades the industry has been driven forward by Moore’s law, according to which capabilities of a chip of a given size double every two years. Using very advanced photolithographic techniques developed and industrialised in Europe, the number of transistors that can be packed into a chip today is on the order of ten billion (see fig. 7).

⁴² *U.S. Lawmakers Propose \$25 Billion to Help Chip Industry*, Bloomberg 10 June 2020

⁴³ The annual growth rate of the global market is estimated at 5.6% until 2025

⁴⁴ COM (2020) 66. A European strategy for data. 19 February 2020

⁴⁵ Nowadays the ICT sector is responsible for about 3% of global carbon emissions

⁴⁶ HiPEAC. (2019). *HiPEAC Vision 2019*.

⁴⁷ Real-time systems guarantee a response within a specified time constraint, usually in the order of milliseconds.

While the dimensions of transistors may be squeezed further to 3 and 2 nanometer, Moore’s Law is reaching physical (and economic) limits and remains a major R&I challenge. This **progressive miniaturisation** has had the added advantage of increasing computing speed. So-called microprocessors and memory chips resulting from these developments have driven the successive generations of computing and communication devices which account for roughly 60% of the semiconductor component market today.

Figure 7. Technological evolution of semiconductor production technologies (Moore’s Law)

As Moore’s law reaches its physical limits, **alternative computing paradigms** are beginning to emerge. Today’s main contenders are neuromorphic computing (based on neural networks), spintronics and quantum computing – areas where European research organisation are sought after for their know-how. While the first chips have been developed, the full ecosystem of design methodologies and tools, software simulation and fabrication equipment are still in development. Neuromorphic computing, for example, offers great promise for achieving 2-3 orders of magnitude improvements in energy efficiency for data processing tasks and it is particularly suited to power Artificial Intelligence.⁴⁸ Further industrialisation of emerging technologies, their integration with sensing and connectivity, will open a window of opportunity. Building out the ecosystem will require new know-how and expertise, new approaches and new collaborations between research and industrial actors.

Finally, many applications in a variety of sectors today make intensive use of data processing and Artificial Intelligence – process automation in manufacturing for example. Given the large volumes of data that can be collected today - thanks inter alia to the variety of sensors that exist - data processing often takes place in remote data centres (‘the cloud’). Innovative electronic components such as very low-power microprocessors, accelerators and embedded memory can enable more and more processing to take place close to the user – so-called **edge computing**⁴⁹. While cloud and edge computing will likely co-exist, edge

⁴⁸ For a meaningful Artificial Intelligence. Cédric Villani. 2018 (pp. 51-52)

⁴⁹ Emerging compute paradigm whereby processing is done close to the user rather than in remote data centres

computing for AI is on the one hand a huge opportunity for Europe to leverage existing strengths in specific vertical markets. On the other hand, the possibility to avoid transfer of data to the central cloud, improving speed, **energy efficiency, privacy and security**, makes edge computing an attractive proposition from economic, environmental, and fundamental rights perspectives. Electronic components and systems will be important enablers of the transformation.

Stakeholder opinion

In their feedback to the Open Public Consultation to the KDT inception impact assessment, respondents representing industry asked for a broadening of the scope with respect to the ECSEL JU. In particular the need to integrate semiconductor-based photonics, selected software technologies (beyond embedded software) and focus on electronic value chains was highlighted by the industry associations.

A minority of views from industrial representatives expressed concerns with a broader scope. In particular with the fact that an extension of the scope would add complexity to the running of the initiative.

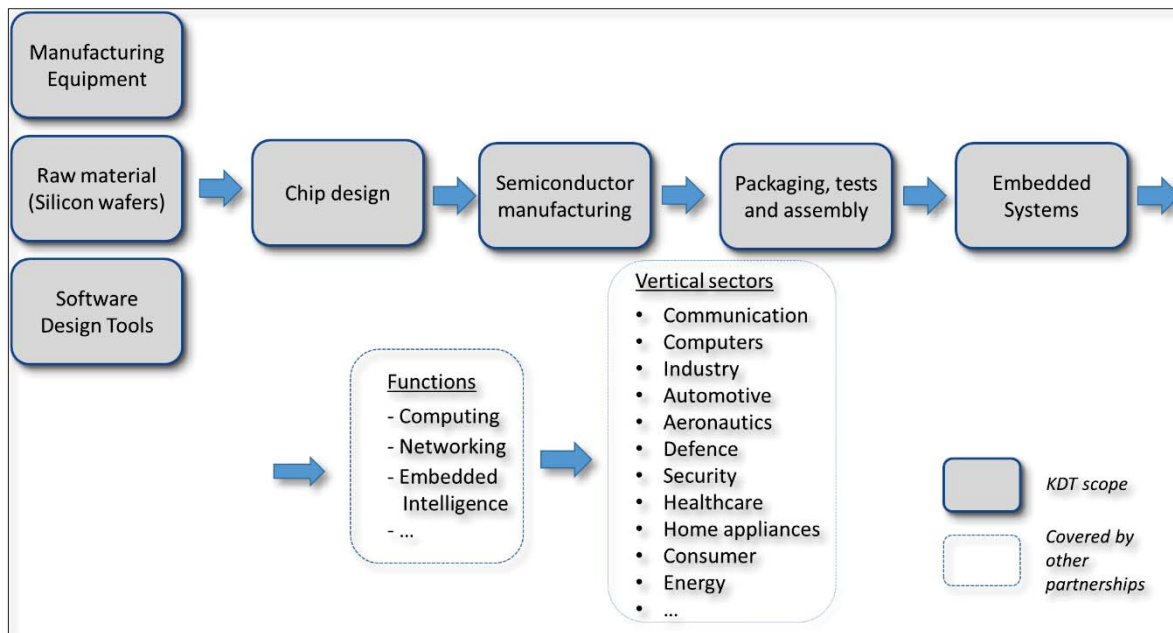

A majority of interviewees⁵⁰, including from large companies, industry associations, SMEs, RTOs and universities equally stressed the importance of AI, computer architectures, software engineering and silicon-based photonics for the KDT initiative.

1.2. EU relative position in the field

The electronics value-chain is made up: of i) manufacturing equipment, raw materials, and software-based design tools; ii) chip design and semiconductor manufacturing; iii) packaging, test and assembly; iv) embedded systems. See Figure 8.

⁵⁰ Interviews taken place in the context of the study « *Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe - Candidate Institutionalised European Partnership on Key Digital Technologies* ». Technopolis Group. January 2020

Figure 8. The electronics components and systems value-chains

Manufacturing equipment, raw materials, and design tools: Europe accounts for 17% (or 24 B€) of the global market⁵¹. Europe is the leading provider of advanced photolithography equipment that enables miniaturization of transistors to dimensions of 2 to 3 nanometres. There is significant know-how in Europe’s research and technology organisations which have supported development of equipment process technologies. Europe has a vibrant ecosystem of smaller actors, active in equipment such as wafer processing and wafer handling.

Europe also leads in the production of Silicon-on-Insulator (SOI) wafers and process technologies which are increasingly important for communications as well as for applications requiring low power consumption. A process technology based on SOI wafers (FDSOI⁵²) was developed in research labs in Europe and transferred to industry.

While Europe has some industrial players in design tools for components, boards and electronic systems it is largely dependent today on US companies for its design needs.

Chip design and Semiconductor manufacturing: EU-headquartered companies accounted for 9% - or 40 B€ - in 2018⁵³ of this fiercely competitive 456 B€ market, with three European vendors⁵⁴ in the top-15 global ranking.⁵⁵ Although revenue growth in Europe has been constant over the last decade - at 4.6% - Korean, Taiwanese and Chinese companies are gaining market share. US, Korean and Taiwanese companies, now dominate the top-15.

⁵² Fully-depleted Silicon on Insulator

⁵³ European Commission. (2019). Study on Emerging technologies in electronic components and systems (ECS) - Opportunities ahead. SMART 2018-0005

⁵⁴ STM, NXP and Infineon are ranked at 11, 12 and 13 in the 2018 Semiconductor vendors ranking. Reference: “Measuring distortions in international markets: The semiconductor value chain”, *OECD Trade Policy Papers*, No. 234, OECD Publishing, Paris.

⁵⁵ A first indication of the 2019 semiconductor market has been published on April 1st, 2020. Two European vendors are in the top-10 (STM, number 8th, and Infineon, number 10th). With currently available information European share of global semiconductor production is estimated at 10%.

In terms of **market segments**, EU companies are strong in automotive, industrial manufacturing, aerospace, defence and security, and healthcare.⁵⁶ The European industrial ecosystem in semiconductor components is regaining strengths in manufacturing since 2016 after a long period of stagnation. In particular, important investments made in pilot lines for production, have helped bridge the innovation gap and accelerated the move of innovative technologies from the lab to the fab capitalising on Europe's R&D strengths.

Despite limited industrial presence in **computing and communications** segments, which require large investments in both design and manufacturing⁵⁷, European research competencies are strong in these domains in terms of know-how. A number of SMEs – many of which spin-offs from academia – also participate actively in leading-edge research initiatives, such as the European Processor Initiative.⁵⁸ Europe hosts the world's best research labs⁵⁹ in semiconductor technology with leading⁶⁰ capabilities in chips for neuromorphic⁶¹ and in-memory computing, quantum computing and spintronics.

Packaging, test and assembly: Packaging, test and assembly,⁶² traditionally labour-intensive activities located to a large extent in South-East Asia (Malaysia, Thailand, Philippines). Packaging may become more strategically important as the phasing out of Moore's Law calls for new approaches to functional integration and miniaturisation of electronic components and systems. Increasing levels in process automation and growing added-value justifies to relocate in Europe some of the advanced packaging activities. Europe has specific strengths in high-end and niche markets, as well as in academia, and there is scope to develop these further.

Embedded systems: refer to electronic systems that perform specific functions within a larger mechanical/electrical system. They are used in applications in specific market segments, such as adaptive cruise control or lane-warning systems in vehicles, process control systems in industrial machinery, diagnostic systems in medical equipment, and autopilot systems in planes. These segments are dynamic and grow faster than computing and communications, where growth has been showing signs of saturation and where competitiveness is driven largely by processor and memory performance (presently the dominion of US and Asian players). Europe is a strong player in embedded electronics and software both in research and in its exploitation by industry where it is world leading in the field of real-time systems for safety critical applications in automotive, manufacturing and aeronautics. The Important Project of Common European Interest on microelectronics marked a turning point for Europe. Its approval in December 2018 led to private investments of more than 6B€ in first industrial deployment and related R&I, including the first

⁶¹ Neuromorphic refers to computing approaches making use of electronic circuits that mimic neuro-biological architectures such as those present in nervous systems.

⁶² **Packaging** is the process to encapsulate the silicon chip to protect it from the environment. **Testing** assesses the quality and functioning of packaged chips discarding the failures. **Assembly** is the process to mount and interconnect chips onto boards.

greenfield investment in manufacturing in well over a decade. Its main focus was on low-power technology, sensors and power management for electric vehicles.⁶³

SUPPORT TO THE FIELD IN THE PREVIOUS FRAMEWORK PROGRAMME – KEY STRENGTHS AND WEAKNESS IDENTIFIED

The proposed **initiative builds on the on-going (2014-20) ECSEL Joint Undertaking** based on Art. 187⁶⁴, with the participation of the European Commission, ECSEL Participating States (EPS)⁶⁵ and industry. It addresses the research and innovation challenges of electronics components and systems.

The overall strategic orientation and operations of the ECSEL JU are the responsibility of the Governing Board (GB). The GB is composed of representatives of the Commission, the Participating States and the private members representing industry, universities and research institutes. Each member appoints its representatives and a lead delegate who holds the voting rights of that member in the GB.

The financial contribution to the ECSEL JU from the Commission, the Participating States and the private partners is set out in the Council Regulation establishing the partnership.

In practice this is implemented on annual basis. Following confirmation of the proposed Commission contribution at the beginning of each year, each EPS announces their commitments. They are then published in the call work programme. Once projects have been evaluated and selected, fine-tuning of the contributions is always feasible (as EPS can decide to augment theirs).

In the period 2014-2018, total contributions from the Commission, EPS and private partners amounts to 822,2, 731,7 and 1795,6 M€⁶⁶, respectively. The private partners' contribution takes account of all beneficiaries in projects (both members and non-members of the industrial associations). Approximately, 30% of ECSEL beneficiaries are not members of associations, what gives an idea of the openness of the partnership.

The contribution of industry and research organisations to ECSEL projects is mostly in-kind (e.g. personnel, infrastructure) subject to audit. In the period 2014-18, the ratio of the **audited** in kind contribution of private members to the Commission contribution has been **2.18:1**. The ratio of **EPS** to Commission contributions in the same period is **0.9:1**.⁶⁷

The leveraging of the Commission's contribution by a factor of three has enabled a **critical mass of resources** to be mobilised that is essential for **large-scale** collaborative efforts (on the order of 100 M€) around major industry objectives, such as **pilot lines on new component technology** and **software platforms** and related standardisation efforts. This

⁶³ In 2018, the Commission gave its approval for an Important Project of Common European Interest (IPCEI) on Microelectronics. Under this IPCEI, DE, FR, IT and the UK jointly support transnational cooperation of 29 companies to maintain and further expand European competencies in the electronics ecosystem. It combines €1.75 billion of national aid with €6.25 billion of private investment addressing innovation and first industrial deployment of technologies developed within European R&D initiatives.

⁶⁴ Council Regulation (EU) No 561/2014 establishing the ECSEL Joint Undertaking. 6 May 2014

⁶⁵ ECSEL Participating States comprise 25 Member States (Cyprus and Croatia excluded) and four Associated States within the Horizon 2020 programme (Switzerland, Norway, Israel and Turkey).

⁶⁶ ECSEL Annual Activity Report 2018.

⁶⁷ The Council Regulation establishing the JU, in its recital 21, foresees that all contributions are taken into account when measuring the impact: "In assessing the overall impact of the ECSEL Joint Undertaking, investments from all legal entities other than the Union and the states participating in the ECSEL Joint Undertaking (the 'ECSEL Participating States') contributing to the objectives of the ECSEL Joint Undertaking should be taken into account. Those overall investments are expected to amount to at least EUR 2 340 000 000."

streamlining of priorities and strategies, and synchronisation of funding decisions to mobilise resources, would otherwise not have been possible⁶⁸.

What has or is being achieved so far

ECSEL has become instrumental for the European stakeholders and a key pillar of Europe's industrial R&I strategy.⁶⁹ Major technological achievements enabled by **large scale** initiatives include:

- *Extreme UV lithography*: development of the world's most advanced process equipment for ultimate miniaturisation of semiconductor components.
- *FDSOI*: Innovative technology for the production of components with reduced energy consumption (a factor of two compared to competing processes) and high performance for radio frequency (RF). It is being rolled-out for Internet of Things applications.
- *Advanced power electronics*: using alternatives to conventional Silicon (e.g. SiGe, GaN). Europe is leading the world in devices for power management and conversion - indispensable for electric vehicles, smart energy grids and industry 4.0.
- *Safety-critical embedded systems*: has become a recognised European strength in applications for which safety is a primary concern such as automotive and avionics.
- *Smart miniaturised systems*: development of a new generation of minimally invasive smart catheters with integrated intelligence.

ECSEL has focused on areas in which the societal impact is particularly strong, such as clean mobility, energy efficient industry and sustainable healthcare.⁷⁰ From the perspective of scientific impact, in the period 2014 to 2018, 66% of publications from ECSEL JU participants were in the top 25% ranked journals in their respective fields. When it comes to patents, ECSEL JU has so far a total of 46 patents registered for 400 Million Euro of paid effort as projects continue.

In a growing competitive environment with increasing societal and environmental challenges and a very rapid technological evolution, the intended KDT initiative would build on ECSEL achievements and take them to a higher level, while adapting to the new technological, industrial and geopolitical reality.

Key areas for improvement and unmet challenges – Lessons learnt

The ECSEL interim assessment⁷¹ identifies areas for improvement and put forward specific recommendations:

- to place greater emphasis on a **strategic approach** with a stronger **alignment to EU priorities**. The current partnership was considered as being too bottom-up in its approach, and the Commission and Participating States were encouraged to play a stronger role in priority setting.
- a **broader coverage of electronic value chains** including participation of systems houses⁷². This was in part intended to encourage better working together of the components and systems communities, but also that R&D is well-aligned with industrial needs – whether

⁷⁰ 'Study on the impact of ECSEL funded actions'. Deloitte, Valdani Vicari and Associati. February 2020.

⁷¹ European Commission. (2018). *Interim Evaluation of the ECSEL Joint Undertaking (2014-2016) Operating under Horizon 2020*. Final report.

⁷² End user industries with capability to design and produce systems

longer or shorter term - from day1. A slight expansion of the scope to higher layers of software would also help facilitate this.

- to aim at **better harmonisation of national** administrative practices and procedures with a view to **simplification**. This regards practices related to the rules and conditions to participants across Participating States, which can be simplified. The application and reporting processes in particular should not be more complex than they would be for the regular Horizon 2020/Europe calls.

and

- to strive for **further integration of SMEs** and start-ups in the electronics innovation ecosystem. Though participation of SMEs represented up to 30% in terms of numbers, in terms of funding share – currently 17% - there is still scope to play a more active role in the partnership and exploit their full potential.

The proposed initiative in KDT takes account of these lessons learnt in its scope, objectives and implementation. The need of a closer alignment with EU priorities, a broad coverage of value-chains and the better integration of SMEs are part of the intervention logic ('problem drivers') of this initiative and they are addressed in its specific objectives. The harmonisation and simplification of national practices and procedures is to be addressed in the setting and implementation of a potential partnership⁷³ (currently in discussion with national authorities).

More details are provided in Section 2 (Problems) and Section 4 (Objectives).

1.3. EU policy context beyond 2021

The proposed initiative can be set in the context of a number of recently announced European policies and priorities. These policies would inform the Strategic Research and Innovation Agendas (SRIA) of a future initiative on Key Digital Technologies and be taken into account in work programmes that form the basis for calls for proposals:

Artificial Intelligence: Recent progress in AI has been driven by the ever-increasing processing power of semiconductor chips. The White Paper on Artificial Intelligence⁷⁴ acknowledges that advanced low-power processors, a market currently dominated by non-EU players, will be essential for Europe to be creators and not just users of AI. This situation can be turned around by initiatives such as the European Processor Initiative, which develops a low-power processor for supercomputing, and a future initiative on Key Digital Technologies which would address the computational requirements of AI (notably deep learning) and their implications for processor design. The Paper also identifies neuromorphic solutions, where Europe is strong today, as being suited to tasks which deploy AI.

The Data strategy⁷⁵: The aim is to enable the data economy for the coming five years. Processing and storage of data, computing power and cybersecurity are among the essential issues to be tackled, if the EU is to acquire a leading role in the data economy. In this perspective, the EU needs to reduce its technological dependencies on secure, energy-efficient, affordable and high-quality data processing capacities. A future KDT initiative would address the R&D needed to master these capacities.

⁷³ An on-going EC-Member States dialogue is addressing harmonisation and simplification.

⁷⁴ European Commission *White Paper on Artificial Intelligence*, COM(2020)65 final, 19.2.2020

⁷⁵ *A European strategy for data*, COM(2020) 66 final, 19.2.2020

Industrial Strategy⁷⁶: The new strategy stresses the need for Europe to pool its strengths to do collectively what no one can do alone. It cites microelectronics as an example of the value of pooling resources to reverse a downward trend. This is in large part due to the current ECSEL JU and an Important Project of Common European Interest (IPCEI) on Microelectronics, and the investments they have triggered in the development and production of electronics components and systems. In the same context the Communication underlines that the EU will continue to support the development of key enabling technologies *i.e.* microelectronics that are strategically important for Europe's industrial future and announces possible follow-up to the first IPCEI on microelectronics. The R&D programme of a future initiative could complement the innovation roadmap of a second IPCEI.

Recovery Plan for Europe⁷⁷: The Commission has proposed a reinforced EU budget to help repair the economic and social damage brought about by the coronavirus pandemic and kick start the recovery. The Commission estimates that investment needs amount to at least 3.5 trillion euros in 2020-2021. Investment in key sectors and technologies is considered crucial. The Communication highlights that strong interdependencies between electronic value chains and other industrial value chains, including digital and automotive, make electronics one of the most important industrial ecosystems in Europe. An annual investment gap of 17B€ has been estimated for semiconductor technologies. Support to Member States and mobilisation of private investment will be crucial to increased investment in key value chains, such as microelectronics, necessary to Europe's future resilience and strategic autonomy in the context of the green and digital transitions. The future initiative will also be instrumental in this sense.

Green Deal: the Communication⁷⁸ points explicitly to the potential of digital technologies to bring efficiencies on the one hand and the need to reduce the environmental footprint on the other, including that of electronics components and systems.⁷⁹ A future initiative would need to embrace this two-pronged approach by focussing on the development of low power technologies and their applications.

Research and Innovation: under the proposed **Horizon Europe** programme, Pillar II Cluster "Digital, Industry and Space" aim to make concrete contributions to three overarching EU policies: 'A Europe fit for the Digital Age', 'An economy that works for people', and 'A European Green Deal'. Horizon Europe would cover the earlier stages of research on electronic component and systems technologies with emphasis on high quality scientific outcomes. Mechanisms for interaction between the initiative and Horizon Europe would be put in place such as the setup of technology clusters and the follow up of specific projects ('from lab to fab').

The three candidate Institutionalised Partnerships covering digital technologies, *i.e.* *Key Digital Technologies*, *Smart Network and Services* and *EuroHPC*, together with partnerships *Photonics* and *AI, data technologies and robotics*⁸⁰, are intended to enable Europe to prepare for the continued massive use of data – much of which is coming from devices and premises at the edge of the network (wearables, autonomous vehicles, factories, hospitals, etc.).

⁷⁶ *A New Industrial Strategy for Europe*, COM(2020)102 final, 10.3.2020,

⁷⁷ *Identifying Europe's recovery needs*, SWD(2020) 98 final, 27.5.2020

⁷⁸ *The European Green Deal*, COM(2019) 640, 19.12.2019

⁷⁹ *A new Circular Economy Action Plan*, COM(2020) 98 final. 03.03.2020

⁸⁰ 'Photonics' and 'AI, data technologies and robotics' are co-programme candidate partnerships.

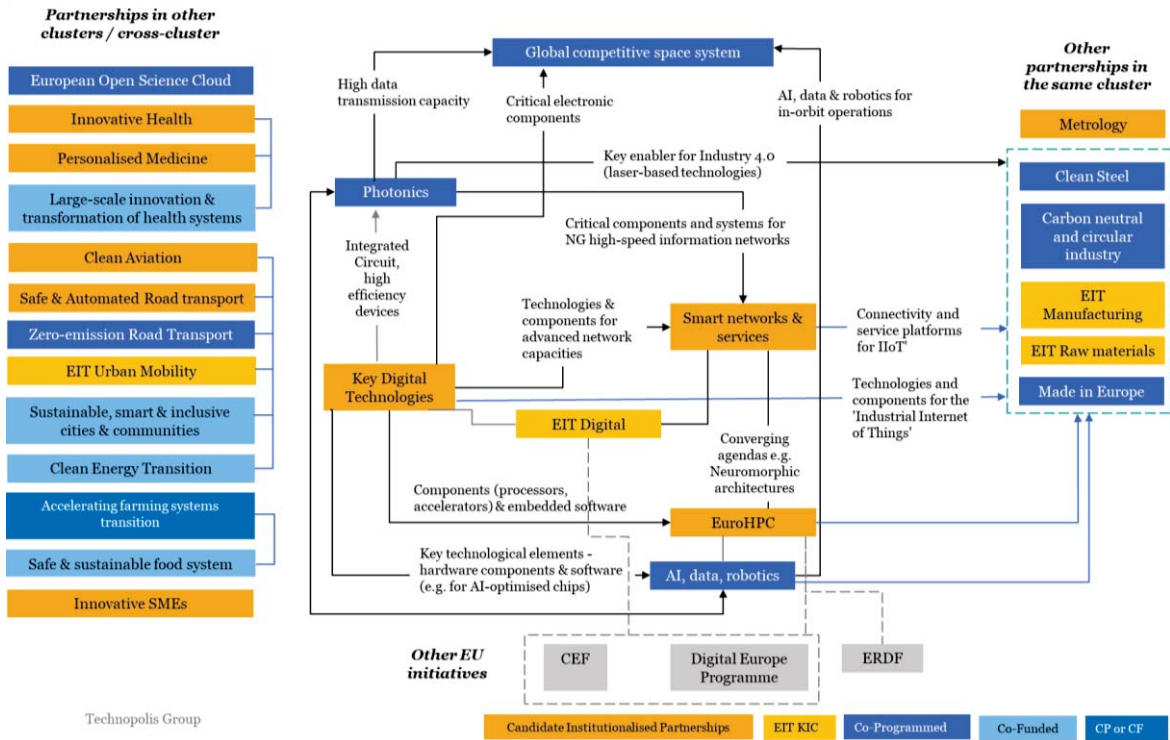

As alluded to in sections 1.1 and 1.2, the proposed **KDT initiative covers advances (design, manufacturing, embedded systems) in the underpinning electronic components and systems technologies** that can provide enhanced performance or additional functionality at the application level. The networking (*Smart Network and Services*), computing (*EuroHPC*) and integrated intelligence (*AI, data technologies and robotics*) functions **build on these advances**. More specifically:

- **Smart Network and Services:** electronic components and systems feed both the network infrastructure (base stations, routers, servers) and the terminals. Network speed, capacity and reliability largely depend on key components (application specific circuits, net processors, radio-frequency devices, smart antennas) that would be expected to be developed by the KDT initiative.
- **EuroHPC:** Supercomputers require high-performance electronic components (processors, accelerators) to be developed by the initiative in KDT.
- **AI, Data and Robotics:** AI systems and robots make use of advanced components (sensors, processors, actuators, embedded memories, power devices) to perform increasingly complex tasks. Data processing is enabled by chips with high computation power which are essential for autonomous, real-time decisions, as requested in robots. Essential components for AI and robotics, such as those mentioned, would be developed in the KDT initiative.
- **Photonics:** Photonics exploits the properties of light and covers a broad range of technologies (such as laser-based 3D printing, optical communications, new types of light sources, multi-sensing, etc.). Photonics include Photonics Integrated Circuits (PICs) which are based on semiconductor technology and, therefore, would be addressed by such an initiative in KDT.

It will thus be important for a future KDT initiative to **build and maintain strategic links** with these partnerships and their stakeholder communities. This is foreseen in the draft Impact Assessment for the candidate European Partnership for Smart Networks and Services (p.32). EuroHPC and ECSEL JUs are currently developing their strategic roadmaps in coordination with each other, and with the involvement of respective Commission and Participating States representatives.

Beyond digital, strategic links with partnerships on mobility, health, manufacturing, space and energy are also envisaged. This is work in progress. Specific targets in this context would be to make use of testbeds (whether vehicles, networks, robots or other) in which components and systems developed in an initiative relating to KDT could be assessed and validated in close-to-real-life scenarios before eventual commercial deployment.

Figure 9: Envisaged European Partnerships in the Digital, Space & industry cluster.

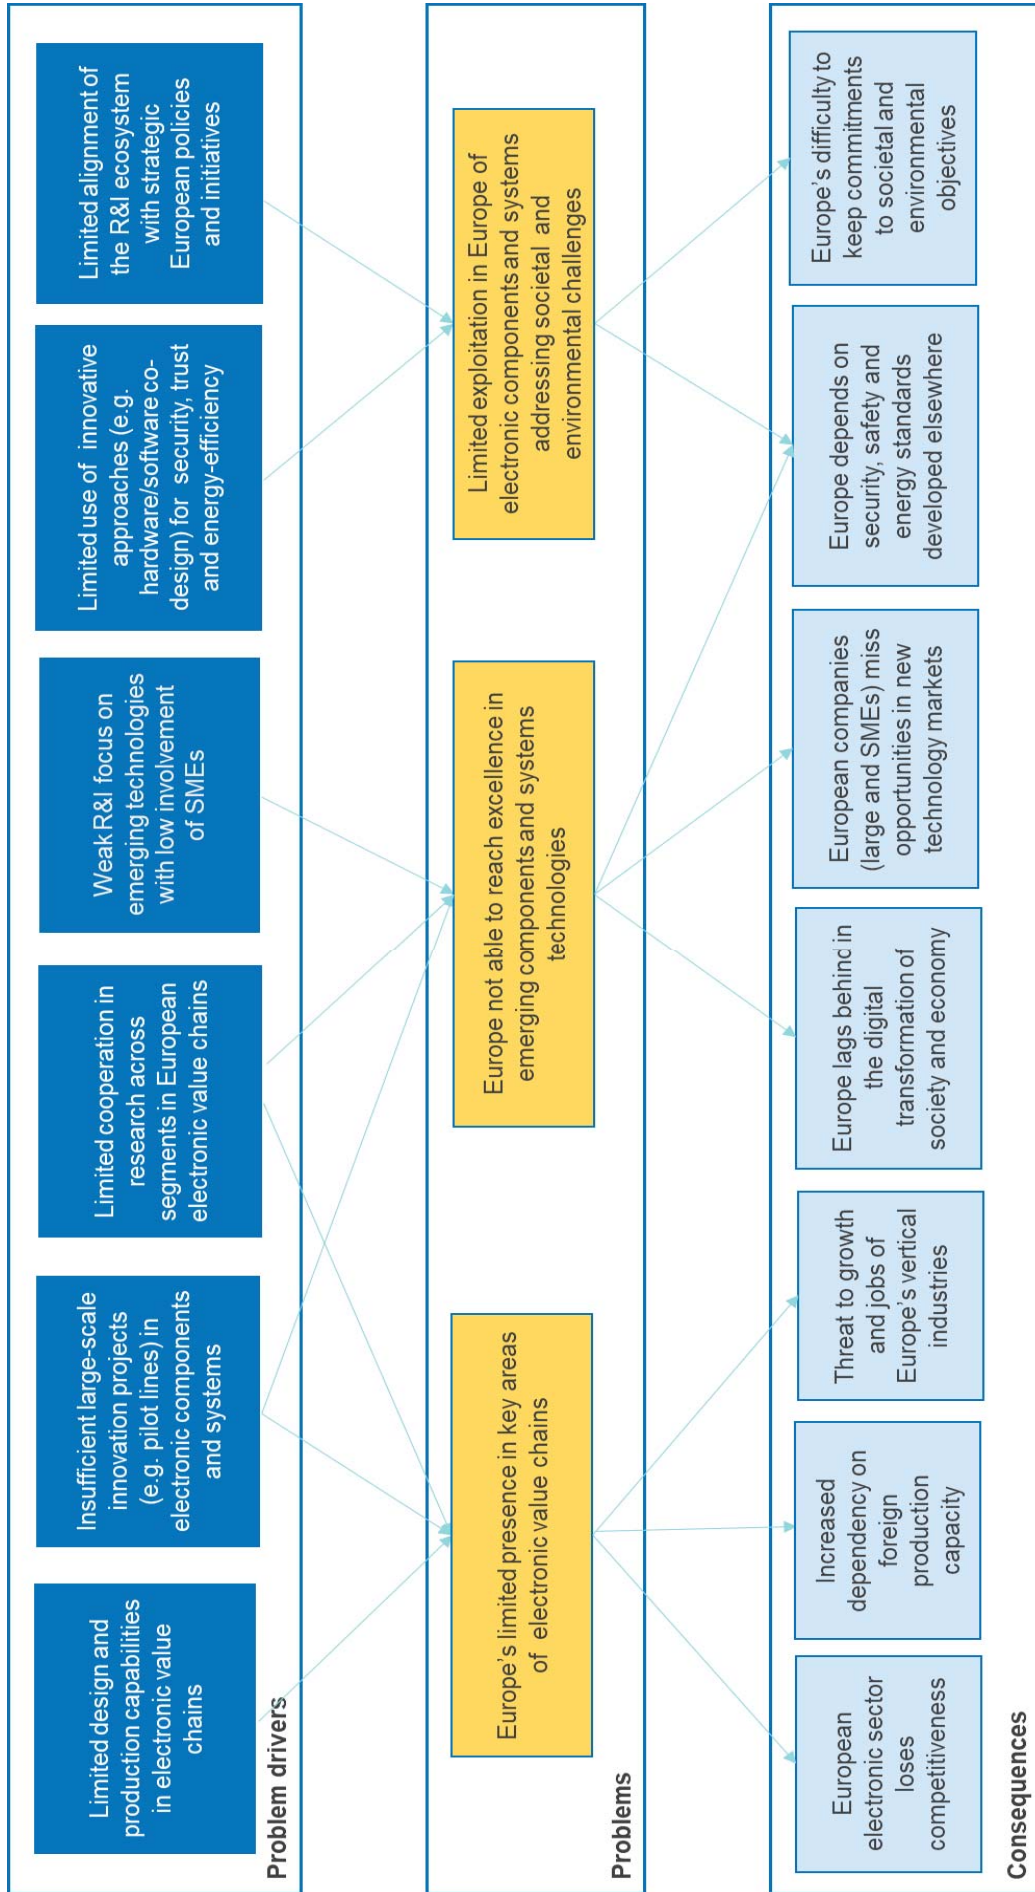

2. PROBLEM DEFINITION

Given the scale of the challenges entailed by the digital transformation, the current scientific, technological and economic positioning of Europe in the field, and the EU policy context, a set of problems have been identified where EU research and innovation in electronic components and systems has a specific role to play.

A problem tree portraying related problems, their drivers and consequences is presented in Figure 10. They are described in detail in the following sections.

Figure 10: Problem tree for the initiative on Key Digital Technologies

2.1. What are the problems?

The predecessor initiative ECSEL was set up to achieve further miniaturisation, higher computing or communication speeds, better energy performance, improved security, safety, reliability, or cost reductions. Despite a considerable number of achievements by ECSEL in these areas, further progress is necessary to stay at the technological forefront and maintain Europe globally competitive in the field of electronics components and systems. Also a number of unmet objectives and shortcomings identified at the interim evaluation of ECSEL need to be addressed.

Main identified problems are:

2.1.1 *Europe's limited presence in key areas of electronic value chains*

European electronic components and systems suppliers have a strong position in global vertical markets, including automotive, industrial equipment, aerospace, security and healthcare⁸¹. However, not all stages of development and production take place in the EU. **Manufacturing** of electronic components and systems mostly takes place in **Asia** and circuit **design** is dominated by US and, more recently, by Asian companies. R&I effort would be required to develop the necessary design and manufacturing competences. Additionally Europe has **very limited presence** in high-volume **computing and communications markets**, which currently account for 60% of global components market. Limited presence in key areas affects electronics value chains and undermines EU sovereignty.

The current **COVID-19 crisis** has put additional strain on supply chain resilience and has illustrated the critical importance of **access** to electronic components^{82,83} and Europe's ability to develop them.

2.1.2 *Europe not able to reach excellence in emerging components and systems technologies*

Analysis of the number of research publications in microelectronics in the period 2009-18 (Fig. 11) shows that Europe has been leading, although its leadership has been taken over by China in 2017 and is closely followed by the US. Steep increases in research capacity and R&D investments in these regions are threatening Europe's ability to seize emerging opportunities.

⁸¹ Europe is a leading global supplier of electronic technologies for automotive, industrial equipment, aerospace, defence & security, and healthcare sectors (See 2018 data in Table 1, Annex 6)

⁸² The Commission has identified microelectronics as a crucial sector for the EU economy and has addressed its challenges linked to the crisis

⁸³ EC proposal for a COVID-19 recovery plan.

Figure 11: Production of research publications on microelectronics per country and year — number of publications (2009-2018)

Source: Calculations by Technopolis Group based on Scopus data

Moreover, the uptake of research output by industry in Europe has been slow, mostly because of its fragmentation and smaller footprint when compared with US and China. Finally, European R&D actors, **SMEs and start-ups** are often particularly strong in emerging domains, but can **lack the connection to a broader ecosystem** to develop partnerships, grow their knowledge and eventual customer base, limiting Europe’s ability to capitalise on the excellence of the research output.

2.1.3 Limited exploitation in Europe of electronic components and systems addressing societal and environmental challenges

In the development of electronic components and systems, focus has traditionally been on performance and costs. More recently the pressure to extend the autonomy of mobile devices and the increasing attention to environmental impacts have made **reduced energy consumption** a key criteria in technology development. **Safety and security** considerations have also grown in importance following increasing cybersecurity concerns, as well as the societal demand for **trust and privacy** in respect to fundamental rights. However, as end-user companies to date have primarily relied on software-based solutions to achieve higher - but still insufficient - levels of energy efficiency and security, the potential of hardware is as yet unexploited.

Stakeholder opinion

The large majority of stakeholders responding in the **open public consultation** recognised the importance of addressing innovation in electronic components and systems at European level. All stakeholder types expressed the need to make a significant contribution to the global competitiveness of Europe’s KDT industries (134 out of 154 respondents, or 87% indicated this as ‘relevant’ or ‘very relevant’). A stronger focus on the development and exploitation of innovative technologies was noted by all consulted stakeholder types (131 out of 150 respondents, or 87%) and notably SMEs.

A minority of stakeholders (mostly industrial representatives) expressed concerns of overlapping of the KDT partnership with the Horizon Europe programme and with related initiatives (e.g. Smart Networks and Services, Connected and Automated Mobility).

2.2. What are the problems drivers?

2.2.1. *Limited design and production capabilities in electronic value chains*

With every technology generation, the complexity and costs of **design and fabrication** of electronic components increase. Without a coordinated R&I effort to develop key competences in design and production, Europe risks limited presence in these segments, and features gaps in electronics value chains.

Within the electronics value-chain, a growing number of stakeholders ('fabless') focus on chip design and outsources manufacturing to third parties ('foundries'). The most prominent 'fabless' vendors are from the US and Taiwan, with only one European company ranked amongst the world's top ten⁸⁴. Europe lacks a robust **design ecosystem** that can support its own **chip development capabilities**. Such ecosystem would provide incentives for the creation of intellectual property, access to design libraries and EDA⁸⁵ tools, and risk-sharing among design houses, Integrated Device Manufacturers (IDMs), research centres and user companies.

The 2019 global market share of semiconductor components that are manufactured in Europe is 9-10%. This, and does not reflect Europe's economic standing and research excellence in the field. In particular, the lack of manufacturing facilities in Europe for advanced digital circuits is a matter of concern as it limits the ability to capture important markets such as data processing and communications. Europe needs, therefore, to strengthen its production capability to bring it in line with its potential for development of digital systems and services, and **avoid disproportionate dependence** on other regions.

2.2.2. *Insufficient large-scale innovation projects (e.g. pilot lines) in electronic components and systems*

Large-scale projects are essential to the development of technologies from the **early stages of research to maturity**. For example, **pilot lines** of production at high Technology Readiness Levels (TRLs) enable testing of new components and process technology by a large variety of users before industrial deployment. Another example is **large-scale demonstrators** of embedded software and systems, where experimentation by a large set of users in a variety of application environments is essential before commercial exploitation. An R&I setting with EU and national diverging priorities, is not suitable to launch projects of large scale that bring together a broad set of stakeholders to address ambitious objectives.

2.2.3. *Limited cooperation in research across segments in European electronic value chains*

Intense competition and **fast technological evolution** make the role of electronics value chains ever more important. Keeping pace with this evolution requires intense R&I effort; however, today the various segments of the supply chain (design, manufacturing, packaging, ..) address research in disconnected ways. This makes the role of technology integration arduous and inefficient. The dynamic nature of value chains requires **close collaboration of technology stakeholders across segments**, for example through a common research roadmap.

⁸⁴ Dialog (UK) is 10th on the 2Q2019 world ranking of IC design companies. Source: TrendForce. Global Top Ten IC Design Companies for 2Q19. Press release August 29th, 2019

⁸⁵ EDA (Electronic Design Automation) are software tools supporting efficient chip design

Stakeholder opinion

According to the **Open Public Consultation**, a majority of stakeholders, especially from SMEs, universities and RTOs, considered that the co-creation of solutions with downstream sectors has high relevance (132 out of 151 respondents, or 87% indicated this as ‘relevant’ or ‘very relevant’).

Minority views: A few **interviewees**, especially from large companies, highlighted the importance of the transition towards more complex value networks and the fast-evolving nature of digital technologies and the application sectors.

2.2.4. *Weak R&I focus on emerging technologies with low involvement of SMEs*

To **respond to future challenges and retain its innovation potential**, Europe needs to develop capabilities in emerging technologies that expand its traditional strengths and offer new opportunities. Despite Europe’s lead in specific segments today (see section 1.2 EU relative position in the field), its leadership is threatened by massive investments by the US, China and other regions in new areas.⁸⁶ Scientific excellence in promising domains is the base for future leadership. Assessment and identification of these domains, based on European capabilities in a global context and their potential for future impact (techno-economic, societal and environmental) is essential.

Emerging technologies open new markets and offer new opportunities to industry, in particular to dynamic **SMEs and start-ups** who can contribute with specific competences and benefit from the value emerging technologies create.

Stakeholder opinion

The need to build technological capabilities in emerging technologies was stressed by several **interviewees** from Member States, large companies, SMEs, business associations, universities and RTOs.

It was frequently mentioned by interviewees that no single European country on its own could take up the competition with the likes of the US and China on emerging technologies.

Some views (mainly from research organisations) in the public consultation suggest to attract more SMEs through a higher involvement of RTOs in the initiative.

2.2.5. *Limited use of innovative approaches (e.g. hardware/software codesign) for security, trust and energy-efficiency*

Europe’s technological capabilities in secure and trusted components do not always find their way into systems and final products. Similarly for energy-efficient devices. Addressing security and environmental issues is often done at software level in the latest stages of development with suboptimal results. Solutions addressing hardware-software co-design early in product development provide more efficient results but they require the adoption of innovative technologies and methodologies by the users.

As electronic components and systems are embedded in most of the smart products and services we use today, ensuring a supply of **trusted, secure, energy-efficient and reliable components** addressing specific environmental and societal requirements is of paramount importance for Europe.

⁸⁶ The ‘Made in China 2025’ initiative plans \$150 billion in semiconductors investments by 2025. The US Networking and Information Technology Research & Development (NITRD) has made \$4 billion available, for high capability computing systems, data management and software design.

Stakeholder opinion

At the **open public consultation** stakeholders put forward that the KDT initiative is highly relevant for securing access to trusted electronics components and systems (127 out of 154 respondents, or 82%, indicated this as ‘relevant’ or ‘very relevant’). This view was especially supported by industry associations, universities, RTOs, Member States and large companies, while it was shared to a lesser extent by SMEs.

A minority of stakeholders (mostly from industry) stressed the importance of security and indicated that the initiative should place a higher emphasis on technologies for security.

2.2.6. *Limited alignment of the electronic R&I ecosystem with strategic European policies and initiatives*

The ECSEL Interim assessment⁸⁷ recommends a **more strategic approach** of the partnership in the development of electronic components and systems, and a closer link to the digital transformation of the EU economy. Limited alignment to policies reduces the strategic impact of an R&I initiative and it is a source of inefficiencies. The support to the societal and environmental objectives of the Union would need to be embedded in the agenda of the future initiative. To this end the **Commission** and the **Participating States** would need to **play a strong role in setting** and monitoring progress towards **strategic objectives**.

2.3. How will the problems evolve?

If action is not taken the problems identified will persist and risks will materialise. Europe will head to a situation from which it will very difficult or not possible to recover.

Without action addressing the risks and problems, it is anticipated that Europe

- will **lose scientific leadership** in terms of R&I in electronic components and systems technologies in which it excels today.
- can **lose competitiveness** by weakening its ability to develop electronic components and systems technologies in which it is strong today (semiconductor equipment and materials, low energy consumption microelectronics, power components, embedded software).
- will put at **risk its leadership in critical industries** and services (automotive, avionics, industrial, machinery, healthcare, security). Performance requirements (whether energy consumption, security, reliability or cost) that determine their position in the market - might not be met. The losses in those sectors will be progressively important as they become increasingly digitised.
- will **miss out on opportunities** that new technologies (e.g. Artificial Intelligence, new forms of computing) may create for the sector of electronic components and systems. It will be increasingly difficult to enter new markets and grow with them.
- will be **dependent on other regions** (US, Asia) for key technologies, with limited choice and exposed to unilateral trade decisions on technology access and conditions.
- will **not be able to shape the digital future according to its values** (privacy, security, ethics). Electronic components and systems coming from abroad do not commonly meet the EU high standards for privacy and transparency.

⁸⁷ European Commission. (2018). Interim Evaluation of the ECSEL Joint Undertaking (2014-2016) Operating under Horizon 2020. Final report

- will **not be able to fully implement key policies**, such as environmental, data and industrial strategies. Digitisation and technological innovation are integral elements of policies, lack of access to advanced digital technologies within the EU will be a major drawback for their implementation.

Over time, with market consolidation and technological maturity these effects would intensify. Their combination can lead to a situation where **Europe is irrelevant as a digital technology driver and becomes a mere technology consumer.**

The development of the necessary technological capabilities requires investments of industry in production capacity for electronics components and systems in Europe within the next 5 to 10 years to provide a solid base for European companies to effectively respond to the challenges ahead. Investments in production capacity in Europe is not in the scope of a KDT initiative that focuses on R&I. However, support to R&D and innovation activities, such as piloting and validation of technologies, are important elements for industries as they federate and lower risks of private investments. The recent IPCEI in microelectronics, addressing innovation and first industrial deployment of technologies developed in European R&D initiatives, ECSEL in particular, is a good example of R&I actions leading to private investments.

Stakeholder opinion

The fast-evolving nature of key emerging digital technologies, including their influence on industries and technological areas, were stressed by **interviewees** from industry associations, large companies and SMEs.

The need for a policy action, and the implications of ‘no action’ for critical industries, was underlined by all interviewed stakeholder types.

3. WHY SHOULD THE EU ACT?

3.1. Subsidiarity: Necessity of EU action

Electronics value chains are vast and complex, expanding across regions and industrial sectors. Rapid technological progress, increasing investments by growth of large vertically-integrated companies in the US and Asia⁸⁸ in developing their own chips⁸⁹, and the massive investments by these competing regions in know-how and production capacity, demand a rapid and coordinated response of the EU to maintain and further improve its competitive position in electronics components and systems, and related industries.

Moreover the impact of geopolitical tensions on the global industrial and technology landscapes with no end yet in sight, calls for an enhanced effort by the EU in close partnership with the Member States, industrial and research actors to agree a coherent strategic agenda with an appropriate level of ambition.

In order to be able to **shape the digital future according to European values** (privacy, security, ethics, respect for the environment), closer collaboration with Member States is needed to agree an appropriate framework at European level including standards and

⁸⁸ Tesla, Google, Huawei, Samsung, Baidu, etc.

⁸⁹ [tesla-new-self-driving-chip-is-here-and-this-is-your-best-look-yet](#), The Verge, Apr. 2019; [google-rattles-tech-world-new-ai-chip](#), wired, May 2017; [samsung-to-make-baidus-new-ai-chips](#), ZDNet, Dec. 2019

certification schemes for electronic components and systems that will ensure those values can be adhered to.

Electronic components and systems also are increasingly important for Europe's vertical industries in their digital transition. The reinforcing of industrial ecosystems and value chains that provide for the research and innovation needs of those industries will necessarily **involve a variety of actors from across the Union**.

The experience of the ECSEL JU confirms that a sustained and coordinated effort under a common structure can lead to positive achievements.

3.2. Subsidiarity: Added value of EU action

Evolution in technology and innovation affects the way stakeholders interact in value chains. A fast-changing environment requires coordinated initiatives that bring together suppliers and users addressing hardware and software technologies, aligning European, national and industry efforts.

Companies alone or single countries cannot meet the scale and the intensity of investments by major competing regions (US, China, South Korea, Taiwan and Japan). Only a European mobilisation and coordination of investments could ensure the necessary critical mass.

Similarly Europe has many strengths at different parts of the electronics value chain which are scattered across different Member States. Consolidation would reinforce those strengths and thereby Europe's global position. Coordinated actions at EU level would stimulate the creation of ecosystems in which SMEs and start-ups can progress and grow faster.

Stakeholder opinion

The results of the **Member States consultation** on Horizon Europe Partnerships⁹⁰ confirm strongly the overall relevance of the proposed initiative in Key Digital Technologies (KDT). 96% of Member States consider electronic components and systems relevant for their national policies and priorities, as well as for their industry, research organisations and universities.

All **interviewed** stakeholder groups noted the need for alignment and policy coordination on research agendas; interviewees from industry commented that the level of investment by the US and China in electronic components and systems technologies cannot be matched by any individual European country and, as a result, coordination and critical mass at EU level are required.

4. OBJECTIVES: WHAT IS TO BE ACHIEVED?

4.1. General objectives of the initiative

Three general objectives corresponding to the main problems discussed in Section 2.1 are identified:

- 1. Reinforce Europe's **technology sovereignty** in electronic components and systems to support future **needs of vertical industries** and the economy at large*

Ensuring that Europe stays at the technological forefront in advanced electronic components and systems would contribute to strong strategic value chains. Gaps in the

⁹⁰ European Partnerships under Horizon Europe: results of the structured consultation of Member States. Shadow Configuration of the Strategic Programme Committee. 27 June 2019

value chain can become problematic in the presence of global crises, as dependence on technologies developed in other regions can deprive user industries of first mover advantage and limit their capacity to innovate. This is of particular importance in the transition of industry to digital and it will be increasingly critical as digital technologies become more pervasive across sectors. European strengths in specific segments of electronic components and systems (e.g. equipment and materials, low-power semiconductors, power electronics, embedded software) have a positive impact on the sectors they serve. European concerted action is required to develop leading-edge technologies, to accelerate their uptake and reinforce EU industries where they are strong.

A reinforced EU sovereignty should materialised in doubling the value of the design and production of electronic components and systems in Europe by 2030, in line with the weight of the EU in products and services.

2. Establish EU scientific excellence and innovation leadership in emerging components and systems technologies

Further miniaturisation towards physical limits, the rapid penetration of artificial intelligence, the emergence of edge computing and of alternative computing paradigms (such as neuromorphic, quantum computing) open new opportunities for electronics components and systems and their applications. A solid scientific base in emerging areas can enable Europe to seize such opportunities. An **early involvement of industry stakeholders** in specific promising areas in the research cycle will speed time-to-market, boost leadership and innovation, and maximise social and economic impacts. Moreover it will facilitate a more prominent role by Europe in standards setting, allowing European needs to be reflected. **SMEs and start-ups** who, in Europe, are generally strong in emerging technologies, can benefit from and help give shape to new ecosystems, supported by simplified administrative procedures.

As a target for an initiative on KDT, SMEs should represent at least one third of the total number of participants while at least 20% of public funding should go to SMEs.

3. Ensure that components and systems technologies address Europe's societal and environmental challenges

Public and private sectors need to pool resources to address EU societal and environmental challenges and objectives to build know-how and capacity in **areas that are currently missing or not sufficiently developed**. Specific components and systems technologies to which Europe needs to step up in these areas would be identified and addressed in the initiative together with standards setting.

Technologies considered essential for Europe will be tailored to **reflect European values in their application**. In particular technologies that provide the right levels of trust and privacy, as well as those contributing to the EU environmental objectives.

The initiative would align with the EU policy on energy efficiency. The target is to reduce energy consumption 32.5% by 2030. This target would be revised upwards by the Commission in 2023.⁹¹

⁹¹ Directive (EU) 2018/2002 of the European Parliament and of the Council of 11 December 2018 amending Directive 2012/27/EU on energy efficiency

Each of the three general objectives of the KDT initiative contributes to the objectives of Horizon Europe to deliver respectively techno-economic, scientific and societal impact from the Union's investments in research and innovation. They would strengthen the scientific and technological base of the Union and foster its industrial competitiveness at global level.

4.2. Specific objectives of the initiative

To better achieve the general objectives, six specific objectives are defined. These specific objectives respond to each of the problem drivers discussed in Section 2.2.

a. Establish design and production capabilities in Europe for strategic application areas

Strengthen and extend current European design and manufacturing capabilities in specific areas (such as power electronics, digital devices, etc.) to critical domains such as communication, computing and intelligent systems. Establishing new capabilities in Europe requires long-term planning and a firm commitment of public and private stakeholders. Interaction with relevant digital partnerships (SNS and EuroHPC for example) and initiatives addressing applications (such as healthcare and automotive) will be necessary to ensure coherence of action along the respective value chains. While R&I for production will involve mainly large semiconductor companies and research labs, the design activities will attract mostly SMEs and start-ups.

b. Launch large-scale projects supporting the fast transfer of technologies from the lab to the fab

This specific objective would support large scale projects, such as pilot lines of production and real scale demonstrators that bring together technology suppliers and users. These actions mobilise a high volume of resources and require the combination of public (European and national) and private resources under a common scheme. Large-scale projects bring specific value to the implementation of a long-term strategic planning. These projects should be open to SMEs - in addition to large companies and research organisations - providing unique opportunities for small companies and start-ups to get access to such facilities.

c. Build a dynamic EU-wide ecosystem based on digital value-chains with simplified access to newcomers

Establish an ecosystem that facilitates interaction between stakeholders and makes cooperation within and across value chains more efficient. The ecosystem will serve semiconductor and software producers, large and small, RTOs and academia, as well as technology users (systems manufacturers, service providers) to set common agendas and technology roadmaps and establish relations that go beyond research cooperation.

The administration and procedures for participation in the initiative would be simplified to make it accessible and attractive to new organisations. The target is to streamline administrative practices to sensibly reduce the complexity, eliminating any double EU and national intervention at all level of the operations (proposals, projects, audits).

d. Strengthen EU scientific excellence and exploit the potential of SMEs and start-ups in emerging technologies

Strengthen current capabilities and develop new knowledge and technological competence in emerging areas such as novel computing paradigms, and support emerging trends and opportunities such as edge AI. This objective would require the mobilisation of new stakeholders, mainly SMEs and start-ups active in emerging technological areas. To stimulate their participation, efforts to simplify the administrative requirements linked to participation – with respect to those of the current partnership - will be important.

e. Enhance component technologies that guarantee security, trust and energy-efficiency for critical infrastructures and sectors in Europe

Reinforce electronic components and systems technologies to guarantee the supply (design and production capacity) of secure, trusted and low energy components. Drive standards setting and support their integration into critical infrastructures (energy, data, transport,...) and systems, ensuring that they respond to future needs.

f. Ensure alignment of the new initiative with European policy priorities

Establish coherence between the Strategic R&I Agenda of the initiative and EU policies so that electronics components and systems technologies contribute efficiently. This objective would require a long-term roadmap that complements R&D with security certification⁹² and standardisation actions. The alignment of projects and the initiative as a whole with EU policies would be monitored and reported regularly.

Stakeholder opinion

The **open public consultation** showed a broad consensus about KDT making a significant contribution to global competitiveness of key European industries (112 out of 162 respondents, or 69% indicated this as ‘very relevant’). Establishing the link between KDT and application sectors was perceived as fully needed by four out of five respondents from business associations, large companies, SMEs, universities, RTOs and public authorities. Promote leadership in emerging technologies and secure technological sovereignty and globally competitive presence in key digital technologies were equally stressed as important by all **interviewed** stakeholder groups.

A majority of stakeholders to the **open public consultation** indicated the need to ‘focus more on bringing about transformative change towards sustainability’ (67 respondents indicated this as ‘needed’, and 63 respondents as ‘fully needed’, with a combined 67%) and to make a ‘significant contribution to the EU efforts to achieve climate-related goals’ (respectively 64 and 61 respondents indicated this as ‘needed’ or ‘fully needed’, combined 64%).

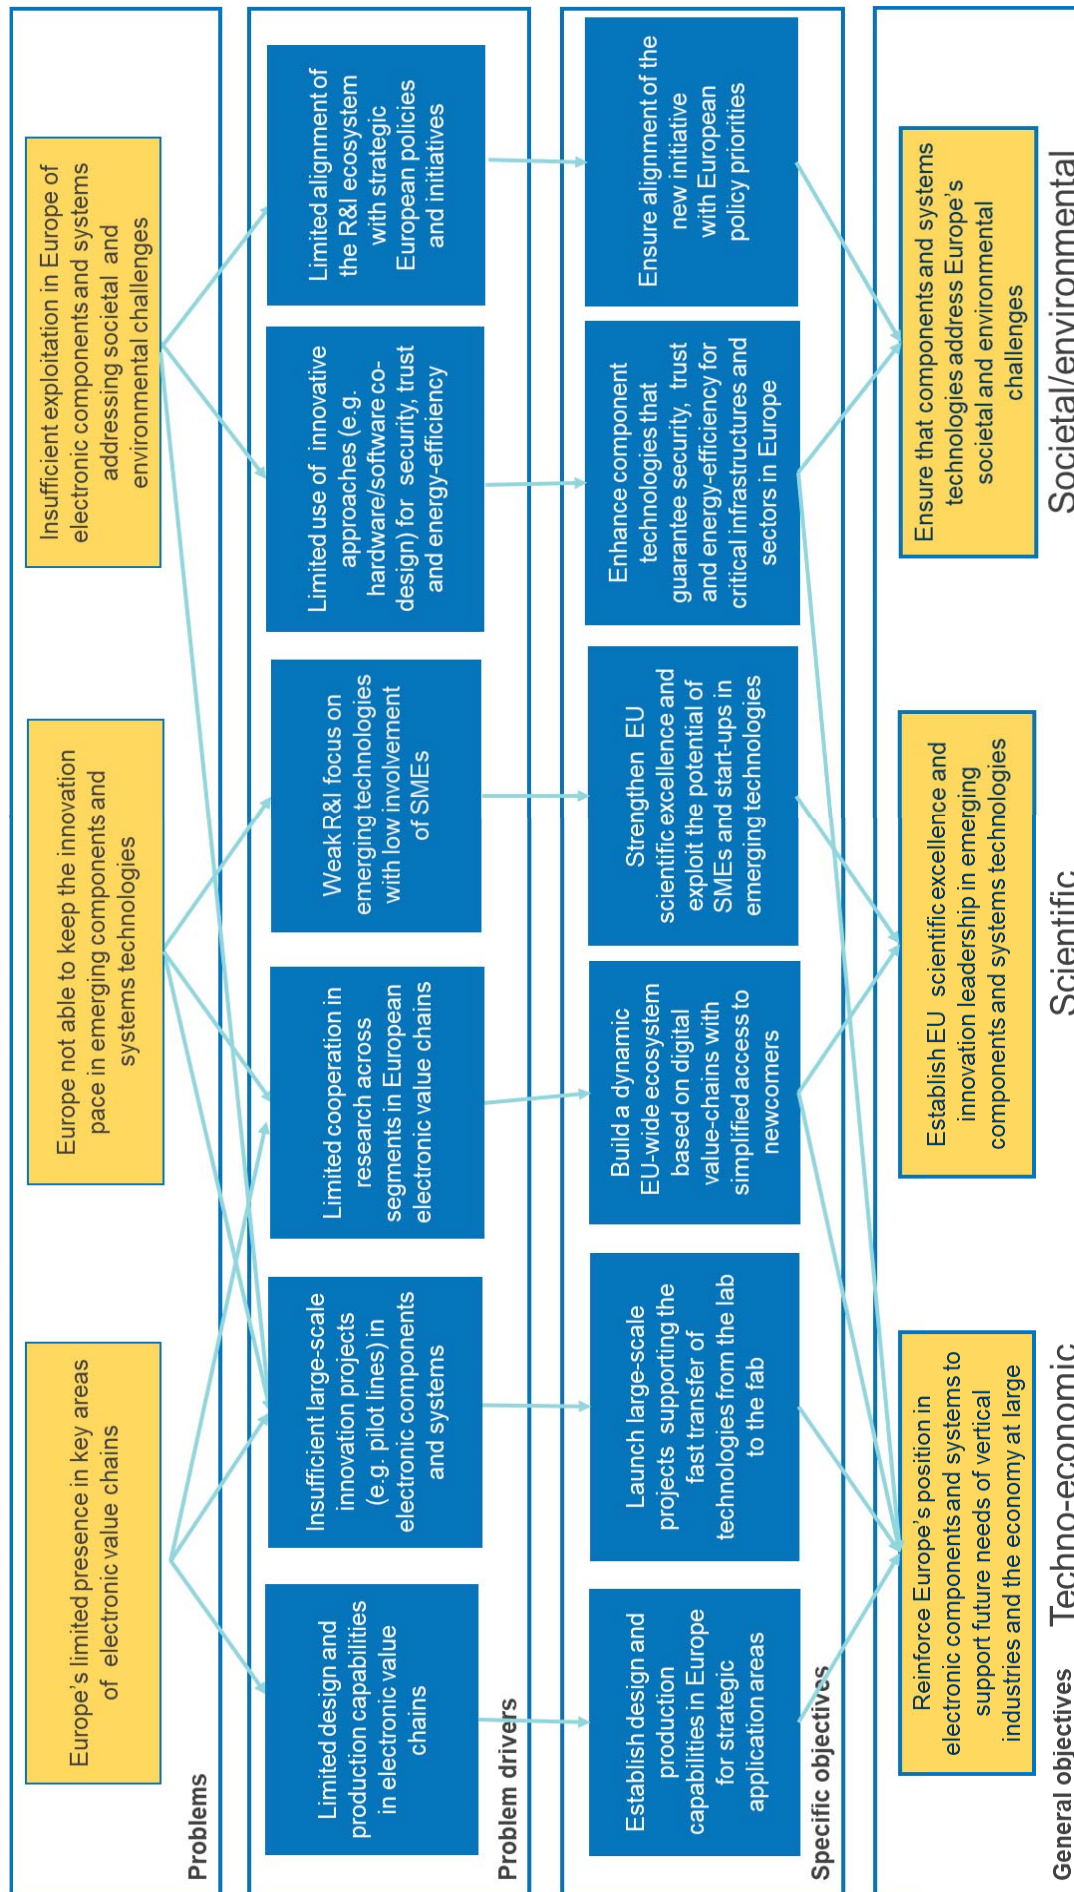

A minority of stakeholders (13 respondents or 8%), mainly academia and citizens, indicated that the KDT initiative was moderately needed or not needed for EU global competitiveness.

⁹² The KDT activities on security and trust would have a direct impact on the EU’s ability to attain its political goals in this area and specifically in the following initiative: Development of cybersecurity certification schemes developed under the European Cybersecurity Certification Framework that was established by the Cybersecurity Act (https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=uriserv:OJ.L_.2019.151.01.0015.01.ENG&toc=OJ:L:2019:151:TOC). In particular, the first scheme being prepared under the Framework is based on the so-called “Common Criteria” (standards that have been applied with great success in the EU to the certification of smart cards, integrated circuits, hardware security modules and other similar technologies).

4.3. Intervention logic for the initiative

The relationship between the general and specific objectives of the potential initiative on Key Digital Technologies is shown in Figure 12.

Figure 12: Intervention logic for an initiative on Key Digital Technologies

How would success look like?

Should the initiative deliver on its specific objectives, it is expected that it would translate in practice into the following impacts:

Scientific impacts

- Europe reinforces its **scientific** capabilities in emerging fields of electronic components and systems, maintaining **excellence** in publications and attracting best talents.
- Improved cross-border and cross-sector **scientific cooperation** that strengthen the exchange of knowledge across the ecosystem

The following specific objectives would contribute to these impacts:

- Strengthen scientific excellence in emerging technologies would contribute to extend Europe's leadership (see ranking of research publications in Figures 1-4 in Annex 6) to new research areas.
- Build a dynamic EU-wide ecosystem with an extensive network of national research organisations and universities spread across Europe facilitates cross-disciplinary and cross-sector dissemination and application of scientific results.

Stakeholder opinion

A majority of stakeholders from business associations, universities, large companies and SMEs identified in the **open public consultation** scientific impact as most relevant for the KDT initiative. More than half of public authorities and more than three-quarters of universities and RTOs consulted found it 'very relevant'.

Regarding minority views, two respondents (a business association and an academic organisation) indicated scientific impact as 'not relevant'.

Economic/technological impacts

- European electronics components and systems industry strengthens its **technological leadership** and its **global competitive position**, creating jobs and aligning its design and production capabilities with the EU's needs and economic weight.
- Strengthen **digital transformation** in vertical sectors through electronic components and systems technologies developed in Europe
- Create a dynamic **ecosystem of innovation** in electronic components and systems with higher and more active involvement of SMEs

The following specific objectives would contribute to these impacts:

- Establish design and production capabilities in Europe for strategic application areas
- Launch large-scale projects supporting the fast transfer of technologies from the lab to industrial settings.
- Build a dynamic EU-wide ecosystem with the involvement of users will help accelerate the market readiness of emerging technologies and facilitate the integration of SMEs.

Stakeholder opinion

According to the **open public consultation**, 'a more innovative, sustainable and competitive electronics and systems industries' was deemed as the most important impact by stakeholders (95 out of 154 respondents, or 62% indicated this as 'very relevant'); an overall majority of universities, RTOs, companies, business associations and public authorities found it relevant or highly relevant.

To facilitate economic impact through the ‘development and exploitation of innovative technology paradigms’ was also considered to be highly relevant (80 out of 150 respondents, or 53%), although to a slightly lower extent.

A minority view, two respondents (a business association and an academic/research organisation) indicated economic/technological impact as ‘not relevant’. In particular for the options ‘a more innovative, sustainable and competitive electronics and systems industries’ and the ‘development and exploitation of innovative technology paradigms’.

Societal impacts

- European applications and services provide high levels of **privacy and security** through the use of European components and systems
- Implementation of **EU policies** (green and digital transition, technology sovereignty) takes place according to **European values and ambitions**

Specific objectives contributing to societal impacts:

- Enhanced component technologies that guarantee security and trust for critical European infrastructures and sectors.
- Alignment of the initiative with European policy priorities would favour the development of digital technologies that meet European standards.

Environmental impacts

- Electronic component and systems industries and vertical industries progressively **reduce their negative environmental impact**

Specific objectives with expected contribution to the environmental impacts are:

- Enhance technologies that guarantee energy-efficiency including the design and manufacturing of low consumption components,
- Alignment with the EU policy priorities and in particular with the European Green Deal and the Circular Economy Action Plan

Expected impacts on fundamental rights

Research and innovation on secure and trusted components, systems, software and related applications will contribute to the protection of sensitive personal information⁹³. This will have an impact on the fundamental right to privacy, essential to human autonomy and protection, serving as the foundation upon which other human rights are built.

This impact is linked to the specific objectives on access to secure and trusted components and alignment to EU policy priorities.

Stakeholder opinion

According to the **open public consultation**, delivering ‘enabled safety and security’ was among the most important impacts for stakeholders (94 out of 153 respondents, or 61% indicated this as ‘very relevant’). It was followed by the need to ensure the ‘provision of trusted electronics components and systems to the public and businesses’ (86 respondents out of 154 respondents, 56%). On the other hand, ‘contribution to more functional, efficient, economical and accessible electronics systems’ was by a smaller number of respondents indicated as ‘very relevant’ (70 out of 152 respondents or 46%).

⁹³ Charter of Fundamental Rights of the European Union (2012/C 326/02). Article 8. Protection of personal data.

With efforts maintained over time, all impacts are expected to be materialised within the time framework of the new initiative.

4.4. What is needed to achieve the objectives – Key functionalities needed

Given the focus of the impact assessment on comparing different forms of implementation, the identification of “key functionalities needed” allows making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. These functionalities relate to the type and composition of actors that have to be involved, the type of range of activities that should be performed, the degree of directionality needed and the linkages needed with the external environment.

4.4.1. Type and composition of the actors to be involved

Collaboration among stakeholders of the ecosystem, representing all segments of the value chains, is essential for the development of new technologies and the fast market uptake of innovation. The scope of the candidate initiative in terms of technology coverage would need to be broader than ECSEL JU, and the need for integrating relevant stakeholders would be even more relevant. **Openness and flexibility** to integrate players from emerging and/or adjacent technologies and to encourage SMEs participation is also vital.

The involvement and commitment of the following actors is necessary to achieve the intended objectives:

- **Industrial technology suppliers.** Industrial actors from the various segments of the value-chain: Manufacturing equipment and material suppliers, design centres, integrated device manufacturers, software developers. They are the core partners in the initiative and play a central role in its implementation.
- **Industrial users (vertical industries).** They set the system and service requirements, assess technological choices and play an active role in their validation and demonstration.
- **SMEs and start-ups.** In relation to both previous categories, they would contribute with specific know-how and expertise, and benefit in multiple ways from the involvement in the initiative. Based on the interim evaluation of ECSEL, a lesson to be learned is in terms of the need to enable an increased participation of SMEs, including from the financial point of view, to help achieve both scientific and economic impacts.
- **Research and academic organisations.** They range from world-class RTOs, to national research organisations and universities. Their cooperation with industry to develop innovative solutions is an essential element for the success of the initiative.
- **Participating States.** Member and Associated States would provide guidance on setting the priorities, ensure the coherence of national and EU programmes and strategies, and stimulate the involvement of relevant national partners. Their financial contribution⁹⁴ allows to raise significantly the ambitions of the initiative.
- **European Commission.** Together with Participating States, the Commission ensures that public societal and environmental priorities are fully considered, integrates the

⁹⁴ From ongoing discussions with Member States it is expected that they will collectively match the EU contribution to the partnership (as it is currently with ECSEL)

initiative in the context of the EU Framework Programme and supervises the proper setup and running of the candidate initiative in the form of a partnership.

Finally, a high level of participation and balance of sectors, technologies and type of partners, should be achieved - improving current ECSEL levels⁹⁵- to guarantee an open initiative and prevent unjustified concentration on specific technologies or sectors to the benefit of a reduced set of organisations.

4.4.2. *Type and range of activities needed*

This section concerns the types of activities that the initiative is intended to encourage, so as to respond effectively to the challenges and problems described in Chapter 2.

To deliver in its objectives, the initiative would need to support activities ranging from the formulation of the technology concept (Technology Readiness Level⁹⁶, TRL2) to the completion and qualification of systems (TRL8). The type of activities include:

- Collaborative R&I actions that foster academia-industry, industry-industry and cross-sectoral collaborations.
- Innovation actions to accelerate the maturity of new technology generations for their rapid integration in vertical industries.
- Large-scale projects, such as pilot lines for validation and demonstration of technologies in close to real-life environments.
- Technology platforms where suppliers and users can assess and optimise new technological approaches.
- Research actions addressing the design and manufacturing challenges of critical cross-cutting technologies, such as smart networking and high-performance computing.
- Research and Innovation actions for developments in emerging technological areas.
- Coordination and support actions for the production of common research agendas, mobilisation of stakeholders (e.g. SMEs) and their integration in the ecosystem; coordination with relevant European and national initiatives; and contribution to standardisation activities.
- Coordinated activities between Participating States, Commission, and private members to address security and energy-efficiency aspects in technology and application roadmaps. They would include certification and standardisation activities.
- Coordination with other European initiatives (e.g. IPCEI, European Processor Initiative) for complementary investments on design and production capacities of secure and trusted components.

⁹⁵ The total number of different entities participating in ECSEL in the period 2014-19 is 2681. ECSEL Annual Activity Report 2019. Pending publication.

⁹⁶ Technology Readiness Level (TRL) gives an indication of the maturity of a technology in a scale from TRL1 (basic principles observed) to TRL9 (competitive manufacturing)

4.4.3. Priority setting system and level of directionality required

It has been argued in the problem analysis in section 2.1 and the analysis of drivers in section 2.2 that for Europe to compete with China and US especially in emerging technologies, significant investments and resources need to be mobilised. To meet the objective of technological sovereignty and address the problem of Europe's dependence on critical technologies, making sure that Europe has access to technology that respects its values, a broad agreement on a roadmap of activities is necessary. The high ambitions for technological sovereignty and economic leadership imply the development of a shared **European vision** implemented through a **unified research agenda** with strategic objectives reflecting EU priorities and supported by a critical mass of resources (financial, infrastructure and human resources) from the members of the initiative. Thus, the highest possible leverage of resources from industry and Member States under the shared vision is critical to be able to tackle the objectives and deliver on impacts.

The strategic vision should be implemented by the stakeholders along the value chain through the preparation of a common Strategic Research and Innovation Agenda (SRIA). Under the existing partnership ECSEL this has been an open exercise that has involved hundreds of representatives from research, industry and administrations. The priorities of technologies and application sectors in the SRIA has been the result of a broad consensus of participants. The SRIA is in a first instance produced by the private partners and submitted for comments and inputs to the partnership members (EC, Participating States) and approved by the Governing Board.

Responding to shortcomings identified in the interim evaluation of the ECSEL partnership, the Commission and the Participating States in the future initiative would need to steer the agenda towards strategic objectives that are aligned with the policy priorities of the Union. This multi-stakeholder process will aim at producing a balanced agenda that takes account of industry priorities, research challenges and EU and national policies, and making it difficult for a small set of partners to wield undue influence. The monitoring of the initiative would need to ensure that this balance is maintained. An updated SRIA would need to be produced annually, following a broader consultation, which is open and involves a larger amount of stakeholders than nowadays, including innovative smaller companies, to ensure that the scope and priorities of the initiative align as necessary with fast-changing developments.

The sectors and technologies identified in this report are presented as examples based on current context and trends.

The interim evaluation of ECSEL JU recognises the significance of coordination, common vision and research agendas.⁹⁷ The experience from ECSEL JU shows that the leverage effect could reach a ratio of 1:3, meaning that for every Euro of EU funding, Participating States and industry could contribute 3 Euros. The ECSEL experience with ratios of 1€ from EU, 0,9€ from Participating States and 2,18€ from private members in the period 2014-18 is encouraging.⁹⁸

Recent declarations from industry associations⁹⁹ and from national authorities¹⁰⁰ confirm their intention to continue the current tri-partite scheme with the same relative contributions

⁹⁷ European Commission. (2018). *Interim Evaluation of the ECSEL Joint Undertaking (2014-2016) Operating under Horizon 2020*. Final report.

⁹⁸ ECSEL Annual Activity Report 2018.

⁹⁹ Declaration of the ECSEL Industry Associations

¹⁰⁰ Declarations from Member States

(1€ from EU, 1€ from participating states, 2€ from private members¹⁰¹). Commitments from the initiative's members would need to be reflected in the future Council Regulation. The implementation details are still pending internal discussion.

The KDT initiative, object of this impact assessment, would aim at a more challenging set of objectives and with a broader impact than the current ECSEL JU. At the time of writing this impact assessment the level of financial support to the KDT initiative is uncertain. Despite the fact that the three members of the initiative (European Commission, Participating States and Industry) consider KDT as an area with far-reaching impact on the EU economy and society, the COVID-19 crisis may limit available resources. In case of a reduced budget, a decision by its members (via a shadow governing board) on the prioritisation of objectives and rationalisation of activities would be necessary to ensure that its ambitions can be realistically achieved.

Given the importance of establishing robust electronics value chains, the consolidation of an ecosystem would be a priority for coordination, especially at the early stages of the candidate initiative.

The above conclusions are also supported by the interviews with the ECSEL JU industry associations and downstream stakeholders. The consensual view is that coordination of research agendas among EU, Member States and industry allows a more effective R&I response in a fast-moving market and with a higher level of impact.

4.4.4. *Coherence needed with the external environment*

Alignment with strategic EU policies and initiatives is a major recommendation from the ECSEL Interim evaluation and one of the problem drivers for the intervention logic of the future initiative. “The European Green Deal”, “A Europe fit for the digital age” and “An economy that works for people”, but also the most recent “Recovery Package”¹⁰², are major EU priorities to which the initiative should provide valuable contributions. Access to secure and energy-efficient components for strategic European infrastructure and sectors and ensuring technological sovereignty would be objectives of the candidate initiative closely related to the objectives of these EU initiatives.

Participation of Member States would facilitate alignment with national programmes and strategies, reducing overlap and fragmentation of efforts, and importantly, ensuring critical mass and synergies can be built.

As indicated earlier, the enabling character of electronic components and systems argues in favour of coordination with other partnerships and initiatives in digital sector (see section 1.3). The ‘digital cluster’ of partnerships is expected to coordinate with Member States and industry for a comprehensive EU digital strategy. Coordination is also expected with partnerships addressing other verticals such as space (Global competitive space system) and manufacturing (Made in Europe) sectors as well as health (IMI), mobility and energy.

Synergies with the Digital Europe Programme (DEP)¹⁰³ would need to be exploited with testing facilities, skills development and capacity building activities in specific digital domains. Similar synergies would need to be explored with Connecting Europe Facilities

¹⁰¹ These relative contributions are based in ECSEL experience. Matching of public funding by the private members takes account of contributions from all project beneficiaries (members and non-members of industrial associations)

¹⁰² Europe's moment: Repair and Prepare for the Next Generation. COM(2020) 456

¹⁰³ DEP (Digital Europe Programme) has been proposed by Commission as part of the EU long-term budget 2021-27. <https://ec.europa.eu/digital-single-market/en/news/digital-europe-programme-proposed-eu92-billion-funding-2021-2027>

(CEF)¹⁰⁴ that supports investments in European infrastructure networks for transport, energy and digital.

The achievement of EU technological sovereignty would need to be facilitated by the coordination of the KDT initiative with a future IPCEI on digital technologies. There are indications¹⁰⁵ that efforts could be made towards combined national and private investments for first industrial deployment, building the required capacity for production in Europe of advanced components for edge-computing.

Finally, the interim evaluation of ECSEL JU stressed the importance and potential for coordination with local, regional, national and European initiatives.¹⁰⁶ Coordination with regional clusters such as Silicon Europe, Silicon Saxony (Dresden), Minalogic (Grenoble), and DSP Valley (Leuven-Eindhoven) could contribute to the mobilisation of stakeholders, especially SMEs, and their integration in the ecosystem.

5. WHAT ARE THE AVAILABLE POLICY OPTIONS?

This section describes the specific functionalities that could be provided under the baseline scenario of traditional calls and the various options of different types of European partnerships.

5.1. What is the baseline from which options are assessed?

The baseline scenario used in this impact assessment is a situation without a Partnership and only traditional calls of Horizon Europe. Given that there is a predecessor Partnership as well as other funding sources in the area, these will continue generating effects even if there is no new Partnership. In particular it is expected that these already existing initiatives will still create effects in the area of digital technologies. This is taken into account in the effectiveness assessment.

In parallel, the baseline situation means that the current implementation structure of the Article 187 would be closed, which bears winding down and social discontinuation costs. There would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is taken into account in the efficiency assessment.

The baseline (Option 0) for the functioning of this research and innovation initiative in the field of electronic components and systems is to make use of mainstream channels of Horizon Europe. The related priorities would be implemented through traditional calls under the Framework Programme. Table 1 presents the key characteristics of the baseline.

Table 1: Key characteristics of the baseline situation – Traditional calls

	Implications of option
Enabling appropriate profile of	<ul style="list-style-type: none"> Consortia of public and/or private actors in ad hoc combinations are eligible. Specific actions can be for a single actor (mono-beneficiary).

¹⁰⁴ CEF (Connecting Europe Facilities) has been proposed by the Commission as part of the EU Multi-financial Framework 2021-27. https://ec.europa.eu/commission/presscorner/detail/en/IP_18_4029

¹⁰⁶ European Commission. (2018). Interim Evaluation of the ECSEL Joint Undertaking (2014-2016) Operating under Horizon 2020. Final report.

<p>participation (<i>actors involved</i>)</p>	<ul style="list-style-type: none"> • Calls are open for participation of entities from Member and Associated States. Organisation from third countries can participate under specific conditions. Partners from industrialised countries are not eligible for funding. • Systematic and structured engagement of Member States limited to the participation in the programme committees.
<p>Supporting implementation of R&I agenda (<i>activities</i>)</p>	<ul style="list-style-type: none"> • Supported activities include Horizon Europe standard actions that allow a broad range of individual actions covering the whole spectrum of activities that are required for the digital technologies achieving the objectives of the KDT initiatives (TRL2 to TRL8). • Combination of activities into a portfolio of actions for achieving a common objective is not possible. • Leverage of additional activities or investments beyond the direct scope of the funded actions is not possible.
<p>Ensuring alignment with R&I agenda (<i>directionality</i>)</p>	<ul style="list-style-type: none"> • The strategic programming through the programme committees of Horizon Europe involving a wide range of stakeholders (who are not necessarily aware of, relevant to, or interested in the objectives of the KDT initiative) implies a lower level of directionality and a lower weight of industry's voice in shaping the priorities compared to other options. • There is possibility to develop an SRRIA or roadmaps. However, without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual financial commitments beyond the single project participation. • The strategic planning mechanisms of Horizon allow for a high level of flexibility and responsiveness to changing needs. • Coordination with national or regional initiatives difficult to achieve in practice. • Coordinated implementation and funding linked to concrete objectives and roadmap is not possible as the funded projects are part of much broader project portfolio managed by an agency or EC services. • Support of priorities cannot continue over the four years of the strategic plan and budget and therefore it is less likely that the funding will be used for supporting long term objectives. • The coherence of funded activities in the area of electronic components and systems with other parties of the Annual Work programme is ensured by the EC. • Coordination and exploitation of synergies with other programmes beyond the FP and industrial strategies is limited as it requires more structured approaches which are not available in Horizon Europe.
<p>Securing leveraging effects (<i>additionality</i>)</p>	<ul style="list-style-type: none"> • Member States do not contribute to the budget. Thus, the resources that could be mobilised are sensibly lower compared with other options. • Substantial industry contribution, mostly in-kind (e.g. researchers, labs), of 50% of the total cost of the initiative, will not be possible.
<p>Key differences compared to the current situation</p>	<ul style="list-style-type: none"> • Moving from the current ECSEL JU to Horizon Europe calls (baseline option) would entail the dismantling of the JU with the following consequences: <ul style="list-style-type: none"> - The development and implementation of a common vision with the partners in the area and the achievement of objectives would not be possible to the same extent - A stable structure encompassing Participating States, the industry associations and the EC for R&I cooperation would disappear - Large scale R&I actions (pilots, platforms) could not be implemented in a coordinated way - The initiative would be fully financed by the EU. Participating States and Industry would not be able to contribute at programme level (but at project level) - The overall budget of the initiative, including contributions by industry and Member

5.2. Description of the policy options

5.2.1. Option 1 - Co-programmed European Partnership

This form of European Partnership is based upon a *Memorandum of Understanding* or a *Contractual Arrangement* signed by the European Commission and industrial associations representing the private partners. The formal commitments from partners are not legally binding and subject to “best efforts”. Table 2 presents the key characteristics of the option.

Table 2: Key characteristics of Option 1- Co-programmed European Partnership

	Implications of option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • Suitable for the participation of a large community of stakeholders able to contribute to the definition and implementation of the Strategic R&I agenda. • Private members (industry, RTOs) represented by associations that provide limited administrative support. • The calls are included in the FP Work programme. Horizon Europe rules for participation apply.
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • Union contribution is implemented via calls for proposals published in the Work Programmes of Horizon Europe based on the input from partners (adopted via comitology). • R&I activities follow 2-year Work programmes, with risk of discontinuity of actions and limited long-term financial stability to pursue the partnership objectives • Implementation of actions and administration by Commission services or relevant executive agency. • A broad range of coordinated activities from low TRL to demonstration are possible under the standard actions of Horizon Europe. • The associations representing private partners allow some level of coordination, including activities related to regulation and standardisation and developing synergies with other initiatives.
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> • The strategic R&I agenda/roadmap is agreed between partners and EC. • The objectives and commitments are set in the contractual arrangement. • The input to FP work programme is drafted with the inputs from partners and finalised by EC (comitology). • The commitments are political/best effort. • Coherence among partnerships and with different parts of the Work programme of Horizon Europe can be ensured by partners and EC, however exploitation of synergies with other programmes is limited. • Coordination with national or regional initiatives difficult to achieve in practice. • Coordinated implementation and funding linked to concrete objectives and roadmap is not possible as the funded projects are part of much broader project portfolio managed by an agency or EC services. • Synergies with industrial strategies is ensured through the industrial partners. • Synergies with national and regional programmes and activities can be explored.
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> • Leveraging target defined and agreed from the onset but agreement to commit resources from the involved stakeholders remains “best efforts” • Under this type of partnership in-kind contribution of industry is possible and it would be included in the Contractual Agreement. • Member States: This option allows only for light coordination of efforts with R&I in the field at the national level but no financial contribution to the budget of the initiative

Key differences compared to the current situation

- Moving from the current ECSEL JU to Co-Programme partnership (Option 1) would entail the dismantling of the JU with the following consequences:
 - The implementation of a common vision and achievement of objectives would be less efficient and take longer
 - A stable structure encompassing Participating States, the industry associations and the EC for R&I cooperation would disappear
 - Large scale integrated R&I actions (pilots, platforms) could not be implemented
 - Important contributions (financial) from Participating States and industry would not materialise and the EU would have to bear a higher share of the cost.
 - The overall budget of the initiative, including contribution by industry, Member States, would likely be substantially reduced
 - Substantial discontinuation cost, with a 4-year winding down period for the current JU (see rationale at 6.2 Efficiency)

5.2.2. Option 2 – Co-funded European Partnership

See table with key characteristics of Option 2 in Annex 6 (Impact Assessment, Part 2)

5.2.3. Option 3 – Institutionalised European Partnership

a) Institutionalised Partnerships under Art. 185 TFEU

See table with key characteristics of Option 3a in Annex 6 (Impact Assessment, Part 2)

b) Institutionalised European Partnership under Art 187 TFEU

An Art 187 TFEU partnership is based on a Council Regulation and implemented by dedicated structures created for that purpose. It can be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.

Table 3: Key characteristics of Option 3: Institutionalised Partnership under Art 187 TFEU

	Implications of option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • This option is suitable for the participation of all types of partners contributing to the definition and the delivery of the SRIA • The upfront commitments and long-term planning of this option are attractive to a large set of participants. • The involvement of Participating States contributes to the mobilisation and participation of national actors. • In response to emerging challenges and evolving priorities, the SRIA can be defined to attract new relevant partners. • Horizon Europe rules apply by default, so any legal entity can apply to partnership calls. • In addition to Participating States, companies and research organisations from other countries can participate but subject to policy considerations. • Non-associated third countries can only be included as partners if foreseen in the basic act and subjected to conclusion of dedicated international agreements. Basic act can foresee exceptions for participation in calls / eligibility for funding.
Supporting implementation	<ul style="list-style-type: none"> • The standard actions of Horizon Europe that allow to build a portfolio with a broad range of research, innovation and demonstration activities.

of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • The dedicated administrative structure of the JU can efficiently implement, monitor and report results of an integrated portfolio of projects. • The option allows the combination of national and Union funding for the joint financial support of activities. It enables the achievement of critical mass of investments in a common agenda across the EU. • Communication and dissemination activities can be supported by the partnership structure.
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> • The Strategic R&I Agenda setting the objectives and priorities of the partnership is agreed between Participating States, the industry associations and the EC. • The annual work programme is adopted by the Governing Board of the partnership. • The voting majority of EU and national members in the partnerships facilitates the alignment of the partnership with public policy priorities. • The objectives and commitments are set in the legal base. Changes require modification of the Regulation and approval by the Council.
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> • Commitments include the obligation for financial and in-kind contributions of partnership members, including contributions to the administrative costs. Commitments would be legally established in the basic act. • For the KDT JU where a tripartite model is envisaged, contribution of industry to the operational running of the partnership is expected to be 50% of the aggregated partnership budget. Contribution of Participating States is expected to maintain the current ECSEL level and match the EU contribution (25% of the aggregated budget)
Key differences compared to the current situation	<ul style="list-style-type: none"> • The JU structure of ECSEL would be taken over by the KDT partnership • Modifications will be introduced in administrative procedures and practices to ensure that operations are lean and as efficient as possible

5.3. Options discarded at an early stage

The Co-Funded partnership and the Institutionalised Partnership created under Article 185 of the TFEU are not considered relevant for the impact assessment of the initiative on Key Digital Technologies.

Based on the objectives of the KDT initiative, the direct beneficiary is the industry. Therefore, the objectives can be only achieved if industry plays a pivotal role in the setting of the agenda, implementation and mobilisation of resources. This precondition is not satisfied by Co-Funded or Art 185 partnerships:

- The Co-Funded partnership allows only public partners at its core and the industry cannot make formal commitments or contributions to it, nor to participate in the setting of the research agenda.
- The participation in Art 185 TFEU is limited to Member States.

6. HOW DO THE DIFFERENT POLICY OPTIONS COMPARE TO ACHIEVE THE EXPECTED IMPACTS?

Based on the objectives pursued by the initiative and the key functionalities identified to be able to achieve them, each option for implementation is assessed in terms of effectiveness, efficiency and coherence compared to the baseline scenario of traditional calls. The analysis is primarily based on the degree to which the different options would cater for the key needed functionalities. All options are compared to the baseline situation of traditional calls, which is thus consistently scored at 0 to serve as reference point.

6.1. Effectiveness

To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. This section considers to which extent the different policy options would allow delivering these expected impacts – confronting what is needed (functionalities) with what each form of implementation can provide in practice. The assessments in this section set the basis for the comprehensive comparative assessment of all retained options against all dimensions in Section 6.4, based on a scoring system¹⁰⁷.

Scientific Impacts

- *Europe reinforces its **scientific capabilities** in emerging fields of electronic components and systems, maintaining **excellence** in publications and attracting best talents.*
- *Improved cross-border and cross-sector **scientific cooperation** that strengthen the exchange of knowledge across the ecosystem*

Scientific impacts would be generated by collaborative actions of **interdisciplinary research** teams. The active **involvement of industry** is necessary, as well as a good degree of **coordination** and a significant **volume of resources**, to ensure that scientific advances are supported through the innovation cycle and eventually transferred to industrial environments. These elements are part of a strategic approach characterised by directionality towards common objectives, alignment of individual projects, and participation of industrial partners.

Baseline: Horizon Europe traditional calls

Option 0 with traditional calls under the Framework Programme can effectively attract **high-quality research** teams particularly in emerging and less established technologies. This option allows to define a technology roadmap, however, it is **less attractive to industry, including to SMEs and start-ups, due to the difficulty of long-term planning** to align research activities with industrial priorities. This option therefore does not ensure the participation of all necessary actors as a partnership would.

The uncertainty of industry involvement and the absence of financial contribution from Participating States makes this option **unlikely to mobilise a critical volume of resources**. Furthermore, the use of open calls, with limited coordination, to address research priorities is likely to involve a considerable **degree of inefficiency** due to the risk of different projects addressing similar issues.

Finally, Horizon Europe traditional calls are **well suited to address cross-sector research** by multi-disciplinary teams. This option, however, **would not mobilise important stakeholders** (large companies and SMEs) to support scientific cooperation towards common objectives. As a consequence, this option would have a **limited contribution** to a dynamic **ecosystem**.

Option 1: Co-Programmed European Partnership

Option 1 can address research challenges as a part of a **strategic agenda that aligns with industrial objectives**. It can attract the participation of **academia and research**

¹⁰⁷ A more in depth and detailed analysis of each policy option is provided in the “Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe – Candidate Institutionalised European Partnership on Key Digital Technologies”. Technopolis Group (2020)

stakeholders to address scientific challenges in emerging fields, and provide a **good level of coordination** to support industrial commitments.

In this option industry associations can mobilise a **broad range of stakeholders**, including SMEs, and ensure a **good coverage** of the value chains, including research organisations and technology users. Also, they can contribute more systematically in the building of a **collaborative multidisciplinary ecosystem**, facilitating the exchange of knowledge across sectors. However, the lack of participation of Participating States in this option **limits both directionality and the volume of resources** necessary to implement large-scale actions supporting the transfer of scientific outcomes to industrial settings, limiting the involvement of user industries.

Therefore, the potential of the option to generate the expected scientific impacts is good (+) compared to the baseline.

Option 3: Institutionalised European Partnership under Article 187 TFEU

Option 3 can attract and engage in research activities the different types of stakeholders, in a **strategic agenda that aligns research effort with industrial and policy priorities**. The participation of the industry is expected to be high as this option provides the **highest possible commitment and a coordinated long-term strategic planning**. The launching of open calls, as in the other options, provides opportunities to **attract new participants** with the necessary competences to address emerging challenges. Further harmonisation and simplification of administrative procedure will also facilitate participation. Therefore, it is considered that the potential of this option to **attract the necessary mix of stakeholders** to research activities is high.

The tripartite model of this option with the **involvement of Participating States** would attract national research organisations and ensure the highest level of coordination with **national research** programmes. On the assumption that the Commission financial contribution would be similar to other options, the tripartite model of this option would **mobilise a substantially higher volume of resources** by combining Commission, national and private contributions, as proven in the existing ECSEL JU. It enables the design and implementation of a common agenda across the EU with the necessary resources to build a dynamic European ecosystem for electronic components and systems.

The existence of a **central coordination** mechanism which can proactively mobilise different types of stakeholders, including national research organisations, can provide the highest possible coverage of value chains. The central coordination of this option also offers the flexibility and enables the implementation of follow-up activities to disseminate **knowledge across sectors and stakeholders** (e.g. SMEs) sustaining and **reinforcing the ecosystem**.

Therefore, the potential of the option to generate the expected scientific impacts is high (++) compared to the baseline.

Table 4: Overview of the options' effectiveness compared to the baseline - Scientific impacts

Impacts	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
Europe reinforces its scientific capabilities in emerging fields of electronic components and systems maintaining leadership excellence in publications and attracting best talents.	0	+	++
Improved cross-border and cross-sector cooperation that strengthen the exchange of knowledge across the ecosystem	0	+	++

Notes: Score ++: Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

Economic/Technological impacts

- *European electronics components and systems industry strengthens its **technological leadership** and its **global competitive position** aligning its design and production capabilities with the EU's needs and its economic weight.*
- *Strengthen **digital transformation** in vertical sectors through electronic components and systems technologies developed in Europe*
- *Create a dynamic **ecosystem of innovation** in electronic components and systems with higher and more active involvement of SMEs*

Achievement of the expected impacts requires the ability to support technology development from the initial phases of R&D until technology maturity. This implies the combined use of **research actions and large-scale pilots at the appropriate points in time.**

It will require a strategic approach endorsed by private and public sector actors and their commitment to **mobilise a critical mass of resources** over the longer term. It will necessarily imply achieving **a coherent alignment between industrial priorities and public sector policies.**

Moreover it requires **moving rapidly from low to higher TRLs** and achieving a high level of integration, with the involvement of users in the early phases of the technology development. SMEs and start-ups should be involved as providers of new ideas for innovations.

Baseline: Horizon Europe traditional calls

Under the **baseline option** the development of a **strategic research and innovation agenda with the participation of the industry is possible**, but **the degree of alignment with industry priorities over time is likely to be limited.**

The absence of any steering and any financial contribution from the Member States limits the potential of this option to establish coherence with national policies and the possibility to mobilise the required volume of resources that would be needed in particular for large-scale pilots.

Horizon Europe calls do not have the mechanism to support successive phases of technological development nor the creation of industrial consortia to accelerate technologies maturity from low to higher TRLs.

Traditional calls in Horizon Europe can attract the participation of SMEs but with considerable risk of discontinuity of effort. The **low level of coordination** offered would not support the creation of an ecosystem where SMEs and start-ups can interact with relevant stakeholders beyond research cooperation.

Option 1: Co-Programmed European Partnership

Under Option 1, the **industry associations could provide coordination** to their members and mobilise the necessary mix of stakeholders.

Option 1 offers the possibility of aligning the partnership with the strategies of industry and the development of an agenda of activities.

However the **industrial commitment may be limited** to 'best effort' which may affect a long-term planning necessary to support technologies along the full R&I cycle from low to higher TRLs.

The interest of industry and their participation in projects contributing to the digital transformation would **stimulate industrial investments**. However, absent national public support, this Option is **unlikely to mobilise the necessary public and private resources** to support large-scale pilot and demonstration projects required for the validation of technologies in specific sectors.

The **industry associations can mobilise stakeholders** and ensure the **participation of relevant organisations** from across the value chain, including SMEs, and is open to newcomers according to emerging needs. The **industry associations will facilitate and steer appropriate collaboration among their members**.

Although the Option offers higher coordination compared to the baseline, the building of the ecosystem that stimulates the involvement of SMEs requires flexibility and feedback mechanisms: flexibility to design and implement calls according to the needs, feedback loops that facilitate learning and adaptation of the activities to fit the changing needs best. These possibilities are only partially covered due to the **absence of a central coordination and management system**.

Therefore, the potential of the Option to generate the expected impact compared to the baseline is high (++) for ‘Strengthen digital transformation in vertical sectors through electronic components and systems technologies developed in Europe’ and it is good (+) for the rest.

Option 3: Institutionalised European Partnership under Article 187 TFEU

The Institutionalised Partnership Art 187 is subject to a legal framework set out in a Council Regulation. As the other options do, it provides the opportunity to any organisation to participate through open calls. Therefore, in terms of the **participation of the necessary mix of partners**, the potential is high.

Option 3 offers the ability to generate integrated portfolios of projects through activities supporting **technology acceleration, scale-up and validation** and allows the pooling of private and public resources and the implementation of **large-scale projects** bringing together technology suppliers and users.

Option 3 offers the **highest directionality** among the various options. The partnership is built around a common European strategic research and innovation agenda agreed among the Commission, the Participating States and the industry represented by industry associations, and implemented through work programmes that can be updated annually.

The legal basis offers a stable framework for long-term planning and financial commitments compared to other Options and facilitates the alignment of the partnership with EU, national and industrial priorities.

The central coordination of this option offers the **flexibility to design specific activities to adapt to emerging areas and to attract and integrate SMEs**. It also provides the highest possible directionality and leverage and the ability to design and implement a portfolio of activities that can support the building of the ecosystem that can attract and sustain SMEs and start-ups. **Further harmonisation of procedures across Participating States and simplification of administrative procedures** (currently in place in ECSEL) will further contribute to the increased participation of SMEs.

Therefore, the overall potential of the option to generate the expected impact is high (++).

Table 5: Overview of the options’ effectiveness compared to the baseline - Economic/technological impacts

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
European electronic components and systems industry strengthens its technological leadership and its global competitive position aligning its design and production capabilities with the EU's needs and its economic weight	0	+	++
Strengthen digital transformation in vertical sectors through electronic components and systems technologies developed in Europe	0	++	++
Create a dynamic ecosystem of innovation in electronic components and systems with higher and more active involvement of SMEs	0	+	++

Notes: Score ++: Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

Societal and environmental impacts

- *European systems and services providing high levels of **privacy and security** through the use of European digital technologies*
- *Implementation of **EU policies** (digital transition, technology sovereignty) according to the **European values and ambitions***
- *Electronic components and systems industries and vertical industries progressively **reduce their negative environmental impact***

Baseline: Horizon Europe traditional calls

Under Horizon Europe, the prioritisation by the Commission and the Member States (through the Programme Committee and the work programmes) is likely to place **high emphasis on societal and environmental impacts**. This emphasis would be accentuated as the European Commission has declared Horizon Europe a key instrument to achieve the Green Deal objectives¹⁰⁸.

High-quality research results are, therefore, expected regarding the optimisation of security and privacy as well as the environmental characteristics of electronic components and systems. However, the generation of the expected impacts depends on the final uptake of relevant digital technologies by the vertical industries. **Horizon Europe** would be **effective in the generation of the research results** through stand-alone projects and early prototyping, but it would be **less effective in facilitating industrial uptake at later stages of technology maturity**. The scale and scope of research impacts would therefore be limited.

Due to the **lack of a critical mass of resources** and the **limited alignment with industry priorities**, it is unlikely that this Option would achieve the intended mitigation of environmental impacts (which requires industry wide adoption of technologies).

Similarly, **lack of coordination** across low and high TRL stages would limit the alignment of the area with EU societal and environmental policies.

Option 1: Co-Programmed European Partnership

Under the Co-Programmed partnership, more emphasis will be given to later stages of the research process compared to traditional calls in Horizon Europe. This option can **balance**

¹⁰⁸ 'Mobilising Research and fostering innovation'. The European Green Deal. COM(2019) 640. 11 December 2019

social/environmentally-driven research and activities supporting the use of research results in sectors and services of interest.

The environmental impacts of the initiative is related to its potential to **reduce the energy consumption** of the applications by making use of greener components and systems technologies.

Further to commercial interests, industry will take into account environmental impacts as the workprogramme is established by the Commission. Therefore, the improvement of energy efficiency and the development of **environmentally friendly technologies** is expected to be a high priority.

In Option 1 the **coordination necessary to align** industry with other EU policies and commit to their implementation might be limited.

The overall potential of the Option to generate societal and environmental impacts is expected to be high (++) compared to the baseline with the exception of impact 'Implementation of EU policies (green and digital transition, technology sovereignty) according to the European values and ambitions' which is expected to be good (+) compared to the baseline. See table 6.

Option 3: Institutionalised European Partnership under Article 187 TFEU

An institutionalised Art. 187 partnership with a **long-term strategy** agreed between public and private members can ensure that **societal and environmental** aspects are addressed in the later stages of R&D and in the preparation for industrialisation.

Joint **public-private priorities** of societal relevance include the development of technologies supporting **security, safety and trust**, ensuring their availability in the digital transition of systems and services.

The **portfolio approach** of this option would support a balanced coverage of **citizen-centred technological solutions** together with others that focus on performance, sustainability, etc.

Public-private priorities of societal relevance also include skills and education policies. There is a clear shortage of engineering and ICT skills in microelectronics that needs to be addressed. Increased collaboration between academia and industry can facilitate on-the-job learning; research ministries can facilitate support programs for Masters, PhDs, and internships in these areas.

A **tripartite model** with the participation of Member States would bring to an institutionalised partnership national experiences, **expanding and diversifying the scope** of societal challenges addressed and approaches taken.

In addition to commercial interests, **the strong coordination and central management** of this option and the key role of the Commission and the Participating States would enable closer alignment to EU policies, including by establishing coordination with relevant partnerships and, improving on the current experience in ECSEL, by steering the SRIA towards those policy objectives.

As shown in the existing ECSEL JU, the **high volume of public and private resources** that this option can mobilise will help the development of technologies and their integration in a broad number of sectors and applications.

Therefore, the overall potential of the Option to generate both societal and environmental impacts related to security and alignment with EU policies is expected to be high (++) compared to the baseline.

Summary

Table 6 below lists the scores assigned for each of the policy options to reach the various impacts. Scores are based on the assessments above, as well as on the views expressed by the different stakeholders.

Table 6: Overview of the options' effectiveness compared to the baseline - Societal impacts

	Option 0: Horizon Europe calls	Option 1: Co- programmed	Option 3: Institutionalised Art 187
European systems and services providing high levels of privacy and security through the use of European digital technologies	0	++	++
Implementation of EU policies (green and digital transition, technology sovereignty) according to the European values and ambitions	0	+	++
Electronic components and systems industries and vertical industries progressively reduce their negative environmental impact	0	++	++

Notes: Score ++: Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

Assessment of directionality and additionality

As argued in the problems and drivers sections for both the European electronic ecosystem and the vertical industries that depend on these technologies for their competitiveness, the main challenge is Europe's ability to retain leadership and address technological sovereignty while facing severe competition from other regions, in particular China and US. The KDT initiative is expected to play a pivotal role in tackling the challenge by strengthening technological leadership of Europe in electronic components and systems, ensuring the supply of secure and energy-efficient components and systems for critical infrastructures and sectors, and ensuring the coordination and integration of R&I efforts by companies, national research communities and ecosystems that connect their long-term investment to the European and global value chains and networks. The development of a shared European vision, set together with the Commission and the Participating States, with a coordinated research agenda and a central management system aligned with EU, national and industry priorities and strategies is necessary for exploiting synergies. Also the commitment of the initiative members to enable the pooling of resources and the leverage effects is necessary to support the activities that would generate the expected impacts. Thus, the option that offers the highest level of directionality and additionality will maximise the economic and technological impacts of the initiative.

6.2. Efficiency

In order to compare the policy options consistently in terms of their efficiency, a standard cost model was developed for the external study supporting the impact assessment for the set of candidate Institutionalised Partnerships. The model and the underlying assumptions and analyses are set out in the Common Part of this impact assessment, Section 2.3.2 and in the Methodology Annex 4. A dedicated Annex 3 also provides more information on who is affected and how by this specific initiative in line with the Better Regulation framework. The scores related to the costs set out in this context allow for a "value for money" analysis (cost-effectiveness) in the final scorecard analysis in Section 6.4.

In addition, for this specific initiative under the baseline scenario of traditional calls, there would be winding down and social discontinuation costs for the existing implementation

structure of the current Article 187 initiative ECSEL. The JU statutes¹⁰⁹ foresee a 4-year winding down period to manage projects launched in the last phase of the JU and running beyond 31st December 2020.¹¹⁰

There would be also ‘intangible costs’ associated to the JU discontinuity. It will be difficult to justify a lower intensity of EU support in R&I to the components and systems industry at a moment in which access in Europe to key digital technologies is becoming critical and when other regions (China, US, Korea) are receiving substantial public support that goes beyond R&I.

Discontinuity of the ECSEL JU will represent administrative savings of €5.53 million/year (of which 50% contribution by the EC), with the exception of the 2021-24 period as indicated above. It is estimated that the overall longer term cost savings from using traditional calls (or a co-programme model) instead of an existing Article 187 initiative would considerably exceed the costs incurred for winding down operations. This overall situation is set as the starting point for the comparison of options. The score of this baseline scenario (traditional Horizon Europe calls) is set to 0 to be used as a reference point.

On this basis, the scores for the costs of the different options range from a value of 0, in case an option does not entail any additional costs compared to the baseline, to a score of (-) when an option introduces limited additional costs when compared to the baseline and a score of (-)(-) when substantial additional costs are expected in comparison with the baseline. In case the scores are lower than for the baseline scenario, (+) and (+)(+) are used.

The intensity of additional costs for specific items for the various options as compared to the baseline, i.e. Option 0 (Horizon Europe calls) is presented in Figure 4 in the overview of the methodology (Section 2.3. in the common part of this report).

It is considered therefore that there is a clear gradation in the **overall costs** of the policy options, this is reflected in the scores assigned to baseline (0), co-programme (0) and Article 187 (-)(-) scenarios. The cost differentials, however, are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. Indeed, in terms of cost-efficiency, the Co-Programmed Partnership (Option 1) is 2 percentage points more efficient than the baseline; and an Article 187 Partnership is 2 percentage points less cost-efficient than the baseline. A score of (+) is therefore assigned for **cost-efficiency** to the Co-Programmed options and a score of (-) for the Institutionalised Partnership policy option¹¹¹.

It should be noted that the potential for the creation of crowding-in effects for industry has been taken into account when assessing the effectiveness of the policy options, above.

When assessing efficiency, the financial contribution of Member States to the candidate KDT JU as well as the industrial commitment need to be taken into account. Based on the existing JU experience¹¹² and on-going consultation with Member States and Industry Associations, it is intended (see sub-section 4.4.3) that the envisaged initiative in KDT

¹⁰⁹ Council Regulation (EU) No 561/2014 of 6 May 2014 establishing the ECSEL Joint Undertaking

¹¹⁰ The administrative cost planned for the management of ECSEL legacy in the period 2021-24 is €10.4 million, to be equally shared by EC and industry members.

¹¹¹ The baseline (traditional calls) is scored 0, as explained above.

¹¹² ECSEL leverage ratios in the period 2014-18: 1€ from EU, 0,9€ from participating states and 2,18€ from private members. ECSEL Annual Activity Report 2018

would generate a leverage effect of 1:3, enabling a critical volume of resources to support actions at the right scale to generate the foreseen impacts.

Table 7 summarises the cost scores.

Table 7: Matrix on ‘overall costs’ and ‘cost-efficiency’

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
Overall cost	0	0	(-)(-)
Cost-efficiency	0	(+)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared with the baseline; score (-)(-) = substantial additional costs compared with the baseline.

6.3. Coherence

6.3.1. Internal coherence

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with other programmes and initiatives under Horizon Europe, in particular European Partnerships.

Option 0: Horizon Europe calls (baseline)

Under this option, coherence between activities in the area of electronic components and systems with activities under Cluster 4 of the Horizon Europe and the other initiatives presented are ensured by the Commission. However, exploitation of synergies between the KDT and other initiatives, such as exchange of knowledge and experience at the level of projects and stakeholders, is limited as it requires an extra layer of coordination beyond the Programme Committees.

Option 1: Co-Programmed

Under the Co-Programmed option, the exploitation of synergies can go beyond the possibilities offered by the baseline option. The Commission can ensure coordination at the level of the research agendas, while the industry associations can proactively bring together projects and stakeholders from various initiatives to work together on common problems or exploit together common challenges.

Therefore, the potential of the Option to generate the expected impact is good (+) compared to the baseline

Option 3: Institutionalised Art 187

The Institutionalised Art 187 partnership can provide the highest level of coordination, as in addition to the role of the Commission, the Participating States and the industry associations there is a central coordination mechanism which can increase the effectiveness of the effort. Since the central management of the partnership (i.e. the Governing Board, with representation of all members) decides on the actions, calls and funding allocation, the KDT partnership could set together with other initiatives joint activities of common interest.

Therefore, the potential of the Option to generate the expected impact is high (++) compared to the baseline

6.3.2. External coherence

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with EU-level programmes and initiatives beyond the Framework Programme and/or national and international programmes and initiatives.

Option 0: Horizon Europe calls (baseline)

In section 4.4.4 several opportunities for collaboration and development of synergies with initiatives and programmes beyond Horizon Europe have been identified. Under this option, some coordination with other European Commission activities is possible at the level of priorities. However, coordination at the level of implementation is somewhat limited or even not feasible.

Collaboration with national or regional initiatives such as national programmes for the support of KDT or a close coordination with regional clusters is difficult to achieve under this option.

Option 1: Co-Programmed European Partnership

Under this option, limited synergies can be established with other Union programmes and industrial strategies. For example, 35% of the budget of Horizon Europe will be supporting the Green Deal.

Therefore, the potential of the Option to generate the expected impact is good (+) compared to the baseline

Option 3: Institutionalised European Partnership under Article 187

The central coordination of this option provides the best scenario for exploitation of synergies with initiatives outside the framework programme, including international programmes. The participation of Member States provides the opportunity for coordination with national programmes and regional clusters. The close interaction in this option between Member States and private partners can support the coordination of national and industry efforts to set up a new IPCEI contributing to EU technological sovereignty, as announced in the Industrial strategy¹¹³.

Beyond Horizon Europe, the Digital Europe Programme (DEP) is of particular interest to the KDT initiative. The central management and the up-front member commitments of an institutionalised partnership would facilitate the planning and coordination of the R&I activities of the envisaged partnership and the capacity building, technology deployment and skills development activities foreseen in the Digital Europe Programme.

Therefore, the potential of the Option to generate the expected impact is high (++) compared to the baseline

Based on the above analysis, table 8 summarise the scores assigned to the various options on internal and external coherence.

Summary

Table 8: Overview of the options' potential for ensuring and maximizing coherence

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
Internal coherence	0	+	++

¹¹³ EU Industrial Strategy. A new Industrial Strategy for a green and digital Europe. 10 March 2020. https://ec.europa.eu/info/strategy/priorities-2019-2024/europe-fit-digital-age/european-industrial-strategy_en

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
External coherence	0	+	++

Notes: Score ++: Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

6.4. Tabular comparison of options and identification of preferred option

Table 9 below, lists the scores assigned for each of the policy options, based on the assessments above, and taking into account the views expressed by the different stakeholders.

Table 9: Scorecard of the policy options for all criteria

	Criteria	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 3: Institutionalised Art 187
Effectiveness	Scientific impacts			
	Europe reinforces its scientific capabilities in emerging fields of electronic components and systems	0	+	++
	Improved cross-border & cross-sector scientific cooperation that strengthen the exchange of knowledge across the ecosystem	0	+	++
	Economic/technological impacts			
	European electronic components and systems industry strengthens its technological leadership and its global competitive position	0	+	++
	Strengthen digital transformation in vertical sectors through electronic components and systems technologies developed in Europe	0	++	++
	Create a dynamic ecosystem of innovation in electronic components and systems with higher and more active involvement of SMEs	0	+	++
	Societal impacts			
	European systems and services providing high levels of privacy and security through the use of European digital technologies	0	++	++
	Implementation of EU policies according to the European values and ambitions	0	+	++
	Electronic components and systems industries and vertical industries progressively reduce their negative environmental impact	0	++	++
	Coherence	Internal coherence	0	+
External coherence		0	+	++
Efficiency	Overall cost	0	0	(-)(-)
	Cost-efficiency	0	(+)	(-)

Notes: Scores for effectiveness and coherence: Score ++: Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline Scores for efficiency: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared with the baseline; score (-)(-) = substantial additional costs compared with the baseline

According to the scorecard in Table 9 the baseline option (Option 0) performs less well against the criteria of effectiveness and coherence compared to Options 1 (Co-Programme) and Option 3 (Institutionalised Art. 187). The higher score of Option 0 in the criterion of overall cost does not weight up against its low scores in all the other dimensions.

When compared with Option 1, Option 3 received the highest scores in effectiveness for most criteria on scientific and economic/technological impacts (in one economic/technological impact at the same level as Option 1). On the criteria for societal/environmental impacts Options 1 and Option 3 have the same scores in two impacts and Option 3 higher in one impact. We can conclude that Option 3 maximises the benefits compared to the other two options.

Option 3 received the lowest score in terms of cost-efficiency. However, the difference with the other two options is not significant (one to two percentage points) and it is largely compensated with the clear benefits in all other criteria.

Weights can be associated to the different criteria to reflect their relative importance in the objectives of the initiative. For this initiative a very important success factor is its impact on the vertical industries. This suggests that higher weights be given to societal/environmental and economic/technological impacts.

On societal and economic/technological impacts, Option 3 scores at the same level or higher than Option 1 and significantly better than Option 0. A higher weight for this impact, therefore, will not change the conclusion that Option 3 offers the highest benefits.

Compared to the other options, Option 3 would:

- Provide a more appropriate structure than the other options to implement a common vision and to achieve the objectives more efficiently (in terms of time and resources).
- Generate overall higher level of all impacts.
- Provide higher levels on internal and external coherence.
- Support integrated large-scale actions (pilots, platforms) with involvement of a large variety of users.
- Stronger involvement of technology users will generate spillover effects on the vertical “user” industries.
- Support a tri-partite model (EU, Participating States and Industry) with financial contributions from the EU and Participating States, mobilising a volume of resources not possible with Horizon Europe calls or a co-programmed partnership.
- Provide greater effectiveness through higher leverage and structuring effects in the ecosystem, creating a critical mass of financial and human resources, attracting more SMEs.
- Improve coherence beyond Horizon Europe and a co-programmed partnership through better coordination with European, national or regional initiatives at the level of priorities and implementation, as well at the level of individual projects or stakeholders.

When considering Option 3 (Institutionalised partnership based on Art. 187) in a bi-partite approach with **European Commission and Industry as members** (i.e. excluding Member States), it is concluded that the **following benefits will be severely limited or fully disappear**:

- ✓ The volume of R&I resources (public funding and industry contribution) supporting the initiative would be reduced to 50%. This would substantially limit the ambitions of the KDT initiative, and in particular the industrial actors, in a scenario of increasing competition from other regions.

- ✓ The integration of European and national priorities in electronic components and systems under a unified strategy at EU level will not be fully implementable.
- ✓ The coherence of the initiative at the European (Horizon Europe and beyond) and national levels would diminish in scope and efficiency.
- ✓ The needs of users will not be taken into account
- ✓ Enhancing technology sovereignty which requires a critical mass of efforts at both demand and supply sides will no longer be realistic as a goal.
- ✓ The coexistence of EU and national initiatives in the area will create fragmentation of actions and stakeholders, and will weaken the ecosystem of electronics components and systems technologies which is critical to maintain a strong industrial base in Europe.
- ✓ The contribution of the initiative to EU political priorities, notably to ‘A Europe fit for the Digital Age’ and to the ‘European Green Deal’, would be lowered if Member States are not actively involved in the initiative.

The above assessment concludes that Option 3, **Institutionalised Partnership based on TFEU Article 187** in a tri-partite configuration with European Commission, Participating States and Industry is the preferred option, showing **higher levels of impacts and coherence** than the other options that largely compensate the lower cost-efficiency of the Option.

The Institutionalised Partnership Art 187 is subject to a legal framework set out in a Council Regulation, which defines the objectives and the resources contributed by partners in relation to the proportion of EU funding. The partnership is steered by a governing board with representation of all partners, i.e. the private sector, represented by industry associations, representatives of all Participating States and the Commission. The operation is managed by a central structure supporting, among other things, the development of a long-term strategy and the specification of annual work programmes delivered through projects through open calls.

As it was unanimously agreed by stakeholders interviewed, Option 3 can ensure the highest possible commitment of industry and Member States around a strategic agenda. At the same time, the alignment with the EU policy is ensured by the participation of the Commission in the management of the partnership. The calls are designed by the management of the partnership according to the work programme with the highest possible alignment with the industry’s strategy. The central coordination of the selection of the projects will result in a stronger and more coherent research portfolio. Therefore, the potential to achieve the required directionality is high.

Based on the assessment in chapter 6, we conclude that Institutionalised Partnership based on Article 187 TFEU is the preferred option for the KDT initiative.

This option

- ensures that the electronic components and systems industry, including all segments of the European ecosystem, is taking a leading role and it is fully engaged in the implementation of the initiative.
- ensures the highest possible coordination of research agendas (including national ones) and mobilisation of resources that are necessary for the creation of the critical mass that is necessary for achieving the ambitious initiative objectives.
- provides the highest level of commitments from public and private members
- provides a stable structure and simplified administrative procedures to sustain a long-term planning that attracts major stakeholders as well as SMEs

- offers the highest possible coordination and coherence with other initiatives of Horizon Europe, as well as external initiatives.
- favours the alignment of the initiative with the EU priorities through the involvement of European and national authorities

Finally the preferred option provides flexibility in the definition and implementation of priorities through the annual revision of the strategic agenda and the efficient decision process through a central management. This makes the Institutionalised Partnership based on Article 187 TFEU best suited for the KDT initiative to respond to future technological changes and to new political priorities.

Comparison between the preferred option & the current partnership existing in the area taking into account lessons from past evaluations	
What continues	What is different
<ul style="list-style-type: none"> • A focus on electronics components and systems • An industry-driven R&I programme • High-quality science and research actions • A tri-partite (EC, Participating States, Industry) model • A governance model with a Public Authorities Board (EC and PS) and a Governing Board (EC, PS and Industry) • The Joint Undertaking support office • The combination of EU and national financing (50/50) • The industrial commitment to match public funding 	<ul style="list-style-type: none"> • A broader coverage of electronic value-chains, involving technology supply- and user-sides • A more effective participation of SMEs and start-ups • A more active involvement of users in early phases of research • A more strategic approach to R&I actions following a set of priorities established by industry, Commission and Participating States • A closer alignment to European political priorities such as environment, societal and digital transformation objectives • Increased flexibility in addressing technology change • A stronger focus on emerging technologies • A closer follow-up of project impacts • A stronger interaction with relevant partnerships • A larger set of Participating States* • A simplified set of rules and participation criteria for the Participating States* <p><i>* Currently in discussion with Member States</i></p>

7. THE PREFERRED OPTION – HOW WILL ACTUAL IMPACTS BE MONITORED AND EVALUATED?

7.1. The preferred option

In Table 10, below, the alignment of the preferred option of Institutionalised European Partnership under Article 187 TFEU with the selection criteria for European Partnerships defined in Annex III of the Horizon Europe Regulation is depicted. Seeing that the design process of the candidate Institutionalised Partnerships is not yet concluded and several of the

related topics are still under discussion, the criteria of additionality/directionality and long-term commitment are covered in terms of *expectations* rather than ex-ante demonstration.

Table 10: Alignment with the selection criteria for European Partnerships

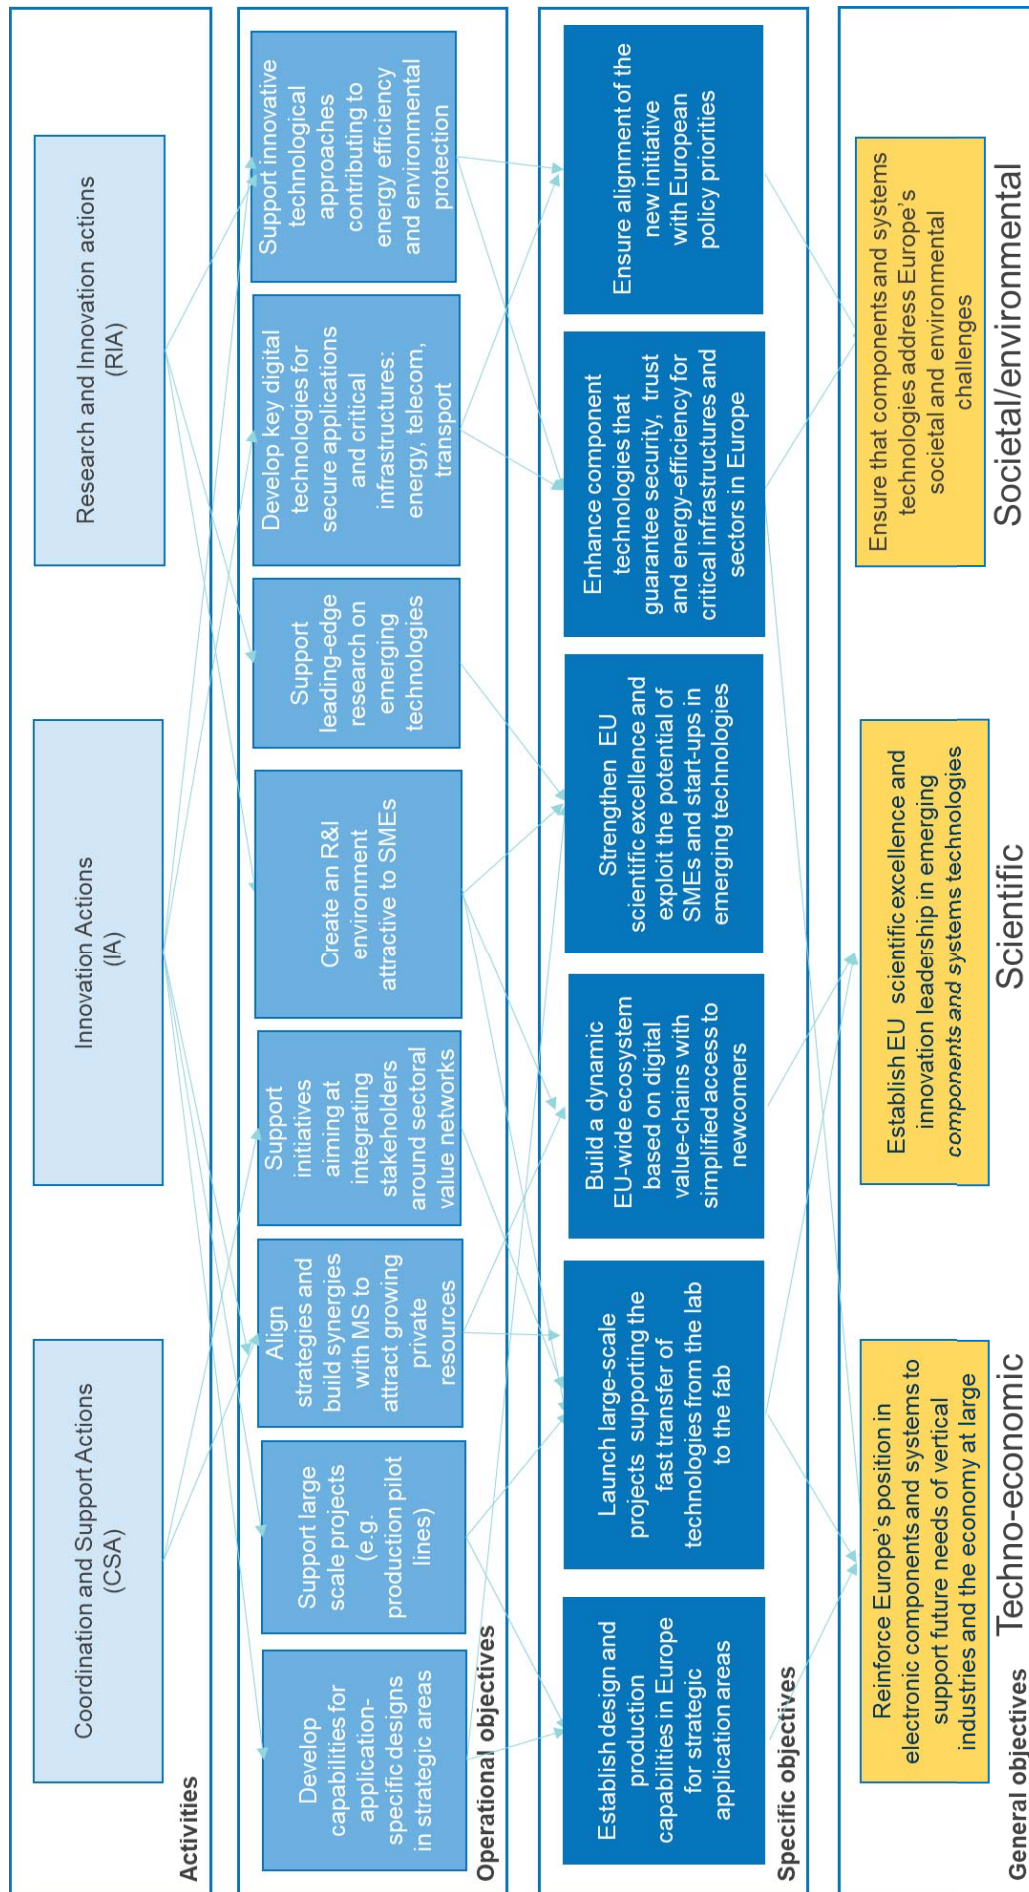

Criterion	Alignment of the preferred option
Higher level of effectiveness	According to the assessment in chapter 6, an Article 187 TFEU partnership will be more effective in increasing the competitive position of the electronic components and systems and the downstream industries, establish the European leadership in emerging technologies and securing the technological sovereignty of Europe
Coherence and synergies	Article 187 TFEU partnership provides the necessary conditions for coordination and creating synergies with other internal or external initiatives and also for developing the electronic ecosystem. The participation of the EC in the governance structure of the partnership ensures the alignment of the objectives with the Horizon Europe objectives and the EU priorities, while the central management structure can effectively coordinate with other partnerships and European initiatives.
Transparency and openness	The management framework and the tripartite character of the partnership ensure transparency and openness in terms of participation.
Additionality and directionality	The partnership would be able to assemble contributions from the EU, Participating States and private members in a tripartite model. This would create the critical mass of resources necessary to address the ambitious objectives of the partnership. The partnership would also be able to develop a coherent, long-term European strategy for the development of the electronic ecosystem and its technological capabilities. The ambition is to establish leadership in emerging technologies, secure the sovereignty of Europe in electronic components and systems and further strengthen its competitive position in strategic sectors that rely on electronic components and systems.
Long-term commitment	The partnership would encourage long-term commitment of financial and in-kind resources from Participating States and private members. Based on the experience of ECSEL and on-going consultations the partnership is expected to ensure a financial contribution from Participating States up to 25% and a contribution from the private sector at least equal to 50% of the aggregated European Partnership budget.

7.2. Objectives and corresponding monitoring indicators

Operational objectives

The Figure 13 identifies a broad range of activities and operational objectives that can be implemented under Horizon Europe. This reflects the definition of European Partnerships in the Horizon Europe Regulation as initiatives for which the Union and its partners “commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”

Figure 13: Operational objectives of the initiative

Monitoring indicators

In addition to Key Impact Pathways indicators set centrally in the Regulation of Horizon Europe, a number of short, medium and long-term monitoring indicators have been identified to measure progress of the partnership towards its objectives. See Table 11.

Table 11: Monitoring indicators in addition to the Horizon Europe key impact pathway indicators

Objectives	Impacts	Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
Establish EU scientific excellence and innovation leadership in emerging components and systems technologies	Scientific impact – Europe reinforces its scientific capabilities in emerging fields of electronic components and systems	Number of projects with one or more publications Number of peer reviewed publications produced by the partnership	Share of publications produced by the partnership in journals within the upper 25% based on Field-weighted Citation index	Number and share of peer reviewed publications from the partnership projects that are core contribution to the scientific field
	Scientific impact – Improved cross-border and cross-sector cooperation that strengthen the exchange of knowledge across the ecosystem	Number of peer reviewed publications with co-authoring from industry and academia (Universities, research organisations)	Field-weighted citation index of peer reviewed publication with co-authoring from industry and academia	Number and share of peer reviewed publications from projects that are core contributions to scientific field with co-authoring from industry and academia
Reinforce Europe’s position in electronic components and systems to support future needs of vertical industries and the economy at large	Technological / economic impact – Strengthen digital transformation in vertical sectors through electronic components and systems technologies developed in Europe	Number of IPs, new products or services digitised with European technologies	Number/Share of supported companies successfully launched new digitised products and services	World market share of Europe in the supported segments due to the initiative
	Technological / economic impact - European electronics components and systems industry strengthened its technological leadership and its global competitive position	Contribution of the initiative to the various market segments of electronic components and systems	Global market share of Europe in the various market segments of electronic components and systems	Evolution of world market share of Europe in electronic components and systems segments due to the initiative
	Technological / economic impact – Create a dynamic ecosystem of innovation in electronic components and systems with higher and more active involvement of SMEs	Number of SMEs involved in research and innovation actions in the initiative and associated funding	Participation (number of partners) and percentage of funding to SMEs in the initiative	Market share differential of SMEs through their participation in the KDT initiative
Ensure that components and systems technologies address Europe’s societal and environmental challenges	Societal impact – European systems and services providing high levels of privacy and security through the use of European digital technologies	Number of technologies (chips, components, systems, applications) with high levels of security and privacy developed in selected projects	Number of technologies in the value chains (chips, components, systems, applications) with reduced consumption of energy developed by supported projects and reached the market	Market share of new products with enhanced security and privacy
	Societal impact – Implementation of EU policies (digital transition, technological sovereignty) according to the European values and ambitions	Number of projects with a direct link to the EU policy objectives	Number of project outcomes making a specific and measurable contribution to EU policies	Share of products and services specifically developed to align with EU priorities and policies
	Environmental impact – Vertical industries progressively reduce their negative environmental impact	Number of projects with reduction in energy consumption Number of projects addressing improvement of the environmental characteristics of technologies.	Maximum level of energy efficiency achieved in projects Number of applications and services adopting technologies with improved environmental performance	Overall energy efficiency gain due to projects results Share of vertical industries with highly reduced environmental impact through the use of European electronic components and systems supported in projects

7.3. Evaluation framework

The evaluation of the Partnership will be done in full accordance with the provisions laid out in Horizon Europe Regulation Article 47 and Annex III, with external interim and ex-post evaluations feeding into the overall Horizon Europe evaluations. As set in the criteria for European Partnerships, the evaluations will include an assessment of the most effective policy intervention mode for any future action; and the positioning of any possible renewal of the Partnership in the overall European Partnerships landscape and its policy priorities. In the absence of renewal, appropriate measures will be developed to ensure phasing-out of Framework Programme funding according to conditions and timeline agreed with the legally committed partners ex-ante.

Annex 1 Procedural Information

1. LEAD DG, DECIDE PLANNING REFERENCES

Co-Lead DG: Directorate-General for Communications Networks, Content and Technology (CNECT), Directorate-General for Research and Innovation (RTD)

Decide number: PLAN/2019/5389

2. ORGANISATION AND TIMING

Institutionalised partnerships are foreseen in Articles 185 and 187 of the Treaty on the Functioning of the European Union (TFEU). The preliminary agreement on Horizon Europe contained a list of possible areas for institutionalised partnerships based on Article 185 and 187. For each of these areas the Commission considered 12 potential institutionalised partnerships. Their set up involves new EU legislation and the establishment of dedicated implementing structures and therefore an impact assessment for each of these initiatives.

Following political validation in June 2019, the impact assessment process started with the publication of inception impact assessments for each initiative in August 2019.

An inter-service steering group (ISSG) on research and innovation partnerships under Horizon Europe was set up in May 2019 and held 4 meetings before submission of the Staff Working Document to the Regulatory Scrutiny Board (7 May 2019, 19 June 2019, 5 December 2019, 20 January 2020). The ISSG consisted of representatives of the Secretariat-General, Directorate-General for Budget, Directorate-General for Research and Innovation, Directorate-General for Communications Networks, Content and Technology, Directorate-General for Mobility and Transport, Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs, Directorate-General for Energy, Directorate-General for Environment, Directorate-General for Climate Action, and the Legal Service.

An online public stakeholder consultation was launched between September and November 2019, gathering 1635 replies for all 12 initiatives.

3. CONSULTATION OF THE RSB

Two upstream meetings with the Regulatory Scrutiny Board were held on 10 July 2019 and 30 September 2019.

The Staff Working Document was submitted to the Regulatory Scrutiny Board for a hearing that took place on 13 May 2020. In accordance with the feedback received from the Regulatory Scrutiny Board on 15.05.2020 the Staff Working Document has been revised as presented in Figure 1. These revisions were endorsed by the Inter Service Steering Group on 10 June 2020.

4. EVIDENCE, SOURCES AND QUALITY

To ensure a high level of coherence and comparability of analysis for all candidate initiatives, an external study was procured to feed into the impact assessments of the 12 candidate

institutionalised partnerships¹. It consisted of a horizontal analysis and individual thematic analyses for each of the initiatives under review.

For all initiatives, the evidence used includes desk research partly covering the main impacts and lessons learned from previous partnerships. A range of quantitative and qualitative data sources complement the evidence base, including evaluations; foresight studies; statistical analyses of Framework Programmes application and participation data and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options. Public consultations (open and targeted) supported the comparative assessment of the policy options. For each initiative up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation (Sep – Nov 2019), the consultation of the Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of candidate Institutionalised European Partnerships.

A more detailed description of the methodology and evidence base used, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

Figure 1 Modifications to the draft Staff Working Document based on comments received from the Regulatory Scrutiny Board

Comments from the Regulatory Scrutiny Board	Actions taken for the Staff Working Document
The report pre-selects certain sectors and technologies for support, instead of setting out the best partnership approach for promoting a competitive innovation environment.	The revised text in section 4 (Objectives) makes clear that there are no preselected priorities, neither for specific technologies nor specific sectors. It describes the preparation of what would constitute the Strategic Research and Innovation Agenda (SRIA). This is where sectors, technologies and applications would be identified and updated annually based on technological trends and political priorities. The preparation itself would be done through an inclusive and multi-stakeholder participative process.
The dividing lines between this partnership and other initiatives that support research and innovation in the ICT sector are not clear.	The differences in scope and the interactions foreseen with relevant partnerships and initiatives, both digital-centric and related applications, are now addressed in section 1.3. The strategic importance of building and maintaining these interactions under the current and future European policies and

¹ Technopolis Group, 2020, forthcoming.

	priorities is highlighted.
The report does not sufficiently integrate the mid-term evaluation findings of the existing Joint Undertaking into the problem description and the intervention logic.	Conclusions and recommendations from the mid-term evaluation of the existing JU are described in the box “Support to the field in the previous Framework Programme – Key strengths and weaknesses identified”. They have been taken into consideration, and integrated into the problem definition and intervention logic (sections 2.1, 4.3 and 4.4). Moreover, specific actions are identified addressing the main findings of the mid-term evaluation.
The report does not score the options in a consistent way. It does not justify how it weighs the different impacts when arriving at the preferred option.	The justifications and the accompanying scores corresponding to the various impacts in the analysis of options have been reviewed (in both the text and the tables section 6) and checked for consistency. The section includes an updated comprehensive comparative assessment of all options under consideration.
Additional comments	Actions taken for the Staff Working Document
How would the partnership differ from the existing Joint Undertaking?	The table in Section 6 describing the differences between the envisaged initiative and the existing JU (‘what continues’ and ‘what is different’ columns) have been updated. In section 1 and throughout the report the differences between the candidate KDT and existing ECSEL are also highlighted.
What ways are envisaged to help materialise a co-financing of 1:3, given the uncertainties surrounding the overall budget and design of the partnerships? How can these risks be mitigated?	The 1:3 leverage target is based on the ECSEL experience and feedback received in recent consultations with Member States and industry associations. The report now describes how the 1:3 leverage is achieved in ECSEL (section 1.2). The ambition is that the KDT initiative achieve a similar target (Sections 4.4 and 6.2). This depends ultimately on how this can be implemented under HE and is still pending internal discussion.
The IA should report stakeholders’ views, in particular those of relevant minorities. It should also appropriately treat the views of respondents considered as participating in a ‘campaign’.	A ‘campaign’ of 20 respondents has meanwhile been identified in the open public consultation (OPC). These responses have been omitted in the OPC analysis. They have been treated and reported separately. Stakeholder opinions from OPC and interviews are included in relevant parts of the Impact Assessment, now including minority views with indication of type of supporting stakeholders.

Recommendations accompanying positive opinion	Actions taken for the Staff Working Document
Substantiate further the societal impacts of the preferred option and its scoring	The societal impacts associated to the long-term planning, the portfolio approach and tripartite model of the preferred option (institutionalised partnership based on Art. 187) have been elaborated further. They cover joint public-private societal priorities, a balanced set of projects that address societal challenges, and the contribution to the initiative of national societal impacts through the involvement of Participating States. The scoring associated to the preferred option (++) Option presenting a high potential compared to the baseline) has been further justified on the basis of the elements provided in the analysis of societal impacts for the various options. See Pages 66-68.
Clarify interactions with projects and recently announced EU policies and priorities	Details have been included on interaction with specific policies announced recently (data strategy, industrial strategy) and initiatives (recovery plan for Europe). Also the interactions with Horizon Europe have been elaborated further as well as with relevant partnerships (AI, data and robotics). See P. 33-34
Address uncertainties of funding level and ways to cope with potential lower financing	The fact that the financing level is uncertain at the time of writing the assessment is addressed by proposing ways to ensure a sound match between the scope and objectives of the initiative and the overall amount of resources allocated. See P. 55
Report in a more consistent way the minority views	Stakeholder opinions are included throughout the assessment. This includes views expressed by stakeholders in response to the open public consultation or at interviews conducted in the context of the supporting study. Minority views (with indication of type of stakeholders) have been more consistently reported next to the dominating opinions. See the blue boxes throughout the document..

The table above summarises modifications introduced in the revised KDT Impact Assessment to address the comments received with the RSB Opinion and issues raised at the Impact Assessment Quality Checklist as well as comments received at the RSB hearing.

Annex 2 Stakeholder Consultation

1. OVERVIEW FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1.1. Introduction

In line with the Better Regulation Guidelines,² the stakeholders were widely consulted as part of the impact assessment process of the 12 candidates for institutionalised partnerships, including national authorities, the EU research community, industry, EU institutions and bodies, and others. These inputs were collected through different channels:

- A feedback phase on the inception impact assessments of the candidate initiatives in August 2019, gathering 350 replies for all 12 initiatives on the “Have your say” web portal during a period of 3 weeks;
- A structured consultation of Member States performed by the EC services over 2019 through the Shadow Strategic Configuration of the Programme Committee of Horizon Europe (in line with the Article 4a of the Specific Programme of Horizon Europe). This resulted in 44 possible candidates for European Partnerships identified as part of the first draft Orientations Document towards the Strategic Plan for Horizon Europe (2021-2024), taking into account the areas for possible institutionalised partnerships defined in the Regulation.
- An online public stakeholder consultation administered by the EC, based on a structured questionnaire, open between September and November 2019, gathering 1635 replies for all 12 initiatives;
- A targeted consultation run by the external study contractors with a total of 608 interviews performed as part of the thematic studies by the different study teams between August 2019 and January 2020.

1.2. Horizontal results of the Open Public Consultation

The consultation was open to everyone via the EU Survey online system.³ The survey contained two main parts to collect views on general issues related to European partnerships (in Part 1) and specific responses related to one or more of the 12 candidate initiatives (as selected by a participant). The survey was open from 11 September till 12 November 2019. The consultation was available in English, German and French and advertised widely through the European Commission’s online channels as well as via various stakeholder organisations.

1.2.1. Profile of respondents

In total, 1635 respondents filled in the questionnaire of the open public consultation. Among them, 272 respondents (16.64%) were identified to have responded to the consultation as part of a campaign (coordinated responses). Based on the Better Regulation Guidelines, the groups of respondents where at least 10 respondents provided coordinated answers were labelled as ‘campaigns’, segregated and analysed separately and from other responses. In total 11 campaigns were identified, the largest of them includes 57 respondents⁴. In addition, 162

² https://ec.europa.eu/info/files/better-regulation-guidelines-stakeholder-consultation_en

³ <https://ec.europa.eu/eusurvey/runner/ConsultationPartnershipsHorizonEurope>

⁴ The candidate Institutionalised Partnership Clean Hydrogen has the highest number of campaigns, namely 5. A few initiatives, such as Innovative SMEs, Smart Networks and Systems, were not targeted by campaigns. Some campaign respondents decided to provide opinions about several partnerships.

respondents in the consultation also display similarities in responses but in groups smaller than 10 respondents. Hence, these respondents were not labelled as campaigns and therefore were not excluded from the general analysis.

Table 1: Country of origin of respondents (N=1635)

Country	Number of respondents	Percentage of respondents
Germany	254	15.54%
Italy	221	13.52%
France	175	10.70%
Spain	173	10.58%
Belgium	140	8.56%
The Netherlands	86	5.26%
Austria; United Kingdom	61	3.73%
Finland	49	3.00%
Sweden	48	2.94%
Poland	45	2.75%
Portugal	32	1.96%
Switzerland	28	1.71%
Czechia	24	1.47%
Greece	23	1.41%
Norway; Romania	22	1.35%
Denmark	20	1.22%
Turkey	19	1.16%
Hungary	14	0.86%
Ireland	12	0.73%
United States	11	0.67%
Estonia; Slovakia; Slovenia	10	0.61%
Bulgaria; Latvia	9	0.55%
Bosnia and Herzegovina	7	0.43%
Lithuania	4	0.24%
Canada; Croatia; Israel	3	0.18%
China; Ghana; Iceland; Japan; Luxembourg; Morocco	2	0.12%
Bhutan; Botswana; Cyprus; Iran; Malta; Mexico; Moldova; Mongolia; Palestine; Russia; Serbia; South Africa; Tunisia; Ukraine; Uruguay	1	0.06%

As shown in Figure 2, the three biggest **categories of respondents** are representatives of companies and business organisations (522 respondents or 31.9%), academic and research institutions (486 respondents or 29.7%) and EU citizens (283 respondents or 17.3%). Among the group of respondents that are part of campaigns, most respondents are provided by the same groups of stakeholders, namely company and business organisations (121 respondents or 44.5%), academic and research institutions (54 respondents or 19.8%) and EU citizens (42 respondents or 15.4%).

Figure 2 Type of respondents (N=1635) - For all candidate initiatives

Among all consultation respondents, 1303 (79.69%) have been **involved in the on-going research and innovation framework programme** Horizon 2020 or the preceding Framework Programme 7, while 332 respondents (20.31%) were not. In the group of campaign respondents, the share of those who were involved in these programmes is higher (245 respondents out of 272 or 90.07%) than in the group of non-campaign respondents (1058 out of 1363 or 77.62%). When respondents that participated in the Horizon 2020 or in the preceding Framework Programme 7 were asked to indicate in which capacity they were involved in these programmes, the majority stated they were a beneficiary (1033 respondents) or applicant (852 respondents). The main stakeholder categories, e.g. companies/business organisation, academic/research institutions, etc., show a similar distribution across the capacities in which they ‘have been involved in Horizon 2020 or in the Framework Programme 7’ as the overall population of consultation respondents.

Among those who have been involved in Horizon 2020 or the preceding Framework Programme 7, 1035 respondents (79.43%) are/were **involved in a partnership**. The share of respondents from campaigns that are/were involved in a partnership is higher than for non-campaign respondents, 89.80% versus 77.03% respectively. The list of partnerships under Horizon 2020 or its predecessor Framework Programme 7 together with the numbers, percentages of participants is presented in Table 4, the table also show the key stakeholder categories for each partnership. Most consultation respondents participated in the following partnerships: Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, Clean Sky 2 Joint Undertaking, European Metrology Programme for Innovation and Research (EMPIR) and in Bio-Based Industries Joint Undertaking. The comparison between the non-campaign and campaign groups of respondents shows that the overall distribution is quite similar. However, there are some differences. For the campaign group almost a half of respondents is/was involved in the Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, a higher share of campaign respondents is/was participating in Clean Sky 2 Joint Undertaking and in Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking.

When respondents were asked in which **role(s) they participate(d) in a partnership(s)**, over 40% indicated that they act(ed) as partner/member/beneficiary in a partnership. The second largest group of respondents stated that they applied for funding under a partnership. The roles selected by non-campaign and campaign respondents are similar.

Table 4: Partnerships in which consultation respondents participated (N=1035)

Name of the partnership	Number and % of respondents from both groups (n=1035)	Number and % of respondents from a non-campaign group (n=815)	Academic/research institutions	Business associations	Company/business organisations	Company/business organisations	EU citizens	NGOs	Public authority
Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking	354 (33.33%)	247 (30.31%)	97	9	37	43	41	8	5
Clean Sky 2 Joint Undertaking	195 (18.84%)	145 (17.79%)	57	2	10	27	37	1	7
European Metrology Programme for Innovation and Research (EMPIR)	150 (14.49%)	124 (15.21%)	64	0	13	9	14	2	19
Bio-Based Industries Joint Undertaking	142 (13.72%)	122 (14.97%)	39	8	20	27	14	1	6
Shift2Rail Joint Undertaking	124 (11.98%)	101 (12.40%)	31	7	5	31	14	3	7
Electronic Components and Systems for European Leadership (ECSEL) Joint Undertaking	111 (10.72%)	88 (10.80%)	42	2	7	20	12	0	5
Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking	66 (6.38%)	46 (5.64%)	10	3	3	20	3	2	3
5G (5G PPP)	53 (5.12%)	47 (5.77%)	20	1	6	14	5	0	1
Eurostars-2 (supporting research-performing small and medium-sized enterprises)	44 (4.25%)	40 (4.91%)	17	0	6	1	7	0	6
Innovative Medicines Initiative 2 (IMI2) Joint Undertaking	37 (3.57%)	35 (4.29%)	18	2	3	3	2	4	3
Partnership for Research and Innovation in the Mediterranean Area (PRIMA)	28 (2.71%)	26 (3.19%)	15	0	3	1	2	0	2
European and Developing Countries Clinical Trials Partnership	25 (2.42%)	24 (2.94%)	12	0	1	2	3	3	2
Ambient Assisted Living (AAL 2)	22 (2.13%)	21 (2.58%)	11	2	1	1	3	0	3
European High-Performance Computing Joint Undertaking (EuroHPC)	22 (2.13%)	18 (2.21%)	6	0	2	3	5	0	2

For the remaining of the consultation, respondents could provide their views on each/several of the candidate initiatives. The majority of respondents (31.4%) provided their views on the

Clean Hydrogen candidate partnership. More than 45% of respondents from the campaigns selected this partnership. Around 15% provided their views for European Metrology, Clean Aviation and Circular Bio-based Europe. The share of respondents in the campaign group that chose to provide views on the Clean Aviation candidate partnership is of 20%. The smallest number of respondents provided opinions on the candidate initiative ‘EU-Africa research partnership on health security to tackle infectious diseases – Global Health’.

Table 5: Candidate Institutionalised Partnerships for which consultation respondents provide responses (N=1613)

Name of the candidate Institutionalised European partnership	Number and % of respondents from both groups (n=1613)	Number and % of respondents from a non-campaign group (n=1341)
Clean Hydrogen	506 (31.37%)	382 (28.49%)
European Metrology	265 (16.43%)	225 (16.78%)
Clean Aviation	246 (15.25%)	191 (14.24%)
Circular bio-based Europe	242 (15%)	215 (16.03%)
Transforming Europe’s rail system	184 (11.41%)	151 (11.26%)
Key Digital Technologies	182 (11.28%)	162 (12.08%)
Innovative SMEs	111 (6.88%)	110 (8.20%)
Innovative Health Initiative	110 (6.82%)	108 (8.05%)
Smart Networks and Services	109 (6.76%)	107 (7.98%)
Safe and Automated Road Transport	108 (6.70%)	102 (7.61%)
Integrated Air Traffic Management	93 (5.77%)	66 (4.92%)
EU-Africa research partnership on health security to tackle infectious diseases – Global Health	49 (3.04%)	47 (3.50%)

1.2.2. Characteristics of future candidate European Partnerships

Respondents were asked to assess what areas, objectives, aspects need to be in the **focus of the future European Partnerships** under Horizon Europe and to what extent. According to Figure 6, a great number of respondents consider that a significant contribution by the future European Partnerships is ‘fully needed’ to achieve climate-related goals, to the development and effective deployment of technology and to EU global competitiveness in specific sectors/domains. Overall, respondents’ views reflect that many aspects require attention of the Partnerships. The least attention should be paid to responding towards priorities of national, regional R&D strategies, including smart specialisation strategies, according to respondents.

Overall, only minor differences can be found between the main stakeholder categories. Academic/research institutions value the responsiveness towards EU policy objectives and focus on development and effective deployment of technology a little less than other respondents. Business associations, however, find that the future European Partnerships under Horizon Europe should focus a little bit more on the development and effective deployment of technology than other respondents. Furthermore, business associations, large companies as well as SMEs value the role of the future European Partnerships for significant contributions to EU global competitiveness in specific sectors domains a little higher than other

respondents. Finally, both NGOs and Public authorities put a little more emphasis on the role of the future European Partnerships for significant contributions to achieving the UN SDGs. The views of citizens (249, or 18.3%) do not reflect significant differences with other types of respondents. However, respondents that are/were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7 assign a higher importance of the future European Partnerships to be more responsive towards EU policy objectives and to make a significant contribution to achieving the UN’s Sustainable Development Goals.

A qualitative analysis of the “other” answers highlights the importance of collaboration and integration of relevant stakeholders to tackle main societal challenges and to contribute to policy goals against which fragmentation of funding and research efforts across Europe should be avoided. Additionally, several respondents suggested that faster development and testing of technologies, acceleration of industrial innovation projects, science transfer and market uptake are needed. Next to that, many respondents provided answers related to the hydrogen and the energy transition, which corresponds to the high number of respondents that provided answers to the candidate initiative on this topic.

Figure 6: To what extent do you think that the future European Partnerships under Horizon Europe need to (N=1363) (non-campaign replies) For all candidate initiatives

1.2.3. Main advantages and disadvantages of Institutionalised European Partnerships

An open question asked to outline the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe (1551 respondents). The advantages mentioned focus on the development of technology, overall

collaboration between industry and research institutions, and the long-term commitment. Disadvantages mentioned are mainly administrative burdens. An overview is provided below.

Advantages mentioned: Long term commitment, stability, and visibility in financial, legal, and strategic terms; Participation of wide range of relevant stakeholders in an ecosystem (large/small business, academics, researchers, experts, etc.); Complementarity with other (policy) initiatives at all levels EU, national, regional; Efficient and effective coordination and management; High leverage of (public) funds; Some innovative field require high levels of international coordination/standardisation (at EU/global level); Ability to scale up technology (in terms of TRL) through collaboration; Networking between members; Direct communication with EU and national authorities.

Disadvantages mentioned: Slow processes; System complexity; Continuous openness to new players should be better supported as new participants often bring in new ideas/technologies that are important for innovation; Lower funding percentage compared to regular Horizon Europe projects; Cash contributions; Administrative burdens; Potential for IPR constraints.

1.2.4. Relevance of EU level to address problems in Partnerships' areas

Respondents were asked to rate the **relevance of research and innovation efforts at EU level efforts to address specific problems in the area of partnerships**. Research and innovation related problems were rated as most relevant across all candidate initiatives, followed by structural and resources problems and problems in the uptake of innovations. Overall, all three areas were deemed (very) relevant across the partnerships, as more than 80% of respondents found these challenges (very) relevant. Only minor differences were found between stakeholder categories. Research and innovation problems were found slightly more relevant by academic/research institutions, yet slight less relevant by large companies and SMEs. Structural and resource problems were indicated as slightly more relevant by NGOs, but slightly less by academic/research institutions. While both NGOs and public authorities find slightly more relevant to address problems in uptake of innovation than other respondents. The views of citizens are not differing significantly. Respondents that are/were directly involved in a current/preceding partnership find, however, the need to address problems related to the uptake of innovations slightly more relevant than other respondents.

Figure 9: To what extent do you think this is relevant for research and innovation efforts at EU level to address the following problems in relation to the candidate partnership in question? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.5. Horizon Europe mode of intervention to address problems

Respondents were asked to indicate how these challenges could be addressed through **Horizon Europe intervention**. Just over 50% of all respondents indicated that institutionalised partnerships were the best fitting intervention, with relatively strong differences between stakeholder categories. The use of Institutionalised Partnership was indicated more by business associations and large companies, but less by academic/research institutions and SMEs. While academic/research institutions valued traditional calls more often, this was not the case for business associations, large companies and public authorities. Public authorities indicated a co-programmed intervention more often than other respondents. Citizens indicated slightly less often that institutionalised partnerships were the best fitting intervention. Respondents that are/were directly involved in a current/preceding partnership, selected the institutionalised partnership intervention in far higher numbers (nearly 70%).

Figure 10: In your view, how should the specific challenges described above be addressed through Horizon Europe intervention? (non-campaign replies) For all candidate initiatives

When asked to reflect on their answers, respondents that pointed to the need for using institutionalised partnership mentioned the long-term commitment of collaboration, a common and ambitious R&I strategy as well as the overall collaboration between industry and research institutions. Others shared positive experiences with other modes of interventions:

- Traditional calls, because of their flexibility and integration of a wide range of actors, as long as the evaluation panels do not deviate from the policy focus. This was mentioned by 94 participants, including companies (25), academics (26) and EU citizens (25).
- Co-funded partnership, as a mechanism to ensure that all participants take the effort seriously, while allowing business partnerships to develop. This approach was deemed suitable based on previous experiences with ERANETs. This was raised by 84 participants, 36 of them academic respondents, 18 companies and 16 EU citizens.
- Co-programmed partnerships, to tackle the need to promote and engage more intensively with the private sector. This was mentioned by 97 participants, most of them companies (34), followed by academics (22), business associations (15) and EU citizens (11).

1.2.6. Relevance of a set of elements and activities to ensure that the proposed European Partnership would meet its objectives

Setting joint long-term agendas

Respondents were asked how relevant it is for the proposed European Partnerships to meet their objectives to have a strong involvement of specific stakeholder groups in setting joint

long-term agenda. All respondents see stakeholders from industry as the most relevant, followed by academia and governments. The involvement of foundations and NGOs as well as other societal stakeholders were, however, still found to be (very) relevant by more than 50% of the respondents. Most respondents indicated the stakeholder group they belong to themselves or that represent them as relevant to involve.

Figure 11: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives - Setting joint long-term agenda with strong involvement of: (non-campaign replies) For all candidate initiatives

Pooling and leveraging resources through coordination, alignment and integration with stakeholders

Respondents were asked how relevant it is for the proposed European Partnership to meet its objectives to pool and leverage resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with specific groups of stakeholders. Respondents see stakeholders from industry as the most relevant, followed by academia and governments (Member States and Associated Countries). The involvement of foundations and NGOs as well as other societal stakeholders are also still found to be (very) relevant for more than 50% of the respondents. Similarly as described for the question on setting joint long-term agendas, most stakeholder categories valued their own involvement higher than other respondents – although also here differences between stakeholder categories were minor.

Figure 12: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Pooling and leveraging resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with: (non-campaign replies) For all candidate initiatives

Composition of the partnerships

Regarding the composition of the partnership most respondents indicated that for the proposed European Partnership to meet its objectives the composition of partners needs to be flexible over time and that a broad range of partners, including across disciplines and sectors, should be involved (see Figure 13). When comparing stakeholder groups only minor differences were found. Academic/research institutions and public authorities found the involvement of a broad range of partners and flexibility in the composition of partners over time slightly more relevant than other respondents, while large companies found both less relevant. SMEs mainly found the flexibility in the composition of partners over time less relevant than other respondents, while no significant differences were found regarding the involvement of a broad range of partners. Citizens provided a similar response to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, indicated a slightly lower relevance of the involvement of a broad range of partners and flexibility in the composition of partners over time.

Figure 13: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Partnership composition (non-campaign replies) Aggregation of responses of all candidate initiatives

Implementation of activities

Most respondents indicated that implementing activities like a joint R&I programme, collaborative R&I projects, deployment and piloting activities, providing input to regulatory aspects and the co-creation of solutions with end-users are all (very) relevant for the partnerships to be able to meet its objectives. Minor differences were found between the main stakeholder categories, the differences found were in line with their profile. As such, academic/research institutions found joint R&I programme & collaborative R&I projects slightly more relevant and deployment and piloting activities, input to regulatory aspects and co-creation with end-users slightly less relevant than other respondents. For SMEs an opposite pattern is shown. Large companies, however, also found collaborative R&I projects slightly more relevant than other respondents, as well as input to regulatory aspects. The views of citizens are similar to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, show a slightly higher relevance across all activities.

Figure 14: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Implementing the following activities (non-campaign replies) For all candidate initiatives

1.2.7. Relevance of setting up a legal structure (funding body) for the candidate European Partnerships to achieve improvements

Respondents were asked to reflect on the relevance of setting up a legal structure (funding body) for achieving a set of improvements, as shown in the Figure below. In general, 70%-80% of respondents find a legal structure (very) relevant for these activities. It was found most relevant for implementing activities in a more effective way and least relevant for ensuring a better link to practitioners on the ground, however differences are small.

Figure 15: In your view, how relevant is to set up a specific legal structure (funding body) for the candidate European Partnership to achieve the following? (non-campaign replies) Aggregation of responses of all candidate initiatives

When comparing stakeholder categories there are only minor differences. Academic/research institutions indicated a slightly lower relevance for transparency, better links to regulators as well as obtaining the buy-in and long-term commitment of other partners. SMEs also indicated a lower relevance regarding obtaining the buy-in and long-term commitment of other partners. Large companies showed a slightly higher relevance for implementing activities effectively, ensure better links to regulators, obtaining the buy-in and long-term commitment of other partners, synergies with other EU/MS programmes and collaboration with other EU partnerships. NGOs find it slightly more relevant to implement activities faster for sudden market or policy needs. Public authorities, however, find it slightly less relevant to facilitate collaboration with other European Partnerships than other respondents. The views of citizens show a slightly lower relevance for a legal structure in relation to implementing activities in an effective way. Respondents that are/were directly involved in a current/preceding partnership indicated a higher relevance across all elements presented.

1.2.8. Scope and coverage of the candidate European Partnerships based on their inception impact assessments

Consulted on the scope and coverage for the partnerships, based on their inception impact assessments, the large majority feels like the scope and coverage initially proposed in the inception impact assessments is correct. However, about 11% to 15% of the respondents indicated the scope and coverage to be too narrow. About 11%-17% of respondents answered “Don’t know”. Overall, differences between the main stakeholder categories were found to be minor. Academic/research institutions indicated slightly more often that the research area was “too narrow” than other respondents. SMEs on the other hand indicated slightly more often that the research area and the geographical coverage were “too broad”. NGOs and public authorities, however, found the geographical coverage slightly more often “too narrow”. Large companies found the range of activities slightly more often “too broad” and the sectoral focus slightly more often “too narrow” when compared to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership more often indicated that the candidate institutionalised European Partnership have the “right scope & coverage”.

Figure 16: What is your view on the scope and coverage proposed for this candidate institutionalised European Partnership, based on its inception impact assessment? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.9. Scope for rationalisation and alignment of candidate European Partnerships with other initiatives

When asked whether it would be possible to rationalise a specific candidate European Institutionalised Partnership and its activities, and/or to better link with other comparable initiatives, nearly two thirds of respondents answered “Yes” (1000, or 62%), while over one third answered “No” (609, or 39%). Nearly no differences were found between stakeholder categories, only large companies and SMEs indicated slightly more often “Yes” in comparison to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership, indicated “No” more often, the balance is about 50/50 between “Yes” and “No” for this group.

1.2.10. Relevance of European Partnerships to deliver targeted scientific, economic/technological and societal impacts

Finally, respondents were asked to rate the relevance of partnership specific impacts in three main areas: Societal; Economic/technological; and Scientific impacts. All three areas were deemed (very) relevant across the candidate partnerships. Scientific impact was indicated as the most relevant impact, more than 90% of respondents indicated that this as (very) relevant. Only minor difference between stakeholder groups were found. Academic/research institutions found scientific impacts slightly more relevant, while large companies found economic and technological impacts slightly more relevant than other respondents. NGOs found societal impact slightly more relevant, while SMEs found this slightly less important. Citizens did not a significantly different view when compared to other respondents. Respondents that are/were directly involved in a current/preceding partnership find all impacts slightly more relevant than other respondents.

Figure 17: In your view, how relevant is it for the candidate European Institutionalised Partnership to deliver on the following impacts? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.3. Stakeholder consultation results for this specific initiative

1.3.1. Scope of the consultation

Key Digital Technologies (KDT) have been identified as one of the Commission's research and innovation initiatives under the Horizon Europe 'Digital, Industry and Space' cluster (Pillar II-Cluster 4). It is proposed to be supported by one of the European Partnerships in the envisaged partnership area of "Advancing key digital and enabling technologies and their use, including but not limited to novel technologies such as Artificial Intelligence, photonics and quantum technologies" (Area 2).

The Commission conducted a series of stakeholder consultations with various stakeholder groups of different levels (e.g. Member States, R&I funding beneficiaries, industry associations, citizens, etc.) to seek views on EU Research and Innovation (R&I), and on the proposed KDT Partnership. In particular, the consultation activities focused on the need for, the scope and coverage, the type and the planned focus of this partnership.

1.3.2. Whom has the Commission consulted

The Commission consulted a wide range of stakeholders (e.g. public authorities, companies, business organisations, academia, research organisations and end-users) to anticipate a broad involvement of interested participants in the partnership. The consultation activities included but were not limited to those which applied for and/or received funding from the current Framework Programme or the interrelated partnership in Electronic Components and Systems for European Leadership (ECSEL), stakeholders from the European ICT and technological domains (current and emerging), and from vertical application areas. These targeted stakeholders were complemented by the identification of additional relevant stakeholders to be consulted, based on an external study undertaken to feed into the impact assessment for each of the potential institutionalised European Partnerships.

In summary, the following type of stakeholders have been consulted:

- The research community, consisting of academic/research institutions such as universities, public government-funded organisations, independent organisations or private research centres.
- The industrial community, which includes large companies, SMEs and Start-ups, material suppliers and equipment manufacturers.
- Public authorities, such as ministries and national bodies for research, EU institutions and bodies.
- EU citizens responding on their own behalf.
- Interested independent authorities and platforms.

representing a vast research, development and user community of nanoelectronics, embedded intelligent systems, smart system integration, semiconductor manufacturing, photonics and integrated software; a convergence of areas of research in KDT.

1.3.3. How has the Commission consulted?

The Commission launched a structured consultation of Member States through the Shadow Strategic Configuration of the Programme Committee Horizon Europe, which provided early

input⁵ into the preparatory work and resulted in 44 possible candidates for European Partnerships, taking into account the identified areas for possible institutionalised partnerships.

In addition, an open public consultation that covered all 12 potential institutionalised partnerships based on Articles 185 and 187 TFEU was launched. This consultation collected input from a broad range of stakeholders, across Europe and associated countries, on both the overall approach and the individual candidates for institutionalised partnerships.

Furthermore, a combination of written consultation tools and direct interactions with stakeholders were put in place, seeking input, views, ideas and experiences. Several (targeted) meetings and stakeholder workshops on the specific issues covered by the proposed partnership were organized to discuss and gather detailed input on various policy options. The identified option in the impact assessment largely builds on the outcome of these consultations with stakeholders.

1.3.4. Feedback received on the Inception Impact Assessment

The inception impact assessment⁶ of the initiative was published for feedback from 30 July 2019 to 27 August 2019, with the aim to seek initial feedback. Seventeen reactions were received on the inception impact assessment, notably from industry associations dealing with electronics components and systems, academic/research institutions, private business organisations, public authorities and citizens.

In summary, the majority of the reactions stressed the need for and emphasized support to such an initiative. According to the feedback received, several respondents asked for a broadening of the scope of the proposed KDT Partnership – e.g. the need to integrate semiconductor-based integrated photonics, selected software technologies (beyond embedded software) and their applications to cover full value chains and networks.

1.3.5. Meetings & Workshops with Stakeholders

From the private sector (Industry, Research, and Academia)

A series of meetings and workshops between the European Commission and key European private organisations have taken place, to discuss potential activities to be covered under a KDT partnership, the requirements and links between suppliers and users of digital technologies, the KDT value chains and application areas where these technologies play an essential role:

On February 1, 2018 in Brussels, high-level representatives of companies and research and technology organisations (RTOs) active in semiconductor technology met with Mariya Gabriel, the Commissioner for Digital Economy and Society, to discuss a consolidated set of strategic measures for electronics value chains in Europe. The outcome of this meeting – together with a series of specific KDT value chain workshops/consultations (March-April 2018) on automotive, health, space/aeronautics, security, hardware for AI, robotics and automation - resulted in a report: ‘Boosting Electronic Value Chains in Europe’⁷. The report

⁵ European Partnerships under Horizon Europe: results of the structured consultation of Member States (Report)

⁶ https://ec.europa.eu/info/law/better-regulation/initiatives/ares-2019-4972315_en

⁷ <https://ec.europa.eu/digital-single-market/en/news/boosting-electronics-value-chains-europe>

sets out an updated strategy for the electronics sector in Europe, and makes the case for a change in approach and outlines a set of actions intended to set the basis for future European policy.

In June 2019, a draft Implementation Plan (IP), as a direct development of the aforementioned report on ‘Boosting Electronics Value Chains in Europe’, was presented by key industrial organisations to the European Commission. This Implementation Plan included a specific chapter on a KDT partnership.

In September and November 2019 the European Commission met with Integrated Device Manufacturers (IDMs) to discuss a strategic cooperation between key European nanoelectronics companies, that would ensure leadership in KDT for edge computing, including specific activities that would potentially be covered under such a Partnership.

In October 2019 a workshop with KDT System Houses took place in Brussels, to specifically address the requirements of users of digital technologies. It covered mostly the demand side of KDT value chains and addressed applications where these technologies play an essential part.

In November 2019 at the European Forum for Electronic Components and Systems - EF ECS2019⁸ in Helsinki, a High-level meeting took place between CONNECT Deputy Director General Khalil Rouhana and representatives of main Nanoelectronics companies, to further discuss a renewed strategy in Europe under the new Commission. It addressed the actions proposed in the implementation plan and the specific role of private members in a future KDT partnership.

From the Public sector (Members States)

In April and May 2019, two meetings took place with Member State representatives, building upon a consultation process on a potential follow-up Joint Undertaking (JU) to the current ECSEL JU, under Horizon Europe.

In May/June 2019, a Member State consultation was realised on the proposed portfolio of European Partnerships under Horizon Europe. 30 countries (all Member States, Iceland and Norway) provided feedback, which has been analysed by the Commission services and summarised (overall and per partnership candidate) in a report⁹. In summary, the overall feedback was positive on the proposed portfolio, with a general satisfaction to the thematic coverage.

On the proposed KDT Partnership, opinions strongly supported its high relevance in the national context, while also raising the importance of the scope of partners and relevant stakeholders, the need to provide strong support to and impact on SMEs, and the limitation of activities related to photonics and to those that require a very strong integration with electronic devices. Synergies with other partnerships within and outside the cluster would need to be ensured.

The results of the Member State consultation strongly confirmed the KDT partnership approach in addressing the specific priority and the overall relevance, also in line with

⁸ <https://efecs.eu/>

⁹ European Partnerships under Horizon Europe: results of the structured consultation of Member States (Report)

national policies, priorities and R&I strategies, as well as for industry, research organisations and universities.

In October 2019, Member State representatives met with the EC to discuss their involvement in a potential KDT Partnership and the desired complementary steps to improve efficiency of implementation of an improved tri-partite model.

In November 2019, the Commission organised three workshops with Member State representatives on European Partnerships, to obtain a better understanding of the possible benefits of a collaboration between Member States and the candidate European Partnerships with industry, and its format. The discussions with the MS representatives were important to early detect opportunities to align on joint priorities, as well as to consider in design and preparation of implementation of the partnerships, thus ensuring discussions would be embedded in policy developments of a concrete field and high engagement of sectoral ministries.

One of the three workshops was on Digital Technologies, in which KDT was featured, highlighting its foundation of an existing and solid collaboration with Member States under ECSEL JU, and underlining the aim to ensure EU/national alignment through combined financing, as well as increase collaboration in testing of components. Overall, the digital-centric partnership was considered of high-relevance, since Europe has a dynamic and innovative digital industry.

1.3.6. Open Public Consultation

An online public consultation took place from 11 September 2019 to 12 November 2019, with the aim to seek the views of EU research and innovation stakeholders and citizens on the 12 proposed institutionalised European partnerships under the future Horizon Europe Research and Innovation programme (2021-2027). The consultation was available in English, German and French. It was advertised widely the European Commission's online channels as well as via various stakeholder organisations.

The consultation focused on the overall need for and the planned focus of these potential European partnerships, and had a part with specific questions on the proposed KDT Partnership.

Characteristics of Respondents

For the KDT Partnership, 182 respondents provided their views of which 20 were identified as belonging to a campaign. These campaign contributions were analysed separately and are not part of the actual analysis with a number of 162 responses.

Out of these 162 non-campaign responses, 55 (33.95%) of the respondents were representatives of academic and research institutions, 42 (25.93%) were company/business organisations, 35 respondents (21.60%) were citizens. Public authorities (4,32%) and NGOs (3,08%) also participated in the consultation.

The majority of respondents, namely 124 (76.54%), have been involved in the on-going research and innovation framework programme, while 84 respondents (67.74%) were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7.

Results on General Questions by non-campaign respondents

Relevance of efforts of the candidate European Partnership to address problems

At the beginning of the consultation, the respondents of this partnership indicated their views of the needs of the future European Partnerships under Horizon Europe. Overall, respondents indicated that many of these needs were fully required. The needs where most respondents indicated this, was making a significant contribution to EU global competitiveness in specific sectors and/or domains (112 respondents or 69.14%) and focusing more on the development and effective deployment of technology (101 respondents or 62.35%). These identified needs are in line with its proposed focus of the Partnership. No statistical differences were found between the views of citizens and other respondents for most needs.

Main advantages and disadvantages of participation in the Institutionalised European Partnership

The respondents were asked what they perceived to be the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe. A key-word analysis showed that respondents viewed collaboration as the main advantage, in addition to a strategic research agenda and leadership in Europe. The subsequent administrative burden was identified as a disadvantage.

Results on candidate European Partnership Specific Questions by non-campaign respondents

Relevance of research and innovation efforts at the EU level to address problems in relation to key digital technologies

In the consultation, respondents were asked to provide their view on the relevancy (5-point scale) of research and innovation efforts at EU level to address the following problems in relation to key digital technologies:

- Problems in uptake of digital innovations

With regard to the problems in uptake of digital innovations, the majority of respondents have picked either a 4 or a 5 on the 5-point relevancy scale. Respondents indicated that the most relevant problem is when the regulatory framework lags behind technology developments (106 respondents or 67.95% indicated this as a ‘relevant’ or ‘very relevant’ problem). The options that have received the least 5 (‘very relevant’) answers, out of all the problems presented, are the lack of consideration of societal or user needs (37 respondents or 23%) followed by the barriers to exploitation due to limited access to capital data or intellectual property (37 respondents or 24%).

- Structural and resource problems

With regard to structural and resource problems, the limited collaboration and pooling of resources between Member States, European Commission, Industry and Research organisations (Universities, RTO’s) is clearly considered as a very relevant problem for research and innovation efforts at EU level to address (65 respondents or 42% indicated a 5 on the 5-point relevancy scale).

- *Research and innovations problems*

Finally, respondents have indicated that research and innovation problems are considered the most relevant, as all of the problems presented in this category have received more 5 (very relevant) responses than any of the other problems. The rapid change including big data and the emergence of new computing paradigms is considered the most relevant, with 105 respondents selecting ‘very relevant’ on this problem (66%).

Addressing the specific challenges through Horizon Europe intervention

- *Type of partnership*

Respondents were asked to indicate how these challenges could be addressed through Horizon Europe intervention. As shown in the figure below, just over 40% of respondents indicated that an Institutionalised Partnership would be the best fitting intervention to address these problems.

Respondents that selected an institutionalised partnership as the best fitting intervention mentioned for example that it is the most suitable instrument to “bring together the critical mass of public and private resources needed to ensure Europe’s competitiveness, sovereignty and autonomy in the strategic domain of KDT”. Furthermore, several respondents signalled its suitability to implement a long-term vision and to provide “substantial and long-term guidance on the R&I activities in the EU”, the “broad impact and wide range of stakeholders” in the key digital technologies area, and the importance of “aligning national strategies on digital technologies into a single EU strategy”.

Respondents who did not select institutionalised partnership as their preferred intervention (N=76) mentioned traditional calls, public private sector and the development of new technology.

Relevance of elements and activities to ensure that the proposed European Partnership would meet its objectives

- *Involvement of actors in setting joint long-term agenda*

Respondents were asked how relevant the involvement of actors is in setting a joint long-term agenda to ensure that the proposed European Partnership would meet its objectives. A high number of respondents (120 respondents or 77%) indicated that a strong involvement of industry is very relevant actor for setting a joint long-term agenda. The role of academia and Member States, Associated Countries is also considered very relevant by many respondents (respectively 95 respondents or 61.29%, and 76 respondents or 51.35% indicated their role of as ‘very relevant’). A strong involvement of foundations, NGOs and other stakeholders is considered less relevant by respondents (respectively 30 respondents or 20.69%, and 18 respondents or 13.24% indicated their role as ‘very relevant’). Respondents that are/were involved in a current/preceding partnership indicated that industry and government (Member States and Associated Countries) are more relevant compared to other respondents.

- *Pooling and leveraging resources*

Respondents were asked to assess the relevance of different actors in pooling and leveraging resources (such as financial, infrastructure, in-kind expertise) through coordination, alignment or integration to meet Partnership objectives. The role of industry is considered as very relevant, as 104 respondents out of 154 (68%) indicated that their involvement is very relevant for the above-listed purpose. The involvement of foundations, NGOs and other stakeholders is seen as less important (respectively 25 respondents or 18% indicated the role of foundations/NGOs, and 20 respondents or 15% indicated the role of other stakeholders as very relevant).

A slight statistical difference was found between the views of citizens and other respondents. Citizens found the relevance of academia in pooling and leveraging resources through coordination, alignment or integration slightly less relevant. Similarly, respondents that are/were involved in a current/preceding partnership indicate a slightly higher relevance of industry.

- *The partnership composition*

Respondents were asked about the relevance of certain elements of the Partnership composition, such as flexibility in the composition of partners over time and involvement of a broad range of partners (including across disciplines and sectors), to reach objectives of the KDT Partnership.

A high share of respondents (117 or 77%) view that flexibility in composition of partners over time is relevant by giving a score of 4 and 5 on the indicated scale. The large majority of respondents (125 or 82%) also indicated that ensuring involvement of a broad range of partners is relevant to ensure that proposed European Partnership would meet its objectives.

- *Implementation of activities*

Respondents were asked to provide opinions on the relevance of implementation of several activities for meeting objectives of the Partnership. According to the analysis, a high number of respondents view that joint R&I programme, collaborative R&I projects, deployment and piloting of activities, as well as, co-creation of solutions with end-users is very relevant for meeting the objectives. Over 85% of respondents assessed listed activities as relevant or very relevant, giving a score of 4 and 5 on the indicated scale. In comparison, only 37 respondent out 152 (24.34%) consider that the input to regulatory aspects is very relevant for meeting objectives of the KDT Partnership.

Relevance of setting-up a specific legal structure (funding body) for the candidate European Partnership to meet objectives

Respondents were asked to assess the relevance of a specific legal structure (funding body) for the candidate European Partnership to achieve several objectives. According to the feedback, a large number of respondents suggested that setting-up a specific legal structure would be very relevant to implement activities more effectively (70 respondents or 46%), to implement activities faster to respond to sudden market or policy needs (62 respondents or 42%), to facilitate synergies with other EU and national programmes (62 respondents or 41%) and to facilitate collaboration with other relevant European Partnerships (60 respondents or 41%). On the other hand, a lower number of respondents (24 or 16%) indicated that the legal structure would be very relevant to ensure better links to regulators. Respondents that

are/were involved in a current/preceding partnership indicate a slightly higher relevance of setting up a specific legal structure to facilitate collaboration with other relevant European Partnerships.

Scope and coverage proposed for candidate institutionalised European Partnership

Respondents were asked to assess the scope and coverage proposed for the Key Digital Technology Partnership, based on its inception impact assessment. Overall, the majority of respondents consider that the scope and coverage are right in terms of technologies, research areas, geographical coverage, types of partners, range of activities and sectors. However, a significantly smaller number of respondents consider it too narrow for the research areas (22 respondents or 15%) and type of partners covered (20 respondents or 14%).

Alignment of the European Partnership with other initiatives

The majority of respondents (100 or 76%) consider that it would be possible to rationalise the candidate European Institutionalised Partnership and its activities, and/or to better link it with other comparable initiatives.

Relevance of the Candidate European Partnership to deliver impacts

Respondents were asked to assess the relevance of the candidate European Institutionalised Partnership to deliver on listed societal, economic/technological and scientific impacts.

The majority of respondents indicated that the Partnership would be ‘very relevant’ to deliver on the following societal impacts: provision of trusted electronics components and systems to the public and businesses (86 respondents or 55.84%), enabled safety - automotive, avionics, and security - transactions, communications (94 respondents or 61.44%). On the other hand, contribution to more functional, efficient, economical and accessible electronics systems was by a smaller number of respondents indicated as ‘very relevant’ (70 respondents or 46.05%).

Among economic/technological impacts that were suggested, a large number of respondents indicated that the Partnership would be ‘very relevant’ for more innovative, sustainable and globally competitive electronics and systems industries – including SMEs (95 respondents or 61.89%), and for the development and exploitation of innovative technology paradigms (80 respondents or 53.33%).

A large number of respondents, namely 102 out of 153 (66.66%), indicated that the Partnership would be ‘very relevant’ for the mentioned scientific impact: new scientific knowledge and reinforcement of EU research and innovative capabilities in Key Digital Technologies.

Summary of open question responses by non-campaign respondents

To complement and personalise further the answers to the multiple-choice questions in the Open Public Consultation, respondents were given the opportunity to provide feedback in an open-type format. The main consequent messages were:

In general, a future European Institutionalised partnership was the clear choice to bring together the critical mass of public and private resources needed to ensure Europe’s competitiveness, sovereignty and autonomy in the strategic domain of KDT and act on the

basis of an industry-driven, truly pan-European common strategy, especially in light of the success of the current ECSEL Joint Undertaking.

Some respondents preferred the options of a co-funded or co-programmed partnership, due to the low complexity level, as this would lead to higher success rates due to the dedicated work amongst partners that have collaborated in the past, whilst also providing a relational flexibility among eligible stakeholders to participate in a European project. With a view to SME access in such programs, playing a key part in the innovation development, it is the opinion that co-fund or co-programmed has proven to be successful in attracting interest towards open innovation.

For others, traditional calls were the preferred option, due to their familiarity. It is the opinion that the introduction of new rules, model agreements, procedures etc. would put participants in another learning curve. From the long line of framework programmes, they have shown that they offer simplicity, functionality and high potential of collaboration and results.

Respondents also noted that, experience from the current partnership in this domain has illustrated a further need to extend R&I efforts to related aspects of technologies. Some respondents also noted that cybersecurity, should be part of the future partnership on key digital technologies. Addressing lower technology readiness levels, would also provide the ability to innovate and address the unprecedented complexity of future digital technologies, requiring dedicated research efforts and collaboration across multiple industrial and academic domains.

Finally, as the majority of respondents agreed on the technological scope of the KDT partnership, it was also highlighted that these technologies and applications would act as main drivers in the digital transformation of the European economy and society.

Summary of campaign responses

Further to this, a single campaign (campaign #10 – 20 respondents) was identified for the current candidate Partnership. The participants of the campaign were strongly in favour of an institutionalised partnership.

An overview of the campaign responses can be seen in table 1.

Table 1: Overview of responses of campaign participants

Question category	Summary of responses
Research and innovation problems	All categories are considered mostly ‘very relevant’ (score 5).
Structural and resource problems	The categories “Limited availability of testbeds for novel computing components and systems” and “Sky-rocketing costs of equipment” are considered ‘relevant’ (score 4) and ‘very relevant’ (score 5). In contrast, “Limited collaboration and pooling of resources between Member States, European Commission, Industry and Research organisations (Universities, RTOs)” received an average score.
Problems in uptake of digital innovations	The category “Insufficient market size or inappropriate business models” is considered ‘relevant’, while other categories in this group of questions received a low score (namely, 2 and 3).
Preferred Horizon Europe intervention	Institutionalised Partnership was selected by all respondents. When respondents were asked to explain their choice, all of them used the following quote: “Only an institutionalised European Partnership based on Article 187 TFEU will bring together the critical mass of public

	<i>and private resources needed to ensure Europe’s competitiveness, sovereignty and autonomy in the strategic domain of KDT and act on the basis of an industry-driven, truly pan-European common strategy. A JU will create a long-term dedicated implementing structure representing the deepest level of integration, engagement and up-front commitment from public and private partners”.</i>
Relevance of actors for setting joint long-term agenda	Involvement of Member States and Associated Countries, Industry and Academic is considered ‘very relevant’ by all respondents, while other categories received a low score (namely, 2 or 3).
Relevance of actors for pooling and leveraging resources	Involvement of Member States and Associated Countries, Industry and Academic is considered ‘very relevant’ by almost all respondents, while other categories received a low score (namely, 2 or 3).
Partnership composition	Mostly low score (on average, 3) on both answer categories (“Flexibility in the composition of partners over time” and “Involvement of a broad range of partners, including across disciplines and sectors”).
Implementation of activities	Joint R&I programme, collaboration R&D projects and deployment, piloting activities, and co-creation of solutions with end-users are considered ‘very relevant’ and ‘relevant’ by most respondents. In contrast, “input to regulatory aspects” received a low score.
Relevance of the legal structure	Most answer categories received a high score with exception of “ensure better links to regulators”, “ensure better links to practitioners on the ground” and “ensure harmonisation of standards and approaches”.
Scope and coverage of the candidate Partnership	Almost all respondents considered that listed components of the candidate Partnership have right scope and coverage. Respondents were offered an opportunity to provide comments on the proposed scope and coverage of the Institutionalised Partnership. Several of them included the following quote: <i>“Experience from ECSEL has illustrated a need to extend R&I efforts to related aspects of photonics and software, advanced computing technologies (such as neuromorphic computing and edge computing), biosensors and flexible electronics, all of which are featuring increasingly in the digital transformation of the economy and society and now need to be co-integrated to build complex systems and open up new avenues of application”.</i>
Rationalisation of the candidate Partnership and linking to other initiatives	Respondents consider that it would not be possible to rationalise the candidate Partnership and its activities, and/or to better link it with other comparable initiatives. Respondents were asked to explain their answer, most of them inserted a following quote: <i>“The technologies of the KDT partnership and their applications will be key in addressing multiple global challenges such as transport & smart mobility, health & wellbeing, energy, digital industry and digital life, as well as driving the digital transformation of multiple sectors of Europe’s economy and society. Whereas the KDT partnership will collaborate closely with comparable initiatives focusing on one specific challenge or sector, it cannot be linked or merged with only one of them”.</i>
Societal impact	Almost all respondents considered that the candidate Partnership would be ‘very relevant’ to deliver on listed impacts.
Economic/technological impact	Almost all respondents considered that the candidate Partnership would be ‘very relevant’ to deliver on listed impacts.
Scientific impact	All respondents considered that the candidate Partnership would be ‘very relevant’ to deliver on listed impacts.

1.3.7. Interviews (IA Study)

As part of the stakeholder consultation efforts, the impact assessment study on the candidate partnership performed interviews with a carefully balanced sample of relevant stakeholders covering five different categories. In summary, 51 stakeholders have been interviewed in the

framework of this partnership: around one third of interviews were conducted with large companies (31%), followed by industry associations (25%), RTOs and universities (14%), Member States (14%), SMEs (12%) and European Commission services (4%). Concerning geographical location, around half were from Western Europe (49%), followed by Eastern Europe (10%), Southern Europe (8%), the Nordics (4%) and international (6%). Finally, gender balance was at 76.5% male and 23.5% female.

The interviews were required to cover, among others, research, development, supply and end-user organisations as well as representatives from the KDT value chain, from equipment, design and production to systems integration and end-product. The segments sought covered, for example, electronics, semiconductors, foundries, systems, software, application areas (automotive, MedTech, energy, manufacturing, etc.), engineering and photonics. To obtain information about the envisaged set up and measures, it was equally sought to carry out interviews with executive level and board members of the current JU, in addition to Member State representatives, to scope the opinions and interest.

These interviews confirmed the strong need for a partnership in this domain, in line with the outcome of the open public consultation analysis. As it was apparent overall, the preferred option would be that of an Institutionalised Partnership (option 3), given its ability to ensure commitment of industry and MS around a strategic agenda, alignment with industry strategies, coordination of research agendas and mobilisation of funding. This appears to be linked to the existence of the current ECSEL JU, which was also successful in a form equivalent to an Institutionalised Partnership.

Option 0 – Traditional Calls

Interviewees mainly from MS, business organisations and RTOs supported the conclusion that traditional calls are effective in generating scientific impact and in targeting lower TRLs. However, it was also pointed out by MS and industry associations that traditional calls are less suited for aligning with the industrial demand/user side or in generating scientific impact in areas aligned with industry needs. Some interviewees also highlighted that calls are unlikely to mobilise a level of investment equivalent to other options, for example given the absence of national funding. In this context, the lack of formal mechanism of commitment and uncertainty concerning the level of financial contribution by industry was highlighted.

According to interviewees, traditional calls have a relatively low capacity to ensure long-term commitment, leverage resources and to build upon results of previous projects, thereby restricting it from strengthening technological leadership and competitiveness of Europe's KDT industry. This would require the alignment of strategies and coordination, something which traditional calls cannot deliver according to several interviewed organisations.

Option 1 - Co-programmed partnership

In general, the co-programmed partnership was found to allow for a high level of flexibility and agility in the organisation and involvement, while also having the capacity to facilitate commitment from both public and private partners as well as mobilise funding. In comparison to traditional calls, it was found to have a more aligned format to industry needs combined with a high level of flexibility and openness – both perceived to be conducive to achieving technological and industrial impact.

Option 3 - Institutionalised Partnership

Overall it was emphasised that an Institutionalised Partnership is mostly capable of addressing and building the KDT ecosystem and value chains, with a long term perspective on coordination and collaboration, supportive in addressing fragmentation and strengthening integration and cooperation in European value chains. Moreover, an Institutional Partnership is likely to contain a broad coverage of TRLs, thereby providing a broad coverage of the value chain. The tripartite nature and centralised structure of an Institutionalised Partnership offers a strong incentive for making synchronised funding decisions taking into account national and industry developments.

Through this partnership option, the alignment with the EU policy is ensured by the participation of the EC in the management of the partnership, according to the interviewees. The calls are designed by the management of the partnership according to the work programme with the highest possible alignment with the industry's strategy. The central coordination of the selection of the projects will result in a stronger and more coherent research portfolio. Therefore, the potential to achieve the required directionality is high. By comprising a centralised coordination and management, it is anticipated to provide a higher level of internal coherence.

It was also mentioned that the Institutional Partnership has a long-term perspective on collaboration and accordingly more effective in strengthening the exchange of knowledge within the value networks, given that traditional calls limit participation in a single project with low possibilities for continuation of the collaboration in follow-up calls.

Several interviewees highlighted that this partnership option has the highest relevance for achieving industrial impact and competitiveness and for developing strategic technologies; this viewpoint is based on that the option provides the strongest type of commitment, long-term stability and critical mass. It offers a better format for addressing alignment and ensuring coordination, relevant for agreeing on priorities of technological importance and for achieving technological sovereignty.

An Institutionalised Partnership has a relatively high capacity to ensure coordination and alignment with other national and European policies in the field, as stated by interviewees, also indicating potential links in relation to key application areas, such as automotive, energy, health, manufacturing and mobility/transport, in need of KDT solutions.

Annex 3 Who is affected and how?

1. PRACTICAL IMPLICATIONS OF THE INITIATIVE

This annex describes the practical implications of the preferred option identified in the Impact Assessment: the establishment of an institutionalised partnership based on Article 187 to support and reinforce Europe's industrial, technological and innovation capacities in Key Digital Technologies, for directly or indirectly affected stakeholder groups.

2. SUMMARY OF COSTS AND BENEFITS

Overview of benefits (for all stakeholder groups)

Member States

The preferred option will provide the means to build up research, innovation and production capabilities in Key Digital Technologies, where no single Member State would have the industrial or economic potential to achieve similar results on its own.

The institutionalised partnership will not only enhance the investments at European level, but also make their returns proportionally higher, as the access to upgraded facilities starts to bear fruit. Additionally, funding through the partnership will stimulate MS support to KDT industry through appropriated instrument(s) such as IPCEI.

The initiative will allow Member States to anticipate requirements early enough in order to facilitate the deployment of key digital technologies at national and European levels. An effective tri-partite model will provide for greater synergies between the Member States, the Commission and the private sector and enable implementing a clear strategy for the sector at European level and merging expertise and resources to develop the necessary means and infrastructures, what would otherwise bear the cost or require effort, exceeding capacity of a single Member State.

The increased coherence and synergies between different funding mechanisms (Horizon Europe, Digital Europe Program, PENTA¹⁰ and IPCEI) would also have a positive impact on the efficiency of the EU budget to which Member States contribute, with an evident reduction of the fragmentation of research effort.

Businesses

European companies at large, both from the demand and supply side of nanoelectronics, embedded intelligent systems, smart system integration, semiconductor manufacturing, photonics and integrated software will be among the most affected stakeholder groups. Key companies from vertical application areas (transport and mobility, communications, manufacturing, health & care, energy, to name a few) will complement this comprehensive demand-supply approach, which will cover the value chains in full. With such an ambition, cross-industry cooperation will combine hardware and software, design and manufacturing

¹⁰ PENTA is a EUREKA initiative launched in 2016 to replace CATRENE with the aim to catalyse research, development and innovation in the areas of micro and nanoelectronics enabled systems and applications where there is shared high national and industrial interest.

and provide a basis for collaborative work, whilst creating ecosystems along the relevant value and supply chains.

Further to this, research efforts aiming directly at industrial needs will benefit from such a collaboration between research and industry, which will indirectly support the deployment of European leading-edge KDT products and solutions across the market.

SMEs

SMEs are the key players in emerging and less established key digital technologies. They will thus experience direct and indirect economic benefits from the initiative. The KDT partnership will open up opportunities to SMEs with a more tailored implementing structure, as research topics clearly become more market oriented. The cost of designing new products will decrease, since SMEs, which usually lack or look outside of their current market for the necessary infrastructure and resources, will gain easier access – through co-participation of large industrial actors - to a high-level scientific capacity, manufacturing equipment and materials. It is also expected that this initiative will open up new product and application markets for European SMEs active in the field of KDT, as novel computing paradigms (neuromorphic), AI and related software, support.

Research community

European research and development organisations, both on the supply and demand side, will benefit from improved coordination, pooling of resources and greater access to advanced methodologies and tools, such as pilot lines and platforms and testing and experimentation facilities, supported by the partnership. They will be able to attain the critical mass for longer-term projects of common strategic interest and perspective. Furthermore, the institutionalised partnership option will ensure coordination between research and industry, resulting in new technologies, devices and systems, and ensuring that a broad scope of innovations benefit from standardisation of underlying technologies, thus bringing down the costs of reaching the market. The tri-partite dimension will help the research community to accurately direct efforts towards concrete industrial needs, introducing applicable and marketable solutions that various industries and public authorities can easily take up. The research community would also experience cross-fertilisation amongst the various KDT stakeholder groups under the common overarching focus of several EU research programmes, as researchers learn about new avenues to pursue and developers learn about new possibilities for products. Creating the necessary conditions, via the partnership, to enhance every aspect of KDT research, will in turn give further visibility to the already globally leading EU excellence.

Citizens

Citizens will benefit from the institutionalised partnership as the new solutions and products are developed and delivered to make their lives safer and easier, such as safe autonomous vehicles, seamless and secure means of communication, as well as novel healthcare techniques and devices. Enhanced European expertise in KDT will also contribute to tackling societal problems, such as climate change or ageing society, as finding solutions for them will become easier with AI enabled computing derived from the combination of efficient, powerful and trusted electronics and advanced sensors.

The technologies developed under the KDT partnership will improve energy efficiency, make use of renewable energy sources, and look at new (edge) computing paradigms for data

processing. As downstream industries, through KDT, will progressively reduce the energy consumption of their products, develop technologies and applications of higher energy efficiency, and substitute existing with more environmentally friendly materials, the positive impact on the environment and sustainability will become more and more pronounced.

EU institutions, agencies and bodies

The EU institutions, agencies and bodies will benefit both from the outcome of the research, development and strategic actions of the initiative, whilst attaining state of the art methodologies and tools for the future. Cross-links with other domains open opportunities for synergies with multiple other bodies of EU relevance, such as with partnerships targeting enabling technologies, i.e. EuroHPC, SNS, Photonics, AI data & robotics, Global competitive space system and Made in Europe, together with the EIT Digital which will contribute to the development of skills and the boosting of digital entrepreneurship.

All stakeholder groups

Overall, the preferred option will benefit all stakeholders, as it will help to deal with the complexity of the research and innovation landscape in the development of digital products/services, where no single organisation or MS can master all required technologies. The collaborative functionalities of the initiative will enable stakeholders to expand collaborations, and develop innovations, and ultimately mature, as Europe-wide KDT cutting-edge projects, pilot lines and platforms become available, retaining the best talents in the EU and attracting highly skilled professionals from third countries.

A summary of the benefits can be seen in the table below:

<i>I. Overview of Benefits (total for all provisions) – Preferred Option</i>		
<i>Description</i>	<i>Estimation (quantitative or qualitative)</i>	<i>Comments</i>
<i>Direct benefits</i>		
Build-up of KDT research, innovation and production capabilities in Europe	Combined resources would effectively address the main objectives, where no single Member or Associated State would have the industrial or economic capacity to realise on its own.	The initiative will allow Member States to anticipate requirements early enough in order to facilitate the deployment of key digital technologies at national and European levels.
Joint R&I strategy	Collaboration across the EU will enable R&I stakeholders to further build collaborations, develop new innovations, and ultimately mature, as Europe-wide KDT pilot lines and platforms become accessible.	The complexity of digital products/services entails that no single entity can master all required technologies. Research and industry organisations will benefit from such a collaboration, which will indirectly support the deployment of European leading-edge KDT products and solutions across the market.
Economic growth particularly for SMEs	SMEs would directly benefit from such a specific collaborative environment, as market oriented research topics make use of a more tailored implementing structure, with a large capacity of manufacturing equipment and materials via participation of key large industrial enterprises	EU growth in Key Digital Technologies is evident, especially for SMEs, which are the key role players in emerging and less established technologies, such as novel computing paradigms (neuromorphic), Artificial Intelligence and related software.
Societal	Citizens would benefit from the introduction of KDT in areas of interest, as safe autonomous	Addressing societal problems such as climate change or an ageing society, can be

	vehicles and seamless and secure means of communication are realised, as well as novel healthcare techniques and devices.	made easier with AI enabled computing derived from the combination of efficient, powerful, trusted electronics and advanced sensors.
Environmental	KDTs would contribute to sustainability and in protecting the environment, as technologies developed would improve energy efficiency, make use of renewable energy sources, and look at new low-power (edge) computing paradigms for data processing.	Downstream industries, through KDT, would progressively reduce the energy consumption of their products, develop technologies and applications of high energy efficiency, and substitute existing with more environmentally friendly materials.

Overview of costs – For the preferred option

With the assumption that the partnership will maintain the internal structure of the current ECSEL Joint Undertaking, it can be implicit that this option is considered closest to a ‘cost-neutral’ setup, as there is a likely continuation of the existing structure, building rental, HR, etc.

Under this assumption and in the case of JU discontinuity, the estimated cost and benefits are analysed. ECSEL statutes foresee a 4-year winding-up period to manage projects launched in the last phase of the Joint Undertaking that will be running beyond 31st December 2020. The administrative cost planned for the management of ECSEL legacy in the period 2021-24 is €10,4 million, to be equally shared by EC and industry members.

There would be also ‘intangible costs’ associated to the JU discontinuity. It will be difficult to justify a lower intensity of EU support in R&I to the components and software industry at a moment in which access in Europe to key digital technologies is becoming critical and when other regions (China, US, Korea) are receiving substantial public support that goes beyond R&I.

Finally, a tri-partite JU structure enables the mobilisation of a critical amount of resources as it supports the combined contributions of EU, Participating States and Industry.

<i>II. Overview of direct and indirect costs – Preferred option</i>							
		Citizens/Consumers		Businesses		Administrations	
		One-off	Recurrent	One-off	Recurrent	One-off	Recurrent ¹¹
Management/ Administrative costs	Direct costs						Running cost €2.29 million ¹² /year (EC 50%)
	Indirect costs						
Personnel costs	Direct costs						€ 3.24 million /year - 30 full time equivalent staff (EC 50%)
	Indirect costs						
Coordination costs (or transaction costs)							

¹¹ Commitment appropriations

¹² These are the costs of running the ECSEL JU according to the 2018 Annual Activity Report.

Budget expenditure/ investment costs							
---	--	--	--	--	--	--	--

REFIT Cost savings table

Not applicable for the proposed KDT Partnership. The initiative will benefit from the existing organisation/structure (e.g. the Programme Office) already in place for the ECSEL JU. There are no additional regulatory costs associated, and no specific simplification measures apply in this case.

Annex 4 Analytical Methods

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines¹³ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This is complemented by integrating the **conditions and selection criteria for European Partnerships**, as well as requirements for setting up Institutionalised Partnerships.¹⁴

1. OVERVIEW OF THE METHODOLOGIES EMPLOYED

In terms of **methods and evidence used**, the set of impact assessments for all candidate Institutionalised European Partnerships draw on an external study covering all initiatives in parallel to ensure a high level of coherence and comparability of analysis¹⁵.

All impact assessments mobilised a mix of qualitative and quantitative data collection and analysis methods. These methods range from desk research and interviews to the analysis of the responses to the Open Consultation, stakeholder analysis and composition/portfolio analysis, bibliometrics/patent analysis and social network analysis, and a cost-effectiveness analysis.

The first step in the impact assessment studies consisted in the definition of the context and the problems that the candidate partnerships are expected to solve in the medium term or long run. The main data source in this respect was desk research. This includes grey and academic literature to identify the main challenges in the scientific and technologic fields and in the economic sectors relevant for the candidate partnerships, as well as the review of official documentations on the policy context for each initiative.

In the assessment of the problems to address, the lessons to be learned from past and ongoing partnerships were taken into account, especially from relevant midterm or ex-post evaluations.

The description of the context of the candidate institutionalised European Partnerships required a good understanding of the corresponding research and innovation systems and their outputs already measured. Data on past and ongoing Horizon 2020 projects, including the ones implemented through Partnerships, served as basis for descriptive statistic of the numbers of projects and their respective levels of funding, the type of organisations participating (e.g. universities, RTOs, large enterprises, SMEs, public administrations, NGOs, etc.) and how the funding was distributed across them. Special attention was given to analysing the participating countries (and groups of countries, such as EU, Associated Countries, EU13 or EU15) and industrial sectors, where relevant. The sectoral analysis required enriching the eCORDA data received from the European Commission services with sector information extracted from ORBIS, using the NACE codification up to level 2. These data enabled the identification of the main and, where possible, emerging actors in the relevant systems, i.e. the organisations, countries and sectors that would need to be involved (further) in a new initiative.

¹³ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

¹⁴ A pivotal element of the present analysis is the so-called two-step 'necessity test' for European Partnerships, used to establish: step 1) the need for a partnership approach in the first place, followed by step 2) a justification for the form of Institutionalised Partnership. The necessity test is described in Annex 6. This impact assessment focuses on the second step of the test.

¹⁵ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe.

A Social Network Analysis was performed by the contractors using the same data. It consisted in mapping the collaboration between the participants in the projects funded under the ongoing R&I partnerships. This analysis revealed which actors – broken down per type of stakeholders or per industrial sector – collaborate the most often together, and those that are therefore the most central to the relevant research and innovation systems.

The data provided finally served a bibliometric analysis run by the contractor aimed at measuring the outputs (patents and scientific publications) of the currently EU-funded research and innovation projects. A complementary analysis of the Scopus data enabled to determine the position and excellence of the European Union on the international scene, and identify who its main competitors are, and whether the European research and innovation is leading, following or lagging behind.

A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options.

The conclusions drawn from the data analysis were confronted to the views of experts and stakeholders collected via three means:

- The comments to the inception impact assessments of the individual candidate institutionalised European Partnerships;
- The open public consultation organised by the European Commission from September to November 2019;
- The interviews (up to 50) conducted by each impact assessment study team conducted between August 2019 and January 2020 (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others).

The views of stakeholders (and experts) were particularly important for determining the basic functionalities (see further below) that the future partnerships need to demonstrate to achieve their objectives as well as their most anticipated scientific, economic and technological, and societal impacts. The interviews allowed more flexibility to ask the respondents to reflect about the different types of European Partnerships. Furthermore, as a method for targeted consultation, it was used to get insights from the actors that both the Study Teams and the European Commission were deemed the most relevant. For the comparative assessment of impacts, the external contractors confronted the outcomes of the different stakeholder consultation exercises to each other with a view of increasing the validity of their conclusions, in line with the principles of triangulation.

Annex 2 includes also the main outcomes of the stakeholder consultation exercises.

2. METHOD FOR ASSESSING THE EFFECTIVENESS, EFFICIENCY AND COHERENCE OF EACH OPTION - THE USE OF FUNCTIONALITIES

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has been adapted to introduce “**key functionalities needed**” – so as to link the intended objectives of the candidate European Partnerships and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1 in the main body of the impact assessment). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as

regards e.g. the type and composition of actors that can be involved ('openness'), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options. It also allows for a structured comparison of the options as regards their effectiveness, efficiency and coherence, and also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)¹⁶.

Figure 3 Overview of key functionalities of each form of implementation of European Partnerships

Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 2: Co-funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
Type and composition of actors (including openness and roles)				
<u>Partners:</u> N.A., no common set of actors that engage in planning and implementation <u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> core of national funding bodies or governmental research organisations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> limited, according to national rules of partner countries	<u>Partners:</u> National funding bodies or governmental research organisation <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations
Type and range of activities (including additionality and level of integration)				
<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions <u>Additionality:</u> no additional activities and investments outside the funded projects <u>Limitations:</u> No systemic approach beyond individual actions	<u>Activities:</u> Horizon Europe standard actions that allow broad range of individual actions, support to market, regulatory or policy/ societal uptake <u>Additionality:</u> Activities/investments of partners, National funding <u>Limitations:</u> Limited systemic approach beyond individual actions.	<u>Activities:</u> Broad, according to rules/programmes of participating States, State-aid rules, support to regulatory or policy/ societal uptake <u>Additionality:</u> National funding <u>Limitations:</u> Scale and scope depend on the participating programmes, often smaller in scale	<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach <u>Additionality:</u> National funding	<u>Activities:</u> Horizon Europe standards that allow broad range of individual actions, support to regulatory or policy/societal uptake, possibility to systemic approach (portfolios of projects, scaling up of results, synergies with other funds). <u>Additionality:</u> Activities/investments of partners/ national funding
Directionality				
<u>Priority setting:</u> Strategic Plan and	<u>Priority setting:</u> Strategic R&I	<u>Priority setting:</u> Strategic R&I	<u>Priority setting:</u> Strategic R&I	<u>Priority setting:</u> Strategic R&I

¹⁶ The criterion on the ex-ante demonstration of partners' long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 2: Co-funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
annual work programmes, covering max. 4 years. <u>Limitations:</u> Fully taking into account existing or to be developed SRIA/roadmap	agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution Input to FP annual work programme drafted by partners, finalised by COM (comitology) Objectives and commitments are set in the contractual arrangement.	agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution Annual work programme drafted by partners, approved by COM Objectives and commitments are set in the Grant Agreement.	agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution Annual work programme drafted by partners, approved by COM Objectives and commitments are set in the legal base.	agenda/ roadmap agreed between partners and COM, covering usually 7 years, including allocation of Union contribution Annual work programme drafted by partners, approved by COM (veto-right in governance) Objectives and commitments are set in the legal base.
Coherence: internal (Horizon Europe) and external (other Union programmes, national programmes, industrial strategies)				
<u>Internal:</u> Between different parts of the Annual Work programme can be ensured by COM <u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes and activities	<u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Limited synergies with other Union programmes and industrial strategies If MS participate, with national/regional programmes and activities	<u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with national/regional programmes and activities	<u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with national/regional programmes and activities	<u>Internal:</u> Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with other Union programmes and industrial strategies If MS participate, with national/regional programmes and activities

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made in comparison to the baseline. Therefore, for each of the above criteria, the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. When relevant, this estimation also includes the costs/benefits of discontinuing existing implementation structures. The policy options are then scored compared to the baseline with a + and – system along a two-point scale, to indicate limited (+ or -) or high (++ or --) additional/lower performance compared to the baseline. When a policy option is scored 0, this means that its impact is expected to be roughly equal to the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact

assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options¹⁷.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach¹⁸ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account¹⁹. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²⁰ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation

¹⁷ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

¹⁸ For further details, see Better Regulation Toolbox # 57.

¹⁹ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²⁰ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

increase only marginally compared to the baseline (<1%),²¹ but lead to an additional R&I investment of at least the same amount than the Union contribution²² (efficiency of 98% for the overall investment).

- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution²³. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).²⁴
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution²⁵. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution²⁶. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0		↑↑		
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0		↑↑		
Ex-ante Impact Assessment for partnership		0		↑↑↑	
Preparation of EC proposal and negotiation		0		↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0		↑		
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				

²¹ Specifically, some additional set-up costs linked for example to the creation of a strategic research and innovation agenda (SRIA) and additional running costs linked with the partners role in the creation of the annual work programmes and the Commission's additional supervisory responsibilities. A CPP will have lower overall costs than each of the other types of European Partnership, as it will function with a smaller governance and implementation structure than will be required for a Co-Funded Partnership or an Institutionalised Partnership and – related to this – its calls will be operated through the existing HEU agencies and RDI infrastructure and systems.

²² Minimum contributions from partners equal to the Union contribution.

²³ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

²⁴ These costs reflect set-up costs and additional running costs for partners, and the Commission, of the distributed, multi-agency implementation model.

²⁵ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

²⁶ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC	0				↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

3. METHOD FOR IDENTIFYING THE PREFERRED OPTION – THE SCORECARD ANALYSIS

For the **identification of the preferred option**, a scorecard analysis is used to build a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

This scorecard approach also relies on a standard cost model developed for the external study supporting the impact assessment, as illustrated in Figure 5. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

These costs essentially refer to the administrative, operational and coordination costs of the various options. The figure shows how the scoring of costs range from a value of 0, in case an option does not entail any additional costs compared to the baseline (traditional calls), to a score of (-) for options introducing limited additional costs relative to the baseline and a score of (- -) when substantial additional costs are expected in comparison with the baseline. Should the costs of a policy option be lower than those of the baseline, (+) and (+ +) are used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed and Co-Funded options,

a score of 0 to the Article 185 option and a score of (-) for the Article 187 Institutionalised Partnership policy option²⁷.

Figure 5: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3a: Institutionalised 185	Option 3b: Institutionalised 187
Administrative, operational and coordination costs	0	(0)	(-)	(- -)	(- -)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. <i>cost- efficiency</i>)	0	(+)	(+)	(0)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to baseline; score (- -) = substantial additional costs compared to baseline. ; score (+) = lower costs compared to baseline

²⁷ The baseline (traditional calls) is scored 0, as explained above.

1. Can the Union act? What is the legal basis and competence of the Unions' intended action?
1.1 Which article(s) of the Treaty are used to support the legislative proposal or policy initiative?
<p>This proposal is based on (1) Article 185 TFEU which stipulates that in implementing the multiannual framework programme, the Union may make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; and (2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes (both Articles are under Title XIX of the TFEU - Research and Technological Development and Space).</p> <p>The proposal aims to implement Article 8 of the Commission proposal for Horizon Europe - the future EU research and innovation (R&I) programme for 2021-2027, according to which, “<i>European Partnerships shall be established for addressing European or global challenges only in cases where they will more effectively achieve objectives of Horizon Europe than the Union alone and when compared to other forms of support of the Framework programme</i>”. The Horizon Europe proposal has received the political agreement of the Council and the European Parliament.</p>
1.2 Is the Union competence represented by this Treaty article exclusive, shared or supporting in nature?
<p>Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the European Union can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas.</p> <p><i>Subsidiarity does not apply for policy areas where the Union has exclusive competence as defined in Article 3 TFEU²⁸. It is the specific legal basis which determines whether the proposal falls under the subsidiarity control mechanism. Article 4 TFEU²⁹ sets out the areas where competence is shared between the Union and the Member States. Article 6 TFEU³⁰ sets out the areas for which the Unions has competence only to support the actions of the Member States.</i></p>

²⁸ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E003&from=EN>

²⁹ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E004&from=EN>

³⁰ <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E006:EN:HTML>

2. Subsidiarity Principle: Why should the EU act?

2.1 Does the proposal fulfil the procedural requirements of Protocol No. 2³¹:

- Has there been a wide consultation before proposing the act?
- Is there a detailed statement with qualitative and, where possible, quantitative indicators allowing an appraisal of whether the action can best be achieved at Union level?

This proposal and the accompanying impact assessment were supported by a wide consultation of stakeholders, both during the preparation of the Horizon Europe proposal and - later on, all the candidates for European Partnerships. Member States were consulted via the Shadow Strategic configuration of the Horizon Europe Programme Committee. On candidates for institutionalised Partnerships based on Article 185/187 of the TFEU, an Open Public Consultation (OPC) was held between 11 September and 6 November 2019. Over 1 600 replies were received. In addition, targeted consultation activities were undertaken to prepare the present impact assessment. In particular, for each of the candidate partnerships, an external consultant interviewed a representative sample of stakeholders. The need for EU action as well as its added value were covered in those interviews.

The explanatory memorandum and the impact assessment (horizontal part, Section 3) contain a dedicated section on the principle of subsidiarity, as explained in question 2.2 below.

2.2 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the conformity with the principle of subsidiarity?

The impact assessment accompanying the proposal features a horizontal part on relevant common elements to all the candidate partnerships, including the conformity of the proposed initiative with the principle of subsidiarity (Section 3). Moreover, the individual assessments of each candidate partnership include additional details on subsidiarity, touching in particular on the specificities of a candidate partnership that could not be adequately reflected in the horizontal part of the impact assessment. This will also be reflected in the explanatory memorandum.

2.3 Based on the answers to the questions below, can the objectives of the proposed action be achieved sufficiently by the Member States acting alone (necessity for EU action)?

National action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives, to deliver on the EU's strategic policy priorities (including the climate and energy goals set out in the Paris Agreement, and the European Green Deal), and to contribute to tackling global challenges and meeting the

³¹ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12016E/PRO/02&from=EN>

Sustainable Development Goals (SDGs).

(a) Are there significant/appreciable transnational/cross-border aspects to the problems being tackled? Have these been quantified?

The thematic areas covered by the candidate partnerships feature a series of challenges in terms of cross-border/transnational aspects, need to pool resources, need for a critical mass to meet intended policy objectives, need to coordinate different types of actors (e.g. academia, industry, national and regional authorities) across different sectors of the economy and society, which cannot be tackled to the same degree by Member States alone. This is particularly true for the research and innovation (R&I) dimension of the proposed initiative: the importance of a multi-centre and interdisciplinary approach, cross-country data collection and research, and the need to develop and share new knowledge in a timely and coordinated manner to avoid duplication of efforts are key to achieve high quality results and impact. The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide extensive qualitative and quantitative evidence on the above points. In addition, Sections 1 and 2 of the individual impact assessments on the candidate partnerships include more detail on the necessity to act at EU-level in specific thematic areas. Finally, it is worth noting that not all Member States have the same capacity or R&I intensity to act on these challenges. As the desired policy objectives can be fully achieved only if the intended benefits are widespread across the Member States, this requires action at the EU-level.

(b) Would national action or the absence of the EU level action conflict with core objectives of the Treaty³² or significantly damage the interests of other Member States?

As per Article 4(3) TFEU, national action does not conflict with core objectives of the Treaty in the area of R&I. The absence of EU level action in this area would however prevent the achievement of core objectives of the Treaty. Indeed, national action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives on e.g. competitiveness, to deliver on the EU's strategic policy priorities, and to contribute to tackling global challenges and meet the Sustainable Development Goals (SDGs).

(c) To what extent do Member States have the ability or possibility to enact appropriate measures?

As foreseen by Article 4(3) TFEU, this proposal does not hamper Member States' ability to enact appropriate measures in the field of R&I. However, the scale and complexity of the policy objectives pursued by the present initiative cannot be fully addressed by acting at national level alone.

(d) How does the problem and its causes (e.g. negative externalities, spill-over effects) vary across the national, regional and local levels of the EU?

³² https://europa.eu/european-union/about-eu/eu-in-brief_en

As described in the horizontal part of the impact assessment accompanying the present proposal, several problems (e.g. on competitiveness, global challenges, demographic change) and their underlying causes affect the EU as a whole rather than individual Member States. Where important differences between Member States are present, these are described in Sections 1 and 2 of the individual impact assessments.

(e) Is the problem widespread across the EU or limited to a few Member States?

The problem of coordinating R&I efforts in the thematic areas covered by the candidate partnerships affects all Member States, albeit to different degrees. However, from a general EU perspective, available evidence shows that the EU as a whole needs to step up efforts and investments in thematic areas that are crucial to tackle present and future policy challenges on several fronts, e.g. ageing population, global technological trends, and climate change to name a few. The way these problems affect the EU and its Member States is described in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual impact assessments.

(f) Are Member States overstretched in achieving the objectives of the planned measure?

As indicated in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual assessments, the sheer scale, speed and scope of the needed support to R&I would overstretch national resources, without guaranteeing the achievement of the intended objectives. Acting at EU-level would achieve greater impact in a more effective and efficient manner.

(g) How do the views/preferred courses of action of national, regional and local authorities differ across the EU?

No specific differences between the views of national, regional and local authorities emerged from the stakeholder consultation.

2.4 Based on the answer to the questions below, can the objectives of the proposed action be better achieved at Union level by reason of scale or effects of that action (EU added value)?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national initiatives in the same area.

(a) Are there clear benefits from EU level action?

Quantitative and qualitative evidence of the benefits of EU level action are available in the

interim evaluation of Horizon 2020 and in the impact assessment of Horizon Europe, among others. An analysis of the emerging challenges in each thematic areas, of the EU's competitive positioning, as well as feedback gathered from different types of stakeholders for the present impact assessment indicate that EU level action remains appropriate also for the present proposal. In addition, the benefits of acting at EU-level have been illustrated by the success and the impact achieved by the predecessors to the proposed initiative.

(b) Are there economies of scale? Can the objectives be met more efficiently at EU level (larger benefits per unit cost)? Will the functioning of the internal market be improved?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. This is the case both in terms of effectiveness in achieving intended policy objectives, but also in terms of efficiency. Positive impact is also visible in terms of competitiveness: recent data on EU funded R&I activities indicate that EU-funded teams grow 11.8% faster and are around 40% more likely to be granted patents or produce patents applications than non-EU funded teams. Efficiency gains are also visible in terms of dissemination of results to users beyond national borders, including SMEs and citizens. EU funded R&I is more effective in leveraging private investment. Finally, there are clear additionality benefits (i.e. EU R&I funding does not displace or replace national funding), as the EU focuses on projects that are unlikely to be funded at national or regional level. Overall, this is beneficial to the functioning of the internal market in several respects, including human capital reinforcement through mobility and training, the removal of barriers to cross-border activity for economic players including SMEs, easier access to finance and to relevant knowledge and research, and increased competition in the area of R&I.

(c) What are the benefits in replacing different national policies and rules with a more homogenous policy approach?

A homogeneous policy approach in the various thematic areas covered by the present proposal would reduce fragmentation and increase efficiency and effectiveness in meeting the intended policy objectives. Indeed fragmentation, persisting barriers in the internal market and differences in the resources available to Member States are some of the key problems that stand in the way of fully achieving the intended policy objectives and reaching the required critical mass to obtain tangible results. Specific detail on how these issues differ in each thematic area are illustrated in Sections 1 and 2 of the individual impact assessments, so as to reflect the specificities of each case.

(d) Do the benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities (beyond the costs and benefits of acting at national, regional and local levels)?

The proposed initiative does not lead to a loss of competence of the Member States. In fact, the proposed initiative should be seen as complementary and reinforcing national and sub-

national initiatives in the same area. Previous quantitative and qualitative assessments of Horizon Europe and Horizon 2020 have shown that the proposed EU-level action do not displace national ones and tend to concentrate on initiatives that would not have been funded by the Member States themselves, or would not have reached the same scale and ambition without EU-level intervention, due to their complexity and trans-national nature.

(e) Will there be improved legal clarity for those having to implement the legislation?

Yes. The proposed initiatives will be implemented in line with the Horizon Europe single set of rules for participation; this will ensure increased clarity and legal certainty for end beneficiaries, other stakeholders and programme administrators. It will also reduce the administrative burden for beneficiaries, and for the Commission services. In addition, the accessibility and attractiveness of the broader Horizon Europe programme, in particular for applicants with limited resources, would be sustained.

3. Proportionality: How the EU should act

3.1 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the proportionality of the proposal and a statement allowing appraisal of the compliance of the proposal with the principle of proportionality?

The principle of proportionality underpins the entire analysis of the candidate partnerships. Specifically, the analysis included in the accompanying impact assessment is structured along the following logic: 1. Justification of the use of a partnership approach in a given area (including considerations on additionality, directionality, link with strategic priorities) instead of other forms of intervention available under Horizon Europe; 2. If the partnership approach is deemed appropriate, proportionality considerations guide the assessment of which type of partnership intervention (collaborative calls, co-programmed, co-funded or institutionalised partnership) is most effective in achieving the objectives. This will also be reflected in the explanatory memorandum.

3.2 Based on the answers to the questions below and information available from any impact assessment, the explanatory memorandum or other sources, is the proposed action an appropriate way to achieve the intended objectives?

The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the present proposal leaves full freedom to the Member States to pursue their own actions in the policy areas concerned. This will also be reflected in the explanatory memorandum.

(a) Is the initiative limited to those aspects that Member States cannot achieve

<p>satisfactorily on their own, and where the Union can do better?</p>
<p>The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments.</p>
<p>(b) Is the form of Union action (choice of instrument) justified, as simple as possible, and coherent with the satisfactory achievement of, and ensuring compliance with the objectives pursued (e.g. choice between regulation, (framework) directive, recommendation, or alternative regulatory methods such as co-legislation, etc.)?</p>
<p>For each of the candidate partnerships, the analysis carried out in the accompanying impact assessment has explored several options for implementation. A comparative assessment of the merits of each option also included an analysis of the simplicity of the intervention, its proportionality and effectiveness in achieving the intended objectives. This is reflected in the fact that a tailored approach has been suggested for each candidate partnership, ranging from looser forms of cooperation to more institutionalised ones, depending on the intended policy objectives, specific challenges, and desired outcome identified in each case.</p>
<p>(c) Does the Union action leave as much scope for national decision as possible while achieving satisfactorily the objectives set? (e.g. is it possible to limit the European action to minimum standards or use a less stringent policy instrument or approach?)</p>
<p>The proposed approach leaves full freedom to the Member States to pursue their own actions in the policy areas covered by the present proposal.</p>
<p>(d) Does the initiative create financial or administrative cost for the Union, national governments, regional or local authorities, economic operators or citizens? Are these costs commensurate with the objective to be achieved?</p>
<p>The proposed initiatives do create financial and administrative costs for the Union, national governments and, depending on the chosen mode of implementation, for regional and local authorities. In addition, economic operators and other stakeholders potentially involved in the candidate partnerships will also incur some costs linked to implementation. The financial cost of the proposed initiative is covered under the Horizon Europe programme. Its exact amount is still subject to political decision. As regards the candidate partnerships and the different modes of implementation (co-programmed, co-funded, institutionalised), the relevant costs and benefits are assessed in the individual impact assessments covering each candidate partnership. The additional administrative costs of implementation via partnerships are limited, when compared to the administrative costs of implementation through traditional calls. As indicated by comparable experience with previous initiatives and in feedback provided by a variety of stakeholders, these costs are expected to be fully justified by the benefits expected from the proposed initiative. Where available, additional details on costs are provided in Annex 3 of the impact assessment.</p>

(e) While respecting the Union law, have special circumstances applying in individual Member States been taken into account?

Where relevant, differences between Member States in capacity and stage of advancement of R&I in specific thematic areas have been taken into account in the individual impact assessments.

Annex 6 Additional background information

1. BACKGROUND INFORMATION FOR ALL INITIATIVES

1.1. Selection criteria of European Partnerships

Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

The necessity test for a European Partnership (as set out in the Horizon Europe regulation) has two levels:

1. **The justification for implementing a priority with a European Partnership** to address Horizon Europe and EU priorities. This is linked to demonstrating that a European Partnership can produce added value beyond what can be achieved through other Framework Programme modalities, notably traditional calls in the work programmes (Option 0 – Baseline).
2. **The justification for the use of the form of Institutionalised Partnership:** Once it has been demonstrated that a partnerships approach is justified, co-programmed and/or co-funded forms are considered for addressing the priorities as they are administratively lighter, more agile and easier to set-up (Options 1 and/or 2). As Institutionalised Partnerships require setting up a legal framework and the creation of a dedicated implementation structure, they have to justify higher set-up efforts by demonstrating that it will deliver the expected impacts in a more effective and efficient way, and that a long-term perspective and high degree of integration is required (Option 3).

The outcomes of the ‘necessity test’ is presented together with the preferred option.

Figure 6 Horizon Europe selection criteria for the European Partnerships

Common selection criteria & principles	Specifications
1. More effective (Union added value) clear impacts for the EU and its citizens	Delivering on global challenges and research and innovation objectives
	Securing EU competitiveness
	Securing sustainability
	Contributing to the strengthening of the European Research and Innovation Area
	Where relevant, contributing to international commitments
2. Coherence and	Within the EU research and innovation landscape

Common selection criteria & principles	Specifications
synergies	Coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions
3. Transparency and openness	Identification of priorities and objectives in terms of expected results and impacts
	Involvement of partners and stakeholders from across the entire value chain, from different sectors, backgrounds and disciplines, including international ones when relevant and not interfering with European competitiveness
	Clear modalities for promoting participation of smes and for disseminating and exploiting results, notably by smes, including through intermediary organisations
4. Additionality and directionality	Common strategic vision of the purpose of the European Partnership
	Approaches to ensure flexibility of implementation and to adjust to changing policy, societal and/or market needs, or scientific advances, to increase policy coherence between regional, national and EU level
	Demonstration of expected qualitative and significant quantitative leverage effects, including a method for the measurement of key performance indicators
	Exit-strategy and measures for phasing-out from the Programme
5. Long-term commitment of all the involved parties	A minimum share of public and/or private investments
	In the case of institutionalised European Partnerships, established in accordance with article 185 or 187 TFEU, the financial and/or in-kind, contributions from partners other than the Union, will at least be equal to 50% and may reach up to 75% of the aggregated European Partnership budgetary commitments

1.2. Overview of potential functions for a common back office among Joint Undertakings

Functions	Current situation	Option of joint back-office	Comments
Organising calls for grant and proposal evaluations	Each JU organises this independently.	A central organisation of evaluation, logistics, contracting evaluators, managing the data of the evaluation results Central database of potential evaluators with domain expertise in thematic areas of partnerships	The evaluations would still need to be supervised by the Scientific staff of the individual Joint Undertakings (consensus meetings of expert evaluators etc)
Human Resources related matters	Each JU has own HR policy and resources Quite some resources spent on recruitment in some JUs Some HR facilities are procured from external contractors Some JUs have a Service Level	More generic resources and expertise for HR matters More consistency in HR policy Shared HR investment for specialised expertise	Ensuring consistency with EC HR policies is already in place

	Agreement with COM for HR	(IP and legal)	
Financial management	<p>Each JU conducts own financial contract management; differences between JUs</p> <p>Each JU is audited separately.</p> <p>Auditing at project level more frequent than in other Horizon 2020 parts and outsourced by JUs thus differences</p> <p>ECA: too many audits on JUs</p>	<p>Financial management by one core team of financial staff</p> <p>Would reduce the number of interfaces for audits and simplifies the auditing of the all JUs</p> <p>Harmonisation of project auditing</p>	Simplifies the harmonisation of financial management across JUs in line with Horizon Europe
Communication (internal and external)	Each JU has a separate communication strategies, teams and resources	<p>A common back-office can support activities such as event organisation, dissemination of results, setting up website communication</p> <p>Can help create a more visible Partnership brand</p>	<p>A considerable share of communication activity is partnership specific (addressing particular target groups, synthesising project results) however there are generic communication activities that can be shared</p> <p>Needs to avoid duplication of efforts</p>
Data management on calls, project portfolios, information on project results	<p>Most JUs but not all use e-Corda for project data</p> <p>Overall IT integration of JUs still difficult</p>	<p>Harmonised data management</p> <p>Reduction of IT systems and support that is procured</p>	This will need to happen regardless of the common back office but will likely be more smooth if managed centrally

2. BACKGROUND INFORMATION FOR THIS SPECIFIC INITIATIVE

Table 1: EU28 share of the world production of electronics for downstream industries and mass-market consumer devices — shares in 2018

Sector	Semiconductors	Electronic boards	Electronic equipment (embedded and stand-alone)	Downstream industries (auto, aerospace, etc)	Services related to end user equipment
Automotive	22%	22%	27%	20%	22%
Industrial equipment	14%	17%	20%	18%	13%
Aerospace, defence & security	15%	15%	22%	22%	19%
Health and care	20%	20%	19%		20%
Home appliances	4%	8%	17%		
Audio & video	5%	7%	11%		
Computers & data processing	4%	5%	5%		5%
Telecommunications	5%	4%	4%		18%

Source: European Commission. (2019). Study on Emerging technologies in electronic components and systems (ECS) - Opportunities ahead. SMART 2018-0005.

The darker area presents segments where Europe has a strong position with the highest spillover to downstream industries.

Europe risks to be a follower in emerging key digital technologies

Scientific publications produced per region

Figure 1: Production of publications on microelectronics per country and year — number of publications (2009-2018)

Source: Calculations by Technopolis Group based on Scopus

Figure 2: Growth in production of publications on edge computing per country and year — number of publications

Source: Calculations by Technopolis Group based on Scopus data

Figure 3: Growth in production of publications on computer architectures per country and year — number of publications

Source: Calculations by Technopolis Group based on Scopus data

Figure 4: Growth in production of publications on AI per country and year — number of publications

Source: Calculations by Technopolis Group based on Scopus data

The analysis of scientific publications indicate that Europe retains a strong position in microelectronics research³³, producing 31% of publications in the period 2009-2018 (Figure 5). China (25%) comes second followed by the US (24%).

Figure 5: Publications in the area of microelectronics by country (2009-2018)

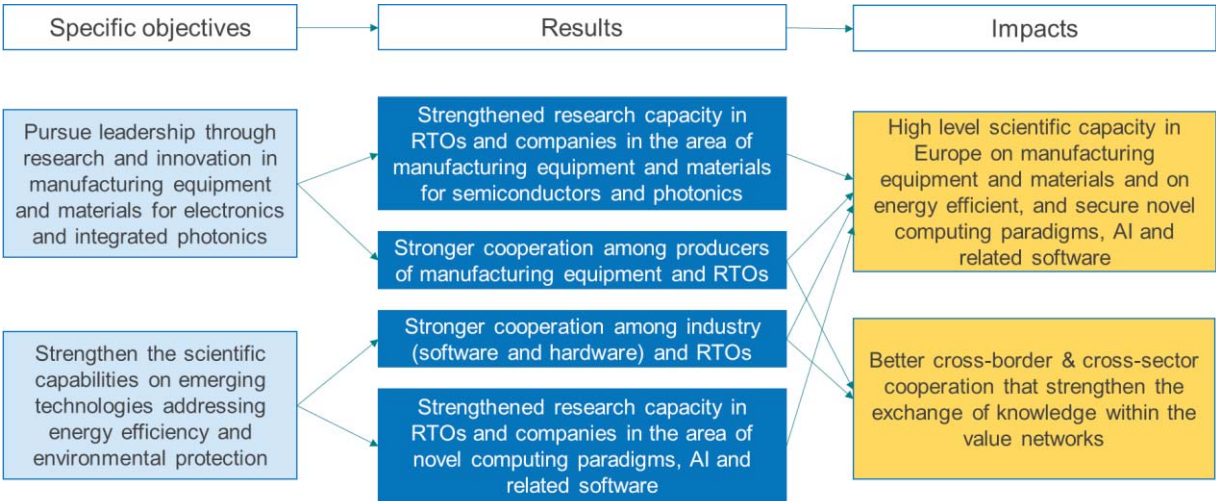

Source: Calculations by Technopolis Group based on Scopus data.

However, looking at the performance of MS, and comparing their performance against other countries, China is the leader followed by the US (Figure 2). The two top European countries, Germany and France, remain far behind. Comparing the two figures and observing the significant differences in the capacity of individual countries, illustrates the limitations of thinking national, while it also sketches out possibilities and the **added value of pooling together resources at the European level**.

Targeted impacts for the initiative

The initiative is estimated to lead to two key scientific impacts, as illustrated below:

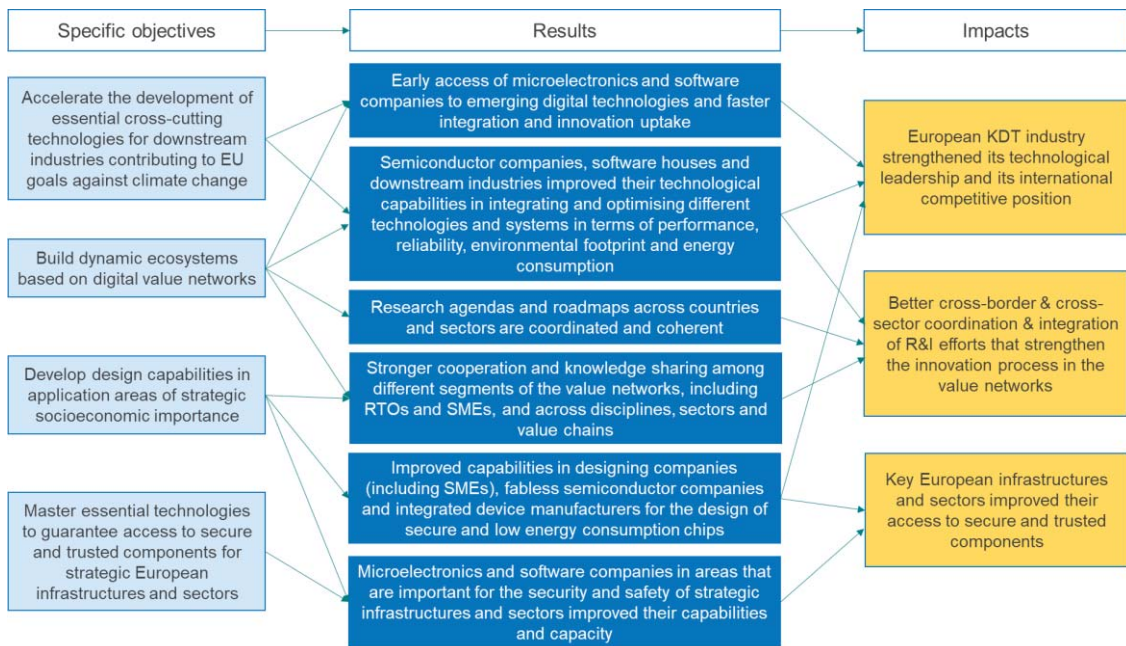

Figure 6: Impact pathway leading to scientific impacts

³³ The area of microelectronics was defined by a cloud of keywords suggested by the Expert Panel. The other technological areas included in the analysis were defined in a similar way.

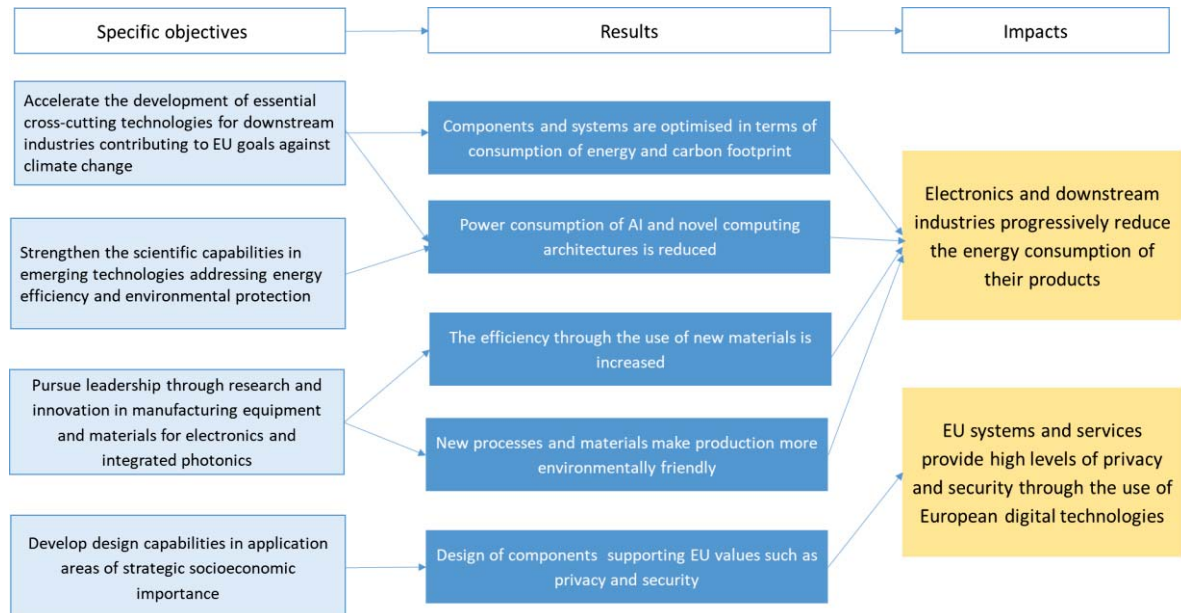

The expected key economic/technological impacts of the initiative are mapped in Figure 7.

Figure 7: Impact pathway leading to economic/technological impacts

The scientific and economic/technological impacts will also support the attainment of societal impacts as shown in Figure 8.

Figure 8: Impact pathway leading to societal impacts

OPTIONS DISCARDED AT AN EARLY STAGE

Option 2 – Co-funded European Partnership

The Co-funded Partnership is based on a *Grant Agreement* between the Commission and the consortium of partners, resulting from a call for a proposal for a programme co-funded action implementing the European Partnerships in the Horizon Europe Work Programme.

Key characteristics of Option 2 – Co-funded European Partnership

	Implications of option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> Partners can include <i>any</i> <i>national funding body or governmental research organisation</i>, Possible to include also <i>other type of actors</i>, including foundations. It is not possible to have the KDT industry associations as partners. Requires substantial national R&I programmes (competitive or institutional) in the field and therefore limited the participation to few Member States with existing national KDT programmes. Usually only legal entities from countries that are part of the consortia can apply to calls launched by the partnership, under national rules.
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> Activities may range from R&I, pilot, deployment actions to training and mobility, dissemination and exploitation, but according to national programmes and rules. The decision and implementation are responsibility of the partners through institutional funding KDT programmes, or by “third parties” receiving financial support, following calls for proposals launched by the consortium. The scale and scope of the initiative is limited and depends on the participating programmes. The resulting funded R&I actions are typically smaller in scale than FP projects.
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> The strategic R&I agenda/roadmap is agreed between the Member States and EC without the participation of industry. The annual work programme drafted by partners, approved by EC. Objectives and commitments are set in the Grant Agreement. The coherence of the partnership with other actions of the can be ensured by partners and EC. There are strong synergies with national/regional programmes and activities, and they can be ensured by the Member States. Synergies with other European programmes or industrial strategies are limited.
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> Low possibilities for leverage of industry contribution as industry does not participate in the decision making.

Option 3a – Institutionalised European Partnership under Art 185 TFEU

Article 185 of the TFEU is a complex and high-effort arrangement and is based on a Decision by the European Parliament and Council and implemented by dedicated structures created for that purpose. It allows the Union to participate in programmes jointly undertaken by Member States and Associated Countries.

Table 3: Key characteristics of Option 3: Institutionalised Partnership Art 185 TFEU

	Implications of option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • Partners can include <i>Member States and Associated Countries</i>. • Non-associated third countries can only be included as partners if foreseen in the basic act and subjected to conclusion of dedicated international agreements. • Good geographical coverage is required with participation of at least 40% of Member States • The existence of substantial national R&I programmes (competitive or institutional) in the field is required • Substantial differences can be found between legal entities from Participating States and those from other Member or Associated States in the rules for participation and funding.
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • Horizon Europe’s standard actions that allow a broad range of coordinated activities from R&I to uptake apply. • In case of implementation based on national rules (subject to derogation) the activities follow the national programmes and rules. • The option allows the integration of national funding and Union funding into the joint funding of projects
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> • The strategic R&I agenda/roadmap is agreed between partners and the EC • The objectives and commitments are set in the legal base. • The annual work programme is drafted by partners and approved by the EC • The commitments include the obligation for financial contributions (e.g. to administrative costs, from national R&I programmes).
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> • National R&I activities can be integrated into the programme, which can then be matched from the EU budget to increase scope and promote transnational cooperation.

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED

1.1. Focus and objectives of the impact assessment

This impact assessment accompanies the Commission proposal for Institutionalised European Partnerships to be funded under Horizon Europe, the 2021-2027 Framework Programme for EU Research and Innovation (R&I).¹ It sets out to **help decide in a coordinated manner the right form of implementation for specific candidate initiatives** based on a common approach and methodology to individual assessments². It also provides an **horizontal perspective on the portfolio of candidate European Partnerships** to identify further efficiency and coherence gains for more impact.

European Partnerships are initiatives where the Union, together with private and/or public partners (such as industry, public bodies or foundations) commit to support jointly the development and implementation of an integrated programme of R&I activities. The rationale for establishing such initiatives is to achieve the objectives of Horizon Europe more effectively than what can be attained by other activities of the programme.³

Based on the Horizon Europe Regulation, European Partnerships may be set up using **three different forms**: “Co-funded”, “Co-programmed” and “Institutionalised”. The setting-up of **Institutionalised Partnerships** involves new EU legislation and the establishment of dedicated implementing structures based on Article 185 or 187 of the Treaty on the Functioning of the EU (TFEU). This requires an impact assessment to be performed.

The Horizon Europe Regulation defines **eight priority areas**, scoping the domains in which Institutionalised Partnerships could be proposed⁴. Across these priority areas, **13 initiatives** have been identified **as suitable candidate initiatives** for Institutionalised Partnerships because of their objectives and scope. This impact assessment aims to identify whether 12 of these initiatives⁵ need to be implemented through this form of implementation and would not deliver equally well with traditional calls of Horizon Europe or other lighter forms of European Partnerships under Horizon Europe. This means assessing whether each of these initiatives meets the necessity test set in the **selection criteria** for European Partnerships in the Horizon Europe Regulation, Annex III.

¹ Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

² Based on the European Commission Better Regulation framework (SWD (2017) 350) and supported by an external study coordinated by Technopolis Group (to be published in 2020).

³ For further details on these points, see below Section 1.2.2.

⁴ Set out in the Annex Va of the Horizon Europe Regulation (common understanding). <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

⁵ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47).

This assessment is done **without any budgetary consideration**, as the overall budget of the Multiannual Financial Framework of the EU – and hence of Horizon Europe – for the next financing period is not known at this stage.⁶

1.2. The political and legal context

1.2.1. Shift in EU priorities and Horizon Europe framework

European priorities have evolved in the last decades, and reflect the social, economic, and environmental challenges for the EU in the face of global developments. In her Political Guidelines for the new European Commission 2019 – 2024⁷, the new Commission President put forward six overarching priorities, which reach well beyond 2024 in scope⁸. Together with the Sustainable Development Goals (SDGs), these priorities will shape future EU policy responses to the challenges Europe faces, and thus also give direction to EU research and innovation.

As part of the Multi-annual Financial Framework (MFF) 2021-27 the new EU Framework Programme for Research and Innovation **Horizon Europe will play a pivotal role for Europe to lead the social, economic, and environmental transitions needed to achieve these European policy priorities**. It will be more impact driven with a strong focus on delivering European added value, but also be more effective and efficient in its implementation.⁹ Horizon Europe finds its rationale in the daunting challenges that the EU is facing, which call for “*a radical new approach to developing and deploying new technologies and innovative solutions for citizens and the planet on a scale and at a speed never achieved before, and to adapting our policy and economic framework to turn global threats into new opportunities for our society and economy, citizens and businesses.*” While Horizon Europe continues the efforts of strengthening the scientific and technological bases of the Union and foster competitiveness, a more strategic and impact-based approach to EU R&I investment is taken. Consequently, the **objectives of Horizon Europe** highlight the need to *deliver on the Union strategic priorities and contribute to the realisation of EU objectives and policies, contribute to tackling global challenges, including the Sustainable Development Goals by following the principles of the Agenda 2030 and the Paris Agreement.*¹⁰

In this context, **at least 35 % of the expenditure from actions under the Horizon Europe Programme will have to contribute to climate action**. Furthermore, a **Strategic Plan** is co-designed with stakeholders to identify **key strategic orientations for R&I support** for 2021-2024 in line with the EU priorities. In the Orientations towards the first Strategic Plan for Horizon Europe, the need to strategically prioritise and “*direct a substantial part of the funds towards the areas where we believe they will matter the most*” is emphasised. The Orientations

⁶ EU budget commitments to the European Partnership candidates can only be discussed and decided following the political agreement on the overall Multiannual Financial Framework and Horizon Europe budgetary envelopes. The level of EU contribution for individual partnerships should be determined once there are agreed objectives, and clear commitments from partners. Importantly, there is a ceiling to the partnership budgets in Pillar II of Horizon Europe (the legal proposal specifies that *the majority of the budget in pillar II shall be allocated to actions outside of European Partnerships*).

⁷ https://ec.europa.eu/info/strategy/priorities-2019-2024_en

⁸ 1.A European Green Deal; An economy that works for people; A Europe fit for the Digital Age; Promoting our European way of life; A Stronger Europe in the World; and 6.A New push for European Democracy

⁹ EC (2018) *A Modern Budget for a Union that Protects, Empowers and Defends. The Multiannual Financial Framework for 2021-2027*. Communication from the Commission to the European Parliament, the European Council, the Council, the European Economic and Social Committee and the Committee of the Regions, COM(2018) 321 final

¹⁰ Article 3, Common understanding regarding the proposal for Horizon Europe Framework Programme.

specify, that actions under Pillar II of Horizon Europe “Global Challenges and European Industrial Competitiveness” will target only selected themes of especially high impact that significantly contribute to delivering on the political priorities of the Union. Most of the candidate European Partnerships fall under this Pillar.

1.2.2. Key evolutions in the approach to partnerships in Horizon Europe

Since their start in 1984 the successive set of Framework Programmes uses a variety of instruments and approaches to support R&I activities, address global challenges and industrial competitiveness. Collaborative, competition-based and excellence-driven R&I projects funded through Work Programmes are the most traditional and long-standing approach for implementation. Since 2002, available tools also include **partnerships**, whereby the Union together with private and/or public partners commit to jointly support the development and implementation of a R&I programme. These were introduced as part of creating the European Research Area (ERA) to align national strategies and overcome fragmentation of research effort towards an increased scientific, managerial and financial integration of European research and innovation. Interoperable and integrated national research systems would allow for better flows of knowledge, technology and people. Since then, the core activities of the partnerships consist of building critical mass mainly through collaborative projects, jointly developing visions, and setting strategic agendas.

As analysed in the **interim evaluation of Horizon 2020**¹¹, a considerable repertoire of partnership initiatives have been introduced over time, with 8 forms of implementation¹² and close to 120 partnership initiatives running under Horizon 2020 - without clear exit strategies and concerns about their degree of coherence, openness and transparency. Even if it is recognised that these initiatives allow setting long-term agendas, structuring R&I cooperation between otherwise dispersed actors, and leveraging additional investments, the evaluation points to the complexity generated by the proliferation of instruments and initiatives, and their insufficient contribution to policies at EU and national level.

Box 1 Key lessons from the interim evaluation of Horizon 2020 and R&I partnerships

- The **Horizon 2020 Interim Evaluation** concludes that the overall partnership landscape has become overly complex and fragmented. It identifies the need for rationalisation, improve their openness and transparency, and link them with future EU R&I missions and strategic priorities.
- The **Article 185 evaluation** finds that these public-public partnerships have scientific quality, global visibility and networking/structuring effects, but should in the future focus more on the achievement of policy impacts. From a systemic point of view, it found that the EU public-to-public cooperation (P2P) landscape has become crowded, with insufficient coherence.
- The **Article 187 evaluation** points out that Public-Private Partnership (PPP) activities need to be brought more in line with EU, national and regional policies, and calls for a revision of the Key Performance Indicators. As regards the **contractual PPPs (cPPPs)** their reviews identified challenges of coherence among cPPPs and the need to develop collaborations and synergies with other relevant initiatives and programmes at EU, national and regional level.

¹¹ Interim evaluation of Horizon 2020, Commission Staff Working Document, SWD(2017)221 and 222
Interim evaluation of the Joint Undertakings operating under Horizon 2020 (Commission Staff Working Document, SWD(2017) 339); Evaluation of the Participation of the EU in research and development programmes undertaken by several Member States based on Article 185 of the TFEU, Commission Staff Working Document, SWD (2017)340

¹² E.g. initiatives based on Article 187 (Joint Technology Initiatives), Article 185 TFEU, Contractual Public-Private Partnerships (cPPPs), Knowledge & Innovation Communities of the European Institute of Innovation & Technology (EIT-KICs), ERA-NETs, European Joint Programmes, Joint Programming Initiatives.

Over 80% of respondents to the Open Public Consultation (OPC) indicated that a significant contribution by future European Partnerships is 'fully needed' to achieve climate-related goals, to develop and effectively deploy technology, and for EU global competitiveness in specific sectors/domains. Views converged across all categories of respondents, including citizens, industry and academia.

The impact assessment of Horizon Europe identifies therefore the need to **rationalise the EU R&I funding landscape**, in particular with respect to partnerships, as well as to **re-orient partnerships towards more impact** and delivery on EU priorities. To address these concerns and to realise the higher ambition for European investments, Horizon Europe puts forward a **major simplification and reform for the Commission's policy on R&I partnerships**¹³. Reflecting its pronounced systemic nature aimed at contributing to EU-wide 'transformations' towards the sustainability objectives, Horizon Europe indeed intends to make a more effective use of these partnerships with a **more strategic, coherent and impact-driven approach**. Key related changes that apply to all forms of European Partnerships encapsulated in Horizon

Box 2 Key features of the revised policy approach to R&I partnerships under Horizon Europe based on its impact assessment

- ✓ **Simpler architecture & toolbox** by streamlining 8 partnership instruments into 3 implementation forms (Co-Funded, Co-Programmed, Institutionalised), under the umbrella 'European Partnerships'
- ✓ **More systematic and transparent approach** to selecting, implementing, monitoring, evaluating and phasing out all forms of partnerships (**criteria** for European Partnerships):
 - The selection of Partnerships is embedded in the strategic planning of Horizon Europe, thereby ensuring coherence with the EU priorities. The selection criteria require that partnerships are established with stronger ex-ante commitment and higher ambition.
 - The implementation criteria stipulate that initiatives adopt a systemic approach in achieving impacts, including broad engagement of stakeholders in agenda-setting and synergies with other relevant initiatives to promote the take-up of R&I results.
 - A harmonised monitoring & evaluation system will be implemented, and ensures that progress is analysed in the wider context of achieving Horizon Europe objectives and EU priorities.
 - All partnerships need to develop an exit strategy from Framework Programme funding. This new approach is underpinned by principles of openness, coherence and EU added value.
- ✓ **Reinforced impact orientation:**
 - Partnerships are established only if there is evidence they support achieving EU policy objectives more effectively than other Horizon Europe actions, by demonstrating a clear vision and targets (**directionality**) and corresponding long-term commitments from partners (**additionality**).
 - European Partnerships are expected to provide mechanisms – based on a concrete roadmap - to join up R&I efforts between a broad range of actors towards the development and uptake of innovative solutions in line with EU priorities, serving the economy and society, as well as scientific progress.
 - They are expected to develop close synergies with national and regional initiatives, acting as dynamic change agents, strengthening linkages within their respective ecosystems and along the value chains, as well as pooling resources and efforts towards the common EU objectives.

Regulation are summarised in the Box below.

Under Horizon Europe, a 'European Partnership'¹⁴ is defined as *“an initiative where the Union, prepared with early involvement of Member States and/or Associated Countries, together with private and/or public partners (such as industry, universities, research organisations, bodies with a public service mission at local, regional, national or international level or civil society organisations including foundations and NGOs), commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”*

The Regulation further specifies that European Partnerships shall adhere to the *“principles of Union added value, transparency, openness, impact within and for Europe, strong leverage effect on sufficient scale, long-term commitments of all the involved parties, flexibility in*

¹³ Impact assessment of Horizon Europe, Commission Staff Working Document, SWD(2018)307.

¹⁴ Article 8 and Annex III of the Horizon Europe Regulation (common understanding))

implementation, coherence, coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions.”

1.3. Why should the EU act

1.3.1. Legal basis

Proposals for Institutionalised European Partnerships are based on:

- 1) Article 185 TFEU which allows the Union to make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; or
- 2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes.¹⁵

1.3.2. Subsidiarity

The EU should act only in areas where there is demonstrable advantage that the action at EU level is more effective than action taken at national, regional or local level. Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the EU can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas. The candidate initiatives focus on areas where there is a demonstrable value added in acting at the EU level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national activities in the same area. Overall European Partnerships find their **rationale in addressing a set of systemic failures**¹⁶:

- Their primary function is to create a platform for a strengthened **collaboration** and knowledge exchange between various actors in the European R&I system and an enhanced **coordination** of strategic research agendas and/or R&I funding programmes. They aim to address **transformational failures** to better align agendas and policies of public and private funders, pool available resources, create critical mass, avoid unnecessary duplication of efforts, and leverage sufficiently large investments where needed but hardly achievable by single countries.
- The concentration of efforts and pooling of knowledge on common priorities to solve multi-faceted societal and economic challenges is at the core of these initiatives. Specifically, enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems are among the key objectives of these instruments. In the light of Horizon Europe, the aim is to **drive system transitions and transformations towards EU priorities**.
- Especially in fast-growing technologies and sectors such as ICT, there is a need to **react to emerging opportunities** and address systemic failures such as shortage in skills or

¹⁵ Both Articles are under Title XIX of the TFEU - Research and Technological Development and Space.

¹⁶ The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide qualitative and quantitative evidence on these points. Sections 1 and 2 of each impact assessment on candidate European Partnerships include more detail on the necessity to act at EU level in specific thematic areas.

critical mass or cross-sectoral cooperation along the value chains that would hamper attainment of future European leadership and/or strategic autonomy.

- They also aim to address **market failures** predominantly to enhancing industry investments thanks to the sharing of risks.

2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED

2.1. Portfolio of candidates for Institutionalised European Partnerships

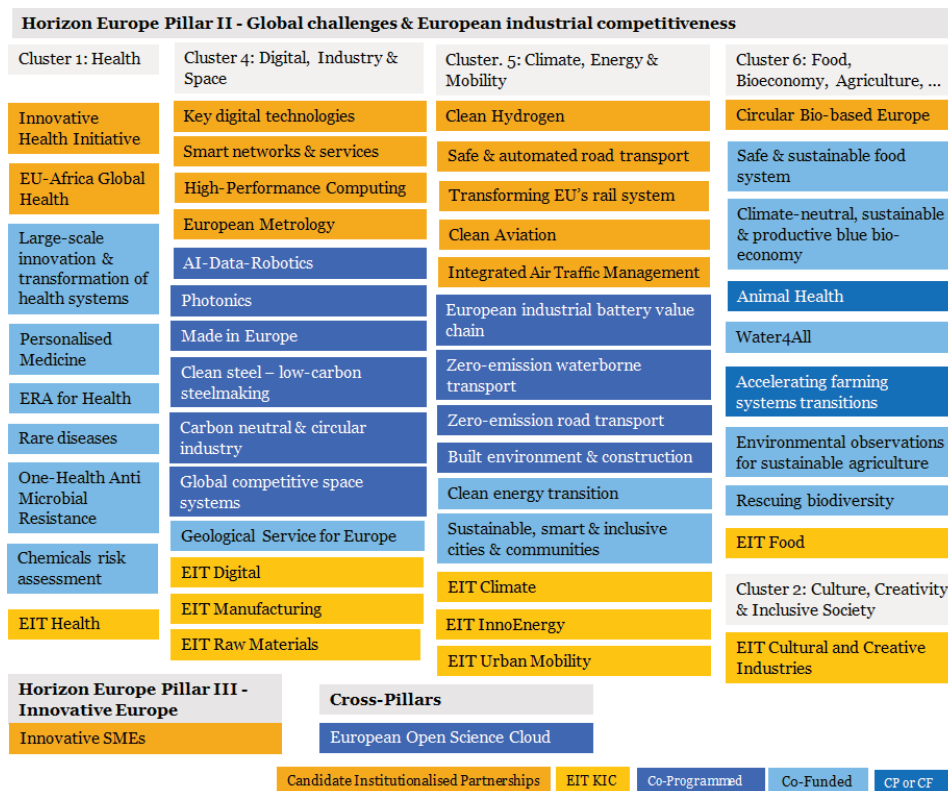

The new approach for more objective-driven and impactful European Partnerships is reflected in the way candidate Partnerships have been identified. It involved a co-design exercise aiming to better align these initiatives with societal needs and policy priorities, while broadening the range of actors involved. Taking into account the 8 areas for Institutionalised European Partnerships set out in the Horizon Europe Regulation¹⁷, a co-design exercise as part of the Strategic Planning process of Horizon Europe lead to the identification of **49 candidates for Co-funded, Co-programmed or Institutionalised European Partnerships**¹⁸. Out of these, **13 were identified as suitable candidate Institutionalised Partnerships because of their objectives and scope**¹⁹. Whilst the Co-Funded and Co-Programmed Partnerships are linked to the comitology procedure (including the adoption of the Strategic Plan and the Horizon Europe Work Programmes), Institutionalised Partnerships require the adoption of legislation and are subject to an impact assessment. The Figure 1 below gives an overview of all candidate European Partnerships according to their primary relevance to Commission priorities for 2019-2024.

¹⁷ Horizon Europe Regulation (common understanding), Annex Va.

¹⁸ Shadow configuration of Strategic Programme Committee for Horizon Europe. The list of candidate European Partnerships is described in “Orientations towards the Strategic Plan of Horizon Europe” - Annex 7

¹⁹ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47)

Figure 1 - Overview of the candidates for Co-Funded, Co-Programmed and Institutionalised European Partnerships according to Horizon Europe structure

Source: Technopolis group (2020)

There are only three partnerships for which implementation as an Institutionalised Partnership under Article 185 is an option, i.e. European Metrology, the EU-Africa Global Health partnership, and Innovative SMEs. Ten partnerships are candidates for Institutionalised Partnerships under Article 187. Overall the initiatives can be categorised into ‘horizontal’ partnerships and ‘vertical’ partnerships.

The ‘horizontal’ partnerships have a central position in the overall portfolio, as they are expected to develop methodologies and technologies for application in the other priority areas, ultimately supporting European strategic autonomy in these areas as well as technological sovereignty. These ‘horizontal’ partnerships are typically proposed as Institutionalised or Co-programmed Partnerships, in addition to a number of EIT KICs, they cover mainly the digital field in addition to space, creative industries and manufacturing, but also the initiative related to Innovative SMEs. ‘Vertical’ partnerships are focused on the needs and development of specific application areas, and are primarily expected to support enhanced environmental sustainability thereby addressing Green Deal related objectives. They also deliver on policies for more people centred economy, through improved wellbeing of EU citizen and the economy, like health related candidate European Partnerships.

2.2. Assessing the necessity of a European Partnership and possible options for implementation

Horizon Europe Regulation Article 8 stipulates that Institutionalised European Partnerships based on Article 185 and 187 TFEU shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration. At the core of this impact assessment is therefore the

need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

For all candidate Institutionalised European Partnerships the options considered in this impact assessment are the same, i.e.:

- Option 0 – Baseline option – Traditional calls under the Framework Programme
- Option 1 – Co-programmed European Partnership
- Option 2 – Co-funded European Partnership
- Option 3 – Institutionalised Partnership
 - Sub-option 3a Institutionalised Partnerships based on Art 185 TFEU
 - Sub-option 3b Institutionalised Partnerships based on Art 187 TFEU

2.2.1. *Option 0* - Baseline option – Traditional calls

Under this option, strategic programming for R&I in the priority area will be done through the mainstream channels of Horizon Europe. The related priorities will be implemented through **traditional calls** of Horizon Europe covering a range of actions, mainly R&I and/or innovation actions but also coordination and support actions, prizes or procurement. Most actions involve consortia of public and/or private actors in ad hoc combinations, while some actions are single actor (mono-beneficiary). There will be no dedicated implementation structure and no support other than what is foreseen in the related Horizon Europe Work Programme. This means that discontinuation costs/benefits of predecessor initiatives should be factored in for capturing the baseline situation when relevant.

Under this option, strategic planning mechanisms in the Framework Programme will allow for a high level of flexibility in the ability of traditional calls to respond to particular needs over time, building upon additional input in co-creation from stakeholders and programme committees involving Member States. The Union contribution to addressing the priority covers the full duration of the initiative, during the lifetime of Horizon Europe. Without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual commitments and contributions outside their participation in funded projects.

2.2.2. European Partnerships

Under this set of options, three different forms of implementation are assessed: Co-funded, Co-Programmed, Institutionalised European Partnerships. These have **commonalities that cannot serve as a distinguishing factor in the impact assessment process**. They are all based on agreed objectives and expected impacts and underpinned by Strategic Research and Innovation Agendas / roadmaps that are shared and committed to by all partners in the partnership. They all have to follow the same set of criteria along their lifecycle, as defined in the Horizon Europe Regulation (Annex III), including ex ante commitment from partners to mobilise and contribute resources and investments. The Union contribution is defined for the full duration of the initiative for all European Partnerships. The Horizon Europe legal act introduces few additional requirements for Institutionalised Partnerships, e.g. the need for long-term perspective, strong integration of R&I agendas, and financial contributions.

Figure 2 - Key differences in preparation and implementation of European Partnerships

Type	Legal form	Implementation
Co-Programmed	Contractual arrangement / MoU	Division of labour , whereby the Union contribution is implemented through a Framework Programme and partners' contributions under their responsibility.
Co-Funded	Grant Agreement	Union provides co-funding for an integrated programme with distributed implementation by entities managing and/or funding national research and innovation programmes
Institutionalised based on Article 185/187 TFEU	Basic act (Council regulation, Decision by European Parliament and Council)	Integrated programme with centralised implementation

The main differences between the different forms of European Partnerships are in their preparation and in the way they function, as well as in the overall impact they can trigger. The Co-Programmed form is assessed as the simplest, and the Institutionalised the most complex to prepare and implement. The functionalities of the different form of Partnerships – compared to the baseline option – are presented in Figure 3. They relate to the types of actors Partnerships can involve and their degree of openness, the types of activities they can perform and their degree of flexibility, the degree of commitment of partners and the priority setting system, and their ability to work with their external environment (coherence), etc. These key distinguishing factors will be at the basis of the comparison of each option to determine their overall capacity to deliver what is needed at a minimised cost.

Figure 3 - Overview of the functionalities provided by each form of European Partnerships, compared to the traditional calls of Horizon Europe (baseline)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Type and composition of actors (including openness and roles)				
<u>Partners:</u> N.A., no common set of actors that engage in planning and implementation <u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning <u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology <u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules	<u>Partners:</u> core of national funding bodies or government-mental research organisations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> limited, according to national rules of partner countries	<u>Partners:</u> National funding bodies or governmental research organisation <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with Horizon Europe rules, but possible derogations

	systemic approach beyond individual actions	programmes, often smaller in scale		Activities/investments of partners/ national funding
Priority-setting process and directionality				
<u>Priority setting:</u> Strategic Plan and annual work programmes, covering max. 4 years. <u>Limitations:</u> Fully taking into account existing or to be developed SRIA/ roadmap	<u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution Input to FP annual work programme drafted by partners, finalised by EC (comitology) Objectives & commitments set in contractual arrangement	<u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution Annual work programme drafted by partners, approved by EC Objectives & commitments set in Grant Agreement	<u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution Annual work programme drafted by partners, approved by EC Objectives & commitments set in legal act	<u>Priority setting:</u> Strategic R&I agenda/ roadmap agreed between partners & EC, covering usually 7 years, incl. allocation of Union contribution Annual work programme drafted by partners, approved by EC (veto-right in governance) Objectives & commitments set in legal act
Coherence: internal (Horizon Europe) & external (other Union programmes, national programmes, industrial strategies)				
<u>Internal:</u> Coherence between different parts of the FP Annual Work programme can be ensured by EC <u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes & activities	<u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC <u>External:</u> Limited synergies with other Union programmes & industrial strategies. If MS participate, with national/ regional programmes & activities	<u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC <u>External:</u> Synergies with national/ regional programmes & activities	<u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC <u>External:</u> Synergies with national/ regional programmes & activities	<u>Internal:</u> Coherence among partnerships & with parts of the FP Annual Work programme can be ensured by partners & EC <u>External:</u> Synergies with other Union programmes and industrial strategies If MS participate, with national/ regional programmes & activities

Option 1 - Co-programmed European Partnership

This form of European Partnership is **based upon a Memorandum of Understanding or a Contractual Arrangement** signed by the Commission and the private and/or public partners. Private partners are represented by industry associations, which also support the daily management of the partnership. This type of partnership would allow for a large degree of flexibility for the activities, partners and priorities to continuously evolve. The commitments of partners are political efforts described in the contractual arrangement and the contributions from partners are provided in kind more than financially. The priorities for the calls, proposed by the Partnership's members for integration in the Horizon Europe's Work Programmes, are subject to further input from Member States (comitology) and Commission services. The Union contribution is implemented within the executive agency managing Horizon Europe calls for research and innovation projects proposals. The full array of Horizon Europe instruments can be used, ranging from research and innovation (RIA) types of actions to coordination and support actions (CSA) and including grants, prizes, and procurement.

Option 2 – Co-funded European Partnership

The Co-funded European Partnership is **based on a Grant Agreement** between the Commission and a consortium of partners, resulting from a specific call in the Horizon Europe Work Programme. This form of implementation only allows to address public partners at its core.

Typically these provide co-funding to a common programme of activities established and/or implemented by entities managing and/or funding national R&I programmes. The recipients of the EU co-funding implement the initiative under their responsibility, with national funding/resources pooled to implement the programme with co-funding from the Union. The expectation is that these entities would cover most if not all EU Member States. Calls and evaluations would be organised centrally, beneficiaries in selected projects would be funded at national level, following national funding rules.

Option 3 – Institutionalised European Partnership

This type of Partnership is the most complex and high-effort arrangement, and requires meeting additional requirements. Institutionalised European Partnership are **based on a Council Regulation (Article 187 TFEU or a Decision by the European Parliament and Council (Article 185 TFEU))** and are implemented by dedicated structures created for that purpose. These regulatory needs limit the flexibility for a change in the core objectives, partners, and/or commitments as these would require amending legislation. The basic rationale for this type of partnership is the need for a strong integration of R&I agendas in the private and/or public sectors in the EU in order to address a strategic challenge. It is therefore necessary to demonstrate that other forms of implementation would not achieve the objectives or would not generate the necessary expected impacts, and that a long-term perspective and high degree of integration is needed. For both Article 187 and 185 initiatives, contributions from partners can be in the form of financial and in-kind contributions. Eligibility for participation and funding follows by default the rules of Horizon Europe, unless a derogation is introduced in the basic act.

Option 3a - Institutionalised Partnerships based on Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and limits therefore the scope to **public partners** which are Member States and Associated Third Countries. This type of Institutionalised Partnership aims therefore at reaching the greatest possible impact through the integration of national and EU funding, aligning national strategies in order to optimise the use of public resources and overcome fragmentation of the public research effort. It brings together R&I governance bodies of most if not all EU Member States (legal requirement: at least 40% of Member States) as well as Associated Third Countries that designate a legal entity (Dedicated Implementation Structure) of their choice for the implementation. By default, participation of non-associated Third Countries is not foreseen. Such participation is possible only if it is foreseen in the basic act and subject to conclusion of an international agreement.

Option 3b - Institutionalised Partnerships based on Article 187 TFEU

Article 187 of the TFEU allows the Union to set up joint undertakings or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes. This type of Institutionalised Partnership brings together a stable set of **public and private partners** with a strong commitment to taking a more integrated approach and requires the set-up of a dedicated legal entity (Union body, Joint Undertaking (JU)) that carries full responsibility for the management of the Partnership and implementation of the calls. Different configurations are possible:

- Partnerships focused on creating strategic industrial partnerships where, most often, the partner organisations are represented by one or more industry associations, or in some cases individual private partners;

- Partnerships coordinating national ministries, public funding agencies, and governmental research organisations in the Member States and Associated Countries;
- Or a combination of the two: the so-called tripartite model.

Participation of non-associated Third Countries is only possible if foreseen in the basic act and subject to conclusion of an international agreement.

2.3. Overview of the methodology adopted for the impact assessment

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines²⁰ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This also integrates **key selection criteria for European Partnerships**.

Box 2 Summary of European Partnerships selection criteria²¹

- **Effectiveness** in achieving the related objectives and impacts of the Programme;
- **Coherence** and synergies of the European Partnership within the EU R&I landscape;
- **Transparency & openness** as regards the identification of priorities and objectives and the involvement of partners & stakeholders from the entire value chain, backgrounds & disciplines;
- Ex-ante demonstration of **additionality** and **directionality**;
- Ex-ante demonstration of the partners' **long term commitment**.

2.3.1. Overview of the methodologies employed

In terms of **methods and evidence used**, the impact assessments draw on an external study covering all candidate Institutionalised European Partnerships in parallel to ensure a high level of coherence and comparability of analysis, in addition to a horizontal analysis.²² For all initiatives, the understanding of the overall context of the candidate institutionalised European Partnerships relied on desk research, including among others the lessons learned from previous partnerships. This was complemented by the analysis of a range of quantitative and qualitative evidence, including evaluations of past and ongoing initiatives; foresight studies; statistical analyses of Framework Programmes application and participation data, and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options, as described below. Public consultations (both open and targeted) supported the comparative assessment of the policy options. For each initiative, up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation run between September and November 2019, the consultation of Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of initiatives.

²⁰ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

²¹ For a comprehensive overview of the selection criteria for European Partnerships, see Annex 6.

²² Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

A more detailed description of the methodology and evidence base that were mobilised, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

2.3.2. *Method for identifying the preferred option*

The first step of the assessments consisted in scoping the problems that the initiatives are expected to solve given the overall economic, technological, scientific and social context, including the lessons to be learned from past and ongoing partnerships on what worked well and less well. This supported the identification of the objectives of the initiative in the medium and long term with the underlying intervention logic – showing how to get there.

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has then been adapted to introduce “**key functionalities needed**” - making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options while allowing at the same time a structured comparison of the options not only as regards their effectiveness, efficiency and coherence, but also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)²³.

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made compared to the baseline. Therefore, for each of these aspects the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. This includes the discontinuation costs/benefits of existing implementation structures when relevant. The policy options are then scored compared to the baseline with a + and – system with a two-point scale, to show a slightly or highly additional/lower performance compared to the baseline. A scoring of 0 of a policy option means that it would deliver as much as the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows

²³ The criterion on the ex-ante demonstration of partners’ long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options²⁴.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU's R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach²⁵ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account²⁶. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²⁷ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are predominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%), but lead to an additional R&I investment of at least the same amount than the Union contribution²⁸ (efficiency of 98% for the overall investment).

²⁴ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

²⁵ For further details, see Better Regulation Toolbox # 57.

²⁶ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²⁷ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

²⁸ Minimum contributions from partners equal to the Union contribution

- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2.3 times the Union contribution²⁹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution³⁰. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution³¹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0				↑↑
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0				↑↑
Ex-ante Impact Assessment for partnership		0			↑↑↑
Preparation of EC proposal and negotiation		0			↑↑↑
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0				↑
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC			0		↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in

²⁹ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

³⁰ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

³¹ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**)³². In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

For the **identification of the preferred option**, the scorecard analysis builds a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each cri

As a last step, the alignment of the preferred option with key criteria for the selection of European Partnerships is described, reflecting the outcomes of the ‘necessity test’. The monitoring and evaluation arrangements are concluding the assessment, with an identification of the key indicators to track progress towards the objectives over time.

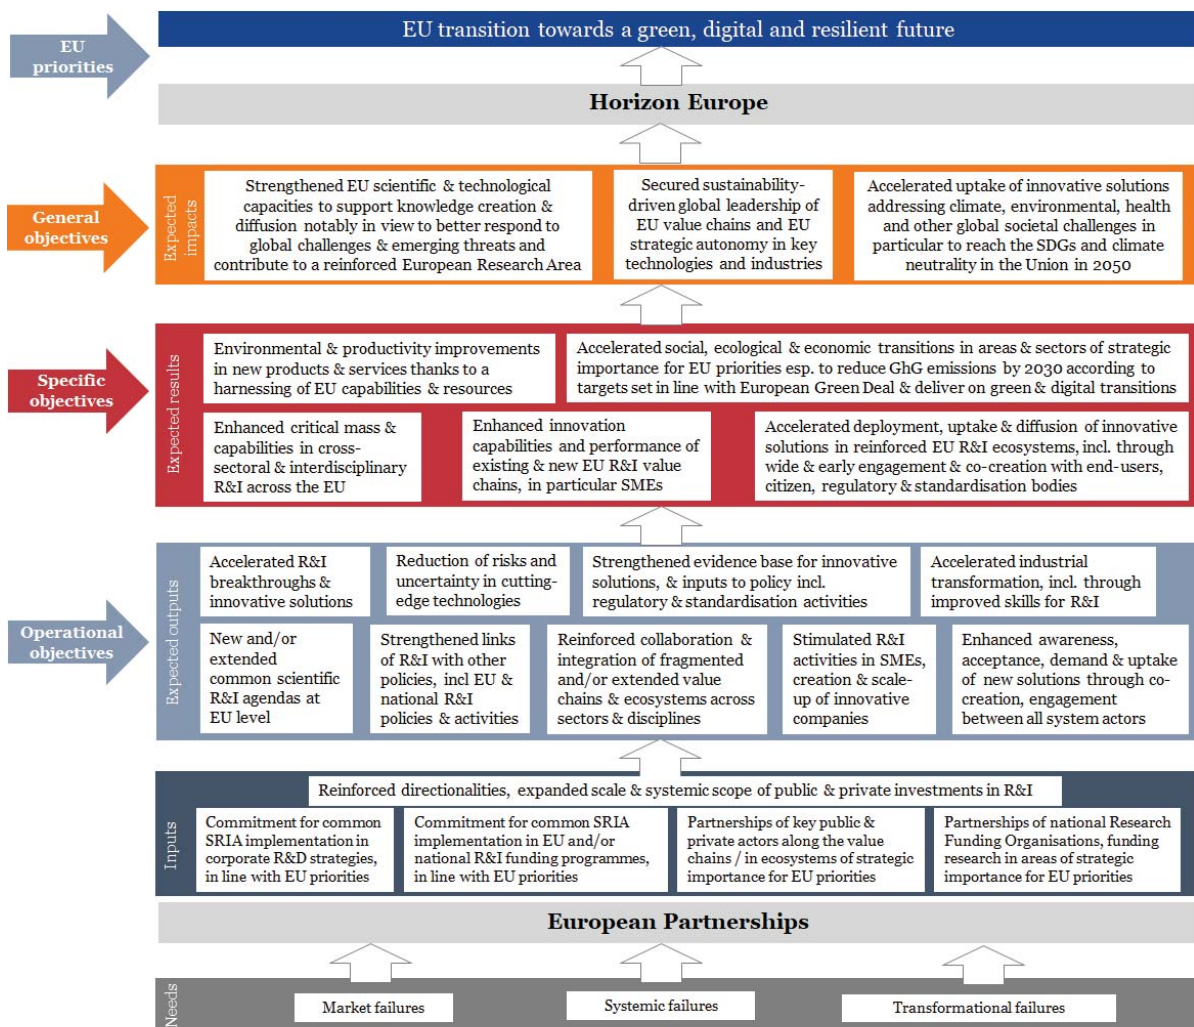

2.4. **Horizontal perspective on candidate Institutionalised European Partnerships**

2.4.1. *Overall impact orientation, coherence and efficiency needs*

The consolidated **intervention logic** for the set of candidate Institutionalised European Partnerships in the Figure below builds upon the objectives as reported in the individual impact assessments.

³² More details on the methodology can be found in Annex 4.

Figure 5 – Overall intervention logic of the European Partnerships under Horizon Europe

Source: European Commission, DG Research & Innovation, Unit A2 Programme Analysis and Regulatory Reform, adapted from Technopolis Group (2020)

When analysed as a package the 12 candidate Institutionalised European Partnerships are expected to support the achievement of the European policy priorities targeted by Horizon Europe by pursuing the following joint general objectives:

- Strengthening and integrating EU scientific and technological capacities to support knowledge creation and diffusion notably in view to better respond to global challenges and emerging threats and contribute to a reinforced European Research Area;
- Securing sustainability-driven global leadership of EU value chains and EU strategic autonomy in key technologies and industries; and
- Accelerate the uptake of innovative solutions addressing climate, environmental, health and other global societal challenges contributing to Union strategic priorities, in particular to reach the Sustainable Development Goals and climate neutrality in the Union in 2050.

In terms of specific objectives, they jointly aim to:

- Enhance the critical mass and scientific capabilities in cross-sectoral and interdisciplinary research and innovation across the Union;
- Accelerate the social, ecological and economic transitions in areas and sectors of strategic importance for Union priorities, in particular to reduce greenhouse gas emissions by 2030 according to the targets set in line with the European Green Deal, and deliver on the green and digital transition;

- c) Enhance the innovation capabilities and performance of existing and new European research and innovation value chains, in particular SMEs;
- d) Accelerate the deployment, uptake and diffusion of innovative solutions in reinforced European R&I ecosystems, including through wide and early engagement and co-creation with end-users, citizen and regulatory and standardisation bodies;
- e) Deliver environmental and productivity improvements in new products and services thanks to a harnessing of EU capabilities and resources.

In terms of their operations, taking a horizontal perspective on all initiatives allows for the identification of further possible collective efficiency and coherence gains for more impact:

- **Coherence for impact:** The extent and speed by which the expected results and impacts will be reached, will depend on the scale of the R&I efforts triggered, the profile of the partners involved, the strength of their commitments, and the scope of the R&I activities funded. To be fully effective it comes out clearly that future partnerships need to operate over their whole life cycle in full coherence with their environment, including potential end users, regulators and standardisation bodies. This relates also to the alignment with relevant EU, national or regional policies and synergies with R&I programmes. This needs to be factored in as of the design stage to ensure a wide take-up and/or deployment of the solutions developed, including their interoperability.
- **Collaboration for impact:** Effectiveness could also be improved collectively through enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems. An adequate governance structure appears in particular necessary to ensure cross-fertilisation between all European Partnerships. This applies not only to initiatives where similar R&I topics are covered and/or the same stakeholders involved or targeted, but also to the interconnections needed between the ‘thematic’ and the ‘vertical’ Partnerships, as these are expected to develop methodologies and technologies for application in EU priority areas. Already at very early stages of preparing new initiatives, Strategic Research and Innovation Agendas and roadmaps need to be aligned, particularly for partnerships that develop enabling technologies that are needed in other Partnerships. The goal should be to achieve greater impacts jointly in light of common challenges.
- **Efficiency for impact:** Potential efficiency gains could also be achieved by joining up the operational functions of Joint Undertakings that do not have a strong context dependency and providing them through a common back-office³³. A number of operational activities of the Joint Undertakings are of a technical or administrative nature (e.g. financial management of contracts), or procured from external service providers (e.g. IT, communication activities, recruitment services, auditing) by each Joint Undertaking separately. If better streamlined this could create a win-win situation for all partners leading to better harmonization, economies of scales, and less complexity in supervision and support by the Commission services.

2.4.2. *Analysis of coherence* of the overall portfolio of candidate initiatives at the thematic level

Looking at the coherence of the set of initiatives at the thematic level, the “**digital centric**” initiatives have a strong focus on supporting the digital competitiveness of the EU ecosystem.

³³ See Annex 6 for an overview of key functions/roles that could be provided by a common back office.

Their activities are expected to improve alignment and coordination with Member States and industry for the development of world-competitive EU strategic digital technology value chains and associated expertise. Addressing the Key Digital Technologies, the 5G and 6G connectivity needs as part of a Smart Networks and Services initiative and the underlying supercomputing capacities through a European High Performance Computing initiative present potential for synergies that can be addressed through cooperative actions (e.g. joint calls, coordinated support activities, etc.). They may as well profit from and contribute to Partnerships envisaged for Photonics, AI, data, robotics, Global competitive space system and Made in Europe, together with the EIT Digital. Synergies between these initiatives and several programmes (Digital Europe and Connecting Europe as well as cohesion programmes) are needed in areas where EU industry has to develop leadership and competitiveness in the global digital economy. They are expected to impact critical value chains including on sectors where digital is a strong enabler of transformation (health, industrial manufacturing, mobility/transport, etc.).

The **transport** sector face systemic changes linked to decarbonisation and digitalisation. Large scale R&I actions are needed to prepare the transition of these complex sectors to provide clean, safer, digital and economically viable services for citizens and businesses. Past decades have shown that developing and implementing change is difficult in transport due to its systemic nature, many stakeholders involved, long planning cycles and large investments needed. A systemic change of the air traffic network through an Integrated Air Traffic Management initiative should ensure safety and sustainability of aviation, while a Clean Aviation initiative should focus on the competitiveness of tomorrow's clean aircrafts made in Europe. The initiative for Transforming Europe's rail system would comprehensively address the rail sector to make it a cornerstone in tomorrow's clean and efficient door-to-door transport services, affordable for every citizen as well as the most climate-friendly mode of transport for freight. Connected and Automated Mobility is the future of road transport, but Europe is threatened to fall behind other global regions with strong players and large harmonised markets. The initiative Safe and Automated Road Transport would bring stakeholders together, creating joint momentum in digitalising road transport and developing new user-based services. Stronger links and joint actions will be established between initiatives to enable common progress wherever possible. The Clean Hydrogen initiative would be fundamental to that regard. Synergies would also be sought with partnerships driving the digital technological developments.

To deliver a deep decarbonisation of highly emitting industrial sectors such as the steel, transport and chemical industries would require the production, distribution and storage of **hydrogen** at scale. The candidate hydrogen initiative would have a central positioning in terms of providing solutions to the challenges for sustainable mobility and energy, but also is expected to operate in synergies with other industry related initiatives. The initiative would interact in particular with initiatives on the zero emission road and water transport, transforming Europe's railway system, clean aviation, batteries, circular industry, clean steel and built environment partnerships. There are many opportunities for collaboration for the delivery and end-use of hydrogen. However, the Clean Hydrogen initiative would be the only partnership focused on addressing hydrogen production technologies.

Metrology, the science of measurement, is an enabler across all domains of R&I. It supports the monitoring of the Emissions Trading System, smart grids and pollution, but also contributes to meeting demands for measurement techniques from emerging digital technologies and applications. More generally, emerging technologies across a wide range of fields from biotechnologies, new materials, health diagnostics or low carbon technologies are giving rise to demands requiring a world-leading EU metrology system.

The initiative for a **Circular Bio-based Europe** is intended to solve a shortage of industry investments in the development of bio-based products whose markets do not have yet certain long-term prospects. The **Innovative Health Initiative** and **EU-Africa Global Health** address the lack of investments in the development of solutions to specific health challenges. The initiative on **Innovative SMEs** supports innovation-driven SMEs in participating in international, collaborative R&I projects with other innovative firms and research-intensive partners. As a horizontal initiative it is expected to help innovative SMEs to grow and to be successfully embedded in global value chains by developing methodologies and technologies for potential application in the other partnership areas or further development by the instruments of the European Innovation Council.

The description of the interconnections between all initiatives for each Horizon Europe cluster is provided in the policy context of each impact assessment and further assessed in the coherence assessment for each option.

1. INTRODUCTION: POLITICAL AND LEGAL CONTEXT

1.1. Emerging challenges in the field

Smart Networks and Services (SNS) are the digital infrastructures that provide connectivity-based services to consumers and businesses ranging from mobile and fixed Internet access to professional digital services such as Machine-to-Machine communication or public safety services. They are composed of user devices, communication networks and service computing platforms. SNS will increasingly provide connectivity for industrial ‘vertical’ sectors such as transport, energy, manufacturing, health care and media. While SNS solutions based on the newest technology standard – 5G - will allow for first such industrial services in the next few years, 6G technology will provide another step change to mainstream such services in this and the next decade enabling the digital and green transition of the economy and society.

Such digital services are increasingly critical. The political guidelines of the new Commission identify related networks as crucial for Europe’s technological sovereignty, which is gaining even further significance in light of the COVID-19 pandemic and the need to guarantee security of supply in critical sectors. Europe’s capacity to set evolving 5G and later 6G standards will be of paramount importance in this regard. In particular, the role of equipment suppliers, which has been the most strategic issue related to the recent 5G cyber-security toolbox³⁵, needs to be reinforced.

The COVID-19 pandemic is posing enormous challenges to the health of our citizens and to our economic development. It has underlined how critical are communication networks for the functioning of our economy in times of crisis. SNS systems will further improve our capability to guarantee critical and essential digital services, enable remote healthcare and monitoring as well as rapid health crisis responses, e.g. based on big data and artificial intelligence tools that respect Europe’s data protection rules. Finally, this initiative, in particular the piloting and deployment part of the partnership (using CEF2, DEP, and InvestEU), will lead to a major infrastructure investment programme, in support of sustainable economic recovery and is expected to provide for major opportunities for SMEs as part of new SNS-based digital ecosystems.

R&I initiatives on 6G are now starting in all leading regions world-wide. SNS systems based on 6G standards are expected to offer a new step change in performance to enable new critical applications such as real-time automation or extended reality as basis for advanced industrial services. There will also be an opportunity for new business models and players through architectures such as Open-RAN³⁶ and software networks, which will be an important basis for a competitive supply market in a multi-vendor environment as targeted in the 5G cyber toolbox. Moreover, the convergence with new technologies in the area of cloud and edge computing, AI, as well as components and devices beyond smartphones offer great opportunities for European players to seize new value chain opportunities. SNS are expected to significantly contribute to Sustainable Development Goals. Radically bringing down the cost of infrastructure with

³⁴ this is a working title which will be adjusted following high-level political guidance in time for the adoption of the Commission proposal

³⁵ COM(2020) 50 final

³⁶ More open and interoperable interfaces in Radio Access Networks (RAN) enabling more competition.

generalised software implementations will decisively contribute to advanced infrastructure availability. Connectivity and IoT will potentially enable distributed energy systems and grid transformation systems, supporting intelligent energy consumption in cities and ensuring optimization of energy production. They will also be able to facilitate precision farming and food monitoring for increased agricultural productivity and reduced need for scarce resources. IoT devices and smart systems will also enhance the efficiency of water usage, quality and the protection of oceans.

In relation to the green deal, SNS systems will be substantial contributor to reducing energy consumption and lower carbon emissions both as enabler for greening industrial sectors (ICT for green) and conceiving new technologies and for deploying greener networks.

1.2. EU positioning in the field

The European **SNS value chain** composed of connected devices, networks and related computing platforms has the following characteristics:

Devices: Europe has the scientific and technology knowledge but is no longer an important player in the smartphone market dominated by three global players (Apple, Samsung, Huawei) with a few additional Chinese ones emerging (Xiaomi, Oppo). Smartphones represent an important global market of €700 billion in 2019 without significant presence of European players. However, Europe maintains strong industrial assets for future generations of connected devices such as cars, drones, robots and agricultural sensors, which will be key for the industrial IoT.

Network services represent about €300 billion of revenues in Europe, about 27% of the global service revenues from service providers. This is a market with little growth at the moment, but new prospects of services to vertical industries may boost growth by 50% in 2026³⁷. Vertical markets are a strong opportunity, also to diversify the European digital dependence to communication services, which represent 50% of digital outputs in Europe against 25-30% in the US or Asia³⁸. In the context of industrial applications, Europe is pioneering with more than 160 major 5G trials running today³⁹.

Network equipment: Europe remains a major player in the network equipment representing about 45% of the mobile infrastructure market, but is increasingly challenged by China, as shown by the Figure 5 below⁴⁰. In some EU countries, Chinese vendors capture more than 40% of the telecom equipment market. Other upcoming challenges relate to the emergence of vendors originating from the IT industry (Cisco, Mavenir, AltioStar..) with potentially highly competitive offers for radio networks. EU industry is part of the Open-RAN initiative and has potential to benefit from these new opportunities.

Figure 5: Evolution of mobile infrastructure market shares of the main networks equipment vendors

Cloud/Edge computing: the cloud computing service market in Europe is growing fast with €24 billion revenues in 2017 expected to reach €52 billion after 2020⁴¹. This market is though captured mainly by non EU platforms, with only one actor in the field (OVH). The same applies to cloud technology providers. Opportunities reside in edge computing⁴², a new paradigm placing data processing close to the user to minimise latency and optimise user data control. It is expected to become a €13.8 billion market by 2024, with 40% of growth per year⁴³. Europe may capture 27% of the market by 2024. Still, this requires solving technological issues, related notably to the security and energy consumption.

Software and IT services importance will grow for SNS. Europe has clear assets: Germany's SAP, France's Capgemini, Atos are all in the global top ten⁴⁴. For IoT and cellular Machine-to-Machine (M2M), the Asia-Pacific and North America regions have now overtaken Europe former lead with large operators developing M2M services. Europe is ahead of North America for IoT in general and behind China. Asia-Pacific is expected to represent 57% of connections in 2030 against 16% for Europe, the second region in the world.⁴⁵

In conclusion, the initiative intends to leverage EU industrial strengths in networking to stimulate industrial opportunities for devices and computing platforms, hence optimising also growth opportunities across the value chain for Europe.

Box 3 Support for the field in the previous Framework Programmes – key strengths & weaknesses identified

What was/is being done with EU research and innovation funding until now

Dedicated R&I activities related to communication networks have been supported since Framework Programmes 3 reflecting the strategic position of this industry for Europe. In recent years this was done mainly through the 5G PPP. This partnership between the European Commission and the 5G Industry Association, received €700 million of EU funding between 2014 and 2020 to deliver technologies and solutions for 5G mobile networks. Details on the way the partnership functions are available in Annex 6.

What has or is being achieved so far

⁴⁵ IDATE Digiworld, World IoT Markets (2018) <https://fr.idate.org/produit/iot-markets-4/>

The main problem addressed by the 5G-PPP was the need for European industry to create critical mass and to be able to leverage large-scale investment in R&I on 5G technology, focussing mainly on the development of technology building blocks for the global 5G standard and its validation for a range of target use cases. It has allowed European actors to keep 55% of the Standard Essential patents out of the 4 global vendors of network infrastructures, and to be part of the leading regions of the world in this field.

What are the key areas for improvement & challenges not met

The proposed new initiative goes beyond this scope, and needs to respond to new strategic challenges. As SNS become increasingly critical for the functioning of all parts of the economy and society, mastering technologies for SNS and having European players well positioned on a global scale becomes a key issue of public policy. In this perspective, the competitiveness of European industry becomes a strategic challenge to be addressed.

New technological challenges emerging are briefly described in section 2.2.1 to 2.2.4

Furthermore, the initiative needs to address a range of other problems closely linked to the policy priorities of the new Commission, such as technology sovereignty, cybersecurity or low carbon emissions.

Such public policy concerns are not necessarily given the same priority by industry and, certainly, cannot be addressed by industry on their own. Therefore, a loose structure such as the 5G-PPP cannot be expected to deliver on the broad range of policy objectives that are increasingly crucial. Addressing these issues from a holistic and coordinated perspective notably requires a closer partnership with the strategic involvement of Member States.

A more strategic and formal partnership for SNS would be able to tackle these issues with an increased scope of the initiative, an increased set of industrial stakeholders, and the strategic involvement of Member States as part of the governance structure.

For example, the proposed initiative addresses the issue of technological sovereignty and how to stimulate it in a strategic domain, which is a key objective of the new Commission in this particular field and gained further importance in light of COVID-19, in relation of ensuring supply to key sectors. This topic will be addressed by extending the scope from connectivity to the broader strategic value chain including cloud-based service provisioning as well as components and devices. It will also seek to align strategic roadmaps of a wider range of industrial players, including the telecom industry as well as IoT and cloud actors, and to some extent actors from the microelectronics/component domain. The critical role of suppliers identified and addressed in the 5G cybersecurity toolbox will be a key preoccupation for upcoming network technologies such as 6G including the broader strategic value chain.

The initiative will also address energy efficiency and carbon neutrality objectives, as embodied by the Green Deal, which have not been sufficiently addressed by the 5G-PPP, such as reduction of the energy consumption of the connectivity platform itself, and directly supporting the reduction of the carbon footprint of vertical industries enabled by SNS systems.

Finally, the 5G-PPP was not designed to prepare and coordinate deployment programmes. The PPP structure is not firm enough to align stakeholders towards a deployment agenda and the scaling-up of results that includes a broad range of stakeholders with sometimes diverging interests and that delivers not only for the commercial but also the public interest (e.g. enabling public safety or low-carbon services). In the proposed initiative a coordination mechanism for

CEF2 Digital as well as synergies with DEP and InvestEU are built-in, both as part of the scope and governance of the partnership, which is not possible under a co-programmed partnership. The infrastructure funded by activities in the scope of the partnership is indeed only a smaller part of the overall (private) 5G investment in the EU, focussing on market failure areas with cross-border dimension. However, such programmes are expected to play a major role in shaping cooperation models of 5G deployment and thereby unlocking the overall large-scale investment. This aspect is of particular importance in relation to infrastructure programmes supporting economic recovery post-COVID-19.

1.3. EU policy context beyond 2021

The proposed initiative has to be set in the context of **multiple European policies and priorities**:

- **Availability of advanced smart connectivity infrastructures:** The Gigabit Society package (COM(2016)587) adopted by the Commission in 2016 stresses the importance for Europe to benefit from an advanced digital communication infrastructure to move Europe into the Gbit/s era, and sets out deployment targets for 5G in Europe through the 5G Action Plan⁴⁶.

The broadband penetration impact on the per capita GDP is widely recognised⁴⁷. Hence the proposed CEF2 Digital programme, which will be coordinated by the SNS initiative targets 5G deployments into lead markets to support European competitiveness and important societal issues, e.g. enabling reduction of road fatalities and of CO2 emissions by vehicles.

- **The Communication of 27 May 2020 on a European recovery post COVID-19**⁴⁸ has further emphasized the need to invest in more and better connectivity, with 5G having spill-over effects across the whole digital society and increase Europe's strategic autonomy. It calls for wider efforts to build infrastructure that can handle emerging and future processes and applications, to provide the necessary bandwidth for health, education, transport, logistics and media which are essential for our resilience, competitiveness and economic recovery.

- **Digitisation of the industry.** The Digitising European Industry package⁴⁹ acknowledges the key role of smart 5G communication infrastructures wide availability for the digitalisation and modernisation of sectors like transport, automotive, energy, healthcare and public administration.

- **Technology leadership, sovereignty and competitiveness perspective:** the need for Europe to master critical network technologies has been outlined by the European Commission on multiple occasions: the Industrial Policy communication adopted in 2017⁵⁰; **the Recommendation on cybersecurity of 5G networks**⁵¹ adopted in 2019; the Council conclusions of 3 December 2019⁵², which “WELCOMES the ongoing preparation by the Commission, of a strategic European partnership on Smart Networks and Services“, and also the European Political Strategy

⁵⁰ https://ec.europa.eu/commission/news/new-industrial-policy-strategy-2017-sep-18_en stresses that 5G is the foundation of future business models

⁵¹ <https://ec.europa.eu/digital-single-market/en/news/cybersecurity-5g-networks>: underlines that Europe should fully master the supply side chain as part of the renewed industrial policy

⁵² <https://www.consilium.europa.eu/en/press/press-releases/2019/12/03/significance-and-security-risks-of-5g-technology-council-adopts-conclusions/>

Centre⁵³ calling for ambitious investments in 5G. The **strategic value chains** identified by the strategic forum put in place by the Commission to define industrial policy priorities for Europe are also relevant (Industrial IoT). The Communication adopted on 29 January 2020 **on the 5G cybersecurity toolbox** is particularly relevant as SNS intends major contributions to its objectives: standards to ensure end-to-end security, maintaining European supply capacities and diversification of actors in the supply chain. The partnership will have an important role to play to establish a dynamic multi-vendor environment and to tap into the potential of Open RAN and software implementations to incentivise existing and new competitive EU players.

- **The Communication of 27 May 2020 on a European recovery post COVID-19** has further emphasized the need for a stronger industrial and technological presence in strategic parts of the digital supply chain. In that context, it foresees recovery investment towards strategic digital capacities and capabilities, including 5G and 6G networks

- **Climate change and Green Deal**⁵⁴: the growth of traffic on communication networks ranges from 50% to 100% per year⁵⁵ with strong impact on energy consumption of SNS platforms, expected to rise by a factor of 10 by 2030 and representing up to 10% of the overall energy demand⁵⁶. SNS has the potential to decrease energy needs in vertical sectors, e.g. automotive or factories between 20 and 30%⁵⁷.

2. PROBLEM DEFINITION

2.1. What are the problems?

Given the scale of the challenges ahead for the transformation of the digital infrastructure, the current scientific, technological and economic positioning of Europe in the field, and the overarching EU policy context, a set of problems have been identified where EU research and innovation and EU deployment policies and programmes in the field of Smart Networks and Services would have a key role to play.

Figure 6: Problem tree for the initiative on Smart Networks and Services

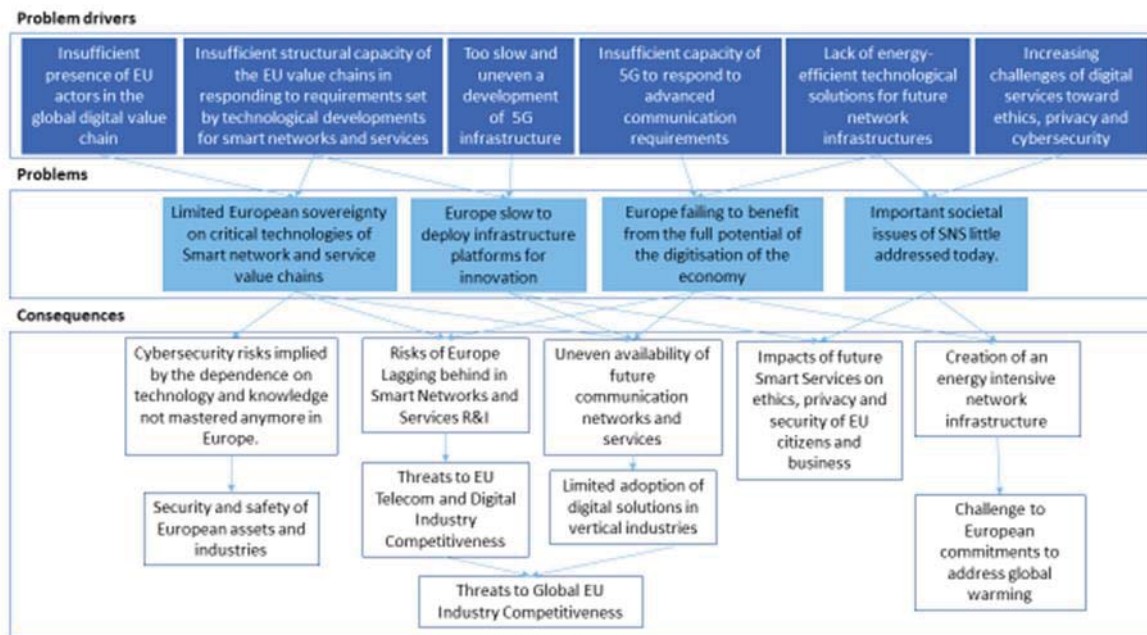

⁵³ https://ec.europa.eu/epsc/publications/strategic-notes/rethinking-strategic-autonomy-digital-age_en

⁵⁴ https://ec.europa.eu/info/strategy/priorities-2019-2024/european-green-deal_en

⁵⁵ <https://www.statista.com/statistics/271405/global-mobile-data-traffic-forecast/>

⁵⁶ Anders S. G. Andrae: “On Global Electricity Usage of Communication Technology: Trends to 2030”

⁵⁷ #SMARTer2030, GeSI report “ICT Solutions for 21st Century Challenges”, page 63

2.1.1. Europe's lack of ability to benefit from the full potential of the digitisation of the economy

The economic potential in the field of SNS is huge. In 2035, they are predicted to enable \$12.3 trillion of global economic output and the global SNS value chain is predicted to generate \$3.6 trillion in economic output and support 22.3 million jobs in 2035⁵⁸. Further estimates predict a global potential economic impact of IoT between €3.5 and €11 trillion per year by 2030 across multiple business domains⁵⁹.

These opportunities, largely represented by the Industrial IoT (IIoT), need SNS as a versatile “connectivity platform” that will become a constituent part of the business process. The Strategic Forum put in place by the Commission⁶⁰ also underlines the need for a better integration of several technological domains, notably cloud computing, connectivity and devices (robots, drones) to reach the full potential of industrial IoT. It also requires performance far beyond the capabilities of the current 5G solutions, e.g. in terms of positioning accuracy, response time, data rates, reliability or automation, which are not available today and will shape the essence of a next generation of mobile and cloud systems towards 6G.

The problem for Europe is hence to put in place the needed critical mass of stakeholders to support a coherent roadmap for SNS, create the needed deployment momentum, and avoid fragmentation. *The Open Public Consultation confirmed that stakeholders from different technological horizons and different application and business model perspectives should be involved.* It needs to go beyond the current 5G-PPP efforts in this field, as the framework policy constraints surrounding use cases in terms of security, privacy, reliability, deployment and even business models require involvement and steering of public actors in the overall R&I process.

Synergies to avoid fragmentation have to be addressed in particular. *The MS consultation led by DG RTD through the SPC* (shadow programme committee) has shown that MS are largely

⁵⁸ <https://cdn.ihs.com/www/pdf/IHS-Technology-5G-Economic-Impact-Study.pdf>

⁵⁹ McKinsey: The Internet of Things, mapping the value beyond the hype

⁶⁰ Strengthening strategic value chains for a future ready EU industry, 6 Nov 2019.

supportive of the SNS domain (more than 80%) with 70 % having national programme related to SNS issues. Finland is the only MS that has so far labelled an initiative as “6G” but related problems are addressed in several MS, e.g. in Sweden, Germany, France, Spain, even if not as full blown dedicated national programmes. MS have different industrial/academic capabilities regarding SNS. MS with a strong supply side industry are interested from the onset in early R&D. Others are more interested in leveraging the technology to create ecosystems in vertical domains for downstream economic return. In order to motivate the involvement of a large number of MS it is necessary to cover a complete chain, from early R&I to trials and validation with a wide distribution of stakeholders.

2.1.2. Limited European sovereignty as regards critical technologies of smart network and service value chains

SNS technology becomes increasingly contemplated for numerous vertical digital use cases, but Europe has to rely on technologies developed elsewhere, putting European sovereignty at risk.

As outlined in section 1.2, Europe’s main technological assets in the SNS value chain is the telecom supply industry, which is challenged both by global competition and by risks of control⁶¹ by non EU actors. Devices and cloud computing are not mastered by Europe, but opportunities exist to develop EU industrial capabilities, through IoT devices and edge computing platforms. New industrial initiatives like Open RAN aiming at providing network functions through cloud based software implementations, a domain where EU industry has less assets today, is also an important area to develop capacities in Europe.

The problem is further aggravated by the trend to design connectivity systems through a vertically integrated perspective from device to service provision, pushed by the very high performance level required in industrial and professional use cases. Non-European actors, who already master vertically integrated value chains, may clearly be at an advantage. The pressure will only increase over time, as the international competition in this domain is fierce, with geo-political approaches promoted by some of our main competitors, looking for dominance of the full SNS value chain.

2.1.3. Europe slow to deploy infrastructure platforms for innovation

In the wake of early 5G developments, SNS are expected to become platforms for innovation, with a level of openness allowing innovators to develop new applications on top. In spite of technological excellence, the deployment of 5G infrastructure in Europe is not as fast as in other regions, due to fragmented regulation, as well as uncoordinated efforts of both industrial and institutional initiatives. This problem is amplified by the limited investment capabilities of European operators. However, new players in the vertical domains could potentially invest in new 5G infrastructure, but the complexity of integrating such technology with a complete connected ecosystem require significant time to fully validate the solutions in operational conditions.

⁶¹ <https://www.justice.gov/opa/speech/attorney-general-william-p-barr-delivers-keynote-address-department-justices-china>

2.1.4. *Important societal issues of SNS little addressed today*

There is a potential conflict between the industrial incentive to develop and deploy SNS, and the concerns of European citizens about the impact of these infrastructures on the environment and on their fundamental rights.

Citizens are increasingly concerned about the use of personal data, by the electro-magnetic field exposure generated by wireless systems and such concerns are already slowing down the adoption of new technologies like 5G. Energy consumption is also an area of concern, as the cloud and network energy consumption may increase by a factor of 10 by 2030, reaching unsustainable levels in the absence of significant technological and operational improvement.

2.2. What are the problem drivers?

2.2.1. *Insufficient capacity of 5G to respond to advanced communication requirements*

Future digital use cases in professional environments will have very demanding connectivity and service requirements exceeding the most advanced capabilities of 5G roadmaps⁶².

These future use cases include:

- Super-immersive multimedia and super-high definition video.
- Holographic telepresence. (up to 100 Gb/s needed, 100 times what 5G offers per user).
- XR Experience: virtual reality (VR), augmented reality (AR) and mixed reality (MR).
- Massive-scale communications (IoT) for anything and anywhere: 6G networks will support extreme massive connectivity.
- Smart City.
- Use cases requiring ultra-high precision 3D positioning, e.g. in factories.

For such a long term perspective, early requirement for future networks and services combining next generation cloud and 6G mobile systems are emerging, with performance improvement factors of at least 10 (positioning, latency) or 50 (capacity, speed) requiring major evolutions beyond the state of the art and across multiple industry sectors.

2.2.2. *Insufficient presence of EU actors in the global value chain*

The uneven presence of EU actors at each level of the SNS value chain threatens the future European technological sovereignty. This problem is fuelled by several factors:

A fragile position of European actors in the global digital ecosystem: European leadership in 5G R&D depends on a limited number of major 5G infrastructure manufacturers (Ericsson and Nokia) and an associated strong ecosystem of academics and R&I centres. However, reaching out more systematically to vertical industries is necessary to address comprehensive value chains. More collaboration is needed with cloud and device players, as new devices (such as IoT) provide an opportunity for Europe to regain a presence in the device industry as well as the software and cloud domain. This also requires strategic links with the microelectronics industry.

⁶²See e.g ITU FG2030 White paper: https://www.itu.int/en/ITU-T/focusgroups/net2030/Documents/White_Paper.pdf

High risk R&D reinforces the risks for European actors: Connectivity and IT equipment sectors have high research intensity on average around 15% and going up to 30% for some actors⁶³. This is comparable to other R&D intensive sectors such as semiconductors with R&D processes involving significant risks and important upfront investment. The stakeholders' consultation confirms the high risk R&D level of the domain, with particular relevance of public-private risk sharing approaches for long term R&D, as practiced by our main competitors (Asia and USA).

A need for critical mass in standardization: Since its inception end of 2015, the global 5G standardisation in 3GPP⁶⁴ has generated more than 60,000 industry contributions and thousands of essential patents. European vendors are at the forefront for contributions and patents⁶⁵ and have been supported by the 5G-PPP programme. However this place remain fragile, and Asia has a strong position on 5G patents and launched 6G programmes. Maintaining European position in global standardisation will require additional European participation, notably more massive involvement of vertical industries.

Stakeholder opinion

A key statement coming up from interviews commonly to all categories deals with the position of Europe lagging behind Asia and US. Indeed almost all interviewees mention the need to keep or regain European leadership in the value chain. Indeed, on network infrastructure, interviewees recognize the leadership of Europe with the presence of two champions. On the rest of the value chain, Europe has lost its position on devices but for most of interviews there could be an opportunity to gain a leadership position on other fields like IoT devices and other emerging technologies like edge computing considered as critical topic. Europe should have the capacity to both support areas where Europe is good at in the value chain and create European alternatives in the whole supply chain.

Also, interviewees from academia categories draw the attention on the necessity to invest more in research in Europe in order to develop its potential, to remain competitive and to avoid shortage of skills and lack of ventures and start-ups.

2.2.3. *EU value chains are not integrated to include all actors important for the development of future smart networks and services*

The future SNS will be a critical infrastructure to be developed with actors beyond the traditional telecommunication value chain, both from a technological and application perspective:

A future infrastructure relying heavily on multiple advanced digital solutions: The development of an infrastructure able to fit the needs of the future smart services requires cooperation with other field of research beyond pure connectivity infrastructure research (5G-PPP). This implies connection to R&I in IoT, edge computing, artificial intelligence, cybersecurity and cloud, and to address the raising importance of software technologies in networks.

An infrastructure critical for the adoption of digital solutions in many industries: SNS is set to become a critical infrastructure for numerous industries that are transforming themselves by

⁶³ Source: Strategy& PwC, The 2018 Global Innovation 1000 study, analysis of the 1000 largest corporate R&D

⁶⁴ 3rd Generation Partnership Project, the global standard development organisation for mobile coms. ETSI is member.

⁶⁵ Estimated that out of the 4 main vendors (Nokia, Ericsson, Huawei, ZTE) EU has about 55% of the essential patents

progressively adopting digital technologies. Future research on 5G, beyond 5G and 6G capabilities has to systematically take into account the requirements from the vertical players, beyond initial research on 5G. The integration of the vertical industries into smart networks and services research will need to be strengthened.

An infrastructure that will require structural changes in various value chains: Rapid changes triggered by the deregulation of markets affected the communication industry, increasing competition and technological innovation. As a result, the mobile ecosystem has transformed in a complex network of specific companies involved at different stages in the value chain. The increasing trend towards software implementation and openness of network functions and interfaces opens prospects for new supply side actors, and new business models to emerge.

These changes in the value chain can disrupt existing businesses, and threaten established European actors, but they also provide opportunity for Europe to reposition its industry and to take a larger part in the digital value chain by relying on its strong existing industries.

Stakeholder opinion

According to interviewees with no clear distinction of specific category of stakeholders, the value chain needs to evolve with players emerging from vertical industries. It will give the opportunity to provide new business models such as “Anything as a Service” model allowed by new technologies that provide flexible and open infrastructure.

2.2.4. *Too slow and uneven development of 5G infrastructure*

Leadership in technology and deployment through lead markets need to go hand in hand to ensure the development of a comprehensive European digital market. Deployment of 5G in Europe is though facing barriers:

Lack of investment in the deployment of the new infrastructure: China is expected to deploy hundreds of thousands of 5G base stations in the coming years. South Korea had already installed more than 90,000 5G base stations by October 2019. Ramp-up is going to be slower in Europe with only hundreds of 5G base stations installed at the same date, what may be due to limited investment capabilities of EU operators. This could be remedied by a new class of investors, like the industry verticals or new value chain actors.

Insufficient synergies between national and European initiatives supporting 5G as well as EU deployment programmes: beyond the European 5G Public Private Partnership (5G-PPP), many European countries have launched national R&D programmes, supporting 5G research and deployments, at national or regional level. They are generally restricted to national participants, and often overlapping with European programs. There is a risk of duplication, and missed opportunities for synergy and coordination. Moreover, deployment programmes such as CEF2 and DEP as well as InvestEU should be coordinated with R&I to achieve a coherent approach. More cooperation at European level would help to optimise the use of resources dedicated to SNS. A consistent strategy with Member States for these two pillars R&I and deployment has been missing to develop an impactful industrial policy in Europe in this field.

A lack of coordination of regulatory approaches, in particular spectrum management: Spectrum assignment remains a national prerogative. There is no formal coordination between EU Member States regarding spectrum assignment conditions. Early 2020, only 16% of the

pioneer bands had been assigned in the EU⁶⁶. This hinders EU wide 5G availability. A common approach to developing a single market environment for large-scale investment in particular spectrum in Europe is beyond the remits of an R&I initiative. However, early technological and business awareness at the Member States level would help to develop a European common approach to spectrum matters and limit the risk for the industry.

Stakeholder opinion

According to the Open Public Consultation, business associations, SMEs and large organizations find very relevant the regulation in the field of radio spectrum allocation.

For several interviewees from different categories, a strong coordination in Europe is required for spectrum harmonization involving the implication of Member States very early in the program. Indeed the spectrum fragmentation in cost and allocation is seen as a key issue.

2.2.5. *Increasing challenges of digital services toward ethics, privacy, and cybersecurity*

The development of digital services poses several challenges for the EU citizen as to their privacy, data protection, cyber security or ethical concerns. Several fundamental human aspects can be challenged, such as: Identity and Reputation, Relationships, Culture, Motivation and Attention, Responsibility, Fairness, Safety and Privacy. Future integrated connectivity platforms will have to take into account such ethical/societal issues from the start and make them part of the design principle. This in turn requires inclusion of stakeholders with new competence profiles, which are currently not a part of industry initiatives like the 5G-PPP.

2.2.6. *Lack of energy efficient technological solutions for future network infrastructures*

The systematic inclusion of additional frequency bands to radio sites is expected to double the energy needed per site, a trend further intensified by expected network densification. Coupled with extended computing service platforms, reports indicate a 10 fold increase of network and computing energy consumption, without accounting for the devices. This is exacerbated by a lack of integrated industrial approach towards energy value chains.

2.3. How will the problem evolve?

Limited European sovereignty on critical technologies: in 20 years, the number of European telecom suppliers shrunk from 4 to 2, with increased competition mainly from China and low margins. Also, Europe lost the smartphone industry and failed to create an Internet service industry. Over the coming decade, this trend will be exacerbated. China, Japan, USA, Korea are all planning strategic 6G initiatives. Without a strong EU policy including R&I, European ability to compete is at risk. Market forces may not be sufficient: our main competitors are all considering SNS as a strategic industry and planning financial public support accordingly.

Europe slow to deploy infrastructures for innovation: this issues in the SNS domain is driven by regulatory and financial issues. On regulation, spectrum availability is key to lead deployment, as demonstrated by the aggressive 5G spectrum auction policy in the US. Without an early and coordinated European approach, there is a risk of a patchy “4G like” deployment of future infrastructures. On finances, European operators have lower revenues compared to US operators.

⁶⁶ 5GObservatory.eu

Investments by vertical industries, as planned in Germany for 5G, would provide new financing sources for deployment. An early involvement of these actors in the R&I process is hence key.

Europe failing to benefit from the full potential of the digitalisation: Reaping the full benefit of digitisation of the industry requires availability of technologies beyond the state of the art to address the most demanding use cases. Deploying such technologies in complex systems takes time and efforts. Should European research on the next step of telecommunication and digital services lag behind, the long term future deployments will be affected, limiting the availability of future infrastructure in Europe with negative impact on the industries requiring it. The development of capabilities of 6G networks and services is also essential to limit the energy need and environmental footprint of the network whilst enabling energy savings in other sectors.

Important societal issues not addressed: citizen concerns like security, trust, privacy, energy footprint or exposure to electromagnetic radiations will be even more exacerbated in the future. Translating these essential requirements into technology will provide a key competitive advantage to leading companies and regions in this field. Failure of European research to address these concerns and to bring them into products and services may leave European policy makers dependent from technological solutions specified elsewhere. Whilst regulation can provide an ex post solution, an early involvement of European public actors in the definition of future SNS provides opportunities to visibly address citizen concerns ex ante from a European perspective.

In conclusion, a coordinated EU policy converging visions and objectives across the multiplicity of SNS stakeholders would alleviate the potential negative problem evolution outlined above.

3. WHY SHOULD THE EU ACT?

EU action is based on two Treaty provisions: the EU is empowered to encourage an environment favourable to cooperation between undertakings and fostering better exploitation of the industrial potential of policies of innovation, research and technological development (Art. 173 of the TFEU). Art. 187 TFEU specifies that the EU may set up the structures needed for the efficient execution of EU research, technological development and demonstration programmes.

3.1. Subsidiarity: Necessity of EU action

SNS play a critical role for the competitiveness of the European industries. In Europe, the mobile communication sectors only generates an output of €550 billion (2017 figures) with an employment level of 2.5 million persons. The sector drives the competitiveness of multiple vertical industries (connected cars, smart factories) and has become key for social life.

The challenges faced by the sector are huge: **massive and risky investments** needed to develop new generation of SNS infrastructures, **massive competition** from non-European players in a domain considered strategic, **emergence of new business actors** and new business models, **increased need of public actors** to co-create future systems that will increasingly support areas of public interests (connected healthcare, smart energy grids, connected cars), raising societal concerns of European citizen. These add to the classical issue justifying actions at EU level in the field, such as global consensus on future standards, spectrum and EU wide deployment scenarios.

These issues suggest a rapid and coordinated response of the EU to keep and further improve its competitive position in SNS technologies and related industries. The positive experience from

5G-PPP is not sufficient to mobilise the larger spectrum of required stakeholders whilst avoiding fragmentation and duplications of resources at national level.

3.2. Subsidiarity: Added value of EU action

EU level can clearly drive European actors towards common visions, common technological roadmaps transforming eventually into global standards. This is key to generate economies of scale and economies of scope, limiting if not avoiding EU fragmentation of efforts and national solutions. In the SNS domain, the last 40 years have demonstrated with GSM, 3G, and 4G that a European approach is the only approach that makes sense to cater for citizen obvious requirements, such as interoperability and service portability across multiple providers' domains.

With the move towards industrial domains and vertical use cases, the value of common and standardised technologies translates into cost savings and capex optimisation.

In this domain, which is highly R&I and capex intensive, the European level is the best solution to keep pace with the investments in other regions, notably in Asia. It is also a must if Europe wants to keep a strong industry in this domain, in the context of US efforts to build their own alternative providers⁶⁷.

4. OBJECTIVES: WHAT IS TO BE ACHIEVED?

4.1. General objectives of the initiative

The general objectives address the problems identified in section 2. They take into account the stakeholders' positions expressed in the consultation, the partnership proposal from the industry and research community, from the ETP Networld2020 Strategic Research and Innovation Agenda⁶⁸, and from the Strategic Deployment Agenda (SDA) developed by stakeholders of the connected mobility domain. It has to be noted that even if the core of the initiative is on R&I, deployment aspects cannot be ignored, as industry innovation investments tend to relocate on lead market regions, so it is key to be a lead market in 5G to prepare 6G R&I investments in Europe.

4.1.1. Ensure European technological sovereignty in future smart networks and services

The initiative will address the issue of technological sovereignty and how to stimulate it in a strategic domain, which is a key objective of the new Commission in this particular field and gained further importance in light of COVID-19, in relation of ensuring supply to key sectors. This topic will be addressed by extending the scope from connectivity to the broader strategic value chain including cloud-based service provisioning as well as components and devices. It will also seek to align strategic roadmaps of a wider range of industrial players, including the telecom industry as well as IoT and cloud actors, and to some extent actors from the microelectronics/component domain. The critical role of suppliers identified and addressed in the 5G cybersecurity toolbox will be a key preoccupation for upcoming network technologies such as 6G including the broader strategic value chain.

⁶⁷ <https://www.onmsft.com/news/microsoft-and-dell-among-companies-tapped-by-the-white-house-to-build-huawei-5g-network-competitor>

⁶⁸ European Technology Platform NetWorld2020: <https://www.networld2020.eu/sria-and-whitepapers/>

4.1.2. Strengthen the uptake of digital solutions in the European markets

European excellence in SNS supply side requires development of a vertical market for 5G and later 6G infrastructure and services in Europe, preparing for the longer term opportunities of SNS. The automotive market will be targeted with deployment of 5G solutions over cross border corridors in line with the 5G Action Plan targets. A coordination mechanism for CEF2 Digital as well as synergies with DEP and InvestEU are built-in, both as part of the scope and governance of the partnership. The infrastructure funded by activities in the scope of the partnership is indeed only a smaller part of the overall (private) 5G investment in the EU, focussing on market failure areas with cross-border dimension. However, such programmes are expected to play a major role in shaping cooperation models of 5G deployment and thereby unlocking the overall large-scale investment. This aspect is of particular importance in relation to infrastructure programmes supporting economic recovery post-COVID-19. This objective would also contribute to SDG 8, SDG 9 and SDG 11.

4.1.3. Develop digital innovations answering European needs

The aim is to develop the technologies and services required for future SNS platforms. It builds on the most demanding requirements of vertical industries and leverages societal requirements (security, energy efficiency, EMF) as key drivers for competitiveness and differentiation. Integration of emerging technologies like Artificial Intelligence to increase performances and entirely new application domains (Internet of senses⁶⁹) is also targeted. It will advance European technological and scientific excellence and support European leadership **to deliver 6G systems by 2030**, and place Europe on par with nations having announced 6G initiatives (China, Korea, Japan, USA, and Taiwan).

4.1.4. Ensure the alignment of future smart networks and services with EU policy and societal needs

The aim is to support the core principles of human centric and sustainable Internet, by addressing ethics, privacy, cybersecurity, electromagnetic fields, and environmental impact from a complete system (data management) and downstream policy perspective. In the Green Deal context, it addresses both radical decrease of energy needs by SNS platforms and SNS contribution to decarbonise vertical sectors through process optimisation. This objective is in line with the political orientations of a “European Green Deal”⁷⁰. The initiative will also address green deal objectives, which have not been sufficiently addressed by the 5G-PPP, such as reduction of the energy consumption of the connectivity platform itself, Electromagnetic Fields emissions and support of the reduction of the carbon footprint of vertical industries enabled by SNS systems.

This objective would contribute to SDG 10 (indirectly through lower cost of technology), SDG 12, and SDG 13.

These objectives contribute to the objective of Horizon Europe to deliver scientific, technological, economic and societal impact from the Union’s investments in R&I to strengthen the scientific and technological bases of the Union and foster its industrial competitiveness at EU and national levels.

⁶⁹ Defined as the fusion of environment sensing and communication to provide a context information.

⁷⁰ https://ec.europa.eu/commission/sites/beta-political/files/political-guidelines-next-commission_en.pdf

4.2. Specific objectives of the initiative

In order to achieve the general objectives, seven specific objectives are defined. These specific objectives respond to each of the problem drivers discussed in Section 2.2. The list of specific objectives is the following.

- **Ensure the development of technologies able to meet advanced communication requirements:** the goal is to ensure European excellence for technologies and architectures required for SNS and evolution towards 6G. Typical measurable targets include data rates beyond 100 Gb/s, ultra-low sub millisecond latency, sub centimetre positioning accuracy, ultra-high reliability beyond 99,999%, wide area coverage alleviating digital divide, support of more than 1 million devices per km² for smart city scenario, integrated device to service security. Related objectives include strong European positions on standards, essential patents, and identification of key deployment needs, e.g. spectrum requirements for regulators
- **Accelerate the development of energy-efficient network technologies:** the goal is to ensure European solutions for architecture and technologies needed to significantly reduce the energy and resource consumption of the whole digital infrastructure from edge cloud services, to the communication network core, the radio access and ultimately to the connected devices. A ten-fold reduction compared to anticipated levels is targeted through reappraisal of integrated architectures networks-clouds and use of low energy technologies such as fibre or new radio spectrum. For SNS support to vertical sectors, a 30% energy decrease of key verticals is targeted.
- **Accelerate the development and widespread deployment of 5G and later 6G infrastructure in Europe:** the goal is to reach the 5G Action plan objective of 5G deployment along main transport paths by 2025 and 5G introduction in key vertical lead markets. In particular the CEF2 Digital programme is targeting at least 6,000 km of 5G deployment across cross border corridors, as seed initiative targeting places where market forces are not sufficient to ensure deployment. Other deployment programmes under CEF2 as well as DEP and InvestEU will be important to accelerate infrastructure investment and create 5G and later 6G ecosystems.
- **Support the transformation of the European value chains:** As promoted under the Cybersecurity toolbox, *the goal is to stimulate a more diverse supply chain* in Europe with more players on the infrastructure side. A related objective is to stimulate emergence of new deployment business models, beyond those of traditional service providers, based either on vertical industry deployment or on neutral host and drawing resources from multiple providers. *Target is to have at least one European provider for software based connectivity* and pilots for new deployment models, also outlining the related regulatory issues to tackle. This has strong standardisation implication.
- **Strengthen the positioning of EU industry in the global digital value chain:** the goal is to put in place a critical mass of public and private actors across the SNS value chain, in view of strengthening the EU industries in the global digital value chain, increasing the contribution from software and IoT actors, leveraging national initiatives and supporting the emergence of new actors such as new types of connectivity providers or devices producers. It targets development of commonly shared strategic R&I and deployment roadmaps, coordinated spin offs towards standardisation bodies and strong international

cooperation to stimulate global consensus and visions. Target: at least 30% of new actors expanding the current set of 5G-PPP beneficiaries.

- **Ensure alignment with ethical and security requirements:** the aim is to include societal and ethical issues as requirements from the onset into the strategic roadmaps with dedicated projects coordinating societal and ethical results developed by SNS as a whole, including at MS level and to map those with existing legislation or to propose new one's as appropriate.

4.3. Intervention logic of the initiative

The relationship between the general and specific objectives of the initiative on Smart Networks and Services is illustrated in Figure 7 below. It outlines a multiplicity of issues to address, including industry competitiveness, industrial policy and repositioning of Europe on strategic value chains and a reinforced EU sovereignty in critical technologies, fostering deployment of advanced infrastructures and addressing societal and challenges from a holistic perspective.

With these challenges in mind, the intervention logic is that the strategic partnership will make a major contribution to several key policies, and that this can not be left entirely to a bottom up industrial approach that leads primarily to a co-ordinated implementation of R&I projects, however excellent this may be from a technological and scientific perspective. The magnitude of the public policies addressed (including deployment in vertical sectors such as healthcare, mobility or energy) suggest a much stronger steering role for the public sector, including at Member State level.

Another dimension of the intervention logic is to engage a wider set of stakeholders from the industrial side, with a compelling roadmap that they can share and agree to, with a view to committing the necessary internal resources. The level of commitment required from the private sector can only be achieved if a long term vision and commitment can be demonstrated from the public side, such that the roadmap can be a mutually shared public-private framework for the full duration of the partnership.

Finally, the partnership needs to join the efforts at Member State level that will further guarantee the success of the initiative. The partnership will not be in a position to resolve fully all the issues at stake, but will place Europe on track to do so. This is particularly important for questions of sovereignty and for the emergence of new industrial players, which will need downstream actions at MS level similar to the IPCEI initiatives in the microelectronics or battery cases. This requires a clear strategic approach across all stakeholders, for which an initiative such as the current 5G PPP was not designed. The requirements and approach will be defined jointly at strategic level in the partnership. However, we recognise that the partnership cannot implement comprehensive reindustrialisation actions nor can it implement general binding legal requirements comparable to the EU legislative process. Whereas the joint approach in the partnership has the advantage of upfront support from a broad range of stakeholders, flanking downstream measures at MS level are still required. Equally, legal measures in the area of spectrum harmonisation, cyber-security or environmental requirements e.g. for networks and data centres, are expected to be a necessary complement. The joint work in the partnership can however prepare the ground for legal proposals and ensure that industrial policy considerations are well addressed.

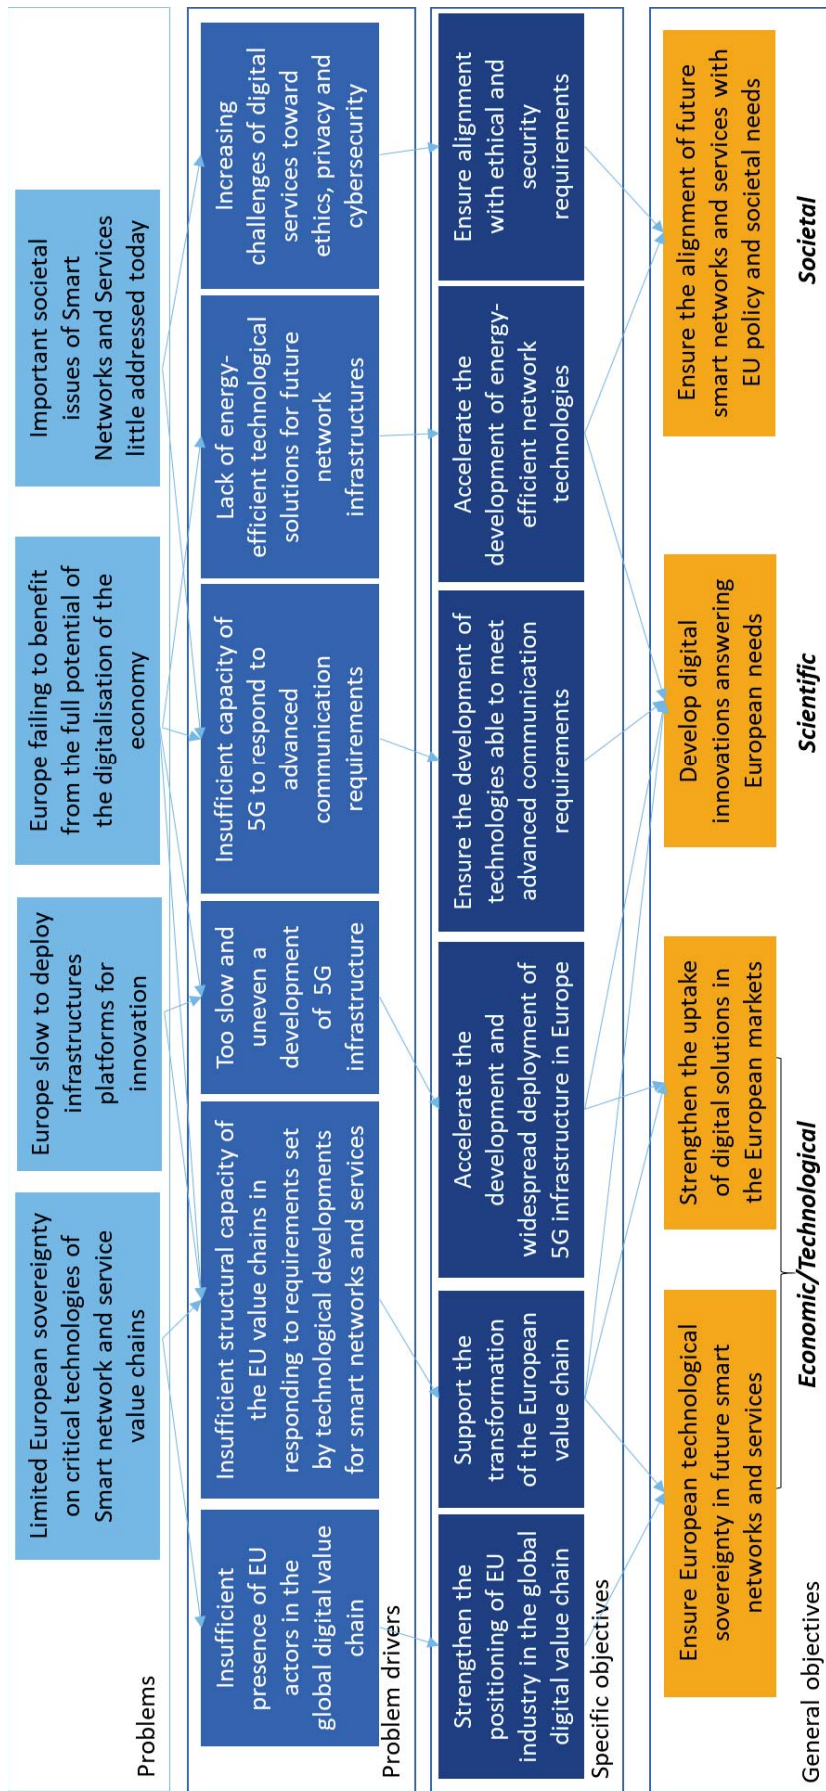

In practical terms, the mechanism used in the 5G-PPP to achieve ambitious leverage factors for large-scale investment in R&I in the field will be reinforced by a strong prior commitment of financial resources from the public side, and a commitment from industry to co-invest in light of

an R&I and deployment roadmap agreed between a broad range of stakeholders. In particular, stakeholders in the area of cloud computing and Internet-of-Things as well as components and devices will be brought on board of the partnership to address the full range of policy objectives through a comprehensive technology roadmap. Furthermore, public authorities in all Member States as well as technology suppliers and users are being mobilised to support the deployment agenda in view of the CEF2 Digital programme.

As regards public policy objectives, the specific legal basis (in case of an institutionalised partnership) will allow technological sovereignty aspects to be addressed, e.g. by taking into account principles of the 5G cybersecurity toolbox concerning the role of future suppliers, for instance by limiting or excluding non-European headquartered companies from certain calls and activities. In this respect, the initiative will have to balance the stronger role for governments with the continued primacy of European industry in controlling the partnership.

Public policy objectives such as the Green Deal will be emphasised in the R&I and deployment roadmaps as well as in the Work Programmes, e.g. in the form of concrete targets in terms of energy-efficiency or carbon-neutrality of future technologies as well as deployments. This can be achieved by strategic guidance from the Commission and Member States as part of the governance structure.

Figure 7 - Intervention logic for an initiative on Smart Networks and Services

How would success look like?

Should the initiative deliver on its specific objectives, it is expected that it would translate in practice into the following impacts:

Scientific impacts

- Generation of new knowledge
- Diffusion of applied knowledge
- Enhanced positioning of Europe in the S&T field

Should the initiative be successful, **the generation of new knowledge in the SNS field** would be achieved through the following:

- Enhanced performance requirements for long term connectivity, device and services with creation of new knowledge to meet the most advanced requirement of future digital use cases.
- The development of an energy efficient platform with major scientific breakthrough in the area of energy consumption notably fostering breakthrough all optical networks.
- The integration of new digital services for the industries undergoing a digital transformation will generate system and operational knowledge.
- The acceleration of the deployment of 5G infrastructure and later 6G solutions will create new knowledge.
- Ensuring compliance with European ethics and cybersecurity requirement will also contribute to scientific progress in mathematics, physics and social sciences

The generation of this new knowledge would contribute to **European competitiveness in the SNS field** through excellence of the European R&I. The initiative would also have important impacts on the **diffusion of more operational and applied knowledge** through several activities, notably:

- Operational knowledge on deployment and operation of future infrastructures.
- Applied knowledge through adoption of digital applications in various vertical industries.

Economic/technological impacts

- Enhanced competitiveness of European SNS Industry
- Increased innovation and research in the field of SNS
- Adoption of digital technologies in European industries
- Diminution of regulatory burdens on businesses

The initiative if successful would contribute to **an enhanced competitiveness of the European industrial ecosystem**, thanks to the large scale coordination and mobilisation of a critical mass of actors across the value chain, in close coordination with member States. **The adoption of digital technologies by European industries** would be stimulated through support of the development of new smart services, targeting explicitly

the vertical industries and making a large use of advanced digital solutions, by the development of new global standards and the deployment of early services.

Increased innovation and research in the field would be catalysed through bigger direct investment of the European industry in the field and the deployment of the new infrastructure. A leveraging factor of at least 7 is expected with industrial investments and additionally.

Finally the initiative would also have some impacts on **the regulatory burden for businesses**, through dedicated actions toward the harmonization of regulation and processes around spectrum assignment and usage. The use of untested spectrum beyond 100 GHz as targeted by SNS would be subject to upstream deployment, sharing and co-existence analysis to fuel European regulatory consensus at international levels.

Societal impacts

- Development of a human-centric internet
- Equal and safe access to a critical infrastructure
- Development of employments in field related to SNS
- Mitigate negative environmental impacts

Environmental impacts: Should the initiative be successful two main impacts are envisaged: i) reduction of the planned energy consumption of SNS platform by a factor of 10 compared to the planned evolution by 2030; ii) reduction of the energy footprint of the vertical sectors (factories, vehicles, healthcare, education) by 30% through better process and resource management. Where appropriate, companion legislation would be proposed, needing strong interactions with Member States. Another impact objective is the limitation of Electromagnetic Fields emissions and the coordination with Member States for measurements and public information approaches.

Social impacts: The ability to provide equal access to a critical infrastructure for EU citizens and businesses would be enhanced through higher competition on the supply side and decrease of infrastructure cost due to massive use of software solutions. Ecosystem developments favour job creation and innovative curricula to be developed through industry-academics partnership.

Impacts on fundamental rights: Positive impacts on fundamental rights would be expected from the development of digital services enabling users to fully control their identities and the data they produce or consume.

4.4. What is needed to achieve the objectives – Key functionalities needed

Given the focus of the impact assessment on comparing different forms of implementation, the identification of “key functionalities needed” allows making the transition between the definition of the objectives and what would be crucial to achieve them in terms of implementation. These functionalities relate to the type and composition of actors that have to be involved, the type of range of activities that should be performed, the degree of directionality needed and the linkages needed with the external environment.

4.4.1. *Type and composition of the actors to be involved*

As initiated by the 5G-PPP and confirmed by the public consultation, SNS need to pool a large critical mass of stakeholders to create an impactful European momentum on Next Generation Mobile and Cloud Systems, 6G.

The core targeted players are the industries and R&I players of the telecommunication value chain complemented with actors representing the Internet of Things, cloud systems, distributed and edge computing, cybersecurity and artificial intelligence. It includes hardware, software and component and equipment manufacturers, and communication service providers.

Vertical industries⁷¹ contribute their advanced requirements, implement validation pilots, and experiments new business models based on alternative connectivity/service providers and data management schemes. Automotive is key for the targeted CEF2 Digital 5G deployment actions.

SME's and start-ups are called upon to benefit from technology transfer, develop and market specific technologies of the entire value chain, from devices to services.

Academics and research centres are key to support research labs of industrial actors and to propose innovative advanced solutions further de-risked by the initiative. In the openness context, academics also mastering social science and societal impacts on technology are called upon to drive ethics/societal related activities and maximise societal acceptability of technology.

International cooperation partners: are not specifically included in SNS but need to be regularly consulted to achieve global vision and standards, especially for what concerns 6G. Reciprocity will be a driver of more operational engagement of such partners.

Member States

The formal and close participation of the Member States as part of the governance structure ensures the possibility to define a top down strategic programming, and to enable synergies with national investments, through a coordinated approach. We foresee a guiding role for Member States in strategic matters that goes beyond the upstream advisory role as in the case of comitology, which is lacking in flexibility when it comes to new and rapidly emerging challenges. This guiding role will be very much needed, considering that for 5G PPP, there were multiple MS initiatives in this field leading to fragmentation and inefficiencies (FI, D, F, ES, S, SL, I, DK, LU, UK..).

The early involvement of MS creates a level of awareness that is key to prepare for deployment in Europe. Deployment of a new generation of connectivity platform requires national involvement in particular in areas of public interest such as 5G along transport paths and 5G cities and communities.

Member States steering is key to the success of the initiative, with upfront strategic guidance, advice on needed regulatory developments, and to support large scale EU wide

⁷¹ E.g: automotive, factories, media, energy, healthcare, though not limited to those

implementation with access to national relevant facilities⁷² to maximise *directionality*. The participation of member States in the governance structure is hence needed

4.4.2. *Type and range of activities needed*

A comprehensive set of activities reaching beyond the sole R&I is planned to maximise impact and take up whilst fostering *additionally* and leveraging the public investments⁷³:

Roadmap and work programme developments, through large scale consultations and downstream production of Strategic R&I agendas, Strategic deployment and exploitation agendas

R&I activities covering the long term R&I on component, technology and architectural needed to deliver the future 6G standards, the IoT devices operating with 6G and the computing service infrastructure, moving towards cloud native, open and full software implementations running on generic hardware. This is complemented with shorter term R&I on applications covering early deployment and novel usages to initiate the markets and prepare for longer term solutions.

Pilot and deployment actions include lead market development of 5G Corridors as planned under CEF2 Digital, other 5G deployment actions under CEF2, DEP and InvestEU, as well as longer term pilot actions trialling pre-6G technologies in dedicated demanding environments requiring large infrastructures (a factory, a stretch off motorway, an hospital). Such activities are typically supported by private investments beyond the seed public support and require coordination with Member States.

Standardisation and common specifications, coordinated exploitation of project results being submitted to standards through core industry contributions;

International alignment of vision and roadmaps, through dialogue with the main regions having launched similar initiatives targeting 6G;

Development of key regulatory issues notably for what concerns spectrum identification and usages⁷⁴, security standards and certification⁷⁵, energy efficiency and ethical aspects;

Coordination/synergy with relevant European initiatives, through platform of exchanges maximising directionality of the various programmes;

The partnership can realistically achieve the delivery of public policy objectives in its field of activity such as CEF2 Digital deployments or when setting requirements for next-generation technology standards. Since SNS standards such as 5G and later 6G are global standards prepared by the projects of the partnership, the impact of the partnership activities will be significant. There is also the potential that approaches of CEF2 Digital deployment projects defined in the SNS partnership will be a model for other deployment projects in Europe and globally.

⁷² In the 5G PPP case, at least 10 MS developed 5G pilot facilities independent of EU actions, or only leveraged ad hoc by industry.

⁷³ The 5G PPP level with a leveraging factor of 7 is taken as a baseline objective.

⁷⁴ Target contribution bodies: RSPG, CEPT, ITU

⁷⁵ As contribution to the evolution of the 5G security toolbox released by the EC on 29 January

Such requirements and approaches will be defined jointly at strategic level in the partnership. However, we recognise that the partnership cannot propose general binding legal requirements comparable to the EU legislative process. Whereas the joint approach in the partnership has the advantage of upfront support by a broad range of stakeholders, flanking legal measures in the area of spectrum harmonisation, cyber-security or green deal requirements e.g. for networks and data centres are expected to be a necessary complement. The joint work in the partnership can however prepare the ground for legal proposals and ensure that industrial policy considerations are well addressed.

4.4.3. *Priority setting and level of directionality required*

Directionality is key and requires a common shared vision to reach the needed ambitious investment to ensure technological sovereignty in the domain⁷⁶. At this stage, multiple fora are already working on such visions: the ITU FG 2030 focus group, the Finish 6G flagship, the IEEE Future Networks initiatives. Similarly, SNS is preparing a similar roadmap. It expands those already mentioned by taking an end to end value chain approach, tackling devices and edge computing. These are instrumental to provide clear investment directions with a 2030 horizon. Development of such visions and roadmaps are classical in this domain and are a must considering the 10 years needed to develop a new generation of connectivity infrastructure. ***A secured long term budgetary visibility also helps to reconcile two conflicting requirements: the need to have a focused vision and the need to involve a very large variety of stakeholders.***

4.4.4. *Coherence needed with the external environment*

Structured links to external actions are key to the success of SNS. At MS level, establishing links with initiatives like the 6G Flagship of Finland is targeted, and other similar national initiatives will be targeted. Given the wide scope of SNS, clear links have to be established with: the partnership on Key Digital Technologies (KDT) to develop the future generation of components needed for 6G, an issue not well addressed in 5G; the cybersecurity partnership, in view of developing the “landscape aware” security methodology in future systems; the partnership on High Performance Computing (HPC) to develop the enabling technologies for edge processing. SNS will then act as test/validation environment of technologies developed under these initiatives.

5. WHAT ARE THE AVAILABLE POLICY OPTIONS?

This section describes the specific functionalities that could be provided under the baseline scenario of traditional calls and the different options of different types of European partnerships.

5.1. Baseline option – Traditional calls under the Framework Programme

The baseline scenario used in this impact assessment is a situation without a Partnership and only traditional calls of Horizon Europe. Given that there is a predecessor Partnership as well as other funding sources in the area, these will continue generating effects even if there is no new Partnership. In particular it is expected that these already

⁷⁶ For 5G only, the sole government of South Korea (60 million people, 8 times less than Europe) invested \$ 500 million public support over 6 years. This made possible the emergence of an infrastructure industrial capability (Samsung) that did not exist in 2013 at the start of the programme.

existing initiatives will still create effects on future Smart Networks and Services. This is taken into account in the effectiveness assessment.

In parallel, the baseline situation means that the current implementation structure of the Article 187 would be closed, which bears winding down and social discontinuation costs. There would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is taken into account in the efficiency assessment.

This option cover calls under the Framework Programme and include activities ranging from research action to innovation actions. Coordination and support actions provide a loose ex post coordination framework. Resulting projects run mainly individually. The research agenda is based on a short-term (2 years) perspective through stakeholder consultation.

Table 2: Key characteristics of the baseline situation - Horizon Europe calls

	What is feasible under this option – functionalities of the option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • Even if a long term roadmap may be identified, extensive consultations are needed every 2 years to feed the bi annual work programme. Because the long term roadmap would be sliced up into 2 years period (assuming continuity would be granted) early commitment of a wide variety of stakeholders is difficult. In particular users and SME's will be more relevant towards the end of the programme rather than at the beginning when basic technological choices are investigated. • Synergies with CEF automotive actors are virtually not possible • Mobilisation of national programmes and actors can only be bottom up and ad-hoc
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • Implementation of R&I and demonstration/pilot actions are possible through regular Horizon Europe calls; • The needed continuity to deliver on 10 years roadmap is not granted, as it depends from bi annual work programme discussions. • The needed financial long term visibility to implement the full R&I cycle is not granted as it depends on bi annual work programme negotiations. • Only loose ex post coordination can be implemented, with little possibility to plan for spin off impact like contribution to standards or to spectrum allocation issues.
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> • Work programmes need to reflect the requirement for R&I activity across TRLs, with input from representatives of all relevant stakeholders. • Specification of calls for activity at higher TRLs, particularly demonstration programmes, need substantial input from industry. • R&I activity would focus on the short to medium term needs of the industry, it may also include fundamental research, not connected to a long term roadmap • Alignment of initiatives across the Union including at MS level very difficult, risks of fragmented and patchy implementations with less interest from MS with little industrial capabilities in the field. • Integration with other programmes and synergies with other relevant initiatives (KDT, cyber, HPC) difficult to plan with a programmatic perspective. • Each project and activity would function individually without strong coordination.
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> • Progress of R&I effort depend largely on EU funding, with no expectation of significant leveraging of industry support as actions are not included in a full EU level programme • Risks of additional activities being unrelated to actual Horizon Europe R&I.
Key differences compared to the current situation	<ul style="list-style-type: none"> • The existing 5G PPP is discontinued and its roadmap based piloting and coordination terminated leaving projects without coordination for standardisation, trials and input to regulation • The contribution from private side through the 5G Industry Association which coordinates activities has to be replaced by mechanisms to be funded under the Horizon Europe Programme.

5.2. Description of the policy options

Option 1 - Co-programmed European Partnership

This option is based on a memorandum of understanding between the European Commission and a European industry association⁷⁷. The agreement is non-legally binding with “best efforts” KPI’s and objectives from the involved stakeholders. The R&I is driven by a long term roadmap primarily defined by the industry and R&I stakeholders and target leveraging effects of at least 5 from the private side.

Table 3: Key characteristics of Option 1 – Co-Programmed European Partnership

	What is feasible under this option – functionalities of the option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • Participation of key stakeholders potentially contributing to the specification and delivery of the strategic R&I agenda is possible. • Work programme decided biannually impacts the long term visibility of the initiative and may affect commitment of stakeholders. • Limited synergies with CEF automotive actors. • Mobilisation of national programmes and actors only ad-hoc. • The partnership is likely to build upon the existing structure of the 5G-PPP but would have to include new stakeholders to fully cover the scope of the smart networks and services topic. • It offer the flexibility to change the profile of participation over time, with new partners joining to support new areas of activity in response to emerging results and changing priorities, but the long term roadmap ensure better participation from the start.
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • Implementation would rely on standard administrative infrastructure underpinning the open calls procedure, drawing on resources of relevant executive agencies and Commission IT systems. • Implementation of R&I and demonstration/pilot actions are possible through regular Horizon Europe calls. • The needed continuity to deliver on 10 years roadmap is not granted, as it depends from bi annual work programme discussions. • The needed financial long term visibility to implement the full R&I cycle is not granted as it depends on bi annual work programme negotiations. • Partial programmatic coordination can be implemented for spin off impact like contribution to standards or to spectrum allocation issues. across multiple projects but within the limits of the implemented roadmap actions.
Ensuring alignment with R&I agenda (<i>directionality</i>)	<ul style="list-style-type: none"> • Work programmes would need to reflect the requirement for R&I activity across TRLs, with input from the various partners to achieve an appropriate balance of activity directed towards different vertical markets (e.g. automotive, manufacturing, transport, health, energy). • The partnership would be responsible for ensuring that priorities for calls were specified in line with R&I priorities, including demonstration programmes. • Coordination with other initiatives at the European level (CEF, DEP, InvestEU), National and Regional level requires significant efforts. • Coordination with the initiatives (KDT, Cyber, HPC) left entirely to industry. • R&I activity aligned with the medium-term needs of the industry can be achieved.
Securing leveraging effects (<i>additionality</i>)	<ul style="list-style-type: none"> • Leveraging target defined and agreed from the onset. • Expected in-kind contributions from the private sector identified in the work programme. • Agreement to commit extra resources remains “best efforts” from the involved stakeholders.
Key differences	<ul style="list-style-type: none"> • Extension of the existing industry association of the 5G PPP with new set of stakeholders to

⁷⁷ The existing 5G Infrastructure Association is considered as the basis for a cPPP

compared to the current situation

address of a larger scope of topics to perform 6G R&I as well as – to a certain extent - deployment actions under CEF2 Digital.

- Additional activities to be planned and reported instead of measuring a mere leveraging factor in H2020.

Option 2 – Institutionalised European Partnership under Article 187 TFEU

This option is based on Article 187 TFEU and requires a Council regulation to implement a Union body, which involve the European Commission, representative from the industry through an industry association Member States and associated countries. The agreement is fixed and legally binding.

The body provides the strategic orientation to work programmes based on a long term research and innovation agenda (5 – 7 years) following a strategic roadmap to develop 6G networks and services and of providing support for the deployment of 5G infrastructures. It runs the evaluations and decides on the projects to be implemented.

The initiative would benefit from EU funds and seek a leverage effect through the contribution of the industry.

Member States are planned to be strongly involved in the governance of the JU, in particular to provide strategic guidance, advice on specific decisions, and contribute to coherence and synergies with national initiatives. To limit administrative overhead, it is not planned that MS would co-finance the SNS partnership (except possibly in-kind contribution for specific areas).

The institutionalized partnership may also have a dedicated role to define framework deployment conditions namely regulation and legislation (e.g. in the fields of spectrum allocation and use, ethics and cybersecurity of digital services, energy consumption of network infrastructures).

Table 4: Key characteristics of Option 2 – Institutionalised European Partnership (Article 187 TFEU)

	What is feasible under this option – functionalities of the option
Enabling appropriate profile of participation (<i>actors involved</i>)	<ul style="list-style-type: none"> • Long term visibility provides incentives for mobilisation of large sets of stakeholders at each phase, from definition to implementation and exploitation. • The structure enables top down approach to involvement of national initiatives and actors. • Industry and MS participation maximise potential involvement of stakeholders.
Supporting implementation of R&I agenda (<i>activities</i>)	<ul style="list-style-type: none"> • A Joint Undertaking (Union body) would be established to coordinate the specification of R&I activity, manage implementation and report on the results. • R&I activities ranging from research action to research and innovation actions (including coordination and support actions) directly conform to industry strategic priorities. • Long term budgetary visibility ensures optimised planning of key R&I priorities including additionally aspects. • MS involvement maximise exploitation potential of demonstration and validation activities, in addressing regulation and standardization, and support to infrastructure deployment and access to finance.

<p>Ensuring alignment with R&I agenda (<i>directionality</i>)</p>	<ul style="list-style-type: none"> • The work programme is fully in line with the R&I priorities of the Union and the priorities identified by the industry, combining activity across the TRLs (including pilots) and with application in different vertical industries. • Alignment with MS initiatives and other initiatives (KDT, Cybersecurity, HPC) is facilitated with strategic top down approaches. • Commission participation in the partnership governance arrangements and approval of the work programme, with MS support, ensure alignment with overarching policy objectives and enable integration with other programmes. • Though full openness is the default, restricted calls may be conceived for specific key aspects of the roadmap touching upon sovereignty.
<p>Securing leveraging effects (<i>additionality</i>)</p>	<ul style="list-style-type: none"> • Legally binding funding requirements would be clearly defined at the outset, with private sector partners expected to provide between 50% and 75% of partnership resources through in-kind and/or financial commitments. • A contribution from the Member States in the form of in-kind contribution (such as access to spectrum frequencies and infrastructures) can, be strategically planned top down.
<p>Key differences compared to the current situation</p>	<ul style="list-style-type: none"> • Extension of the existing industry association of the 5G PPP with new set of stakeholders to address of a larger scope of topics to perform 6G R&I as well as deployment actions under CEF2 Digital. • Additional activities to be planned and reported instead of measuring a mere leveraging factor in H2020. • Integration of functions for strategic steering for 5G deployment through CEF2 and with MS guidance. • Stronger roles for industry and Member States with strategic coordination of EU R&I and policies towards 6G, including input to regulatory processes and societal issues. • Stronger long-term commitments of public and private partners allowing for longer term R&I roadmap implementation, including downstream exploitation activities. • Inclusion of broader public policy objectives in the roadmap and governance structure with involvement of Member States, which is increasing the wider strategic impact and ambition.

5.3. Options discarded at an early stage

Based on the initial impact assessment and on the analysis of the initiative problem drivers, objectives, and functionalities the option Co-funded European Partnership and Institutionalized Partnership under Article 185 is discarded for following reasons: it does not ensure the required level of industry participation - within the ICT sector, across sectors and across the value chain - to ensure technological sovereignty and rapid market deployment; there is no incentive for private additionality. Whilst the option was supported by 20% of respondents to the public consultation, it turns out that none of the respondent come from the public sector, whilst a very strong commitment is needed for such a public-public partnership. DG RTD consulted the Shadow Programme Committee of Member States mid-2019, and no MS suggested such an option, nor the key industry associations that are behind the SNS industry proposal.

6. HOW DO THE DIFFERENT POLICY OPTIONS COMPARE

Based on the objectives pursued by the initiative and the key functionalities identified to be able to achieve them, each option for implementation is assessed in terms of effectiveness, efficiency and coherence compared to the baseline scenario of traditional calls. The analysis is primarily based on the degree to which the different options would cater for the key needed functionalities. All options are compared to the baseline situation of traditional calls, which is thus consistently scored at 0 to serve as reference point.

6.1. Effectiveness

To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like - differentiating between scientific, economic/technological, and societal (including environmental) impacts. This section considers to which extent the different policy options would allow delivering these expected impacts – confronting what is needed (functionalities) with what each form of implementation can provide in practice. The assessments in this section set the basis for the comprehensive comparative assessment of all retained options against all dimensions in Section 6.4, based on a scoring system⁷⁸.

Scientific impacts

Baseline – Horizon Europe traditional calls

Generation of new knowledge: conventional calls with traditional instruments of the Horizon programme are **fully compatible with ambitious research through a competitive process** at European scale.

Diffusion of applied knowledge: this option would lack the **synergies with larger deployments opportunities**, across projects, and large scale **connections with vertical industries**.

Positioning of Europe in the science and technology field of smart networks and services, this option is adequate as **traditional R&I instruments have demonstrated** their full ability to support high quality research and **open** downstream publications.

Option 1: Co-Programmed European Partnership

Generation of new knowledge, a co-programmed partnership based on the traditional instruments of Horizon programme has a full potential **to support ambitious research** at European scale. The partnership also bring **stronger coordination of the research, critical mass** and a better **link between the knowledge generated and the industrial needs**. It also encourage **stronger commitment** from the stakeholders. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Diffusion of applied knowledge, this option allows **synergies with larger deployment opportunities**, and **connections with vertical industries**, through formal **liaison with other initiatives** bring a **stronger commitment from industrial players**. It potentially reduces academic participation but attracts top academics in strong industry partnership with focused scientific outputs. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Enhanced positioning of Europe in the science and technology field of smart networks and services: this option is adequate as **traditional R&I instrument have demonstrated** their full ability to support high quality research and to support downstream open publications. → The potential of the option to generate the expected impact is good (+) compared to the baseline, taking into account the quality of the academics attracted by industry.

⁷⁸ A more in depth and detailed analysis of each policy option is provided in Technopolis Group (2020)

Option 2: Institutionalised European Partnership under Article 187 TFEU

Generation of new knowledge: this option based on the traditional instruments of Horizon Europe has full potential to support **ambitious research** at the scale of Europe. The partnership also bring a **stronger coordination of the research** and a better **link of the generated knowledge with the industrial needs**. It also bring a **stronger commitment** from the involved stakeholders to the research activities. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Diffusion of applied knowledge, this option allows critical mass, **synergies with larger deployments opportunities**, connections **with vertical industries**, and **liaison with other initiatives** and a **stronger commitment from industrial players**. **Long term planning visibility reinforces commitment** of an institutionalized partnership which may reinforce this impact. → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Enhanced positioning of Europe in the science and technology field of smart networks and services, this option is adequate as **traditional R&I instrument have demonstrated** their full ability to promote high quality research and to support downstream open publications. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

NB; when moving from FP7 (normal calls) to H2020 with the 5G PPP, industry participation moved from 40% to 60%; with academic participation moving from 50% to 30%. On the other hand, the academic work has been much more focused by industrial requirements which has led to higher usability and relevance of the knowledge generated. When moving from option 1 (cPPP) to option 2 (institutional partnership), it is not expected that academic participation will further decrease, hence the potential generation of new relevant knowledge is similar for the two options, as well as the position of Europe in the S&T field. Usability and diffusion is higher for option 2 due to long term industry involvement.

Table 5: Overview of the options' potential for reaching the scientific impacts

	Option 0: HE calls	Option 1: Co-prog.	Option 2: Institutionalised Art 187
Generation of new knowledge	0	+	+
Diffusion of applied knowledge	0	+	++
Enhanced positioning of Europe in the S&T field	0	+	+

Notes: Score ++ : Option presenting a high potential compared to baseline; Score + : Option presenting a good potential compared to baseline; Score 0: Potential of the baseline

Economic/technological impacts

Baseline – Horizon Europe traditional calls

Competitiveness of European Smart Networks and Services industry: this option is based on **loosely coordinated R&I projects** and lacks critical mass and directionality. It potentially **lacks the stronger commitments of the industry**, and **the impact of potential synergies with deployment activities**, which is due to the lack of long term

visibility deriving from short term (2 years) cycles that are not aligned with long term industrial roadmaps.

Increased innovation and research in SNS: traditional R&I instrument have demonstrated their **ability to promote research and innovation** and a **dedicated initiative** in the field, even only supported by traditional calls is likely to have an effect in that dimension, though on very specific project related topics as deployment is limited

The adoption of digital technologies in European industries: traditional R&I through standalone projects may enable the **creation of digital services that can be adopted by vertical industries**. However, the research agenda, **lacking the commitments of industry** is likely to be randomly **aligned with the priorities of the industry**. The **participation of vertical industry stakeholders in calls is likely to be ad-hoc** with limited critical mass and both the potential for influencing standards and for **adoption of the innovation will remain limited**.

Regulatory/standards issues, this option would **lack the strong commitment** and critical mass needed **to influence policy and regulations** as additional activities outside of pure R&I. It is very unlikely that it could contribute to harmonization of regulations and processes around spectrum allocation and usage.

Option 1: Co-Programmed European Partnership

Competitiveness of European smart networks and services industry: a **strong commitments of industry is facilitated by a roadmap and SRIA ensuring R&I alignment with the industry needs**. **Synergies are possible with deployment activities at scale as planned from a comprehensive roadmap which involves from the start a critical mass of stakeholders, with opportunities for new entrants and SMEs to participate in the value chain and contribute to sovereignty**. Industry commitment is though not fully secured considering the lack of long term planning capabilities due to unpredictable call cycles (SNS infrastructure developments is an 8 to 10 years process) and content, and implementation trough an Agency process. Also, the **ability to establish top down strategic coordination and liaison** with related initiatives is limited. →The potential of the option to generate the expected impact is good (+) compared to the baseline.

Increased innovation and research in SNS: the possibility to pool research results across projects through a federated initiative supported by **a research roadmap well in line with the industrial needs** stimulates the participation of the industry to the partnership and increase the potential research and innovation impact. →The potential of the option to generate the expected impact is good (+) compared to the baseline.

Adoption of digital technologies in European industries: this option could have some **impact**. **The commitment of industry ensure alignment of R&I with the industry needs**. The **participation of vertical industry stakeholders in calls can be achieved** (as shown in last calls of the 5G-PPP) increasing the potential for **adoption of the innovation**. However, **more synergies and coordination with deployment oriented and other initiatives** may be constrained. Long term planning lack of visibility due to call cycles and content as well as implementation through an Agency may affect impact industrial long term support and impact. →The potential of the option to generate the expected impact is good (+) compared to the baseline.

Regulatory/standards issues: this option has good standard potential and **commitment** and **ability to influence policy and regulations** due to the involved critical mass of actors and additionality. It may contribute to the necessary harmonization of regulations and processes around spectrum allocation and usage. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Option 2: Institutionalised European Partnership under Article 187 TFEU

Competitiveness of the European smart networks and services industry: this option maximises industry commitment and impact beyond the establishment of a commonly shared roadmap and SRIA because i) the long term visibility of an Institutional Partnership allows long term planning and industry commitments from the onset across all phases needed for an 8 to 10 years development; ii) industry is directly involved in the project selection, which reinforces directionality; iii) Member States tighter involvement makes top down strategic planning for coordination with MS developments possible; iv) the domain is sensitive for sovereignty and in addition to the default openness of the initiative, the institutional approach allows for calls with restricted participation which is needed to tackle cybersecurity issues in line with the 5G cybersecurity toolbox or to establish strategic links with key initiatives like KDT, HPC, cybersecurity. → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Increased innovation and research in SNS: a research strategic roadmap well in line with the industrial needs, the maximised long term industrial commitment, the possible mobilisation of MS initiative, increase the potential research and innovation impact compared to traditional calls. The potential is further increased by the deployment plans promoting higher TRL technologies → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Adoption of digital technologies in European industries: is also maximised through the mobilisation of a critical mass of actors across the complete cycle, owing to the long term visibility provided by the institutional approach and the possibility to influence project selection. Stronger MS involvement is key to quickly diffuse technology at MS level through dedicated pilots in the MS's. Embedded deployment initiative (CEF2, DEP, InvestEU) require MS participation and offer synergy with R&I actions. Optimised participation and commitments also favour additional activities like standardisation, which are needed for deployment and adoption. → The potential of the option to generate the expected impact is high (++) compared to the baseline.

For regulatory/standards **long term commitment** from industry and public actors offer an **ability to influence policy and regulations**, contributing to harmonization of regulations on spectrum allocation and usage. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Table 6: Overview of the options' potential for reaching the likely economic /technological impacts

	Option 0: HE calls	Option 1: Co-prog.	Option 2: Institutionalised Art 187
Enhanced competitiveness of European SNS Industry	0	+	++

Increased innovation and research in the field of SNS	0	+	++
Adoption of digital technologies in European industries	0	+	++
Diminution of regulatory burdens on businesses	0	+	+

Notes: Score ++ : Option presenting a high potential compared to baseline; Score + : Option presenting a good potential compared to baseline; Score 0: Potential of the baseline

Societal impacts

Baseline – Horizon Europe traditional calls

Human-centric internet, taking into account fundamental rights such as ethical, privacy and cybersecurity concerns: standalone projects can develop key technologies in these domains but would lack the additionality required to support downstream legislation for significant impact.

Equal and safe access of European citizens to a communication infrastructure that will prove critical for many digital services: the R&I activities may **enable the development of the technology** and can **support early prototyping**. However the **scale and scope** of these deployments is likely to be **limited**.

Development of employment in Europe in the SNS domain: the limited critical mass and long term commitment of the scheme entails limited impact on the framework conditions (standards, regulation, tech de-risking, business model validation) mainly covered through additional actions beyond R&I. Those are essential for large scale take up and employment impact.

Mitigation of environmental impacts requires industry wide adoption of technologies and standardised solutions that this option would not support, as elementary projects would lack the needed critical mass.

Option 1: Co-Programmed European Partnership

Human-centric internet, taking into account fundamental rights such as ethical, privacy and cybersecurity concerns may benefit from a roadmap and SRIA including **cybersecurity as a priority** in the future SNS and **the ethical impacts of related use cases**. The critical mass mobilised by the scheme favours downstream legislations and regulations to an extent as the lack of long term visibility limits additionality. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Equal and safe access of European citizens to a critical communication infrastructure for many digital services: this benefits from stronger focus on **large scale pilots' activities**, involvement of **vertical industries** and potential **liaison with deployment activities** to strengthen the access of European citizens and industries to a critical infrastructure. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Development of employment in Europe: it requires take up of the technologies with framework conditions (standards, regulation, and technology de-risking, business model validation) mainly covered through additional actions beyond R&I. The critical mass and

mobilisation of resources of the scheme put in place through common roadmaps and SRIA. It supports the **position of European actors in the value chain**, and the **development of employment in SNS**. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Mitigation of environmental impacts, requires industry wide adoption of technologies and standardised solutions. The critical mass of actors allows to develop the technologies to alleviate energy footprint in both the SNS and the vertical sectors. Full take up require additional take up conditions beyond R&I (standards, certification) and additional activities potentially limited by the lack of long term visibility on the implementation of the R&I roadmap. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Option 2: Institutionalised European Partnership under Article 187 TFEU

Human-centric internet, taking into account fundamental rights such as ethical, privacy and cybersecurity concerns may benefit from a roadmap and SRIA including cybersecurity **as a priority** in SNS and including **the ethical impacts of future use cases**. The additional synergies with Member States initiatives and the long term visibility on the roadmap implementation guarantees the maximum critical mass effect which favours contributions towards needed downstream legislation → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Equal and safe access of European citizens to a communication infrastructure that will prove critical for many digital services: this benefits from the stronger focus on **large scale pilots' activities**, involvement of **vertical industries**. Furthermore the long term visibility on the roadmap implementation maximises the ability of the institutionalized **partnership to better coordinate with other deployment oriented initiatives**, notably those led at Member States level. → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Development of employment in Europe: it requires take up of the technologies with framework conditions (standards, regulation, and technology de-risking, business model validation) covered through additional actions beyond R&I. The critical mass and mobilisation of resources of the scheme put in place through common roadmaps and SRIA, complemented with synergies with MS initiatives and long term planning of deployment pilot actions provides the framework to multiply R&I activities towards technology take up and favours SNS employment in Europe, through a virtuous circle of “technology push-market pull”. → The potential of the option to generate the expected impact is high (++) compared to the baseline.

Mitigation of environmental impacts, requires industry wide adoption of technologies and standardised solutions. The critical mass of actors allows to develop the technologies to alleviate energy footprint in both the SNS and the vertical sectors. Full take up require additional take up conditions beyond R&I (standards, certification) and additional activities favoured by long term visibility on the implementation of the R&I roadmap. This may though be alleviated by the entailed traffic growth on SNS → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Stakeholder opinion

The relevance of this topic has been asked among stakeholders through the Open Public Consultation especially regarding the concerns with using Smart Networks and Services

platforms for ethical, privacy, security, or EMF reasons. For a majority of respondents in several categories including academia, SMEs, large organizations, EU citizen the topic is evaluated as very relevant. For business association and public authority, the topic is seen as relevant but at a lower degree (which can be taken as a hint that this issue is unlikely to resolve only through market dynamics).

Summary

The Table below lists the scores of each of the policy options. The higher potential of option 2 compared to option 1 relates to i) the early MS involvement and strategic steering, that allow for early anticipation of the societal requirements whilst creating early awareness in MS towards the needed deployment policy/regulatory framework to put in place; ii) the integration of deployment actions under option 2, catalysing take up and related societal impact; iii) the industrial commitment to implement a longer term roadmap including deployment, deriving from the long term operational visibility and commitments certainty of the initiative.

Table 7: Overview of the options’ potential for reaching the likely societal impacts

	Option 0: HE calls	Option 1: Co-prog.	Option 2: Institutionalised Art 187
Development of a human-centric internet	0	+	++
Equal and safe access to a critical infrastructure	0	+	++
Development of employments in field related to SNS	0	+	++
Mitigate negative environmental impacts	0	+	+

Notes: Score ++ : Option presenting a high potential compared to baseline; Score + : Option presenting a good potential compared to baseline; Score 0: Potential of the baseline

6.2. Efficiency

To compare the policy options in terms of efficiency, a standard cost model was developed for the set of candidate Institutionalised Partnerships. The model and the underlying assumptions and analyses are set out in the Common Part of this impact assessment, Section 2.3.2 and in the Methodology Annex 4. A dedicated Annex 3 also provides more information on who is affected and how by this specific initiative in line with the Better Regulation framework. The scores related to the costs set out in this context allow for a “value for money” analysis (cost-effectiveness) in the final scorecard analysis in Section 6.4.

In addition, for this specific initiative under the baseline scenario of traditional calls, there would be winding down and discontinuation costs for the existing implementation structure of the current 5G PPP initiative. These can be estimated at 6 to 7 FTE which would be transferred from the existing industry association to the Commission of its implementing body (see next section).

The score of the baseline scenario (traditional Horizon Europe calls) is set to 0 to be used as a reference point.

On this basis, the scores in terms of the costs of the different options range from a value of 0, reflecting the fact that the baseline option does not entail any additional costs

compared to the baseline situation, to a score of (-) when an option introduces limited additional costs when compared to the baseline and a score of (-)(-) when substantial additional costs are expected in comparison with the baseline. In case the scores are lower than for the baseline scenario, (+) and (+)(+) are used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. Indeed, in terms of cost-efficiency, the Co-Programmed Partnership (Option 1) is 2 percentage points more efficient than the baseline; and an Article 187 Partnership (Option 2) is 2 percentage points less cost-efficient than the baseline. A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed options and a score of (-) for the Institutionalised Partnership policy option⁷⁹. However this scoring is based on the simplified assumption that we start from a greenfield site, i.e. there is no pre-existing established initiative. For the final assessment we need to keep in mind that, whereas, there may be an associated cost with discontinuing the 5G-PPP for the baseline, both the Co-Programmed Partnership (Option 1) and the Article 187 Partnership (Option 2) would benefit from existing structures (see next page on 5G-PPP discontinuation).

Table 8: Matrix on ‘overall costs’ and ‘cost-efficiency’

	Option 0: HE calls	Option 1: Co-prog.	Option 2: Institutionalised
Overall cost	0	0	(-)(-)
Cost-efficiency	0	+	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared with the baseline; score (-)(-) = substantial additional costs compared with the baseline

Costs of 5G PPP (current partnership) discontinuation.

The assumption behind the assessment of discontinuation of the 5G cPPP is based on the idea that the volume of budget remains similar, but handled through normal calls.

Running the action like a programme.

The currently existing 5G IA, the industry association, has a yearly budget of about 300 k€, financed by its members. This budget is used to organise the programme and all its stages: preparation of calls, mobilisation of stakeholders, organisation of projects around topics of common interests, joint events, publication of PPP level papers and dissemination, organisation of joint trials... In addition, each board member (10 in total) is allowed by his/her mother company to work up to 50% of his/her time for the 5G PPP. Altogether, this represent an overall commitment level that may be estimated to about 6 FTE (Full Time Equivalent). This industrial commitment mirrors the long term commitment of the Commission that announced from the onset an available budget of €700 million for the public side of the PPP.

Should the current structure be disbanded and not replaced by another partnership structure, and assuming that the Commission wishes to reach a similar level of

⁷⁹ The baseline (traditional calls) is scored 0, as explained above.

stakeholders commitments, coordination and impact, these 6 FTE would be transferred to EC staff.

In addition, implementing the programme as normal calls that are re-discussed every year without a long term visibility will require additional efforts from the Commission to redefine a roadmap every two years, whilst this is fully in the hands of the stakeholders at the moment, with supporting ETP NetWorld that organises the SRIA in partnership with the 5G-IA. This requires organisation of workshops, seminars, discussion between industry and academia. In that case, the efforts of extra constituency building, SRIA definition and follow up may be estimated of about 1 FTE.

For the operational implementation of the calls, the costs will not change if the budgets remain similar. Current level of budget represents in average two to 3 calls per years, fully implemented by Commission staff. If the normal calls without PPP is implemented, similar statutory staff involvement will have to be targeted. So this does not significantly change, also considering that under the current scheme, the retained approach has been to implement a limited amount of projects of large to very large scale which limits the number of projects and the cost of follow up.

In conclusion, it may be roughly assessed that the cost of discontinuing the current PPP implementation model to revert to normal calls renegotiated (from the existence and budget perspectives) could lead to an estimated 6 to 7 extra FTE's to keep the same budget efficiency in terms of coordination and programme impact.

6.3. Coherence

6.3.1. *Internal coherence*

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with other actions, programmes and initiatives under Horizon Europe, in particular European Partnerships (internal coherence).

Baseline – Horizon Europe traditional calls

This option has a **limited ability to mobilise the broad ecosystem required** by the future development of SNS over a long duration. The participation of **core players from the industry and research communities is ensured** (past programmes, e.g FP7 have proven their ability to mobilise such actors) on a work programme basis, but only for the limited time and objectives corresponding to the implementation of specific projects. This also applies to the vertical industries, that may be mobilised ad hoc through a call but cannot be involved for a long term strategy and planning of the downstream deployment framework.

Similarly, **SMEs** would be involved ad-hoc, on a per call basis.

International cooperation may be envisaged per call, but the lack of long term visibility and predictability does not allow to build a European initiative that would be seen as the counterpart of the visible initiatives launched by China, Japan, and South Korea.

A **strong strategic focus** could be favoured by a **strong cooperation and coordination between the funded projects**, which though would lack the long term visibility of a partnership.

This option is the simplest with **governance issue** limited to cross projects coordination at best.

Option 1: Co-Programmed European Partnership

This option has a **good ability to mobilise the broad ecosystem required** by the future development of SNS on the basis of a shared roadmap and Strategic Research and Innovation Agenda (SRIA). The **participation of core players from the industry and research communities** may be **ensured on a long term basis** from the perspective of strategic planning and definition of the needed actions, as shown by the 5G-PPP. *The unpredictable implementation cycles discussed every two years may though limit their commitments with engagement of the different communities* (ICT tech, verticals, SME's) varying as a function of the planned calls, and limited ability to define a long term strategic plan with MS initiatives. The lack of long term budgetary and planning visibility may limit the impact of downstream additional actions like contribution to standards, spectrum regulation, and business models validation. Whilst these can be planned in advance, they also depend on the implementation of seed R&I actions that cannot be planned with a longer than 2 years cycle.

International cooperation benefits from the **strong positioning and visibility** of a partnership that visibly represents EU R&I in the field of Next Generation Mobile and Cloud Systems.

A **strong strategic focus**, is enabled by early planning and **cooperation and coordination between the funded projects**, though subject to short term implementation cycles. It is reinforced by **the participation of a dedicated industry association**. The participation of a **large and active ecosystem of actors** to the industry association enable a **strong strategic vision**, whose implementation is though not secured by a long term approach.

This option benefits from the **existing governance and process of previous partnerships** (such as the 5G-PPP). **Most industrial actors in the field of SNS** are **already accustomed** to the governance and functionalities of a co-programmed partnership. It can be rapidly operational and ensure an **efficient governance**. However, SNS has a higher ambition than the 5G-PPP (sovereignty across a complete value chain) and requires new actors. The existing industry association of the 5G-PPP has consequently to include a wider set of actors.

Stakeholder opinion

It is to be noted that in the interviews, a large number of actors involved in the 5G-PPP initiative supported this option mostly with regards to the governance aspects.

➔ Overall, The potential of the option to generate the expected impact is good (+) compared to the baseline.

Option 2: Institutionalised European Partnership under Article 187 TFEU

This option has a good ability to mobilise the broad ecosystem required by the future development of SNS on the basis of a shared roadmap and Strategic Research and Innovation Agenda (SRIA). The participation of core players from the industry and research communities may be ensured on a long term basis from the perspective of strategic planning and definition of the needed actions, as well as at implementation level owing to the long term predictability offered by the scheme. It also maximises matching of implemented actions with the strategic roadmap considering the industry involvement in the selection of the funded actions. It also allows long term strategic planning with the MS initiatives and with other key initiatives like KDT, cybersecurity, and HPC through common calls. Commitment of stakeholders to the **institutionalized partnership structure** may depend on Member States role in the governance. This is seen as a

potential factor to **cause delays** in the gathering of the relevant stakeholders, but not as a factor that would significantly reduce the mid-long term ability of the institutionalized partnership to gather the right stakeholders.

SME participation rely mostly on the traditional Horizon instruments. It is facilitated by SME focused actions of the industrial roadmap and by the presence of SME representatives in the board of the industry association member of the partnership. SME participation in the current 5G PPP is of about 20%. Participation of SME's in the SNS field is very much correlated with the implementation of pilot and trial actions. SME tend to be less present in in depth research phases, but become very active when the technology gets closer to standards and actual implementation. SME participation hence requires a careful planning, with full implementation of a roadmap that ranges from early research to pilot and trials at EU scale. Option 2 is superior in that respect as the long term visibility and commitment towards implementation of a comprehensive roadmap maximises SME participation potential at each stage of the R&D cycle

International cooperation benefit from the **strong positioning and visibility** of a partnership that visibly represents the EU in the SNS domain. At implementation level, the institutional partnership allows to restrict some critical call (sovereignty, security) to specific industrial partners.

A strong strategic focus is enabled by early planning and cooperation between the funded projects. It is reinforced by the participation of a dedicated industry association. The participation of a large and active ecosystem of actors to the industry association enable a strong strategic vision, whose implementation is secured by a long term approach.

This option builds on the 5G-PPP industry association, duly modified to take on board the needed new players, which would eventually represent the industry side of the institutional partnership. It require the set-up of an active and efficient governance. Given the **broad range of stakeholders** to be mobilized and the **need of participation of Member States**, this option will require **dedicated efforts and negotiations** to ensure the **efficiency** of the governance structure. →The potential of the option to generate the expected impact is good (+) compared to the baseline.

6.3.2. *External coherence*

In this section we assess the extent to which the policy options show the potential of ensuring and maximising coherence with their external environment, including EU-level programmes and initiatives beyond the Framework Programme and/or national and international programmes and initiatives, but as well as with overarching framework conditions, such as regulation, standardisation, etc. (external coherence).

Baseline – Horizon Europe traditional calls

Regarding the ability to **establish liaison with related R&I initiatives** and in neighbouring domains (such as KDT, cybersecurity or HPC research), the initiative relies **solely on coordination and support actions** and on the willingness of the participants to exchange and collaborate, resulting in a **low level of liaison**, without any possibility of long term strategic planning

Furthermore, the initiative using traditional calls would have **no real ability to consistently coordinate** with the **initiatives from Member States** supporting R&I in the field of SNS. The **coordination with deployment oriented initiatives** (such as CEF2, DEP, and InvestEU) would be **very limited**.

Regarding the ability to establish liaison with **initiatives and actors** able to provide **funding and dedicated supports** to **start-ups and innovators**, an initiative under the traditional calls would have a **very limited impact**. The relatively **low visibility of the action**, will leave little space to attract funding and investment in the field.

Regarding the ability to **link and potentially influence** future **regulations** (in spectrum allocation and usage, energy consumption of future networks and services, or ethical and security issues), an initiative using traditional calls would have a **very limited impact**. It would lack the **critical mass of industrial participants** necessary to really have an impact on future legislations and regulations.

Option 1: Co-Programmed European Partnership

Establishing liaison with related R&I initiatives and in neighbouring domains (such as KDT, HPC, or cybersecurity), could rely **not only on coordination and support actions** but also on **potential actions at the level of the respective industry associations**. Long term strategic planning is possible but not matched by the short term implementation cycles lacking long term visibility.

The **ability to coordinate** with the **initiatives from Member States** supporting R&I in the field is limited as shown by the 5G-PPP. It remains ad-hoc, opportunity driven, without any possibility to establish a long term top down strategic planning. The **coordination with deployment-oriented initiatives** (such as CEF2, DEP, InvestEU) would also be **very limited**.

Liaison with **initiatives and actors** able to provide **funding and dedicated supports** to **start-ups and innovators**, the impact is limited and **depends on individual actors**. The **visibility of the partnership**, could be exploited to some extent to attract investment. However it would likely **lack the ability to set-up dedicated coordination**.

Regarding the ability to **link and potentially influence** future **regulations** (in spectrum allocation and usage, energy consumption of future networks and services, or ethical and security issues), moderate good **impact** is possible. However the **critical mass and strong commitment of industrial participants** necessary to really have a strong impact on future legislations and regulations requires long term visibility of the roadmap implementation. → The potential of the option to generate the expected impact is good (+) compared to the baseline.

Option 2: Institutionalised European Partnership under Article 187 TFEU

Establishing liaison with related R&I initiatives and in neighbouring domains (such as KDT, HPC, or cybersecurity), could rely **not only on coordination and support actions** but also on **potential actions at the level of the respective industry associations**. Long term strategic planning is possible making joint calls possible at the level of the institutional partnerships concerned

The **coordination** with the **initiatives from Member States** supporting R&I in the field is possible with a top down strategic planning. The **coordination with deployment oriented initiatives** (such as CEF2, DEP and InvestEU) would also be **possible**, ensuring **liaison with all development and deployment activities of smart networks and services at the local, national and European level**.

Establishing links with **initiatives and actors** capable of providing **funding and support** to **start-ups and innovators**, **depends on individual actors**. The **large visibility, and political weight of the partnership**, could though be exploited to attract investment (including on an international scale).

Furthermore, the **commitment** (including commitment to funding) of an institutionalized partnership would also **strengthen the leverage effect** as investors and industrials would be **more certain of the long term commitment** of the participants to the initiative.

Regarding the ability to **link and potentially influence** future **regulations** (in spectrum allocation and usage, energy consumption, or ethical and security issues), an initiative using an institutionalized partnership would have a **good impact**, maximised by the large critical mass of actors mobilised, the long term commitment, and the better matching of the roadmap with the implemented R&I actions. →The potential of the option to generate the expected impact is high (++) compared to the baseline.

Stakeholder opinion

According to the Open Public Consultation, business associations, SMEs and large organizations find very relevant the regulation in the field of radio spectrum allocation.

For several interviewees from different categories, a strong coordination in Europe is required for spectrum harmonization involving the implication of Member States very early in the program. Indeed the spectrum fragmentation in cost and allocation is seen as a key issue (very irregular depending on the countries).

Summary

Table 10, below, lists the scores of each of the policy options, based on the assessments above, and taking into account the support expressed by the different stakeholders.

Table 9: Overview of the options’ potential for ensuring and maximizing coherence

	Option 0: Europe calls	Horizon	Option 1: Co-programmed	Option 2: Institutionalised Art 187
Internal coherence	0		+	+
External coherence	0		+	++

Notes: Score ++ : Option presenting a high potential compared to baseline; Score + : Option presenting a good potential compared to baseline; Score 0: Potential of the baseline

6.4. Tabular comparison of options and identification of preferred option

Building upon the outcomes of the previous sections, this section presents a comparison of the options’ ‘performance’ against the three dimensions of effectiveness, efficiency and coherence. In Section 6.4.1, we first compare the policy options against each other for each criterion in the effectiveness and coherence dimensions, resulting in a scorecard with scores from 1 to 3 where 3 stands for a substantially higher performance. Combined with the results from the comparative assessment for efficiency in Section 6.3, the final scorecard will allow for the identification of the preferred option in Section 6.4.2, taking all dimensions and criteria into account.

Effectiveness

Regarding the **scientific impacts**, the impact of the three considered options would be relatively close, due to the overall good capacity of traditional R&I instruments to ensure the generation of new knowledge and to enhance the positioning of Europe in the S&T field. However, the partnerships options (institutionalized and to some extent, the co-programmed partnership as well) would be able to achieve more thanks to better capacity to support the diffusion of knowledge through a better critical mass effect and connection with vertical industries. The partnership options (both institutionalized and co-programmed) would result in a higher impact in term of knowledge creation through a stronger commitment of industrial players to the R&I activities.

Technological and economic impacts: Option 0 ranks significantly lower than the other two options, with limited ability of R&I activities alone to have a strong economic impact beyond a mere increase of R&I in the field. Both partnership options (institutionalized and co-programmed) would be able to achieve more by harnessing a stronger commitment at scale from the industrial actors, including vertical industries. The ability to have a R&I agenda well aligned with industrial needs but also to liaise and support deployment oriented activities further support the partnership options (institutionalized and co-programmed). The institutionalized partnership would provide further impact by ensuring an even stronger longer term commitment of the stakeholders, implementation visibility and by its potential ability to influence R&I projects selection, policy and regulation that could diminish regulatory burdens on businesses. Sovereignty targets are also best addressed through possibilities of restricted actions to strategic EU partners.

Societal impacts: Option 0 (Horizon Europe calls) ranks also significantly lower than the other two options, because of the limited ability of R&I activities to have a strong societal impact without coordination with other actions. The Co-programmed option would provide good societal impact in the 3 considered dimensions. This is directly linked with the fact that the partnership would strengthen the deployment of the infrastructure. Option 2 (institutionalized partnership) would bring additional benefits by enabling an even stronger critical mass, long term visibility and implementation with potentially more coordinated deployment of the infrastructure and by a good ability to influence future regulations (which could be used to foster the development of a human-centric internet).

Coherence

The baseline option can be considered as significantly outranked by the two other options as the initiative would have difficulties to attract the broad range of stakeholders required. Option 1 and Option 2 (co-programmed and institutionalized partnerships) would be comparable in term of internal coherence with a better ability to attract the required stakeholders in the long term for option 2 but a more complex governance scheme.

Regarding the external coherence, the baseline option would have little impact, unable to reach out efficiently to other initiatives. Option 1 would provide some impact by a larger visibility and ability to reach out to other initiatives, but it would lack the benefits brought by the institutionalized partnership (option 2), which benefit from a very high , long term strategic planning and implementation capabilities across institutional partnership, ability to establish strategic synergies with other programmes Including at MS level.

Table 10: Overall scorecard of the policy options for all criteria

	Criteria	Option 0: HE calls	Option 1: Co-programmed	Option 2: Institutionalised
Effectiveness	Scientific impacts			
	Generation of new knowledge	0	+	+
	Diffusion of applied knowledge	0	+	++
	Enhanced positioning of Europe in the S&T	0	+	+

	Criteria	Option 0: HE calls	Option 1: Co-programmed	Option 2: Institutionalised
	field			
	Economic/technological impacts			
	Enhanced competitiveness of EU SNS Industry	0	+	++
	Increased innovation and research in the field of SNS	0	+	++
	Adoption of digital technologies in European industries	0	+	++
	Diminution of regulatory burdens on businesses	0	+	+
	Societal impacts			
	Development of a human-centric internet	0	+	++
	Equal and safe access to a critical infrastructure	0	+	++
	Development of employments in field related to SNS	0	+	++
	Mitigate negative environmental impacts	0	+	+
Coherence	Internal coherence	0	+	+
	External coherence	0	+	++
Efficiency	Overall cost	0	0	(-)(-)
	Cost-efficiency	0	+	(-)

Notes: Score ++ : Option presenting a *high* potential compared to baseline; Score +: Option presenting a *good* potential compared to baseline; Score 0: Potential of the baseline.

The scorecard of policy options shows that the baseline option performs less well against almost all dimensions and criteria compared to the Option 1 and Option 2. Even though it reached a higher score against the cost and cost efficiency criterion, this does not weigh up against its lower performance against the dimensions of effectiveness and coherence.

Stakeholder opinion

Stakeholder opinions from the open consultation and interviews favoured the known model of co-programmed partnership due to the successful implementation of the 5G-PPP, which was found to present significant added value compared to traditional calls.

However, the stakeholders are fully open and understand the advantages of the institutionalised model. For the 37% preferring a co-programmed model, it is to be noted that at least 6 organisations in the 5G PPP, representing a large majority of the Industry and the 5G Industry Association, chose “co-programmed” as preferred option, but with the comment that “this Partnership could be implemented equally as an Institutionalised Partnership”. This relativizes the raw statistics and shows support for an institutionalised approach, provided that its complexity and model for financial contributions are reasonable, which is the condition for stakeholders to sign up.

In particular, the main industry players and key associations that are needed to realise the ambitious scope of activities have shown openness to the institutionalised model. They have

understood its strategic character and their responsibility vis-à-vis EU policy objectives such as technological sovereignty and green deal.

The main reason provided by the key stakeholders why they did not express a clear preference in the first instance for the institutionalised options is the fact that concrete implementation conditions including the allocated budget have not been published. However, concrete implementation options for the institutionalised model have been discussed with these key stakeholders as well as Member States, and workable options for the governance structure and co-investment have been identified. We therefore conclude that the flexibility available to set up the institutionalised partnership will minimise the risk of stakeholders not subscribing to the model.

Comparison between the preferred option & the current partnership existing in the area taking into account lessons from past evaluations

What continues	What is different
<ul style="list-style-type: none"> • The connectivity focus of the 5G PPP (5G) • The 5G PPP stakeholders will continue to be highly relevant • The roadmap based from early R&I to trials and demos approach • The SME objective of the 5G PPP (20%) • The standardisation objective • The target to open new spectrum frontiers • The leveraging factor (7 for 5G PPP industrial players) 	<ul style="list-style-type: none"> • Much higher level of ambition (scope and policies) • Full value chain approach, including capacity building in devices (IoT) and cloud • The sovereignty aspect, notably the support of the objectives of the cybersecurity toolbox is integrated to the SNS partnership • Societal aspects are integrated, notably SDG’s such as “Infrastructure affordability” of SDG 9, Sustainable cities (SDG 11) or Climate actions (SDG 13). The latter is directly coupled with the Green Deal Policy, with two objectives: i) SNS platforms in support of energy efficiency ii) drastic reduction of SNS platforms energy requirements • Stakeholders are extended with IoT and cloud systems players • Member States are associated, as they are key to develop R&I and test/pilot infrastructures that can be leveraged at EU level, hence improving additionality • The JU model imposes a new governance, with a Governing board as specified in an implementing regulation • The restriction of the initiative to EU players, in view of sovereignty objectives is planned, the international cooperation is more selective, based on a case by case approach, whilst the 5G PPP had generated several Joint declaration of cooperation with 4 different nations • The deployment aspect is also addressed from a systematic perspective, with inclusion of 5G deployment actions (precursor to SNS/6G) along main transport paths, using the CEF2 tools as well as other 5G deployment programmes under CEF2, DEP, and InvestEU. The objective is to go beyond pilots, towards operational deployments • Additional activities are factored in from the onset to define the extra investments, e.g: standardisation, specific industry pilots building up on partnership pilots, international regulations (spectrum)

The scorecard also shows that benefits are clearly maximised under the institutionalized partnership option (option 2). In particular, compared with the other options, Option 2 would:

1. Provide greater effectiveness, especially in term of economic, technological and societal impacts by its ability to secure stronger long term commitment of the

involved stakeholders, to optimise the implementation of the R&I roadmap and to foster regulation and standardization activities.

2. Improve the external coherence by a good ability to reach out to other initiative and a strong ability to establish synergies with programmes led at the European, National or Regional level.
3. Offer a relatively good overall efficiency despite additional costs.

Summary Assessment

The Institutional Partnership is primarily motivated by the increasingly strategic role of the technology area for European society and economy.. Whilst the previous initiative was merely motivated by industry competitiveness in the 5G era, the SNS initiative needs to address a multiplicity of policies encompassing sovereignty across a value chain beyond mere connectivity, sustainable recovery post COVID-19 and Green Deal. This requires a more complex roadmap with several policy dimensions and a larger set of committed stakeholders where Member States have to be fully involved, with an adequate governance model with all parties on equal footing, especially for those aspects dealing with emergence of EU industrial capabilities in domains where the EU is less present. It will enable downstream relay actions at MS level similar to the IPCEI model in other strategic domains like components or batteries. Therefore, long term commitment by a broad set of stakeholders and strategic governance formally involving MS become key differentiators.

From a policy perspective, the two options (1 and 2) hence differ in their capabilities to deliver on the strategic objectives of the SNS initiative. The possibility for a more systemic approach and the ability to ensure synergies with other funds, particularly for deployment, the following are other key elements of differentiation:

Commitment of stakeholders

- A broader set of stakeholders to mobilise which requires the alignment to a common long term roadmap, considering that it takes about 10 years to develop a new generation of connectivity platform (from early R&D to deployment). **This requires long-term investment certainty** that only the institutional partnership may provide (Option 2). Option 1, with workplans discussed every 2 years without any visibility of the investments ex- ante will not provide the long term certainty and predictability needed to secure the right level of industry ownership and commitment;

- Long term visibility is further enhanced by the legislative approach towards a firm budgetary commitment on the public and the private side: a clearly identified contribution from the Union mapped with legally identified commitments from the private side, be it in kind or financial.

- In terms of external coherence, the long-term visibility of option 2 and the increased level of industrial commitment allows to plan consistently over time for key outputs such as contribution to standards, position on spectrum or in other regulatory fora. This is more difficult with option 1, where there is no Council Regulation in place setting the frame and the commitments might be put in question for every new work-programme, e.g. every 2 years with varying priorities and lack of commitment towards a mid to long-term roadmap

Close involvement of Member States

- The formal and close participation of the Member States as part of the governance structure ensures the possibility to define a top down strategic programming, and to enable synergies with national investments, through a coordinated approach. We foresee a guiding role for Member States in strategic matters that goes beyond the upstream advisory role as in the case of comitology, which is lacking in flexibility when it comes to new and rapidly emerging challenges. This guiding role is not formally possible with option 1, but will be very much needed, considering that for 5G PPP, we have noted multiple MS initiatives in this field leading to fragmentation and inefficiencies (UK, FI, D, F, E, S, SL, I, DK, LU..). In particular, European level leveraging of Member State infrastructures would significantly increase additionality.

- In the case of option 2, adherence to an industrial roadmap will be mirrored by an adherence to this roadmap by Member States initiatives. It will build on MS initiatives, as during MS consultations through the Shadow Programme Committee (SPC), 80% of MS have declared having SNS related R&I policies in place. This combined roadmap support (EU, industry, MS) will provide a powerful framework to federate long term commitment from industrial stakeholders whilst enabling MS budget investment efficiently complementing EU investments (additionality). Option one would be limited to provide this long term commitment.

- The early involvement of MS creates a level of awareness that is key to prepare for deployment in Europe. Deployment of a new generation of connectivity platform requires national involvement in particular in areas of public interest such as 5G along transport paths and 5G cities and communities. Option 2 is the option that maximises strategic involvement of MS and preparedness towards deployment of 5G and beyond, in view of maximising Europe wide impact.

- Similarly, the long-term visibility of Option 2 in terms of roadmap implementation allows the partnership to be defined from the outset with links to other relevant key initiatives, notably KDT (components), cybersecurity, EuroHPC. Here again, MS involvement from the outset with Option 2 would also allow a strategic steer of the cross cutting actions between these highly complementary initiatives and stimulate cross cutting investments at MS level in efficient synergy with the cooperating partnerships.

Possibility to derogate from standard rules for participation in R&I activities

As the political debate that developed over the security of 5G network equipment demonstrates, the issue of the cybersecurity of communications networks and services will be increasingly critical as they become central to the working of all facets of the economy and society.

So while this initiative has the vocation to maintain and extend Europe's leadership in the global market for smart networks and services, and to maintain cooperation and collaboration in the development of global standards, it may prove necessary to set rules for participation that are aligned with specific cyber-security principles or other strategic considerations. This would only be considered if necessary to ensure the security of systems being developed but also the technological capability of European industry to produce critical communications equipment and software. An institutionalised partnership with its strategic governance structure is better suited for such requirements. In particular, such strategic decisions would necessarily require the input and advice of Member States in the context of their responsibilities for security, and this would be facilitated by the institutionalised model.

7. THE PREFERRED OPTION

7.1. Description of the preferred option

Based on the above assessment, the preferred option is the institutionalised partnership under Article 187 TFEU. In the Table below, we indicate the alignment of the preferred option with the selection criteria for European Partnerships defined in Annex III of the Horizon Europe Regulation. As the design process of the candidate Institutionalised Partnerships is not yet concluded and several topics are still under discussion (such as governance model, legal act, private industry contribution and Member States contribution) at the time of writing, the criteria of additionality/directionality and long-term commitment are covered in terms of *anticipations*.

Table 11: Alignment with the selection criteria for European Partnerships

Criterion	Alignment of the preferred option
Higher level of effectiveness	<p>The analysis presented in section 6 shows that an institutional partnership would have a higher effectiveness than the other options in achieving the objectives defined in section 4 through:</p> <ul style="list-style-type: none"> • A stronger commitment from the whole ecosystem to a long term, sustained 6G strategy whilst leveraging national investments. This is needed considering the potential critical nature of the future network infrastructure and digital services for numerous European industries. • The necessary involvement of a broad ecosystem of stakeholders, ranging from incumbent in the field of smart networks and services to vertical industries that will be future adopters of the solutions developed and potential new entrants. This is needed considering the sovereignty objective and the need to cover a comprehensive value chain.
Coherence and synergies	<ul style="list-style-type: none"> • An institutional partnership allows to establish strategic liaison with other related initiatives and partnerships. The development of smart networks and services has to take into account and use numerous digital technologies (making liaison with the Key Digital Technologies initiative is important) and will serve as the backbone of the digital transformation of numerous industries (Automotive, Health, Transport, Energy, Manufacturing) requiring the set-up of important synergies with other programmes. • An institutional partnership allows a stronger top-down strategic liaison and coordination with R&I initiatives supported by national research programmes. • An institutional partnership allows a stronger liaison with deployment oriented initiative (at the European, National and Local level) which as presented above in section 3 and 4 cannot be decoupled entirely from R&I perspectives. • An institutional partnership allows a stronger ability to foster necessary regulations and legislative adaptation in the field of spectrum allocation and usage, energy consumption or ethics, privacy and cybersecurity.
Transparency and openness	<ul style="list-style-type: none"> • An institutional partnership allows, for more interdisciplinary research, highly needed for the future of networks and digital services, with coherent roadmap based plans • This option also foster the creation of new value chain opportunities (new connectivity providers, new connected device providers), creating higher opportunities for new entrants and SMEs.
Additionality and directionality	<ul style="list-style-type: none"> • The committed participation of a broad ecosystem of stakeholders developing and using the future SNS infrastructure is required to ensure a strong strategic focus. The institutional partnership optimises directionality with strategic planning with MS actions • Additionality is optimised through the long term commitment and visibility offered by the Institutional partnership, which allows strategic planning of long term beyond R&I actions. The 5G-PPP programme has shown a high leverage of industrial investment in R&I activities, (a factor of 10 for larger industries under phase 1 and 2, > 7 in average), which is taken as a basis.

Criterion	Alignment of the preferred option
Long-term commitment	<ul style="list-style-type: none"> For an institutional Partnerships, established in accordance with article 187 TFEU, the financial and/or in-kind, contributions from partners other than the Union, will at least be equal to 50% and may reach up to 75% of the aggregated European Partnership budgetary commitments. Long term industry commitment is maximised through long term visibility enabling secure implementation of the strategic roadmap.

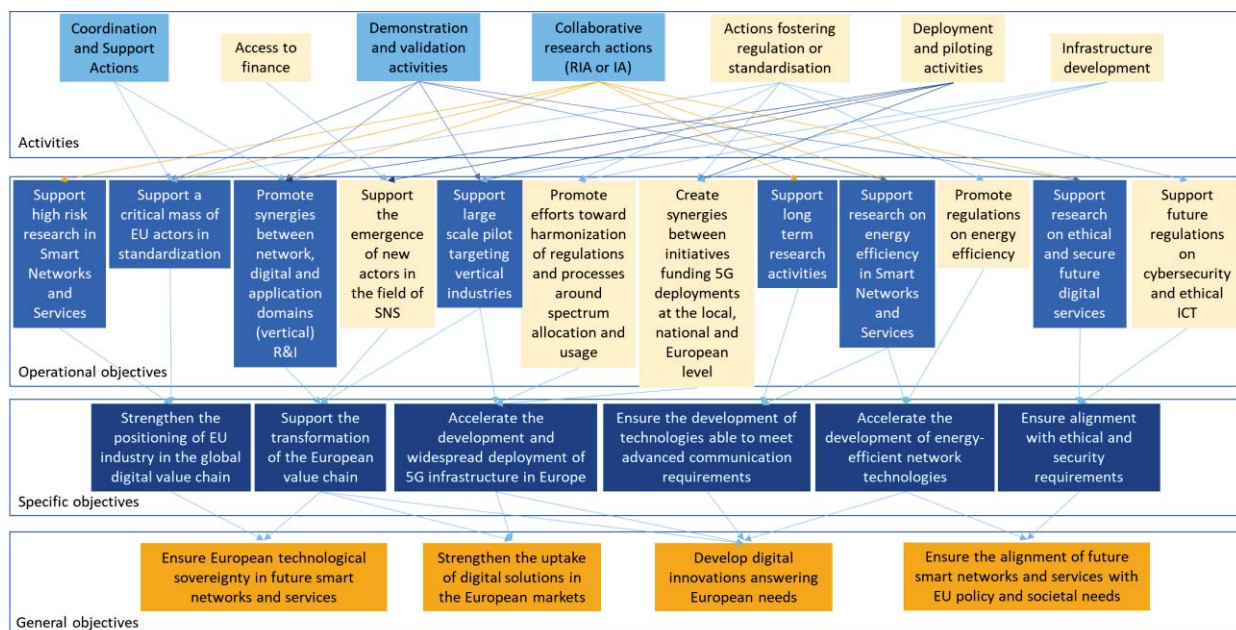

7.2. Objectives and corresponding monitoring indicators

7.2.1. Operational objectives

Several operational objectives have been identified which would enable the partnership to achieve its specific objectives, as shown in Figure 8 below.

The figure below, lists a range of actions and activities, going also beyond the R&I activities that can be implemented under Horizon Europe (highlighted in yellow). This reflects the definition of European Partnerships in the Horizon Europe regulation as initiatives where the Union and its partners “commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”

Figure 8: Operational objectives of the initiative

We introduce here in more details the operational objectives we foresee for the initiative.

Support high risk research in smart networks and services towards 6G: dedicated support for research compensate for the high level of risk and high research intensity of the domain. An average leveraging factor of public investment of at least 7 is targeted.

A strong presence of European actors in standardization is necessary to ensure a critical mass of contributions. This is achieved as a spin-off of collaborative R&I, and demonstration activities, and actions fostering regulation and standardization. It is facilitated by the roadmap based approach of an institutional partnership. A target of 1000 contributions derived from the initiative is targeted, at least 40% of essential patents of future SNS infrastructures with the EU industry.

Promote synergies between network, digital and application domains (vertical)

R&I: The value chain approach requires collaborative research across research fields (networking, devices, IT, verticals). This addresses the problem drivers (*An infrastructure relying heavily on advanced digital solutions*) and (*An infrastructure critical for the adoption of digital solutions in many industries*). It leverages strategic links with other initiatives (notably KDT). Target: 40% of the future markets for connectivity infrastructures mastered by EU actors; at least one European supplier at each level of the value chain: devices; networks; edge computing.

Large scale pilots targeting the future application domains of smart networks and services are supported. These should target vertical industries such as: automotive, transportation, manufacturing, healthcare, and energy. It addresses the problem drivers described in section (*an infrastructure critical for the adoption of digital solutions in many industries*), (*an infrastructure that requires structural changes in various value chains*), and (*a lack of investment in the deployment of the new infrastructure*). Target: at least one large scale pilot per vertical with pan European footprint and leveraging trial capabilities developed at MS level. Regarding the automotive domain, at least 6000 km of cross border corridors covered by 5G is targeted.

Support long term research activities: dedicated activities targeting the longer term evolutions of communication networks and digital services, namely 6G capabilities. This would answer to the problem driver described in section (*Insufficient capacity of 5G to respond to advanced communication requirements*). It could be achieved through collaborative research actions.

Support research on energy efficiency in smart networks and services: research in the field of energy efficiency of the future networks, devices and applications is aimed at. This addresses the problem driver described in section. (*Lack of energy efficient technological solutions for future network infrastructures*). It targets an energy reduction factor of at least 10 for SNS platforms and at least 30% energy reduction in key use cases like factories, automotive, energy. At least 30% of the budget is related to Green Deal objectives.

Support research on ethical and secure future digital services: ensure that ethics, privacy and cybersecurity are integrated in the design of future smart networks and digital services. This addresses the problem driver described in section (*Increasing challenges of digital services toward ethics, privacy and cybersecurity*). **It supports future standards needed in the context of the 5G security toolbox and support the emergence of alternative value chains.** Target: Comprehensive architecture, technologies and standards for an end to end security; full characterisation of risks of data misuse in SNS. In the context of additionality, activities beyond R&I would also:

Promote emergence of new actors in the field: it covers the transformation of the value chain by promoting the emergence of new EU actors in the supply chain and the evolutions of the business models of existing actors (in both the connectivity value chain and vertical industries). This addresses the problem drivers defined in section (*an infrastructure that requires structural changes in various value chains*). It leverages two trends: the emergence of verticals or neutral hosts as suppliers of SNS infrastructures; the softwarisation of SNS infrastructure with lower market entry barriers and potential of new actors to emerge. Targets: availability of European suppliers beyond today actors for the SNS value chain including providers of open solutions like Open RAN or Open Air

Interface cost level of European Radio Access and Core network offers comparable to those of Asian competitors.

Promote efforts toward harmonization of regulations and processes around spectrum allocation and usage: harmonization at the European level of the regulations and processes for spectrum allocation and its usage is sought. This would aim at answering the problem driver defined in section (*A lack of coordination of spectrum policies*). This requires strong contributions towards international bodies. Target: identification of 6G spectrum above 90 GHz, related allocation in ITU, definition of the assignment methods and technical characteristic to be used in licensing process (for licensed bands).

Promote regulations on energy efficiency: fostering regulations that promote energy efficiency and certifications. This would answer the problem driver defined in section (*Lack of energy efficient technological solutions for future network infrastructures*) Target: complement R&I on energy efficiency with specification of an SNS label of energy efficiency and corresponding standards.

Support future regulations on cybersecurity and ethical ICT: To promote a human-centric internet, and mitigate the impact of future digital services on cybersecurity, privacy and other ethical issues, the initiative should aim to foster regulations enforcing an ethical approach. This would answer to the problem driver described in section (*Increasing challenges of digital services toward ethics, privacy and cybersecurity*) Target: label and standards related to ethics and privacy. Compliance with the certification tool put in place in the context of the cybersecurity toolbox.

7.2.2. *Monitoring indicators*

In addition to Key Impact Pathways indicators set centrally in the Regulation of Horizon Europe, additional monitoring indicators have been identified to enable the tracking of progress of the partnership towards meeting its objectives. These are shown in the Table below. A monitoring system to assess the effectiveness of the initiative will particularly be looking at cost benefits and where relevant, the indicators listed below would be used as KPI. Additionally cost, investments levels by the private side should be measured.

One should further divide the KPIs in qualitative and quantitative KPIS or system/performance measurements. The following table present a set of indicators that may be used for SNS.

Table 12: Specific Monitoring indicators for SNS.

Impact Dimension		Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
Scientific impact	Development of new innovations for smart connectivity value chains.	Number of publications, patents and standard contributions achieved by the partnership on beyond 5G capabilities	Number of publications, patents and standard contributions achieved by the on 6G capabilities	Number of publications, patents and standard contributions achieved by the partnership on 6G capabilities
	Lower energy consumption devices and infrastructures	Number of publications, patents and standard contributions achieved by the partnership on energy efficiency in connected devices and networked infrastructures	Number of publications, patents and standard contributions achieved by the partnership on energy efficiency in connected devices and networked infrastructures	Energy consumption of integrated smart connectivity platforms, including service and IoT component.
	Use of digital technologies in future smart connectivity	Number and share of projects including cross cutting research mixing network technologies with advanced digital solutions (A.I., Edge, etc.)	Number and share of projects including cross cutting research mixing network technologies with advanced digital solutions (A.I., Edge, etc.)	Uptake of advanced digital solutions and scientific results in future smart connectivity solutions.
	Vertical oriented applications in SNS	Participation of vertical industry representatives to R&I projects	Participation of vertical industry representatives to R&I projects	Uptake of smart networks and services in vertical industries
	cybersecurity by design	Number of publications, patents and standard contributions achieved by the partnership on Cybersecurity in smart networks and services	Number of publications, patents and standard contributions achieved by the partnership on Cybersecurity in smart networks and services	Number of publications, patents and standard contributions achieved by the partnership on Cybersecurity in smart networks and services

Impact Dimension		Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
	Ethics by design	Number of publications, patents and standard contributions achieved by the partnership on Ethics and Privacy in smart networks and services	Number of publications, patents and standard contributions achieved by the partnership on Ethics and Privacy in smart networks and services	Number of publications, patents and standard contributions achieved by the partnership on Ethics and Privacy in smart networks and services
Tech. / economic impact	Investment of EU industry in SNS	Leverage effect, investment of EU SNS industry in R&I	Leverage effect, investment of EU SNS industry in R&I	Leverage effect, investment of EU SNS industry in R&I
	Contribution to standardization and patents	Share of EU actors contribution to standards and patents on smart networks and services	Share of EU actors contribution to standards and patents on smart networks and services	Share of EU actors contribution to standards and patents on smart networks and services
	Market share of EU actors	Market Share of EU actors in SNS	Market Share of EU actors in SNS	Market Share of EU actors in SNS
	Vertical oriented applications	Number of large scale pilots targeting vertical industries	Take-up of smart connectivity in vertical industries	Take-up of smart connectivity in vertical industries
	New smart connectivity providers across the value chain.		New businesses in EU as smart connectivity providers across the value chain.	New businesses in EU as smart connectivity providers across the value chain.
	Private investment in infrastructure deployment	CAPEX in network and service infrastructure deployment in Europe	CAPEX in network and service infrastructure deployment in Europe	CAPEX in network and service infrastructure deployment in Europe
	Deployment of 5G	Number of 5G subscription in Europe, Share of global 5G subscription. number of km served across main transport paths	Number of 5G subscription in Europe, Share of global 5G subscription. number of km served across main transport paths	Number of 5G subscription in Europe, Share of global 5G subscription. and number of km served across main transport paths
	Harmonization of regulations on spectrum	Share of 5G spectrum assigned new spectrum identified for 6G	Share of 5G spectrum assigned, new spectrum identified for 6G	Share of 5G spectrum assigned new spectrum identified for 6G

Impact Dimension		Short-term (typically as of year 1+)	Medium-term (typically as of year 3+)	Long-term (typically as of year 5+)
	Burden of spectrum allocation	Delay between identification of new spectrum and assignment of spectrum in Europe	Delay between identification of new spectrum and assignment of spectrum in Europe	Delay between identification of new spectrum and assignment of spectrum in Europe
Societal impact	Employment	New curricula in the field of smart networks and services	New curricula in the field of smart networks and services	New curricula in the field of smart networks and services
	Skills	Take up of digital skills and tools in EU Industries	Take up of digital skills and tools in EU Industries	Take up of digital skills and tools in EU Industries
	Ethics and privacy regulations	Set-up of regulations and legislations regarding ethics, security and privacy in the field of SNS	Set-up of regulations and legislations regarding ethics, security and privacy in the field of SNS	Set-up of regulations and legislations regarding ethics, security and privacy in the field of SNS
	Equal Access	Share of the EU population with access to 5G;	Share of the EU population with access to 5G	Share of the EU population with access to 5G
	Environmental Impact	Energy consumption of telecommunication networks, integrated smart connectivity platforms, including service and IoT component	Energy consumption of telecommunication networks, integrated smart connectivity platforms, including service and IoT component	Energy consumption of telecommunication networks, integrated smart connectivity platforms, including service and IoT component
	Environmental Impact	Lifecycle impact of connected devices	Lifecycle impact of connected devices	Lifecycle impact of connected devices

7.2.3. Evaluation framework

The evaluation of the Partnership will be done in full accordance with the provisions laid out in Horizon Europe Regulation Article 47 and Annex III, with external interim and ex-post evaluations feeding into the overall Horizon Europe evaluations. As set in the criteria for European Partnerships, the evaluations will include an assessment of the most effective policy intervention mode for any future action; and the positioning of any possible renewal of the Partnership in the overall European Partnerships landscape and its policy priorities. In the absence of renewal, appropriate measures will be developed to ensure phasing-out of Framework Programme funding according to conditions and timeline agreed with the legally committed partners ex-ante.

Decide number: PLAN/2019/5390

2. ORGANISATION AND TIMING

Institutionalised partnerships are foreseen in Articles 185 and 187 of the Treaty on the Functioning of the European Union (TFEU). The preliminary agreement on Horizon Europe contained a list of possible areas for institutionalised partnerships based on Article 185 and 187. For each of these areas the Commission considered 12 potential institutionalised partnerships. Their set up involves new EU legislation and the establishment of dedicated implementing structures and therefore an impact assessment for each of these initiatives.

Following political validation in June 2019, the impact assessment process started with the publication of inception impact assessments for each initiative in August 2019.

An inter-service steering group (ISSG) on research and innovation partnerships under Horizon Europe was set up in May 2019 and held 4 meetings before submission of the Staff Working Document to the Regulatory Scrutiny Board (7 May 2019, 19 June 2019, 5 December 2019, 20 January 2020). The ISSG consisted of representatives of the Secretariat-General, Directorate-General for Budget, Directorate-General for Research and Innovation Directorate-General for Communications Networks, Content and Technology, Directorate-General for Mobility and Transport, Directorate-General for Internal Market, Industry, Entrepreneurship and SMEs, Directorate-General for Energy, Directorate-General for Environment, Directorate-General for Climate Action, and the Legal Service.

An online public stakeholder consultation was launched between September and November 2019, gathering 1635 replies for all 12 initiatives.

3. CONSULTATION OF THE RSB

Two upstream meetings with the Regulatory Scrutiny Board of were held on 10 July 2019 and 30 September 2019.

In accordance with the feedback received from the Regulatory Scrutiny Board on 15 May 2020 the Staff Working Document has been revised as presented in Figure 1. The impact assessment was endorsed by the Inter Service Steering Group on 20 January 2020.

4. EVIDENCE, SOURCES AND QUALITY

To ensure a high level of coherence and comparability of analysis for all candidate initiatives, an external study was procured to feed into the impact assessments of the 12 candidate

institutionalised partnerships ¹ (Technopolis Group, 2020). It consisted of an horizontal analysis and individual thematic analyses for each of the initiatives under review.

For all initiatives, the evidence used includes desk research partly covering the main impacts and lessons learned from previous partnerships. A range of quantitative and qualitative data sources complement the evidence base, including evaluations; foresight studies; statistical analyses of Framework Programmes application and participation data and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships’ outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options. Public consultations (open and targeted) supported the comparative assessment of the policy options. For each initiative up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition the analysis was informed by the results of the Open Public Consultation (Sep – Nov 2019), the consultation of the Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of candidate Institutionalised European Partnerships.

A more detailed description of the methodology and evidence base used, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

Figure 1 Modifications to the draft Staff Working Document based on comments received from the Regulatory Scrutiny Board

Comments from the Regulatory Scrutiny Board	Actions taken for the Staff Working Document
(1) The report should put greater focus on assessing and justifying the (change of) partnership choice. It should clarify to what extent the problems addressed by this initiative have developed or differ from those that the current 5G-PPP addresses.	The document has been rewritten to highlight the partnership choice pointing out the limitations of the previous one. It also further clarifies the extension of scope, the new technology challenges, the need to address policy objectives beyond industrial competitiveness such as technological sovereignty, critical role of suppliers, green deal objectives, and deployment programmes. Alongside a number of substantial improvements, Box 3, page 26-27, has been redrafted to clarify the needs for change of partnership.
(2) The report should clarify the intervention logic and the mechanisms through which the partnership would deliver on its objectives (including the environmental and social objectives). It should elaborate on what can	Section 4.3 on intervention logic of the initiative has been rewritten (pages 40 and 41) underlining the sovereignty aspects, the necessary extension of the set of stakeholders, the activities related to deployment, public

¹ Technopolis Group, 2020, forthcoming.

<p>realistically be achieved via the partnership and to what extent it will need to be complemented by other policy initiatives (regulatory, financial, public and private investments and investments by Member States). The report should clearly outline the roles of the key public and private actors. The report should explain to what extent the initiative intends to integrate the deployment of networks.</p>	<p>policy objectives, what it will deliver and how. The report has been improved to clarify the roles of the key public and private sectors notably in 4.4.1 and 4.4.2</p>
<p>(3) The report should clarify the scoring system applied when assessing the options and explain the relative importance of the different criteria. It should remove the discrepancies between the text and the tables and correct any inconsistencies in terms of expected impacts. On this basis, the report should better describe the main differences in impact between a co-programmed partnership and a partnership under Article 187 TFEU, and how significant they are. The report should be clearer on the added value of changing from the current co-programmed partnership to an institutionalized partnership.</p>	<p>The scoring system has been clarified and a few inconsistencies corrected (Tables 5, 6 and 10). Section 6 on how the different policy options compare has been extensively rewritten to highlight the main differences of impacts between a co-programmed and an institutionalised partnership, notably on Scientific impacts, social impact, efficiency and coherence. A summary assessment has been added on page 68 underlining the added value of an institutionalised partnership compared to the current model.</p>
<p>(4) The report should explain better how the preferred partnership option would motivate large companies to join, even if this could limit benefiting from size advantages of network industries and opportunities to earn a dominant market position. It should show in more detail how the partnership facilitates a strong prior commitment to public investment.</p>	<p>The report has been revised to better explain how the preferred option will motivate the industry through strategic roadmaps and long-term investment certainty and will also motivate the Member States through formal and close participation as part of the governance structure. These points are now inter alia described on page 68 of the report.</p>
<p>(5) The report should integrate stakeholders' views throughout the assessment. In particular, it should elaborate on stakeholders' positions on the different options and to what extent the preferred partnership form is expected to attract their participation.</p>	<p>In the draft report submitted to the Board, the views of different stakeholders had been reflected in part II, Annex 2 and in part II, Annex 6.4. The main stakeholder views have now been integrated in part I. Details of the results of the Open Public Consultation have been explained beyond the raw statistics, showing the motivation and openness of the stakeholders vis-à-vis the preferred option. These aspects are now presented on page 66 of the IA and in more detail in Annex 2.</p>

Annex 2 Stakeholder Consultation

1. OVERVIEW FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1.1. Introduction

In line with the Better Regulation Guidelines,² the stakeholders were widely consulted as part of the impact assessment process of the 12 candidates for institutionalised partnerships, including national authorities, the EU research community, industry, EU institutions and bodies, and others. These inputs were collected through different channels:

- A feedback phase on the inception impact assessments of the candidate initiatives in August 2019, gathering 350 replies for all 12 initiatives on the “Have your say” web portal during a period of 3 weeks;
- A structured consultation of Member States performed by the EC services over 2019 through the Shadow Strategic Configuration of the Programme Committee of Horizon Europe (in line with the Article 4a of the Specific Programme of Horizon Europe). This resulted in 44 possible candidates for European Partnerships identified as part of the first draft Orientations Document towards the Strategic Plan for Horizon Europe (2021-2024), taking into account the areas for possible institutionalised partnerships defined in the Regulation.
- An online public stakeholder consultation administered by the EC, based on a structured questionnaire, open between September and November 2019, gathering 1635 replies for all 12 initiatives;
- A targeted consultation run by the external study contractors with a total of 608 interviews performed as part of the thematic studies by the different study teams between August 2019 and January 2020.

1.2. Horizontal results of the Open Public Consultation

The consultation was open to everyone via the EU Survey online system.³ The survey contained two main parts to collect views on general issues related to European partnerships (in Part 1) and specific responses related to one or more of the 12 candidate initiatives (as selected by a participant). The survey was open from 11 September till 12 November 2019. The consultation was available in English, German and French and advertised widely through the European Commission’s online channels as well as via various stakeholder organisations.

1.2.1. Profile of respondents

In total, 1635 respondents filled in the questionnaire of the open public consultation. Among them, 272 respondents (16.64%) were identified to have responded to the consultation as part of a campaign (coordinated responses). Based on the Better Regulation Guidelines, the groups of respondents where at least 10 respondents provided coordinated answers were labelled as ‘campaigns’, segregated and analysed separately and from other responses. In total 11 campaigns were identified, the largest of them includes 57 respondents⁴. In addition, 162 respondents in the

³ <https://ec.europa.eu/eusurvey/runner/ConsultationPartnershipsHorizonEurope>

⁴⁴ The candidate Institutionalised Partnership Clean Hydrogen has the highest number of campaigns, namely 5. A few initiatives, such as Innovative SMEs, Smart Networks and Systems, were not targeted by campaigns. Some campaign respondents decided to provide opinions about several partnerships.

consultation also display similarities in responses but in groups smaller than 10 respondents. Hence, these respondents were not labelled as campaigns and therefore were not excluded from the general analysis.

Table 1: Country of origin of respondents (N=1635)

Country	Number of respondents	Percentage of respondents
Germany	254	15.54%
Italy	221	13.52%
France	175	10.70%
Spain	173	10.58%
Belgium	140	8.56%
The Netherlands	86	5.26%
Austria; United Kingdom	61	3.73%
Finland	49	3.00%
Sweden	48	2.94%
Poland	45	2.75%
Portugal	32	1.96%
Switzerland	28	1.71%
Czechia	24	1.47%
Greece	23	1.41%
Norway; Romania	22	1.35%
Denmark	20	1.22%
Turkey	19	1.16%
Hungary	14	0.86%
Ireland	12	0.73%
United States	11	0.67%
Estonia; Slovakia; Slovenia	10	0.61%
Bulgaria; Latvia	9	0.55%
Bosnia and Herzegovina	7	0.43%
Lithuania	4	0.24%
Canada; Croatia; Israel	3	0.18%
China; Ghana; Iceland; Japan; Luxembourg; Morocco	2	0.12%
Bhutan; Botswana; Cyprus; Iran; Malta; Mexico; Moldova; Mongolia; Palestine; Russia; Serbia; South Africa; Tunisia; Ukraine; Uruguay	1	0.06%

As shown in Figure 2, the three biggest **categories of respondents** are representatives of companies and business organisations (522 respondents or 31.9%), academic and research institutions (486 respondents or 29.7%) and EU citizens (283 respondents or 17.3%). Among the group of respondents that are part of campaigns, most respondents are provided by the same groups of stakeholders, namely company and business organisations (121 respondents or 44.5%), academic and research institutions (54 respondents or 19.8%) and EU citizens (42 respondents or 15.4%).

Figure 2 Type of respondents (N=1635) - For all candidate initiatives

Among all consultation respondents, 1303 (79.69%) have been **involved in the on-going research and innovation framework programme** Horizon 2020 or the preceding Framework Programme 7, while 332 respondents (20.31%) were not. In the group of campaign respondents, the share of those who were involved in these programmes is higher (245 respondents out of 272 or 90.07%) than in the group of non-campaign respondents (1058 out of 1363 or 77.62%). When respondents that participated in the Horizon 2020 or in the preceding Framework Programme 7 were asked to indicate in which capacity they were involved in these programmes, the majority stated they were a beneficiary (1033 respondents) or applicant (852 respondents). The main stakeholder categories, e.g. companies/business organisation, academic/research institutions, etc., show a similar distribution across the capacities in which they ‘have been involved in Horizon 2020 or in the Framework Programme 7’ as the overall population of consultation respondents.

Among those who have been involved in Horizon 2020 or the preceding Framework Programme 7, 1035 respondents (79.43%) are/were **involved in a partnership**. The share of respondents from campaigns that are/were involved in a partnership is higher than for non-campaign respondents, 89.80% versus 77.03% respectively. The list of partnerships under Horizon 2020 or its predecessor Framework Programme 7 together with the numbers, percentages of participants is presented in Table 4, the table also show the key stakeholder categories for each partnership. Most consultation respondents participated in the following partnerships: Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, Clean Sky 2 Joint Undertaking, European Metrology Programme for Innovation and Research (EMPIR) and in Bio-Based Industries Joint Undertaking. The comparison between the non-campaign and campaign groups of respondents shows that the overall distribution is quite similar. However, there are some differences. For the campaign group almost a half of respondents is/was involved in the Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking, a higher share of campaign respondents is/was participating in Clean Sky 2 Joint Undertaking and in Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking.

When respondents were asked in which **role(s) they participate(d) in a partnership(s)**, over 40% indicated that they act(ed) as partner/member/beneficiary in a partnership. The second largest group of respondents stated that they applied for funding under a partnership. The roles selected by non-campaign and campaign respondents are similar.

Table 4: Partnerships in which consultation respondents participated (N=1035)

Name of the partnership	Number and % of respondents from both groups (n=1035)	Number and % of respondents from a non-campaign group (n=815)	Academic/research institutions	Business associations	Company/business	Company/business	EU citizens	NGOs	Public authority
Fuel Cells and Hydrogen 2 (FCH2) Joint Undertaking	354 (33.33%)	247 (30.31%)	97	9	37	43	41	8	5
Clean Sky 2 Joint Undertaking	195 (18.84%)	145 (17.79%)	57	2	10	27	37	1	7
European Metrology Programme for Innovation and Research (EMPIR)	150 (14.49%)	124 (15.21%)	64	0	13	9	14	2	19
Bio-Based Industries Joint Undertaking	142 (13.72%)	122 (14.97%)	39	8	20	27	14	1	6
Shift2Rail Joint Undertaking	124 (11.98%)	101 (12.40%)	31	7	5	31	14	3	7
Electronic Components and Systems for European Leadership (ECSEL) Joint Undertaking	111 (10.72%)	88 (10.80%)	42	2	7	20	12	0	5
Single European Sky Air Traffic Management Research (SESAR) Joint Undertaking	66 (6.38%)	46 (5.64%)	10	3	3	20	3	2	3
5G (5G-PPP)	53 (5.12%)	47 (5.77%)	20	1	6	14	5	0	1
Eurostrars-2 (supporting research-performing small and medium-sized enterprises)	44 (4.25%)	40 (4.91%)	17	0	6	1	7	0	6
Innovative Medicines Initiative 2 (IMI2) Joint Undertaking	37 (3.57%)	35 (4.29%)	18	2	3	3	2	4	3
Partnership for Research and Innovation in the Mediterranean Area (PRIMA)	28 (2.71%)	26 (3.19%)	15	0	3	1	2	0	2

European High-	22 (2.13%)	18 (2.21%)	6	0	2	3	5	0	2

Name of the partnership	Number and % of respondents from both groups (n=1035)	Number and % of respondents from a non-campaign group (n=815)	Academic/research institutions	Business associations	Company/business	Company/business	EU citizens	NGOs	Public authority
Performance Computing Undertaking (EuroHPC)									

For the remaining of the consultation respondents could provide their views on each/several of the candidate initiatives. The majority of respondents (31.4%) provided their views on the Clean Hydrogen candidate partnership. More than 45% of respondents from the campaigns selected this partnership. Around 15% provided their views for European Metrology, Clean Aviation and Circular Bio-based Europe. The share of respondents in the campaign group that chose to provide views on the Clean Aviation candidate partnership is of 20%. The smallest number of respondents provided opinions on the candidate initiative ‘EU-Africa research partnership on health security to tackle infectious diseases – Global Health’.

Table 5: Candidate Institutionalised Partnerships for which consultation respondents provide responses (N=1613)

Name of the candidate Institutionalised European partnership	Number and % of respondents from both groups (n=1613)	Number and % of respondents from a non-campaign group (n=1341)
Clean Hydrogen	506 (31.37%)	382 (28.49%)
European Metrology	265 (16.43%)	225 (16.78%)
Clean Aviation	246 (15.25%)	191 (14.24%)
Circular bio-based Europe	242 (15%)	215 (16.03%)
Transforming Europe’s rail system	184 (11.41%)	151 (11.26%)
Key Digital Technologies	182 (11.28%)	162 (12.08%)
Innovative SMEs	111 (6.88%)	110 (8.20%)
Innovative Health Initiative	110 (6.82%)	108 (8.05%)
Smart Networks and Services	109 (6.76%)	107 (7.98%)
Safe and Automated Road Transport	108 (6.70%)	102 (7.61%)
Integrated Air Traffic Management	93 (5.77%)	66 (4.92%)
EU-Africa research partnership on health security to tackle infectious diseases – Global Health	49 (3.04%)	47 (3.50%)

1.2.2. Characteristics of future candidate European Partnerships

Respondents were asked to assess what areas, objectives, aspects need to be in the **focus of the future European Partnerships** under Horizon Europe and to what extent. According to Figure 6, a great number of respondents consider that a significant contribution by the future European Partnerships is ‘fully needed’ to achieve climate-related goals, to the development and effective

deployment of technology and to EU global competitiveness in specific sectors/domains. Overall, respondents' views reflect that many aspects require attention of the Partnerships. The least attention should be paid to responding towards priorities of national, regional R&D strategies, including smart specialisation strategies, according to respondents.

Overall, only minor differences can be found between the main stakeholder categories. Academic/research institutions value the responsiveness towards EU policy objectives and focus on development and effective deployment of technology a little less than other respondents. Business associations, however, find that the future European Partnerships under Horizon Europe should focus a little bit more on the development and effective deployment of technology than other respondents. Furthermore, business associations, large companies as well as SMEs value the role of the future European Partnerships for significant contributions to EU global competitiveness in specific sectors domains a little higher than other respondents. Finally, both NGOs and Public authorities put a little more emphasis on the role of the future European Partnerships for significant contributions to achieving the UN SDGs. The views of citizens (249, or 18.3%) do not reflect significant differences with other types of respondents. However, respondents that are/were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7 assign a higher importance of the future European Partnerships to be more responsive towards EU policy objectives and to make a significant contribution to achieving the UN's Sustainable Development Goals.

A qualitative analysis of the "other" answers highlights the importance of collaboration and integration of relevant stakeholders to tackle main societal challenges and to contribute to policy goals against which fragmentation of funding and research efforts across Europe should be avoided. Additionally, several respondents suggested that faster development and testing of technologies, acceleration of industrial innovation projects, science transfer and market uptake are needed. Next to that, many respondents provided answers related to the hydrogen and the energy transition, which corresponds to the high number of respondents that provided answers to the candidate initiative on this topic.

Figure 6: To what extent do you think that the future European Partnerships under Horizon Europe need to (N=1363) (non-campaign replies) For all candidate initiatives

1.2.3. Main advantages and disadvantages of Institutionalised European Partnerships

An open question asked to outline the main advantages and disadvantages of participation in an Institutionalised European Partnership (as a partner) under Horizon Europe (1551 respondents). The advantages mentioned focus on the development of technology, overall collaboration between industry and research institutions, and the long-term commitment. Disadvantages mentioned are mainly administrative burdens. An overview is provided below.

Advantages mentioned: Long term commitment, stability, and visibility in financial, legal, and strategic terms; Participation of wide range of relevant stakeholders in an ecosystem (large/small business, academics, researchers, experts, etc.); Complementarity with other (policy) initiatives at all levels EU, national, regional; Efficient and effective coordination and management; High leverage of (public) funds; Some innovative field require high levels of international coordination/standardisation (at EU/global level); Ability to scale up technology (in terms of TRL) through collaboration; Networking between members; Direct communication with EU and national authorities

Disadvantages mentioned: Slow processes; System complexity; Continuous openness to new players should be better supported as new participants often bring in new ideas/technologies that are important for innovation; Lower funding percentage compared to regular Horizon Europe projects; Cash contributions; Administrative burdens; Potential for IPR constraints.

1.2.4. Relevance of EU level to address problems in Partnerships' areas

Respondents were asked to rate the **relevance of research and innovation efforts at EU level efforts to address specific problems in the area of partnerships**. Research and innovation related problems were rated as most relevant across all candidate initiatives, followed by

structural and resources problems and problems in the uptake of innovations. Overall, all three areas were deemed (very) relevant across the partnerships, as more than 80% of respondents found these challenges (very) relevant. Only minor differences were found between stakeholder categories. Research and innovation problems were found slightly more relevant by academic/research institutions, yet slightly less relevant by large companies and SMEs. Structural and resource problems were indicated as slightly more relevant by NGOs, but slightly less by academic/research institutions. While both NGOs and public authorities find slightly more relevant to address problems in uptake of innovation than other respondents. The views of citizens are not differing significantly. Respondents that are/were directly involved in a current/preceding partnership find, however, the need to address problems related to the uptake of innovations slightly more relevant than other respondents.

Figure 9: To what extent do you think this is relevant for research and innovation efforts at EU level to address the following problems in relation to the candidate partnership in question? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.5. Horizon Europe mode of intervention to address problems

Respondents were asked to indicate how these challenges could be addressed through **Horizon Europe intervention**. Just over 50% of all respondents indicated that institutionalised partnerships were the best fitting intervention, with relatively strong differences between stakeholder categories. The use of Institutionalised Partnership was indicated more by business associations and large companies, but less by academic/research institutions and SMEs. While academic/research institutions valued traditional calls more often, this was not the case for business associations, large companies and public authorities. Public authorities indicated a co-programmed intervention more often than other respondents. Citizens indicated slightly less often that institutionalised partnerships were the best fitting intervention. Respondents that are/were directly involved in a current/preceding partnership, selected the institutionalised partnership intervention in far higher numbers (nearly 70%).

Figure 10: In your view, how should the specific challenges described above be addressed through Horizon Europe intervention? (non-campaign replies) For all candidate initiatives

When asked to reflect on their answers, respondents that pointed to the need for using institutionalised partnership mentioned the long-term commitment of collaboration, a common and ambitious R&I strategy as well as the overall collaboration between industry and research institutions. Others shared positive experiences with other modes of interventions:

- Traditional calls, because of their flexibility and integration of a wide range of actors, as long as the evaluation panels do not deviate from the policy premier. This was mentioned by 94 participants, including companies (25), academics (26) and EU citizens (25).
- Co-funded partnership, as a mechanism to ensure that all participants take the effort seriously, while allowing business partnerships to develop. This approach was deemed suitable based on previous experiences with ERANETs. This was raised by 84 participants, 36 of them academic respondents, 18 companies and 16 EU citizens.
- Co-programmed partnerships, to tackle the need to promote and engage more intensively with the private sector. This was mentioned by 97 participants, most of them companies (34), followed by academics (22), business associations (15) and EU citizens (11).

1.2.6. Relevance of a set of elements and activities to ensure that the proposed European Partnership would meet its objectives

Setting joint long-term agendas

Respondents were asked how relevant it is for the proposed European Partnerships to meet their objectives to have a strong involvement of specific stakeholder groups in setting joint long-term agenda. All respondents see stakeholders from industry as the most relevant, followed by academia and governments. The involvement of foundations and NGOs as well as other societal stakeholders were, however, still found to be (very) relevant by more than 50% of the respondents. Most respondents indicated the stakeholder group they belong to themselves or that represent them as relevant to involve.

Figure 11: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives - Setting joint long-term agenda with strong involvement of: (non-campaign replies) For all candidate initiatives

Pooling and leveraging resources through coordination, alignment and integration with stakeholders

Respondents were asked how relevant it is for the proposed European Partnership to meet its objectives to pool and leverage resources (financial, infrastructure, in-kind expertise, etc.)

through coordination, alignment and integration with specific groups of stakeholders. Respondents see stakeholders from industry as the most relevant, followed by academia and governments (Member States and Associated Countries). The involvement of foundations and NGOs as well as other societal stakeholders are also still found to be (very) relevant for more than 50% of the respondents. Similarly as described for the question on setting joint long-term agendas, most stakeholder categories valued their own involvement higher than other respondents – although also here differences between stakeholder categories were minor.

Figure 12: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Pooling and leveraging resources (financial, infrastructure, in-kind expertise, etc.) through coordination, alignment and integration with: (non-campaign replies) For all candidate initiatives

Composition of the partnerships

Regarding the composition of the partnership most respondents indicated that for the proposed European Partnership to meet its objectives the composition of partners needs to be flexible over time and that a broad range of partners, including across disciplines and sectors, should be involved (see Figure 13). When comparing stakeholder groups only minor differences were found. Academic/research institutions and public authorities found the involvement of a broad range of partners and flexibility in the composition of partners over time slightly more relevant than other respondents, while large companies found both less relevant. SMEs mainly found the flexibility in the composition of partners over time less relevant than other respondents, while no significant differences were found regarding the involvement of a broad range of partners. Citizens provided a similar response to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, indicated a slightly lower relevance of the involvement of a broad range of partners and flexibility in the composition of partners over time.

Figure 13: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Partnership composition (non-campaign replies) Aggregation of responses of all candidate initiatives

Implementation of activities

Most respondents indicated that implementing activities like a joint R&I programme, collaborative R&I projects, deployment and piloting activities, providing input to regulatory aspects and the co-creation of solutions with end-users are all (very) relevant for the partnerships to be able to meet its objectives. Minor differences were found between the main stakeholder categories, the differences found were in line with their profile. As such, academic/research institutions found joint R&I programme & collaborative R&I projects slightly more relevant and deployment and piloting activities, input to regulatory aspects and co-creation with end-users slightly less relevant than other respondents. For SMEs an opposite pattern is shown. Large companies, however, also found collaborative R&I projects slightly more relevant than other respondents, as well as input to regulatory aspects. The views of citizens are similar to non-citizens. Respondents that are/were directly involved in a current/preceding partnership, when compared to respondents not involved in a current/preceding partnership, show a slightly higher relevance across all activities.

Figure 14: In your view, how relevant are the following elements and activities to ensure that the proposed European Partnership would meet its objectives – Implementing the following activities (non-campaign replies) For all candidate initiatives

1.2.7. Relevance of setting up a legal structure (funding body) for the candidate European Partnerships to achieve improvements

Respondents were asked to reflect on the relevance of setting up a legal structure (funding body) for achieving a set of improvements, as shown in the Figure below. In general, 70%-80% of respondents find a legal structure (very) relevant for these activities. It was found most relevant

for implementing activities in a more effective way and least relevant for ensuring a better link to practitioners on the ground, however differences are small.

Figure 15: In your view, how relevant is to set up a specific legal structure (funding body) for the candidate European Partnership to achieve the following? (non-campaign replies) Aggregation of responses of all candidate initiatives

When comparing stakeholder categories there are only minor differences. Academic/research institutions indicated a slightly lower relevance for transparency, better links to regulators as well as obtaining the buy-in and long-term commitment of other partners. SMEs also indicated a lower relevance regarding obtaining the buy-in and long-term commitment of other partners. Large companies showed a slightly higher relevance for implementing activities effectively, ensure better links to regulators, obtaining the buy-in and long-term commitment of other partners, synergies with other EU/MS programmes and collaboration with other EU partnerships. NGOs find it slightly more relevant to implement activities faster for sudden market or policy needs. Public authorities, however, find it slightly less relevant to facilitate collaboration with other European Partnerships than other respondents. The views of citizens show a slightly lower relevance for a legal structure in relation to implementing activities in an effective way. Respondents that are/were directly involved in a current/preceding partnership indicated a higher relevance across all elements presented.

1.2.8. Scope and coverage of the candidate European Partnerships based on their inception impact assessments

Consulted on the scope and coverage for the partnerships, based on their inception impact assessments, the large majority feels like the scope and coverage initially proposed in the inception impact assessments is correct. However, about 11% to 15% of the respondents indicated the scope and coverage to be too narrow. About 11%-17% of respondents answered

“Don’t know”. Overall, differences between the main stakeholder categories were found to be minor. Academic/research institutions indicated slightly more often that the research area was “too narrow” than other respondents. SMEs on the other hand indicated slightly more often that the research area and the geographical coverage were “too broad”. NGOs and public authorities, however, found the geographical coverage slightly more often “too narrow”. Large companies found the range of activities slightly more often “too broad” and the sectoral focus slightly more often “too narrow” when compared to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership more often indicated that the candidate institutionalised European Partnership have the “right scope & coverage”.

Figure 16: What is your view on the scope and coverage proposed for this candidate institutionalised European Partnership, based on its inception impact assessment? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.2.9. Scope for rationalisation and alignment of candidate European Partnerships with other initiatives

When asked whether it would be possible to rationalise a specific candidate European Institutionalised Partnership and its activities, and/or to better link with other comparable initiatives, nearly two thirds of respondents answered “Yes” (1000, or 62%), while over one third answered “No” (609, or 39%). Nearly no differences were found between stakeholder categories, only large companies and SMEs indicated slightly more often “Yes” in comparison to other respondents. The views of citizens are the same as for other respondents. Respondents that are/were directly involved in a current/preceding partnership, indicated “No” more often, the balance is about 50/50 between “Yes” and “No” for this group.

1.2.10. Relevance of European Partnerships to deliver targeted scientific, economic/technological and societal impacts

Finally, respondents were asked to rate the relevance of partnership specific impacts in three main areas: Societal; Economic/technological; and Scientific impacts. All three areas were deemed (very) relevant across the candidate partnerships. Scientific impact was indicated as the most relevant impact, more than 90% of respondents indicated that this as (very) relevant. Only minor difference between stakeholder groups were found. Academic/research institutions found scientific impacts slightly more relevant, while large companies found economic and

technological impacts slightly more relevant than other respondents. NGOs found societal impact slightly more relevant, while SMEs found this slightly less important. Citizens did not have a significantly different view when compared to other respondents. Respondents that are/were directly involved in a current/preceding partnership find all impacts slightly more relevant than other respondents.

Figure 17: In your view, how relevant is it for the candidate European Institutionalised Partnership to deliver on the following impacts? (non-campaign replies) Aggregation of responses of all candidate initiatives

1.3. Stakeholder consultation results for this specific initiative

The consultation strategy aimed to involve potential members of the partnership, currently involved in the 5G Public-Private Partnership (PPP) or in the other domains, together with a broad range of interested stakeholders from the European ICT sector and vertical industries. New actors from complementary technological domains such as artificial intelligence (AI), components and devices, and from vertical sectors, energy, health and transport that were not yet involved were involved as well.

The main stakeholders are the European Technology Platform Network2020 with more than 1000 members, covering a vast research constituency of academics and industry actors active in the field of telecommunications: network vendors and operators, SMEs, researchers from universities and research centres. A further extension to stakeholders from IoT and cloud has been established to reflect the convergence of these areas of research: the 5G Infrastructure Association (5G-IA) with more than 55 organisations, which comprises the major players of 5G research leading the 5G-PPP R&I, and the Alliance for Internet of Things Innovation (AIOTI), working on the deployment of Internet of Things (IoT) and its applications in Europe and on the development of a future vision for Horizon Europe.

A list of profiles that have been consulted either directly, or through consultation efforts such as an open public consultation, covers the following type of stakeholders:

- The **research community** across the EU, which includes academic/research institutions such as universities, public government-funded organisations, independent organisations or private research centres.
- The **industrial community**, which includes large companies, SMEs and start-ups, network operators and manufacturers.
- **Business oriented stakeholders.**
- **Public authorities**, which includes ministries, utility companies and national bodies for research.
- **Non-governmental organisations** (NGOs), including non-profit advocacy organisations and scientific medical societies.
- **EU citizens** responding on their own behalf.
- **‘Other’ stakeholders**, which includes multi-utility companies, independent authorities and platforms (interest representatives).

1.3.1. Feedback to the inception impact assessment on candidate initiatives for Institutionalised Partnerships

The inception impact assessment⁵ of the initiative was published for feedback from 30 July 2019 to 27 August 2019, with the aim to seek initial feedback. Eight feedback reactions were received, notably from industry associations dealing with 5G and IoT, such as for example the 5G Infrastructure Organisation (5G IA) the Alliance for Internet of Things Innovation (AIOTI). There was also a feedback reaction from the German government and from citizens.

⁵ Available at https://ec.europa.eu/info/law/better-regulation/initiatives/ares-2019-4972300_en

In summary, the reactions showed a strong support for the initiative. The AIOTI association promoted larger inclusion of the IoT dimension which is being taken into account the Partnership proposal. The 5G IA considers that a ‘Co-programmed partnership’ (option 1), including mechanisms to ensure effective communication and coordination with Member States, would be the most suitable instrument to achieve them. Alternatively, the creation of a joint undertaking bringing together the European Commission and private partners without requiring a financial contribution from Member States (option 2a) could also be considered.

1.3.2. Structured consultation of the Member States on European partnerships

The Commission has organised three workshops on the future involvement of Member States in the candidate European Partnerships with industry participation. In parallel, the engagement of Member States was discussed through some bilateral meetings (notably FR, DE) and through the Future Internet Forum. This provided space for Member States to present their ideas and discuss modalities for possible future participation in industry partnerships.

The Future Internet Forum (FIF) consultations - 3 FIF consultation meetings on the proposed SNS partnership took place, followed by a questionnaire on all aspects of the SNS partnership, including R&I. The FIF is a registered group which aims to exchange views on H2020 topics relating to “Future Networks” (5G, cloud, Next-Generation Internet and IoT). The members of this group have been appointed by the respective national authorities of the Member States.

Smart Networks and Services Partnership Members States consultation meeting (Brussels, Belgium) was held on 11 September 2019. Most of the participants considered the two-pillar approach (R&I and deployment) with very ambitious objectives of the proposed partnership to be highly relevant for Europe. They welcomed the idea of developing a body that offers strategic orientation at European level on, among others, support to 5G cross-border corridors. Grouping R&I and deployment in the same partnership was considered very appropriate, as it should facilitate the link between research, testing, validation and deployment. At the same time, several Member States expressed their concerns about the complexity inherent to the implementation of such an approach.

The ‘Digital partnerships workshop’ with Member States (Brussels, Belgium) took place on 28 November 2019 as part of efforts to ensure early involvement of Member States in the preparation of European Partnerships with the industry. All ‘digital-centric’ partnerships were considered of high relevance. For SNS, the added value of closer cooperation with the Member States compared to the current Public Private Partnership (PPP) would be the alignment of R&I agendas with for example the following topics: 6G, terabit connectivity, next generation IoT, cloud computing continuum made possible by high-speed connectivity, standardisation for interoperability. In addition, the partnership would enable structured collaboration on key issues related to 5G deployment, such as cross-border corridors for connected and automated mobility, or regulatory issues.

There was broad agreement that joint cooperation must offer clear added value that goes beyond financial leverage and that other motivators must be included. Cooperation was also perceived as important for scaling up technologies, especially in sectoral applications.

1.3.3. Targeted consultation of stakeholders

For the preparation of the research period after 2020, the first actions of the engagement process were taken by the 5G Infrastructure Association and the Networld2020 European Technology

Platform. They jointly organised workshops on 17 and 29 October 2019, with a large audience, including representatives of key stakeholders in the telecommunications and microelectronics sectors (e.g. Ericsson, Nokia, Infineon, LETI, IMEC, Amazon Edge Computing, ADVA and SMEs). The events included discussions related to the preparation of the planned future partnership, particularly with a focus on the various options for links between partnerships, notably Key Digital Technologies (KDT) and SNS. The workshops have also revealed the accrued importance of relatively new drivers including sustainability and security. To complement the previous initiatives the Commission has organised a series of workshops to gather input from a larger number of interested parties through direct interaction.

Workshops dedicated to the SNS partnership with private sector (Industry, Research and Academia)

Several workshops took place, with a focus on key related areas, such as next generation internet of things, next generation cloud, cybersecurity, components and devices, core smart networks technologies and industrial perspectives.

The 6G Wireless Summit (Levi, Finland) took place on 26 March 2019. The Commission presented the current status of preparation of the partnership, the upcoming steps and the possible timetable towards legislative implementation. Among positive feedback, Nokia has confirmed that they are actively investigating the institutionalised partnership scenario, as well as the co-programmed partnership scenario. The Finnish authorities insisted on the necessity to develop a strong European approach for the deployment of future networks that support the digitisation of the society. They also advocated for a coordinated approach among the Member States, especially with regards to investments.

The European Conferences on Networks and Communications took place in June 2018 (Ljubljana, Slovenia) and June 2019 (Valencia, Spain). The theme for the EuCNC'19 was 'Enabling Smart Connectivity'. The event was thus very useful to gather stakeholders' views on the future of connectivity in the research and innovation domain.

The Smart Networks and Services partnership stakeholder workshop (Brussels, Belgium) with a focus on next generation internet of things (IoT), next generation cloud and cybersecurity. The Commission held the workshop on 4 July 2019, during which participants exchanged their views on challenges associated with the development of future Smart Networks and Services.

The 5G World Forum + SNS Partnership Stakeholder Workshop (Dresden, Germany) took place from 30 September to 2 October 2019. The event gathered industry leaders such as the Huawei CTO, the Nokia CEO for Germany, the Vodafone CTO. The developing ideas for SNS were supported by several speakers: the current trend towards digitisation of industry will continue to be an important driver and push the limits of the KPI's identified for 5G and stimulate collaboration across connectivity, cloud and IoT; the security and energy efficiency are key; societal issues such as climate, sustainable development goals, accessibility are also seen as important design drivers; emerging technologies such as AI, blockchain should be included.

The Panel session 'Partnering for Digital Excellence' at the ICT Proposers Day (Helsinki, Finland) took place on 19 September 2019. The event included a session on the challenges and opportunities offered by future European partnerships. Colin Willcock, Chairman of the 5G-IA, emphasized the necessity and the impact of a European partnership on Smart Networks and

Services, and how such a partnership will boost innovation in vertical industries and public sectors.

The Strategic Deployment Agenda and Stakeholders workshop at Digital Transport Day, (Helsinki, Finland) took place on 7-9 October 2019. The European Commission and key stakeholders discussed 5G deployment for connected and automated mobility. In general, there was agreement that the partnership should contribute to the digital transformation of vertical sectors through deployment of connectivity infrastructure, in parallel to developing the next wave of technologies beyond 5G.

SNS Partnership Stakeholder Vision Workshop, with a focus on core smart networks technologies, 26-27 November 2019 aimed at refining the Strategic Research and Innovation Agenda of the future partnership.

1.3.4. Open Public Consultation

An online public consultation⁶ took place from 11 September 2019 to 12 November 2019, with the aim to seek the views of EU research and innovation stakeholders and citizens on the 12 proposed institutionalised European partnerships under the future Horizon Europe Research and Innovation programme (2021-2027). The consultation was available in English, German and French. It was advertised widely the European Commission's online channels as well as via various stakeholder organisations.

The consultation focused on the overall need for and the planned focus of these potential European partnerships, and had a part with specific questions on the proposed SNS Partnership.

Participants in the consultation

For the Smart Networks and Services Partnership, 107 respondents provided their views. Among them, 21 respondents (20%) are citizens. The group is dominated by respondents from academic and research institutions (34 respondents or 32%), citizens and company/business organisations (29 respondents or 27%).

The majority of respondents (84 or 78%), have been involved in the on-going research and innovation framework programme, while 62 respondents (74%) were directly involved in a partnership under Horizon 2020 or its predecessor Framework Programme 7.

Results on general questions

In order to assess the stakeholders' views on the relevancy of several listed impacts or problems and thus obtain an overall percentage, the 5 ("very relevant") and 4-ratings were combined.

⁶ Available at https://ec.europa.eu/info/law/better-regulation/initiatives/ares-2019-4972300/public-consultation_en

Relevance of efforts of the candidate European Partnership to address problems

At the beginning of the consultation, all 107 of the respondents for this partnership indicated their views of the needs of the future European Partnerships under Horizon Europe. Overall, respondents indicated that many of the options presented were fully needed (score 5) or gave them a score of 4. The needs where most respondents indicated that it was fully needed was related to its contribution to EU global competitiveness in specific sectors and/or domains (68%). Aside from 'other', the needs where the least respondents indicated that improvements were fully needed, was being more responsive towards priorities in national and/or regional R&I strategies (35%) and focusing more on bringing about transformative change towards sustainability in their respective area (36%). However, these options have a large number of respondents who have given the option a 4 out of 5 on the scale. The respondents also had the option to indicate other needs. The results show that respondents have indicated needs around citizen representation and significant healthcare contribution.

Main advantages and disadvantages of participation in the Institutionalised European Partnership

A key-word analysis showed that the respondents viewed collaboration as the main advantage, while also mentioning European leadership and long-term vision.

Results on candidate European Partnership Specific Closed Questions

Relevance of research and innovation efforts at the EU level to address problems in relation to smart networks and services

In the consultation, respondents were asked to provide their view on the relevancy (5-point scale) of research and innovation efforts at EU level to address the following problems:

- Problems in uptake of SNS innovations

With regard to the problems in uptake of SNS innovations, the majority of respondents have picked either a 4 or a 5 on the 5-point relevancy scale. Respondents indicated that insufficient digitalisation (data access and analysis, interoperability) especially for what concerns vertical user sectors is a very relevant problem, with 49 respondents giving this answer (48%). The option that has received the least 5 (very relevant) answers, out of all the problems presented, is regulation in the field of radio spectrum allocation including identification of new innovative spectrum management and sharing technologies (33 respondents or 31%). This lower relevancy could also be related to the higher number of respondents who have indicated that they 'don't know'. 14 respondents have selected this answer (13%), the highest number for any of the options.

Further uptake problems that the initiative would have to address are the 'market fragmentation due to lack of industrial policy favouring harmonised national take up and implementation strategies for new generation of smart connectivity systems', as has been confirmed by 76% of respondents and 'barriers to exploitation due to potential lack of global standards', as confirmed by 76% of respondents. Moreover, efforts are needed to solve 'concerns with use of smart

networks and services platforms for ethical, privacy, security, or EMF reasons”, for 74% of respondents.

- *Structural and resource problems*

The gathered input has also shown that a future initiative on Smart Networks and Services would have to address the ‘limited collaboration and pooling of resources between public actors, private actors i.e. network and internet service providers, connectivity vendors, computing and device actors, vertical industries and users, leading research centres and public authorities’, as has been indicated by a large majority of respondents (88 respondents or 84% indicated this a relevant or very relevant problem to address).

- *Research and innovations problems*

Respondents have indicated that research and innovation problems are considered the most relevant, as both of the problems presented in this category have received more 5 (very relevant) answers than any of the other problems. The innovation gap in the EU in translating the results of connectivity, cloud and Internet of Things devices research into the development of innovative networks and service platforms is considered the most relevant with 72 respondents (69%) indicating it is a very relevant problem.

Type of partnership to be pursued

Respondents were also asked to indicate how the specific SNS challenges could be addressed through Horizon Europe intervention. As shown in the figure below, just over 20% of the respondents indicated that an institutionalised partnership would be the best fitting intervention.

Figure 1 - Assessment of Horizon Europe intervention

The respondents were asked to briefly explain their answers to the question above. A key-word analysis of respondents that selected an institutionalised partnership as the best fitting intervention revealed ‘public private European partnership’, ‘significant results and specific challenges’ as common co-occurring keywords.

Stakeholders favoured the known model of co-programmed partnership due to the successful implementation of the 5G-PPP, which was found to present significant added value compared to traditional calls.

However, the stakeholders are fully open and understand the advantages of the institutionalised model. Even if different stakeholder groups cannot always be properly disaggregated, we found that academics tend slightly to prefer the co-programmed model. The 20% supporting co-funding appears to be a misunderstanding of the instrument since industry is core in the initiative. For the 37% preferring a co-programmed model, it is to be noted that at least 6 organisations in the 5G PPP, representing a large majority of the Industry and the 5G Industry Association, chose “co-programmed” as preferred option with a common line of comments saying “*In our view this Partnership could be implemented equally as an Institutionalised Partnership. The choice between Co-Programmed or Institutionalized Partnership is difficult to make today as the details of how such Programs will be implemented have not been published. In our view the area of SNS*

has the breadth, multiple stakeholders and ambitious goals to justify an Institutionalised Partnership however we also believe that this could be achieved by an extended form of a current cPPP". Another 5 stakeholders had a very similar text and this relativises the significantly the raw statistics and shows good support for an institutionalised approach, provided that its complexity and model for financial contributions are reasonable, which is the condition for them to sign up.

Involvement of actors in setting a joint long-term agenda

Respondents were asked how relevant the involvement of actors is in setting a joint long-term agenda to ensure that the proposed European Partnership would meet its objectives. A high number of respondents (86 respondents or 84%) indicated that a strong involvement of industry is very relevant for setting a joint long-term agenda. In contrast, a low number of respondents (21 respondents or 22%) stated that a strong involvement of foundations and NGOs is very relevant for this purpose.

A slight statistical difference was found between the views of citizens and other respondents. Citizens found a strong involvement of other stakeholders (like Connectivity vendors, Telecom operators, regulators, user groups) in setting a joint long-term agenda slightly more relevant.

Coordination in pooling and leveraging resources

Most respondents also considered that coordination with the industry, academia and Member States and associated countries is very relevant in pooling and leveraging resources. Industry is considered as the most relevant actor for this purpose, based on views of 91 out of 101 respondents (90%). The relevance of academia and Member States, Associated Countries and other stakeholders is also perceived relatively high for pooling and leveraging resources to reach objectives of the Smart Networks and Services Partnership (respectively 72% and 78% indicated their role as relevant or very relevant). Here again, less support could be found for foundations and non-governmental organisations (54%), but also for other societal stakeholders (57%).

Partnership composition

Respondents were asked about the relevance of certain elements of the Partnership composition, such as flexibility in the composition of partners over time and involvement of a broad range of partners, to reach Partnership objectives. A high share of respondents (67%) consider the involvement of a broad range of partners very relevant for meeting objectives of the SNS Partnership. Respondents also highlighted the importance of flexibility in the composition of partners over time (46% of the respondents indicated this as very relevant).

Implementation of activities

Respondents were asked to provide opinions on the relevance of implementation of several activities for meeting objectives of the Partnership. The following activities were listed – joint R&I programme, collaborative R&I projects, deployment and piloting activities, input to regulatory aspects and co-creation of solutions with end-users.

A high number of respondents view that that joint R&I programme (72 respondents or 70%), collaborative R&I projects (80 respondents or 77%), as well as, co-creation of solutions with end-users (104 respondents or 65%) is very relevant for meeting the objectives. In comparison, only 38 respondents out of 103 (37%) consider that the input to regulatory aspects is very relevant for this purpose, and 54 respondents (52%) view that deployment and piloting activities are very relevant for meeting objectives of this partnership.

Activities where a specific legal structure is relevant

Respondents were asked to assess the relevance of a specific legal structure (funding body) for the candidate European Partnership to achieve several objectives. A greater number of respondents indicated that the legal structure would be helpful/relevant to implement activities more effectively (83 respondents gave a score of 4 and 5, or 81%), to ensure harmonization of standards and approaches (82 respondents or 83%). The least number of respondents suggest that the legal structure would assist in ensuring better links to regulators, as only 34 respondents (34%) indicated that it would be very relevant (a score of 5) for this purpose.

Scope and coverage of the partnership

Respondents were asked to assess the scope and coverage of the proposed Partnership, based on its inception impact assessment. The majority of them consider that the Partnership has a right scope and coverage in all aspects. However, among listed areas, a slightly smaller share of respondents (64 respondents or 65%) indicated that the sectoral coverage is right and has an appropriate scope, and (13 respondents or 13%) suggested that the sectoral coverage is too narrow.

Societal impact

With regard to the possible societal impacts, the ‘digital transformation of industries such as health, education, media and transport’ was widely considered to be the most important field of action on which the future partnership should deliver, as has been confirmed by 89% of respondents (93 out 105 respondents indicated this as relevant or very relevant). Furthermore, a large majority of participants considered that the partnership should ‘drastically reduce energy consumption of future smart network and service platform’ (80 respondents or 76%) and deliver on ‘providing consumers faster and smarter mobile communications for consumers’ (77 respondents or 75%).

Economic/ technological impact

Respondents have widely emphasised the importance of ‘developing the digital economy of networks, Internet of Things and cloud computing’ (91 respondents or 88% indicated this as relevant or very relevant), ‘creating new industrial value chains across different sectors such as network equipment and service providers, big data, cloud, software-defined infrastructures and Internet of things technologies and services’ (89 respondents or 86%) and ‘faster, energy efficient and affordable advanced communication systems’ (89%).

Scientific impact

Respondents have widely emphasized the importance of ‘creating synergies between networks, cloud and internet of Things to achieve intelligent connectivity as a basis for the next generation Internet services and applications’ (92 respondents or 89% indicated this as relevant or very relevant), ‘maintaining and reinforcing European world-class research and innovation capabilities in networks and related domains’ (90 respondents or 87%) and ‘developing the scientific knowledge preparing for the 6th Generation of mobile communication networks’ (88 respondents or 85%).

Results on candidate European Partnership Specific Open questions

This part of the questionnaire allowed respondents to personalize their answers.

A future European partnership was generally perceived as a good option to preserve European independence, especially in light of the success of the 5G-PPP. Many have also underlined that they have difficulties choosing between the institutionalised and the co-programmed model, as they find both appropriate.

For some respondents, traditional calls were the preferred option, as they are easy to work with, function well, take into account quick evolving technologies, and ensure better coordination. For others, an institutionalised partnership was the preferred option, as it could reduce complexity, ensure direct involvement of both member states and industrial actors, and thus strategic alignment between European and national authorities as well. Furthermore, it would allow for pulling and deployment of resources in a more coherent way and improve competitiveness. Finally, its inherent stability could justify its adoption, also considering the broad spectrum and wide range of stakeholders of the current initiative. Respondents who viewed the co-programmed partnership as the most suitable model argued that its advantages are its flexibility and speed (quick to set up). Many respondents also wish to extend the current form of CPPP, given the good experience they had with it and create implementation synergies with other domains.

Many respondents agreed with the technical scope and highlighted the need to focus on mobile communications networks but also to include IoT, cloud, edge computing, and devices, AI and smart algorithms in order to enable novel applications. Several stakeholders also stressed the necessity to involve key vertical industries and recommended to take a comprehensive value chain approach. Other (isolated) propositions were to focus on SME’s, or to focus less on connected/automated mobility and smart cities, but rather on fresh food or dangerous goods. With regard to prospective activities, some drew attention to climate change and protection of water resources.

INTERVIEWS REPORT FROM THE IA STUDY

30 stakeholders have been interviewed to support the impact assessment study work, with a large part of the interviewees having experience in EU research program. The objectives of the interviews were to better understand the different perspectives of the stakeholders on the problems to be addressed by the initiative, and to identify the desired objectives and features of a future initiative

The distribution of interviews showed a good balance between academia (23%), the telecom industry (34%), SMEs (17%), industry associations, including verticals, (16%) and representatives from Member States (10%).

Figure 2 - Number of interviews per stakeholder category

Stakeholder category	Number	Share (%)
Academics	7	23%
Telecommunication Equipment / Hardware / Software Providers	8	27%
Telecom Operators	2	7%
Networks, Telecommunications and Digital Services SMEs	5	17%
Other Telecom Representatives (Industry Association, Regulators, Think tanks, etc.)	1	3%
Representatives from Vertical Industries (companies and industrial associations)	4	13%
Representatives from Member States	3	10%
TOTAL	30	100%

The interview outcomes confirm the trends from the other consultation activities, including the strong need for a partnership.

With regard to the preferred form of partnership, the co-programmed partnership was clearly the preferred option. This appears to be linked to the existence of the 5G-PPP, which was successful in a form equivalent to a co-programmed partnership.

- *Option 0: Traditional calls*

Only two interviewees out of the 30 were in favour of traditional calls because of its greater flexibility. For other interviewees – e.g. representatives of vertical industries and representatives of Member States, this **option should be ruled out** because the proposed partnership is required to have an impact on the increasing global competition in the field of SNS. Also, according to the majority of interviewees, this option lacks coordination and engagement capabilities between all stakeholders and thus is not adapted to reach the required objectives.

- *Option 1: Co-programmed partnership*

A co-programmed partnership is **clearly the preferred option among the majority of the interviewees**. This option is especially backed by those already having experience in the 5G-PPP, and comes mainly from the following categories of stakeholders: telecom operators and telecom infrastructure providers. These stakeholders were satisfied with the good achievements of the currently existing 5G-PPP. Although these stakeholders agree on improving the partnership form, they put forward that there is “*no reason to change*” the structure at the “*risk of losing momentum*”. Other categories of stakeholders – e.g. academia and SMEs, are also in favour of a co-programmed partnership but they are **also open to an institutionalized partnership**.

- *Option 2: Institutionalised partnership*

The **second preferred option by interviewees** is an institutionalised partnership. The advantages outlined by stakeholders during the interviews include: the ability to have all relevant players involved including Member States, Commission and the industrial partners, thus maximising cooperation and synergies. It is also seen as a reasonable option if Member States are needed”, for the ability to engage in a long-term contract that is legally binding which would be a strong commitment for the implementation to reach scale and for the ability to reach higher ambition to face the global competition.

For other interviewees, the drawbacks for this option are related to its **organisation structure**, and can be summarized by the following points: doubts on the rules of governance; fear of being an organisation that is too cumbersome; too much overhead and heavy procedures; lack of agility; presence of the Member States that introduces political issues and delays. However, some interviewees would be in favour of an institutionalised partnership option without the Member States.

1.3.5. Conclusion

In summary, the consultation followed the original strategy leading to results that clearly indicates very good support for the SNS Partnership. Stakeholders have recognized the importance of a partnership approach in contributing to Europe's future connectivity infrastructure ecosystem across all value chains.

Overall, the evidence shows that, with a few exceptions, respondents agree on the (research and innovation, structure and resources, uptake of innovations) problems that a future partnership would need to address. Problems that were widely considered as relevant were:

- the innovation gap in the EU in translating the results of connectivity, cloud and Internet of Things devices research
- the limited collaboration and pooling of resources between public/private actors
- the understanding of or knowledge about next generation converged Digital Infrastructures.

The same conclusion can be drawn about the (societal, economic/technological and scientific) impacts where the prospective partnership should deliver on. Furthermore, the present analysis has also shown that respondents are generally satisfied with the proposed scope of the partnership – especially with regard to the range of activities and technologies covered.

On average, respondents were also in agreement about the partnership composition (=broad range of partners, flexibility over time), the joint long-term agenda and the pooling/ leveraging of resources (i.e. to involve industry, academia, Member states and associated countries).

The analysis did however reveal more differences with regard to the preferred type of partnership by stakeholders. The gathered results indicated a preference for either a co-programmed or an institutionalised partnership but many respondents also stressed that they lack clear knowledge of the administrative and legal implications to make a choice between the two partnership models.

Annex 3 Who is affected and how?

PRACTICAL IMPLICATIONS OF THE INITIATIVE

This annex describes the practical implications of the preferred option identified in the Impact Assessment – the establishment of an institutionalised partnership to implement R&I on Smart Networks and Services and to implement the CEF2 initiative related to deployment of 5G networks in Europe, as two complementary activities.

I. Overview of benefits (total for all provisions) – Preferred Option

Member States

The EU Member States will have at disposal an effective mechanism providing them with opportunities to leverage their national investments into SNS at European level, which will also help them to get return from this initiative. They will have an upstream capability to plan ahead the needed national measures to facilitate EU level deployment of technologies.

The initiative will enable Member States to create better synergies together with the Commission for their national investments in necessary SNS research and deployment at the national and European levels. The initiative will allow Member States to plan for pooling expertise as well as resources for tools and infrastructures which would otherwise be more costly or not affordable for individual Member States. Such approach would allow economies of scale and rationalisation. This planning capability is a major benefit of the preferred option, which could not be achieved through traditional Horizon Europe calls (baseline option).

The return from such investments would be also proportionally higher as the Member States would benefit from the access to upgraded capacities and facilities that may not be achieved through national efforts only.

The increased coherence and synergies between different funding mechanisms (Horizon Europe, CEF2) would also reduce the administrative burden of managing different funding programmes, with a positive impact on the efficiency of the EU budget to which Member State contribute.

The preferred option will also have a positive impact on the Member States' capability to deal with the wide range of issues related to downstream regulatory and deployment related issues. The functionalities of the initiative linked to the EU wide comprehensive R&I on SNS, will complement the efforts of the Member States initiatives by providing appropriate input to regulatory and policy makers. At the same time, the access for researchers to cutting-edge projects will help contain the "brain drain" phenomenon and increase the chances of retaining the best talents in the EU and attracting foreign highly skilled professionals.

Businesses

European firms from the networking, the cloud computing and the IoT sectors, alongside the companies active in vertical sectors (e.g. automotive, healthcare, media and energy), will profit the most from the partnership. This comprehensive supplier-user approach will stimulate cross industry synergies and innovative digital use cases, helping them to ensure that supplied technology actually cover the requirements of the user side. This should also help them cut

research and development costs and speed up the development process, which would further reinforce their competitiveness.

The chosen mechanism will ensure coordination between research and industry and therefore direct the research efforts towards concrete industrial needs. The provision of cutting-edge expertise and tools in SNS will indirectly support economic operators in complying with the future Internet regulatory environment.

In addition one of the key functionalities of the initiative is to support the deployment of European 5G leading-edge products and solutions across the market (transport paths).

SMEs

The European SMEs and micro-enterprises operating in the SNS field will experience direct and indirect economic benefits from the initiative as highlighted above. While the set-up of the SNS partnership does not impose regulatory obligations upon them, it will open up opportunities in terms of costs reduction for the design of new products and it will help them gaining easier access to the investors' community and attract the necessary funding to deploy marketable solutions at EU scale. In the case of SMEs and micro-enterprises the access to publically funded testing and experimentation facilities is even more important as they are lacking resources to either purchase or to travel outside their market (and often outside the EU) to find necessary infrastructure. It is also hoped that this initiative would open up new markets for European SMEs and micro-enterprises active in the field of SNS.

Research Community

Research and development organisations throughout the EU, both on the supply and usage side, will enjoy the benefits deriving from better coordination, resource pooling and increased availability of advanced methodologies and tools (such as testing and experimentation facilities). They will be able to achieve the critical mass to carry out projects of common interest with a longer-time, strategic perspective. In addition, the chosen mechanism will ensure coordination between research and industry and therefore direct the research efforts towards concrete industrial needs helping the process of turning the outcomes of the research into applicable and marketable solutions that could be then used by different industries and public authorities. The European dimension will help them to plan in advance for important exploitation such as standardisation spin off of R&I.

The hosting of several programmes under a common "umbrella", possible under traditional Horizon Europe calls, would also allow the research community to experience cross-fertilisation among the different stakeholder groups related to SNS and increase the visibility of the EU excellence in research on the global scene.

Citizens

Stronger European know-how in SNS should result in an overall higher level of societal impact directly beneficial to citizens in the Digital Single Market, e.g. in Internet of Things domains such as smart energy, medical devices, or connected automated vehicles. The initiative should result in an improved provision of products and services which reflect European values and are directly in line with European policies and regulations. Key citizen impacts like energy efficiency and reduction of carbon footprint of networked infrastructures, reduction in EMF radiations, better support of medical or automotive applications will positively impact citizens.

EU institutions, agencies and bodies

The EU institutions, agencies and bodies will benefit both from the outcome of the research and development and the procurement activities of the initiative, and from the access to state-of-the-art methodologies and tools to perform their operations as effectively as possible. Cross links of the initiatives with other domains opens capabilities of synergies with multiple other bodies of EU relevance such as the European Space Agency, the KDT partnership, the cybersecurity partnership. It is also relevant as “one stop EU shop” for policy and regulatory settings such as the RSPG, BEREC, COCOM and the EU for a dealing with digitisation of industry at large.

<i>II. Overview of direct and indirect costs – Preferred option⁷</i>							
		Citizens/Consumers		Businesses		Administrations	
		One-off	Recurrent	One-off	Recurrent	One-off	Recurrent
Management/ Administrative costs	Direct costs				€ 800.000 /year		€ 800.000 /year
	Indirect costs						
Personnel costs	Direct costs				€ 1.2 million /year 50% of 19 FTE		€ 1.2 million /year 50% of 19 FTE
	Indirect costs						
Coordination costs (or transaction costs)							
Budget expenditure/ investment costs							

⁷ Estimation based on the average expenditures of the H2020 Joint Undertaking ECSELand on the estimation from the SNS industry taskforce (“Smart Networks and Services Partnership Proposal” document).

Annex 4 Analytical Methods

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines⁸ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This is complemented by integrating the **conditions and selection criteria for European Partnerships**, as well as requirements for setting up Institutionalised Partnerships.⁹

1. OVERVIEW OF THE METHODOLOGIES EMPLOYED

In terms of **methods and evidence used**, the set of impact assessments for all candidate Institutionalised European Partnerships draw on an external study covering all initiatives in parallel to ensure a high level of coherence and comparability of analysis¹⁰ (Technopolis Group, 2020).

All impact assessment mobilised a mix of qualitative and quantitative data collection and analysis methods. These methods range from desk research and interviews to the analysis of the responses to the Open Consultation, stakeholder analysis and composition/portfolio analysis, bibliometrics/patent analysis and social network analysis, and a cost-effectiveness analysis.

The first step in the impact assessment studies consisted in the definition of the context and the problems that the candidate partnerships are expected to solve in the medium term or long run. The main data source in this respect was desk research. This includes grey and academic literature to identify the main challenges in the scientific and technologic fields and in the economic sectors relevant for the candidate partnerships, as well as the review of official documentations on the policy context for each initiative.

In the assessment of the problems to address, the lessons to be learned from past and ongoing partnerships were taken into account, especially from relevant midterm or ex-post evaluations.

The description of the context of the candidate institutionalised European Partnerships required a good understanding of the corresponding research and innovation systems and their outputs already measured. Data on past and ongoing Horizon 2020 projects, including the ones implemented through Partnerships, served as basis for descriptive statistic of the numbers of projects and their respective levels of funding, the type of organisations participating (e.g. universities, RTOs, large enterprises, SMEs, public administrations, NGOs, etc.) and how the funding was distributed across them. Special attention was given to analysing the participating countries (and groups of countries, such as EU, Associated Countries, EU13 or EU15) and industrial sectors, where relevant. The sectoral analysis required enriching the eCORDA data received from the European Commission services with sector information extracted from ORBIS, using the NACE codification up to level 2. These data enabled the identification of the main and, where possible, emerging actors in the relevant systems, i.e. the organisations, countries and sectors that would need to be involved (further) in a new initiative.

⁸ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

⁹ A pivotal element of the present analysis is the so-called two-step ‘necessity test’ for European Partnerships, used to establish: step 1) the need for a partnership approach in the first place, followed by step 2) a justification for the form of Institutionalised Partnership. The necessity test is described in Annex 6. This impact assessment focuses on the second step of the test.

¹⁰ Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe

A Social Network Analysis was performed by the contractors using the same data. It consisted in mapping the collaboration between the participants in the projects funded under the ongoing R&I partnerships. This analysis revealed which actors – broken down per type of stakeholders or per industrial sector – collaborate the most often together, and those that are therefore the most central to the relevant research and innovation systems.

The data provided finally served a bibliometric analysis run by the contractor aimed at measuring the outputs (patents and scientific publications) of the currently EU-funded research and innovation projects. A complementary analysis of the Scopus data enabled to determine the position and excellence of the European Union on the international scene, and identify who its main competitors are, and whether the European research and innovation is leading, following or lagging behind.

A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options.

The conclusions drawn from the data analysis were confronted to the views of experts and stakeholders collected via three means:

- The comments to the inception impact assessments of the individual candidate institutionalised European Partnerships;
- The open public consultation organised by the European Commission from September to November 2019;
- The interviews (up to 50) conducted by each impact assessment study team conducted between August 2019 and January 2020 (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others).

The views of stakeholders (and experts) were particularly important for determining the basic functionalities (see further below) that the future partnerships need to demonstrate to achieve their objectives as well as their most anticipated scientific, economic and technological, and societal impacts. The interviews allowed more flexibility to ask the respondents to reflect about the different types of European Partnerships. Furthermore, as a method for targeted consultation, it was used to get insights from the actors that both the Study Teams and the European Commission were deemed the most relevant. For the comparative assessment of impacts, the external contractors confronted the outcomes of the different stakeholder consultation exercises to each other with a view of increasing the validity of their conclusions, in line with the principles of triangulation.

Annex 2 includes also the main outcomes of the stakeholder consultation exercises.

2. METHOD FOR ASSESSING THE EFFECTIVENESS, EFFICIENCY AND COHERENCE OF EACH OPTION - THE USE OF FUNCTIONALITIES

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has been adapted to introduce “**key functionalities needed**” – so as to link the intended objectives of the candidate European Partnerships and what would be crucial

to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1 in the main body of the impact assessment). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework (external coherence). This approach guides the identification of discarded options. It also allows for a structured comparison of the options as regards their effectiveness, efficiency and coherence, and also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)¹¹.

Figure 3 Overview of key functionalities of each form of implementation of European Partnerships

Baseline: Horizon Europe calls	Option 1: Co- programmed	Option 2: Co- funded	Option 3.1: Institutionalised Article 185	Option 3.2: Institutionalised Article 187
Type and composition of actors (including openness and roles)				
<u>Partners:</u> N.A., no common set of actors that engage in planning and implementation <u>Priority setting:</u> open to all, part of Horizon Europe Strategic planning <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation, MS in comitology <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules	<u>Partners:</u> core of national funding bodies or govern-mental research organisations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> limited, according to national rules of partner countries	<u>Partners:</u> National funding bodies or governmental research organisation <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations	<u>Partners:</u> Suitable for all types: private and/or public partners, foundations <u>Priority setting:</u> Driven by partners, open stakeholder consultation <u>Participation in R&I activities:</u> fully open in line with standard Horizon Europe rules, but possible derogations

different parts of the Annual Work programme can be ensured by COM <u>External:</u> Limited for other Union programmes, no synergies with national/regional programmes and activities	partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Limited synergies with other Union programmes and industrial strategies If MS participate, with national/regional programmes and activities	among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with national/regional programmes and activities	partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with national/regional programmes and activities	among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and COM <u>External:</u> Synergies with other Union programmes and industrial strategies If MS participate, with national/regional programmes and activities

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made in comparison to the baseline. Therefore, for each of the above criteria, the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. When relevant, this estimation also includes the costs/benefits of discontinuing existing implementation structures. The policy options are then scored compared to the baseline with a + and – system along a two-point scale, to indicate limited (+ or -) or high (++ or --) additional/lower performance compared to the baseline. When a policy option is scored 0, this means that its impact is expected to be roughly equal to the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows

how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options¹².

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU's R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach¹³ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and cost-savings are also taken into account¹⁴. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.¹⁵ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are predominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%),¹⁶ but lead to an additional R&I

¹² In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

¹³ For further details, see Better Regulation Toolbox # 57.

¹⁴ Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

¹⁵ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

¹⁶ Specifically, some additional set-up costs linked for example to the creation of a strategic research and innovation agenda (SRIA) and additional running costs linked with the partners role in the creation of the annual work programmes and the Commission's additional supervisory responsibilities. A CPP will have lower overall costs than each of the other types of European Partnership, as it will function with a smaller governance and implementation

investment of at least the same amount than the Union contribution¹⁷ (efficiency of 98% for the overall investment).

- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution¹⁸. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).¹⁹
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution²⁰. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution²¹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0		↑↑		
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0		↑↑

Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC		0			↑↑↑

structure than will be required for a Co-Funded Partnership or an Institutionalised Partnership and – related to this – its calls will be operated through the existing HEU agencies and RDI infrastructure and systems.

¹⁷ Minimum contributions from partners equal to the Union contribution.

¹⁸ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

¹⁹ These costs reflect set-up costs and additional running costs for partners, and the Commission, of the distributed, multi-agency implementation model.

²⁰ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

²¹ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

3. METHOD FOR IDENTIFYING THE PREFERRED OPTION – THE SCORECARD ANALYSIS

For the **identification of the preferred option**, a scorecard analysis is used to build a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

This scorecard approach also relies on a standard cost model developed for the external study supporting the impact assessment, as illustrated in Figure 5. . Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**). In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

These costs essentially refer to the administrative, operational and coordination costs of the various options. The figure shows how the scoring of costs range from a value of 0, in case an option does not entail any additional costs compared to the baseline (traditional calls), to a score of (-) for options introducing limited additional costs relative to the baseline and a score of (- -) when substantial additional costs are expected in comparison with the baseline. Should the costs of a policy option be lower than those of the baseline, (+) and (+ +) are used.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. A score of + is therefore assigned for **cost-efficiency** to the Co-Programmed and Co-Funded options, a score of 0 to the

Article 185 option and a score of (-) for the Article 187 Institutionalised Partnership policy option²².

Figure 5: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 2: Co-funded	Option 3a: Institutionalised 185	Option 3b: Institutionalised 187
Administrative, operational and coordination costs	0	(0)	(-)	(- -)	(- -)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. <i>cost-efficiency</i>)	0	(+)	(+)	(0)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to baseline; score (- -) = substantial additional costs compared to baseline. ; score (+) = lower costs compared to baseline

Figure 5: Matrix on ‘overall costs’ and ‘adjusted cost scoring’

	Baseline: Horizon Europe calls	Option 1: Co-programmed	Option 2: Co-funded	Option 3: Institutionalised
Administrative, operational and coordination costs	0	(-)	(- -)	(- -)
Administrative, operational and coordination costs adjusted per expected co-funding (i.e. <i>cost-efficiency</i>)	0	0	(-)	(-)

Notes: Score 0 = same costs as for the baseline; score (-) = limited additional costs compared to baseline; score (- -) = substantial additional costs compared to baseline.

The **baseline (regular calls)** has the lowest administrative, operational and coordination costs. This is based on two facts: firstly, that Horizon Europe traditional calls will not entail any additional one-off costs to be set up or discontinued at the end, where each of the other policy options will require at least some additional set-up and phasing out costs; and secondly, that Horizon Europe will not require any additional running costs, where each of the other policy options will involve additional efforts by the Commission and partners in the carrying out of necessary additional tasks (e.g. preparing annual work programmes).

A **co-programmed partnership** (Option 1 - CPP) will entail slightly higher overall costs as compared with the baseline. There will be some additional set-up costs linked for example with the creation of a strategic research and innovation agenda (SRIA) and additional running costs linked with the partners role in the creation of the annual work programmes and the Commission’s additional supervisory responsibilities. A CPP will have lower overall costs than each of the other types of European Partnership, as it will function with a smaller governance and implementation structure than will be required for a Co-Funded Partnership or an Institutionalised Partnership and – related to this – its calls will be operated through the existing HEU agencies and RDI infrastructure and systems.

²² The baseline (traditional calls) is scored 0, as explained above.

The **Co-Funded Partnership** (Option 2 – CFP) has been **scored (- -)** on overall cost. This reflects the additional set-up costs of this policy option and the substantial additional running costs for partners, and the Commission, of the distributed, multi-agency implementation model.

The **Institutionalised Partnership** (Option 3 - IP) has been **scored (- -)** on overall cost. This reflects the substantial additional set-up costs of this policy option – and in particular the high costs associated with preparing the Commission proposal and negotiating that through to a legal document – and the substantial additional running costs for the Commission associated with the supervision of this dedicated implementation model.

It is considered that while there is a clear gradation in the overall costs of the policy options, the cost differentials are less marked when one takes into account the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution. From this perspective, there are only one or two percentage points that split the most cost-efficient policy options – the baseline (traditional calls) and the Co-Programmed policy options – and the least cost-efficient – the Institutionalised Partnership option. A score of 0 is therefore assigned for **cost-efficiency** to the Co-Programmed option and a score of (-) for the Co-Funded and the Institutionalised Partnership policy options²³.

²³ The baseline (traditional calls) is scored 0, as explained above.

Annex 5 Subsidiarity Grid

1. Can the Union act? What is the legal basis and competence of the Unions' intended action?
1.1 Which article(s) of the Treaty are used to support the legislative proposal or policy initiative?
<p>This proposal is based on (1) Article 185 TFEU which stipulates that in implementing the multiannual framework programme, the Union may make provision, in agreement with the Member States concerned, for participation in research and development programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; and (2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes (both Articles are under Title XIX of the TFEU - Research and Technological Development and Space).</p> <p>The proposal aims to implement Article 8 of the Commission proposal for Horizon Europe - the future EU research and innovation (R&I) programme for 2021-2027, according to which, <i>“European Partnerships shall be established for addressing European or global challenges only in cases where they will more effectively achieve objectives of Horizon Europe than the Union alone and when compared to other forms of support of the Framework programme”</i>. The Horizon Europe proposal has received the political agreement of the Council and the European Parliament.</p>
1.2 Is the Union competence represented by this Treaty article exclusive, shared or supporting in nature?
<p>Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the European Union can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas.</p> <p><i>Subsidiarity does not apply for policy areas where the Union has exclusive competence as defined in Article 3 TFEU²⁴. It is the specific legal basis which determines whether the proposal falls under the subsidiarity control mechanism. Article 4 TFEU²⁵ sets out the areas where competence is shared between the Union and the Member States. Article 6 TFEU²⁶ sets out the areas for which the Unions has competence only to support the actions of the Member States.</i></p>

²⁴ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E003&from=EN>

²⁵ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E004&from=EN>

²⁶ <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E006:EN:HTML>

2. Subsidiarity Principle: Why should the EU act?

2.1 Does the proposal fulfil the procedural requirements of Protocol No. 2²⁷:

- Has there been a wide consultation before proposing the act?
- Is there a detailed statement with qualitative and, where possible, quantitative indicators allowing an appraisal of whether the action can best be achieved at Union level?

This proposal and the accompanying impact assessment were supported by a wide consultation of stakeholders, both during the preparation of the Horizon Europe proposal and - later on, all the candidates for European Partnerships. Member States were consulted via the Shadow Strategic configuration of the Horizon Europe Programme Committee. On candidates for institutionalised Partnerships based on Article 185/187 of the TFEU, an Open Public Consultation (OPC) was held between 11 September and 6 November 2019. Over 1 600 replies were received. In addition, targeted consultation activities were undertaken to prepare the present impact assessment. In particular, for each of the candidate partnerships, an external consultant interviewed a representative sample of stakeholders. The need for EU action as well as its added value were covered in those interviews.

The explanatory memorandum and the impact assessment (horizontal part, Section 3) contain a dedicated section on the principle of subsidiarity, as explained in question 2.2 below.

2.2 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the conformity with the principle of subsidiarity?

The impact assessment accompanying the proposal features a horizontal part on relevant common elements to all the candidate partnerships, including the conformity of the proposed initiative with the principle of subsidiarity (Section 3). Moreover, the individual assessments of each candidate partnership include additional details on subsidiarity, touching in particular on the specificities of a candidate partnership that could not be adequately reflected in the horizontal part of the impact assessment. This will also be reflected in the explanatory memorandum.

2.3 Based on the answers to the questions below, can the objectives of the proposed action be achieved sufficiently by the Member States acting alone (necessity for EU action)?

National action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives, to deliver on the EU's strategic policy priorities (including the climate and energy goals set out in the Paris Agreement, and the European Green Deal), and to contribute to tackling global challenges and meeting the

²⁷ <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12016E/PRO/02&from=EN>

Sustainable Development Goals (SDGs).
(a) Are there significant/appreciable transnational/cross-border aspects to the problems being tackled? Have these been quantified?
<p>The thematic areas covered by the candidate partnerships feature a series of challenges in terms of cross-border/transnational aspects, need to pool resources, need for a critical mass to meet intended policy objectives, need to coordinate different types of actors (e.g. academia, industry, national and regional authorities) across different sectors of the economy and society, which cannot be tackled to the same degree by Member States alone. This is particularly true for the research and innovation (R&I) dimension of the proposed initiative: the importance of a multi-centre and interdisciplinary approach, cross-country data collection and research, and the need to develop and share new knowledge in a timely and coordinated manner to avoid duplication of efforts are key to achieve high quality results and impact. The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide extensive qualitative and quantitative evidence on the above points. In addition, Sections 1 and 2 of the individual impact assessments on the candidate partnerships include more detail on the necessity to act at EU-level in specific thematic areas. Finally, it is worth noting that not all Member States have the same capacity or R&I intensity to act on these challenges. As the desired policy objectives can be fully achieved only if the intended benefits are widespread across the Member States, this requires action at the EU-level.</p>
(b) Would national action or the absence of the EU level action conflict with core objectives of the Treaty ²⁸ or significantly damage the interests of other Member States?
<p>As per Article 4(3) TFEU, national action does not conflict with core objectives of the Treaty in the area of R&I. The absence of EU level action in this area would however prevent the achievement of core objectives of the Treaty. Indeed, national action alone cannot achieve the scale, speed and scope of support to R&I needed for the EU to meet its long-term Treaty objectives on e.g. competitiveness, to deliver on the EU's strategic policy priorities, and to contribute to tackling global challenges and meet the Sustainable Development Goals (SDGs).</p>
(c) To what extent do Member States have the ability or possibility to enact appropriate measures?
<p>As foreseen by Article 4(3) TFEU, this proposal does not hamper Member States' ability to enact appropriate measures in the field of R&I. However, the scale and complexity of the policy objectives pursued by the present initiative cannot be fully addressed by acting at national level alone.</p>
(d) How does the problem and its causes (e.g. negative externalities, spill-over effects)

²⁸ https://europa.eu/european-union/about-eu/eu-in-brief_en

vary across the national, regional and local levels of the EU?
As described in the horizontal part of the impact assessment accompanying the present proposal, several problems (e.g. on competitiveness, global challenges, demographic change) and their underlying causes affect the EU as a whole rather than individual Member States. Where important differences between Member States are present, these are described in Sections 1 and 2 of the individual impact assessments.
(e) Is the problem widespread across the EU or limited to a few Member States?
The problem of coordinating R&I efforts in the thematic areas covered by the candidate partnerships affects all Member States, albeit to different degrees. However, from a general EU perspective, available evidence shows that the EU as a whole needs to step up efforts and investments in thematic areas that are crucial to tackle present and future policy challenges on several fronts, e.g. ageing population, global technological trends, and climate change to name a few. The way these problems affect the EU and its Member States is described in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual impact assessments.
(f) Are Member States overstretched in achieving the objectives of the planned measure?
As indicated in the horizontal part of the impact assessment and in Sections 1 and 2 of the individual assessments, the sheer scale, speed and scope of the needed support to R&I would overstretch national resources, without guaranteeing the achievement of the intended objectives. Acting at EU-level would achieve greater impact in a more effective and efficient manner.
(g) How do the views/preferred courses of action of national, regional and local authorities differ across the EU?
No specific differences between the views of national, regional and local authorities emerged from the stakeholder consultation.
2.4 Based on the answer to the questions below, can the objectives of the proposed action be better achieved at Union level by reason of scale or effects of that action (EU added value)?
EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national initiatives in the same area.

(a) Are there clear benefits from EU level action?

Quantitative and qualitative evidence of the benefits of EU level action are available in the interim evaluation of Horizon 2020 and in the impact assessment of Horizon Europe, among others. An analysis of the emerging challenges in each thematic areas, of the EU's competitive positioning, as well as feedback gathered from different types of stakeholders for the present impact assessment indicate that EU level action remains appropriate also for the present proposal. In addition, the benefits of acting at EU-level have been illustrated by the success and the impact achieved by the predecessors to the proposed initiative.

(b) Are there economies of scale? Can the objectives be met more efficiently at EU level (larger benefits per unit cost)? Will the functioning of the internal market be improved?

EU funded R&I activities, including those covered by the present proposal, produce demonstrable benefits compared to the corresponding national and regional initiatives, due to the scale, speed and scope achievable by acting at the EU level. This is the case both in terms of effectiveness in achieving intended policy objectives, but also in terms of efficiency. Positive impact is also visible in terms of competitiveness: recent data on EU funded R&I activities indicate that EU-funded teams grow 11.8% faster and are around 40% more likely to be granted patents or produce patents applications than non-EU funded teams. Efficiency gains are also visible in terms of dissemination of results to users beyond national borders, including SMEs and citizens. EU funded R&I is more effective in leveraging private investment. Finally, there are clear additionality benefits (i.e. EU R&I funding does not displace or replace national funding), as the EU focuses on projects that are unlikely to be funded at national or regional level. Overall, this is beneficial to the functioning of the internal market in several respects, including human capital reinforcement through mobility and training, the removal of barriers to cross-border activity for economic players including SMEs, easier access to finance and to relevant knowledge and research, and increased competition in the area of R&I.

(c) What are the benefits in replacing different national policies and rules with a more homogenous policy approach?

A homogeneous policy approach in the various thematic areas covered by the present proposal would reduce fragmentation and increase efficiency and effectiveness in meeting the intended policy objectives. Indeed fragmentation, persisting barriers in the internal market and differences in the resources available to Member States are some of the key problems that stand in the way of fully achieving the intended policy objectives and reaching the required critical mass to obtain tangible results. Specific detail on how these issues differ in each thematic area are illustrated in Sections 1 and 2 of the individual impact assessments, so as to reflect the specificities of each case.

(d) Do the benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities (beyond the costs and benefits of acting at

national, regional and local levels)?

The proposed initiative does not lead to a loss of competence of the Member States. In fact, the proposed initiative should be seen as complementary and reinforcing national and sub-national initiatives in the same area. Previous quantitative and qualitative assessments of Horizon Europe and Horizon 2020 have shown that the proposed EU-level action do not displace national ones and tend to concentrate on initiatives that would not have been funded by the Member States themselves, or would not have reached the same scale and ambition without EU-level intervention, due to their complexity and trans-national nature.

(e) Will there be improved legal clarity for those having to implement the legislation?

Yes. The proposed initiatives will be implemented in line with the Horizon Europe single set of rules for participation; this will ensure increased clarity and legal certainty for end beneficiaries, other stakeholders and programme administrators. It will also reduce the administrative burden for beneficiaries, and for the Commission services. In addition, the accessibility and attractiveness of the broader Horizon Europe programme, in particular for applicants with limited resources, would be sustained.

3. Proportionality: How the EU should act

3.1 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the proportionality of the proposal and a statement allowing appraisal of the compliance of the proposal with the principle of proportionality?

The principle of proportionality underpins the entire analysis of the candidate partnerships. Specifically, the analysis included in the accompanying impact assessment is structured along the following logic: 1. Justification of the use of a partnership approach in a given area (including considerations on additionality, directionality, link with strategic priorities) instead of other forms of intervention available under Horizon Europe; 2. If the partnership approach is deemed appropriate, proportionality considerations guide the assessment of which type of partnership intervention (collaborative calls, co-programmed, co-funded or institutionalised partnership) is most effective in achieving the objectives. This will also be reflected in the explanatory memorandum.

3.2 Based on the answers to the questions below and information available from any impact assessment, the explanatory memorandum or other sources, is the proposed action an appropriate way to achieve the intended objectives?

The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the present proposal leaves full freedom to the Member States to

<p>pursue their own actions in the policy areas concerned. This will also be reflected in the explanatory memorandum.</p>
<p>(a) Is the initiative limited to those aspects that Member States cannot achieve satisfactorily on their own, and where the Union can do better?</p>
<p>The proposed initiative only focuses on areas where there is a demonstrable advantage in acting at the EU-level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments.</p>
<p>(b) Is the form of Union action (choice of instrument) justified, as simple as possible, and coherent with the satisfactory achievement of, and ensuring compliance with the objectives pursued (e.g. choice between regulation, (framework) directive, recommendation, or alternative regulatory methods such as co-legislation, etc.)?</p>
<p>For each of the candidate partnerships, the analysis carried out in the accompanying impact assessment has explored several options for implementation. A comparative assessment of the merits of each option also included an analysis of the simplicity of the intervention, its proportionality and effectiveness in achieving the intended objectives. This is reflected in the fact that a tailored approach has been suggested for each candidate partnership, ranging from looser forms of cooperation to more institutionalised ones, depending on the intended policy objectives, specific challenges, and desired outcome identified in each case.</p>
<p>(c) Does the Union action leave as much scope for national decision as possible while achieving satisfactorily the objectives set? (e.g. is it possible to limit the European action to minimum standards or use a less stringent policy instrument or approach?)</p>
<p>The proposed approach leaves full freedom to the Member States to pursue their own actions in the policy areas covered by the present proposal.</p>
<p>(d) Does the initiative create financial or administrative cost for the Union, national governments, regional or local authorities, economic operators or citizens? Are these costs commensurate with the objective to be achieved?</p>
<p>The proposed initiatives do create financial and administrative costs for the Union, national governments and, depending on the chosen mode of implementation, for regional and local authorities. In addition, economic operators and other stakeholders potentially involved in the candidate partnerships will also incur some costs linked to implementation. The financial cost of the proposed initiative is covered under the Horizon Europe programme. Its exact amount is still subject to political decision. As regards the candidate partnerships and the different modes of implementation (co-programmed, co-funded, institutionalised), the relevant costs and benefits are assessed in the individual impact assessments covering each candidate partnership. The additional administrative costs of implementation via partnerships are</p>

limited, when compared to the administrative costs of implementation through traditional calls. As indicated by comparable experience with previous initiatives and in feedback provided by a variety of stakeholders, these costs are expected to be fully justified by the benefits expected from the proposed initiative. Where available, additional details on costs are provided in Annex 3 of the impact assessment.

(e) While respecting the Union law, have special circumstances applying in individual Member States been taken into account?

Where relevant, differences between Member States in capacity and stage of advancement of R&I in specific thematic areas have been taken into account in the individual impact assessments.

Annex 6 Additional background information

1. BACKGROUND INFORMATION FOR ALL INITIATIVES

1.1. Selection criteria of European Partnerships

Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

The necessity test for a European Partnership (as set out in the Horizon Europe regulation) has two levels:

1. **The justification for implementing a priority with a European Partnership** to address Horizon Europe and EU priorities. This is linked to demonstrating that a European Partnership can produce added value beyond what can be achieved through other Framework Programme modalities, notably traditional calls in the work programmes (Option 0 – Baseline).
2. **The justification for the use of the form of Institutionalised Partnership:** Once it has been demonstrated that a partnerships approach is justified, co-programmed and/or co-funded forms are considered for addressing the priorities as they are administratively lighter, more agile and easier to set-up (Options 1 and/or 2). As Institutionalised Partnerships require setting up a legal framework and the creation of a dedicated implementation structure, they have to justify higher set-up efforts by demonstrating that it will deliver the expected impacts in a more effective and efficient way, and that a long-term perspective and high degree of integration is required (Option 3).

The outcomes of the ‘necessity test’ is presented together with the preferred option.

Figure 6 Horizon Europe selection criteria for the European Partnerships

Common selection criteria & principles	Specifications
1. More effective (Union added value) clear impacts for the EU and its citizens	Delivering on global challenges and research and innovation objectives
	Securing EU competitiveness
	Securing sustainability
	Contributing to the strengthening of the European Research and Innovation Area
	Where relevant, contributing to international commitments
2. Coherence and	Within the EU research and innovation landscape

Common selection criteria & principles	Specifications
synergies	Coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions
3. Transparency and openness	Identification of priorities and objectives in terms of expected results and impacts
	Involvement of partners and stakeholders from across the entire value chain, from different sectors, backgrounds and disciplines, including international ones when relevant and not interfering with European competitiveness
	Clear modalities for promoting participation of smes and for disseminating and exploiting results, notably by smes, including through intermediary organisations
4. Additionality and directionality	Common strategic vision of the purpose of the European Partnership
	Approaches to ensure flexibility of implementation and to adjust to changing policy, societal and/or market needs, or scientific advances, to increase policy coherence between regional, national and EU level
	Demonstration of expected qualitative and significant quantitative leverage effects, including a method for the measurement of key performance indicators
	Exit-strategy and measures for phasing-out from the Programme
5. Long-term commitment of all the involved parties	A minimum share of public and/or private investments
	In the case of institutionalised European Partnerships, established in accordance with article 185 or 187 TFEU, the financial and/or in-kind, contributions from partners other than the Union, will at least be equal to 50% and may reach up to 75% of the aggregated European Partnership budgetary commitments

1.2. Overview of potential functions for a common back office among Joint Undertakings

Functions	Current situation	Option of joint back-office	Comments
Organising calls for grant and proposal evaluations	Each JU organises this independently.	A central organisation of evaluation, logistics, contracting evaluators, managing the data of the evaluation results Central database of potential evaluators with domain expertise in thematic areas of partnerships	The evaluations would still need to be supervised by the Scientific staff of the individual Joint Undertakings (consensus meetings of expert evaluators etc)
Human Resources related matters	Each JU has own HR policy and resources Quite some resources spent on recruitment in some JUs Some HR facilities are procured	More generic resources and expertise for HR matters More consistency in HR policy Shared HR investment	Ensuring consistency with EC HR policies is already in place

	from external contractors Some JUs have a Service Level Agreement with COM for HR	for specialised expertise (IP and legal)	
Financial management	Each JU conducts own financial contract management; differences between JUs Each JU is audited separately. Auditing at project level more frequent than in other Horizon 2020 parts and outsourced by JUs thus differences ECA: too many audits on JUs	Financial management by one core team of financial staff Would reduce the number of interfaces for audits and simplifies the auditing of the all JUs Harmonisation of project auditing	Simplifies the harmonisation of financial management across JUs in line with Horizon Europe
Communication (internal and external)	Each JU has a separate communication strategies, teams and resources	A common back-office can support activities such as event organisation, dissemination of results, setting up website communication Can help create a more visible Partnership brand	A considerable share of communication activity is partnership specific (addressing particular target groups, synthesising project results) however there are generic communication activities that can be shared Needs to avoid duplication of efforts
Data management on calls, project portfolios, information on project results	Most JUs but not all use e-Corda for project data Overall IT integration of JUs still difficult	Harmonised data management Reduction of IT systems and support that is procured	This will need to happen regardless of the common back office but will likely be more smooth if managed centrally

2. ADDITIONAL INFORMATION ON THE STANDARD COST MODEL

Appendix A *Standard cost model for the options assessment related to efficiency*

Category \ Policy option (in thousands euros)	Horizon Europe	Co-programmed	Co-funded	Article 185	Article 187
BUDGET					
Total contribution from the Union	1000000	1000000	1000000	1000000	1000000
EU funding rate	100%	50%	30%	50%	50%
TOTAL Investment from partners incl. Union (within the partnership)		1000000	2300000	1000000	1000000
TOTAL BUDGET	1000000	2000000	3333333	2000000	2000000
SET-UP COSTS					
Preparation of a partnership proposal (partners and COM)		500	500	500	900
Preparation of the SRIA/roadmap		1500	1500	1500	1500
Impact Assessment				300	300
Preparation of COM proposal, negotiation				13000	13500
Preparation of dedicated implementation structure					1100
TOTAL SET-UP COSTS		2000	2000	15300	17300
RUNNING COSTS					
AWP preparation and comitology	2100	2100	2100	2100	2100
Call and project implementation	40000	80000	160000	100000	136400
Partners' costs not covered by the above		400			400
Additional COM costs	600	600	600		2500
TOTAL RUNNING COSTS	42700	83100	162700	102100	141400
DISCONTINUATION COSTS					
Costs for COM, MS and partners		500	500	800	1900

TOTAL COSTS AND INVESTMENTS	1042700	2085600	3498533	2118200	2160600
R&I INVESTMENT	1000000	1959600	3213333	1940600	1901300
EFFICIENCY	96%	94%	92%	92%	88%

Appendix B *Notes and sources per cost*

Category	Notes	Sources
EU funding rate	The EU funding rates used are the co-financing rates for Horizon 2020 regular calls (research and innovation actions) and the minimum co-financing rates required for each of the European Partnership types.	
TOTAL Investment from partners incl. Union (within the partnership)	The partners' contributions are calculated using the 'theoretical' Union contribution and the standard co-financing rate applicable to the specific policy option.	
Total Budget	The total budget is the total investment available and is the sum of the Union's contribution and the partners' contributions.	
Set-up Costs	The set-up costs are the one-off costs involved in the preparation and setting up of each of the four types of European Partnerships. It has been assumed there are no set-up costs associated with the HEU regular calls, as all of the management and supervisory structures exist already.	
Preparation of a partnership proposal (partners and COM)	We assume 7 staff members are needed to prepare a fully costed proposal for a partnership, covering the costs of all partners. CP require 5 staff from private partners and 2 from the COM, CF and A185s require 5 staff from MS and 2 from the COM, and A187s require 5 COM staff and 2 from private partners.	Cost per capita: €128 k for COM staff (SOURCE: JU benchmark data 2018); € 44.5k for MS staff and private partners (SOURCE: Average EU28 personnel costs (per employee) in 2016 (latest available) for NACE Professional, scientific and technical activities, EUROSTAT).
Preparation of the SRIA/roadmap		In 2019, Horizon 2020 approved a community support action to develop a SRIA for Waterborne Transport, with time horizons to 2025, 203 and 2050. The total Union contribution (100% of eligible costs) is €1.5m.
Impact Assessment	This is the cost involved in preparing the ex ante impact assessments for the candidate partnerships: 25 COM staff for 9 months (at yearly rate of €128 k) plus €1.8 M for a contractor to carry out the 13 IA studies. The total number is then divided by 13 to produce an estimate for the IA cost per partnership. It is assumed these costs only apply to the Institutionalised Partnerships as there is no requirement to carry out an IA for the other policy options. In practice, the cost per partnership will be higher, as not all 13 will be approved and the total effort will need to be amortised across a smaller number than 13.	Advice / data provided by DG RTD A4 'partnerships' team (15/11/19).
Preparation of COM proposal, negotiation	This is the cost involved in developing a full-costed proposal for the candidate Institutionalised Partnerships and the resulting costs of refining and	Cost per capita: €128 k for COM staff (SOURCE: JU benchmark data 2018);

Category	Notes	Sources
	negotiating the proposal through Council and into legislation. We assume that this highly involved procedure only applies to the IPs, and we have been advised by DG RTD that this process might typically require 1 year in elapsed time and 25 staff FTEs from the Commission, 15 FTEs from the Council and 5 FTEs from the EP.	We assume the same cost for the Council and Parliament; €44.5 k for MS staff and private partners (SOURCE: Average EU28 personnel costs (per employee) in 2016 (latest available) for NACE Professional, scientific and technical activities, EUROSTAT). Number of required staff members: Advice / data provided by DG RTD A4 'partnerships' team (15/11/19).
Preparation of dedicated implementation structure	This is the cost involved in setting up the governance and implementation structure. We assume that 1 member of staff is needed per each €268M of total budget to set up the new infrastructure in A187s. We assume that in A185s an existing structure in one or several MS is able to be used.	We based this assumption on the estimate made by the shift2rail IA (2013), where for a total budget of €938M, 3.5 members of staff are required for implementing the structure with a cost of €128k per head. This means that setting up the partnership requires about 1 staff member per each €268M. Once we determine the number of staff needed we multiply that by the corresponding staff cost per capita.
Running Costs		
AWP preparation and comitology	We assume 200 staff are needed working 3 days for €500 per day for the whole 7-year programming period (to be re-assessed).	This is an estimate based on a priori knowledge of the costs associated with the development and negotiation of annual work plans. We have not been able to identify any real cost data from past partnerships.
Call and project implementation	This refers to Title 1 and Title 2 expenditures, which represent a given proportion of the budget implemented in calls.	The costs of implementing HEU and CPP calls is estimated to be 4% of the budget, we use a dual figure for CFPcalls (with is 10% applied to 80% of the budget, to reflect typical MS calls, while the remaining 20% is assumed to be expended through regular HEU calls, where a 4% cost rate is used), 6% for A185s and 6.8% for A187s (SOURCE: Advice / data provided by DG RTD A4 'partnerships' team, 15/11/19); We also add an additional cost of €400k in A187s reflecting extra costs of integrating and making systems interoperable for monitoring; the legal obligations to perform interim and ex-post evaluations (Advice provided by DG RTD A2 team, 25/11/19).
Partners' costs not covered by the above	This refers to the intramural costs borne by private partners as a result of their participation in the governance structure and working groups of the partnership (private partners are not involved in the supervision of HEU calls, CFPs or A185s). We used historical data to estimate that these private coordination costs amount to 1 FTE per €242M of total budget.	The estimation is based on the assumption by the shift2rail IA that a half a person-day per project per week is needed for coordination, thus 1 staff per year for 10 projects running. This resulted (in the shift2rail IA) in 3 additional staff members required to coordinate a total budget of €725M, and thereby 1 staff per €242M. Once defined the number of staff needed under each option, we multiply that by the corresponding cost per capita.
Additional COM costs	The additional COM costs refers to the cost of supervising the partnerships. We use auditing expenditures as proxies for supervision costs. HEU regular calls, CPPs and CFPs have low supervision costs, A185s' costs are included in MS's project implementation costs and A187s require higher levels of COM supervision and therefore have higher costs.	We use the max (35) and min (8) number of audits in past JU as reference for high and low level of supervision effort. Then multiply that by €10k —the average cost per audit (SOURCE: JU benchmark data 2018). The inclusion of this cost category was suggested by DG RTD A4 'partnerships' team (15/11/19).
Discontinuation Costs	Discontinuation costs refer to staff expenditures related to winding-down activities, including the disposal of any assets and the cost of closing the implementation structure when there is one.	

Category	Notes	Sources
Costs for COM, MS and partners	We assume that at least the same number of staff is needed to discontinue the partnership as it was for the preparation of the partnership proposal. Plus, for A187s, we assume that dismantling the dedicated structure has the same cost as its implementation. As for A185s, we assume the same value as for A187s, but adjusted to the staff costs of A185s.	
Total Costs and Investments	This category is the sum of "Total Budget", "Set-up costs", "Running costs" and "Discontinuation costs".	
R&I Investment	We assume that funding for R&I activities equals the total Budget under the HE policy option. For the remaining options, this category is composed of the "Total Budget" after subtracting "Marginal Running costs" –Running costs for each policy option discounted by the Running costs under HE.	
Efficiency	This ratio is the proportion of "Total costs and investments" that is available to be spent on "R&I investment".	

3. ADDITIONAL INFORMATION ON THE POLICY CONTEXT

Support in the field in the previous work programme

Scope and objectives of the 5G-PPP

Through 5G-PPP, the goal of Europe is to put in place the right framework to tackle 5G challenges and bring the appropriate solutions, architectures, technologies and standards to the next generation of communication networks.

The main target objectives of the 5G-PPP are the technological development of 5G and the contribution to growth and jobs. Considered as EU flagship initiative, the **5G-PPP** comprises public and private partners. The latter also agreed on KPIs to leverage the 700 million EUR public investment by a factor of 5 bringing **total funding into 5G-PPP to 4.2 billion EUR**.

5G-PPP is organized in 3 phases, each comprising several call for projects with a variable duration of 24-36 months:

- Phase 1 with 19 projects (2014-2016) focusing on 5G infrastructure, automotive projects and 5G validation trials across multiple vertical industries;
- Phase 2 (2017-2019) with 21 new projects targeting a move towards demonstrations and experimentations in order to establish closer links between 5G community and verticals industries. Many new stakeholders (more than 60% of phase 2 participants) joined the PPP;
- 3rd and last phase ending in 2020 consolidating the results of the previous phases to support implementation and applicability of 5G and will be dedicated to a number of projects in vertical industries use cases.

The global objectives of the 5G programme is to build the next generation of wireless communication network technologies. This new generation is expected to improve the existing (4G) wireless network capabilities (in term of bandwidth, capacity, coverage, and reliability). But beyond this incremental progress, the 5G technologies also aim to provide new capabilities (ultra-low latencies, ability to connect very large numbers of devices, high dependability and quality of service, etc.) that would enable the wireless network to be used in scenarios that are essential for vertical industries.

Indeed, the vision behind 5G is that this new generation of communication network could serve as a critical infrastructure for numerous industries (automotive, transport, manufacturing, etc.)

5G-PPP objectives

Source: 5G-PPP.

Stakeholder analysis of the 5G-PPP

Stakeholders involved so far in the 5G-PPP (note that the analysis is only based on projects funded from the 5G-PPP during Phase I and Phase II, i.e. projects funded before 2018²⁹) are mainly from the telecom

²⁹ Only a part of Phase 3 projects have really started

industry or from the public research centres and universities with a strong background in telecommunications. **The majority of funding was directed towards private research** (56% of funding), and within that the vast majority for the telecom (operators, OEMs (Original Equipment Manufacturers) and IT industries. The involvement of verticals is still modest but growing. This is globally consistent with the analysis done for just Phase 1 project ³⁰ (65% of private research)

Funding has been essentially allocated to EU 15³¹ Member States (92% of funding, of which 70% for top 5 countries in Phase 1), **reflecting also the domination of telcos from bigger EU countries (and their associated partners)**, which are generally controlling telecom operators from smaller EU countries.

Three main groups of players are mainly involved in the 5G-PPP, as designed by the European Commission and the 5G IA (5G Industry Association):

- (1) **Current connectivity providers** (MNOs, MVNOs) are taking the opportunity of these new technologies to try to **diversify their offer and address new market segments** (in specific verticals, including manufacturing) as a way to compensate declining consumer revenues. They have engaged into many projects within the 5G-PPP and trials³² targeting key vertical markets like automotive, healthcare, industry 4.0, energy and media, and additional vertical markets targeted in a second step like public safety and smart city³³. In Europe, Orange, Telefonica, Telecom Italia and BT (plus to a lesser extent Altice, Deutsche Telekom and OTE) have been leading the efforts on 5G.

Trials in Europe testing vertical markets

Source : Euro-5G Annual Journal³⁴

- (2) Providers of enabling technologies include software and hardware vendors. **Hardware equipment manufacturers** can also see 5G as an opportunity to **diversify their business modelling**, by bundling equipment with connectivity service provisioning in, for example, the small cell area. The need for an

³⁰ Mid-term review of the contractual Public Private Partnerships under Horizon 2020 (2007), Report of the Independent Expert Group <https://publications.europa.eu/en/publication-detail/-/publication/6de81abe-a71c-11e7-837e-01aa75ed71a1>

³¹ EU 15 being: Germany, Belgium, France, Italy, Luxembourg, Netherlands, Denmark, Ireland, UK, Greece, Spain, Portugal, Austria, Finland and Sweden.

³² Vertical trials may not involve a vertical stakeholder

³³ 5G IA (2019) available at <https://5g-ppp.eu/verticals/>

³⁴ <https://5g-ppp.eu/annual-journal/>

upgraded infrastructure, supported by virtualization and allowing for edge computing, is also an opportunity, partly challenged nonetheless by the development of pure software players. Traditional OEMs (especially Nokia and Ericsson, but also Huawei and NEC) and their counterpart software and/or electronics companies (Atos, Samsung, Intel) are well represented within the 5G-PPP projects.

(a) Fundamental building blocks may also be developed by academic and public research institutes/centres also well represented in the 5G-PPP. Close to 40% of participants in 5G-PPP (and 36% of funding)³⁵ was allocated to either high education and research centres (with a slight bigger proportion for education).

(3) Some content providers (including OTT players) and **industrial solution providers, and potentially manufacturers (a.k.a. vertical stakeholders)**, will also play a role in the new communication value chains, not only as content and service providers, but also as **connectivity providers**, and infrastructure providers. This is reinforced by the integration of **direct, proximity communications** (such as public safety services or V2V (Vehicle to Vehicle communication), V2I (Vehicle to Infrastructure)) in the 5G standards, thereby **removing partially or even entirely in some cases the need for a mobile operator in the value chain**. Their engagement as participants in projects is still modest (5% overall for Phases 1 and 2) but increasing. Indeed, the NACE code analysis shows the following evolution. Most vertical stakeholders have participated to only 1 project.

Analysis of participants based on NACE codes³⁶

	2014 ³⁷	2016	2017
% of participants from “vertical” NACE codes ³⁸	2%	6.3%	16.4%
% of funding from “vertical” NACE codes	2%	5.4%	16.6%

Source : IDATE Digiworld

Vertical industries were not very active around 5G developments before 2018-2019. **Among the active vertical industries, a few already really stand out:** the automotive industry (thanks to the creation of the 5G AA (5G Automotive association)) and to a lesser extent manufacturing industries (5G ACIA - 5G Alliance for Connected Industries and Automation) and utilities. These vertical stakeholders are often not involved around business use cases but rather focus on specific technologies development. The question of the business sustainability of the proposed scenario thus often remain open.

The main vertical stakeholders in projects of phases 1 and 2 and in other 5G initiatives involving vertical stakeholders.

Vertical industries	Vertical stakeholders
Utilities/Energy	ENGIE, ASM Terni, PowerOps, RomGaz, eMOTION, VerticalM2M, EFAFEC, Power Solutions Group, Siemens, World Sensing
Automotive	Volvo, PSA, Bosch, Fiat, ExpertSystems <i>5GAA (created late 2016) including also AUDI AG, BWM Group, Daimler AG, Ford, Denso, Continental, Honda, Hyundai, Nissan, Mitsubishi, Volkswagen</i>
Public Safety	Thales, ENGIE, WIND-3, RomGaz, ASM Terni <i>Public Safety Communication Europe (PSCE), the European public safety Association, and 5G IA, signed a Cooperation agreement in May 2018 to foster collaboration on 5G development.</i>

³⁵ NACE code analysis

³⁶ NACE code analysis based on participant portal data made available by the European Commission.

³⁷ No calls for the 5G PPP in 2015

³⁸ Vertical NACE codes excludes all NACE codes related to ICT industry, support actions like marketing or administration and wholesale trade

Vertical industries	Vertical stakeholders
Healthcare	Servicio de Asistencia Municipal de Urgencia y Rescate (SAMUR), Irish National Ambulance Services facilitated by CIT; LifeSemantics, Camanio Care AB
Media	RAI, RTVE, BBC, EBU, IRT, Nurogames
Transport	Fiat, COMSA, FGC, Hamburg Port Authority, riaGnoSys GmbH (Zodiac Inflight Innovations), Ferrovial (through Seamless Air Alliance, Delta and Airbus) Ports of Thessaloniki, Patras and Pireus (in SMI initiative) Ahlers in 5G Manifesto ³⁹
Industry	Weidmüller, Airbus, Siemens, Royal Philips in 5G Manifesto <i>5G-ACIA created early 2018</i>
Smart Cities	City of Lucca, City of Bristol, City of Barcelona, Alba Iulia City Flash Lighting Services

Source : IDATE Digiworld⁴⁰

This limited participation of actors from the vertical industries to the 5G-PPP can be explained mainly by the natural phasing of the 5G-PPP, with earlier phases dedicated to technology development and later phases to validation, testbeds and trials, especially around platforms. The increase overtime of the vertical stakeholders' presence in project and access to funding shows positive signs of uptake.

This is in addition confirmed by analysis of the Phase 3 projects started or about to start, reaching even at least 22% of vertical participants (some projects like 5G-TOURS and 5G-DRONES are even with more than a third of vertical participants), when excluding platforms. Verticals industries with the most contributors are by far automotive (with a specific call), transport and industry 4.0, with a mix of very large companies and smaller ones.

Analysis of participants based on listing

	15 Phase 3 projects from calls in 2018	Same scope but excluding the CSA and the 3 platforms
% of participants from "vertical industries" (private only)	18.0%	22.4%

Outcomes and (expected) impacts

It is quite early to measure the outcomes of the 5G-PPP based on previous assessments or evaluations, as the 5G-PPP is still ongoing. Only Phase 1 projects are closed and Phase 2 projects ran until mid 2019 for most of them, while most Phase 3 projects have just started or will start in 2020.

The only evaluation conducted so far relates to the 19 Phase 1 projects⁴² (but is not specific to 5G). The 5G-PPP showed some very good performances in shorter average time to grant than FP7 or Horizon 2020 and higher quality and success rates. This illustrates that the overall structuration has been well thought and organized in advance. Funding was mainly allocated to a limited number of beneficiaries (top 50 getting 65% against only 22% in other Horizon 2020 projects). In Phase 1, 5G-PPP was seen as performing well in general, with some improvements needed around inclusion of SMEs and of EU13 (only 2% of funding for Phase 1) and also in terms of links with other cPPPs (contractual Public Private Partnership).

The contractual arrangement defines 12-13 (depending on documents) specific KPIs (Key Performance Indicators) for the 5G-PPP in addition the common set of KPIs defined by the EC for all cPPPs. These KPIs have been assessed in Euro-5G and To-Euro-5G⁴³.

Scientific and technological results

ITU requirements

The targets set for IMT-2020, corresponding to the fifth generation of mobile systems, by ITU are described below. IMT-Advanced corresponds to 3GPP LTE.

⁴² Mid-term review of the contractual Public Private Partnerships under Horizon 2020 (2007), Report of the Independent Expert Group <https://publications.europa.eu/en/publication-detail/-/publication/6de81abe-a71c-11e7-837e-01aa75ed71a1>

⁴³ D4.4 Final report on 5G PPP KPI progression of June 2019, To-Euro 5G

Enhancement of key capabilities from IMT-Advanced to IMT-2020

Source: ITU⁴⁴

5G-PPP KPIs

The following Key Performance Indicators were set by the Public Private Partnership on 5G⁴⁵:

- (4) Providing 1000 times higher wireless area capacity and more varied service capabilities compared to 2010.
- (5) Saving up to 90% of energy per service provided.
- (6) Reducing the average service creation time cycle from 90 hours to 90 minutes.
- (7) Creating a secure, reliable and dependable Internet with a “zero perceived” downtime for services provision.
- (8) Facilitating very dense deployments of wireless communication links to connect over 7 trillion wireless devices serving over 7 billion people.

The 5G Initiative Technology Board produced a document on the definition, assessment and there cannot and will not be one single overall system analysis per Performance KPI across all 5G Infrastructure PPP projects. The running study leads to a summary of clustered projects contributions to the Performance KPIs in a structured programmatic approach. The PPP Performance KPIs definition, at Programme level, are based on the work of a Phase 1 project (Flex5GWare), the approach has been extended to the overall set of PPP Phase 2 Projects.

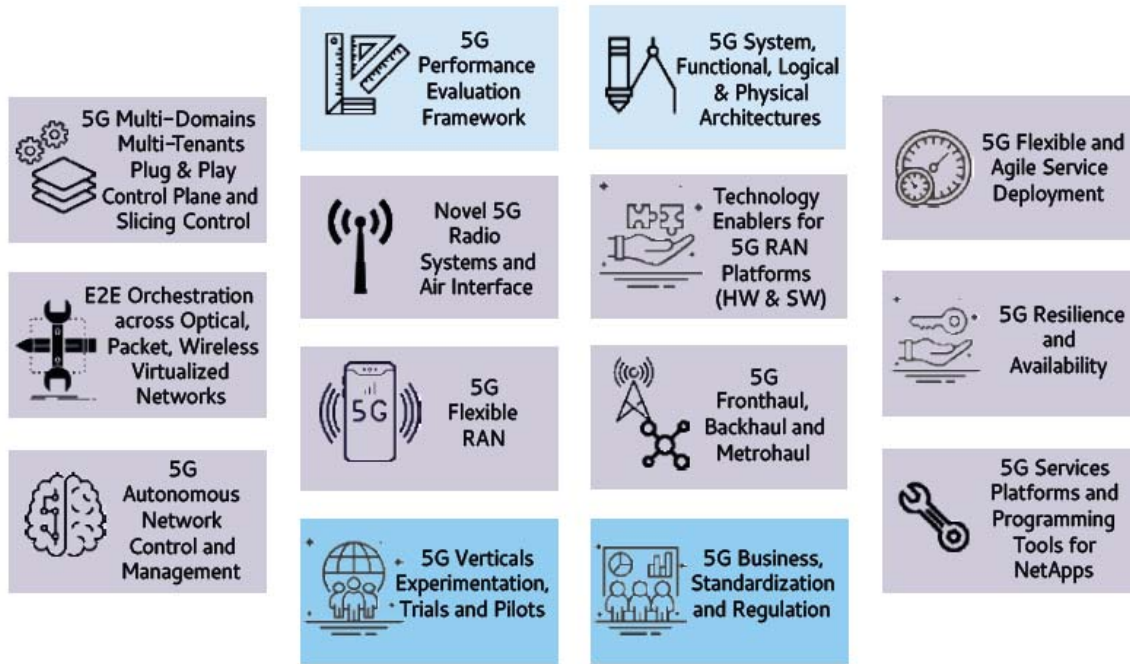

The PMR (Progress Monitoring Report) Annex consolidates the available KPIs from the different sources of the 5G Infrastructure PPP Programme Working Group activities and projects. It consolidates an agreed definition for each KPI and provides an agreed method of measurement. The PPP Performance KPIs work has also then been further developed on specific Performance KPIs, starting first with Latency and Service Creation Time. This information is included in the PMR Annex. It contains the up-to-date status on these KPIs / Projects contributions. **The work is in progress and the final reports will be released during the second half of 2019.** Potentially, additional White Papers could be developed on Peak Data Rate KPI, Summary of individual Projects Performance KPI and PPP KPIs Cartography development of ‘5G-PPP Phase II Projects Performance KPIs’.

⁴⁴ ITU, *Setting the Scene for 5G : Opportunities and Challenges*, 2018. Available at: https://www.itu.int/en/ITU-D/Documents/ITU_5G_REPORT-2018.pdf

⁴⁵ 5G PPP, *5G PPP progress monitoring report, 2017*, available at: <https://5g-ppp.eu/wp-content/uploads/2018/10/5G-PPP-Progress-Monitoring-Report-2017.pdf>

The 5G-PPP Technical Board advanced the approach defined in Phase 1 with the definition of the Programme Golden Nuggets (GNs), elaborated on the basis of the key projects achievements. The PPP GNs Version 2.0 was released in February 2019, allowing all PPP projects to fully understand and match their individual contributions inside the overall programme achievements. **Key achievements from Phase 2 5G-PPP projects include 60 highlighted results categorised under 14 program level achievements as shown in the figure below.**

PPP Key Achievement Phase 2 Projects (Golden Nuggets Version 2.0)

Additional Programme-Level KPIs

(9) Patents

At the end of March 2019, Europe had filed for ~22% of standard essential patents (SEP) for 5G communication systems.

(10) Standardisation activities

5G-PPP has had significant influence in building pre-standardization consensus across key actors. Major impact on the 5G architecture ideas has also been achieved through 610 activities leading to standardization (Phase 1: 315; Phase 2: 295). The table below shows a breakdown of the inputs for the development of 5G standardization tracked between June 2018 and June 2019:

Input to 5G standardisation

Number of contributions per category tracked

Overall architecture: Mostly to 3GPP, with many inputs on the implementation of 5G V2X systems and multimedia broadcast or streaming services.	70
Core and transport architecture: Mostly to 3GPP, with most of the inputs related to terminals.	58
Management and orchestration architecture: Mostly to three ETSI groups, namely, the ZSM ISG, NFV ISG and OSM.	50

⁴⁶ EURO 5G – The European 5G Annual Journal, 2019 <https://bscw.5g-ppp.eu/pub/bscw.cgi/d302069/Euro%205G%20PPP%20Annual%20Journal%202019-web.pdf>

Radio and edge architecture: Mostly to 3GPP, with many inputs on 5G NR enhancements for V2X and multimedia broadcast.	41
Other 3GPP WGs: RAN 3 (new radio); SA1 (service requirements); SA5 (network management, including energy efficiency and architecture); SA4 (codec); SA6 (northbound APIs); SA4-5-6 (media and broadcasting).	21
ETSI Multi-Access Edge Computing (e.g. Instantiating a Network Slice integrating MEC applications, using 3GPP elements).	6
Industry groups (e.g. DVB for media and broadcasting); other standards organisations (e.g. IETF for network virtualisation, fog computing and northbound interfaces); not specified	49
Total	295

Business outcomes and impacts

Three business KPIs were set and have been mostly achieved:

- (11) Leverage effect of EU research and innovation funding in terms of private investment in R&D for 5G systems in the order of 5 to 10 times (B1). The expected KPI has been surpassed, with private investments from large industry and SMEs reaching 10,12 in 2018 (7.24 when taking into account all beneficiaries like education).
- (12) Target SME participation under this initiative commensurate with an allocation of 20% of the total public funding (B2). This KPI has been almost reached over Phase 1 and Phase 2 (19%) and is expected to be reached thanks to the last phase (trials).
- (13) Reach a global market share for 5G equipment & services delivered by European headquartered ICT companies at, or above, the reported 2011 level of 43% global market share in communication infrastructure (B3). With roll-out in progress, it is too early to assess this KPI, but there are some early signs showing the KPI can be reached (such as the good positioning of actors such as Ericsson and Nokia in the standardization and patent activity).

As part of the common set of KPIs, additional outcomes have been calculated or identified

- (14) around 2,000 new jobs are expected from 5G-PPP participants over the period 2014-2018 (i.e. an increase of 5 jobs per participant, of which 2.3 for SMEs)
- (15) an increase of turnover by 10% for SMEs in 2018
- (16) the development of a brochure “European SME expertise in 5G and beyond” (June 2019)

Societal outcomes and impacts

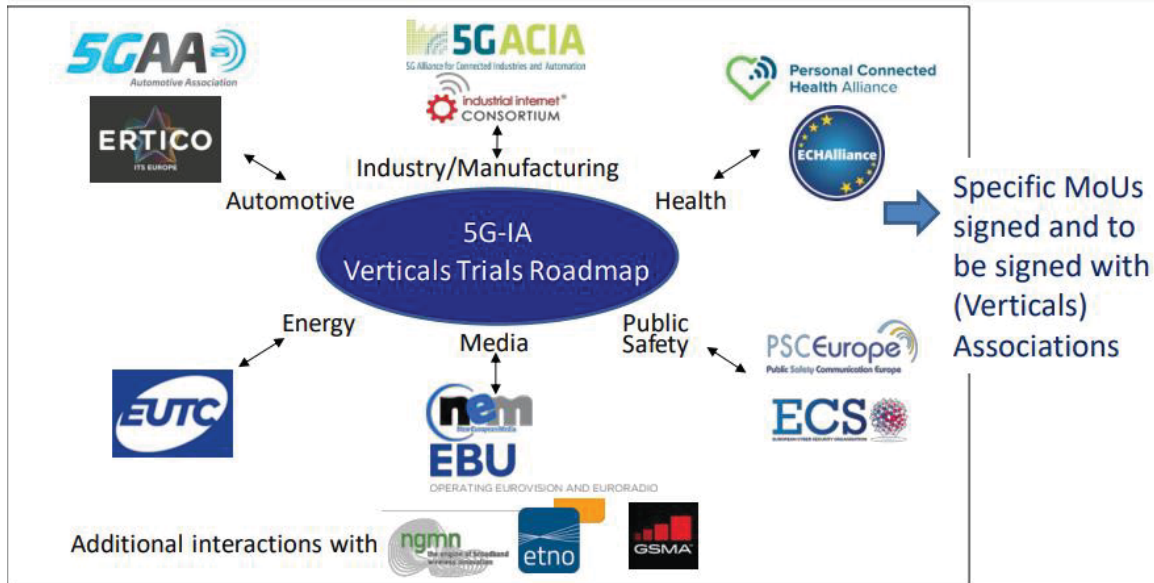

Five business KPIs were set, for which outcomes are not still limited for now (except KPI S3) but are still on track to be achieved for most of them in Phase 3:

- (17) Enabling advanced user-controlled privacy (S1). Progress has been made around security (especially with MEC and slicing) more than privacy, expected to be tackled around with new projects, in Phase 3 and more likely in the candidate PPP.
- (18) Reduction of energy consumption per service up to 90% (as compared to 2010) (S2). No results yet beyond some initial findings in METIS-II project. Data is indicated to be collected from projects to get better information.
- (19) European availability of a competitive industrial offer for 5G systems and technologies (S3). In addition to B3, progress has been made by progressive integration of verticals during Phase 2 and then Phase3. Current forecasts for the share of patent by European HQ vendors is of 45.6% for 5G RAN, 29.45% for 5G patents at a global level and a 25.32% for 5G declared standard essential patents in the automotive industry⁴⁷.
- (20) Stimulation of new economically-viable services of high societal value like U-HDTV and M2M applications (S4). Initial results are encouraging with the progressive integration of verticals and the definition of candidate pilots for media usage by NEM-Networld 2020 and of various pilots and use cases in other projects (with some live experience for a few of them). MoUs are signed or under negotiation with several stakeholder groups (see image below).

⁴⁷ To Euro 5G Project - Final Report on 5G PPP KPI progression, July 2019.

(21) Establishment and availability of 5G skills development curricula (in partnership with the EIT) (S5). Around 500 new curricula and educational qualifications among 5G-PPP participants (around 1.25 per participant) were created over the period 2014-2018. 5G IA and EIT are also in discussions.

Highlights from 5G vertical strategy of 5G-PPP

4. ADDITIONAL INFORMATION ON THE PROBLEM DRIVERS

Additional evidence on the key problem drivers are further detailed below.

4.1. Insufficient presence of EU actors in the global digital value chain

As presented above in section 1.2.1, the European current digital ecosystem is not in a very strong or favourable position. This threatens the future European technological sovereignty in not only future smart networks and services as the current players, will be under threats of rising , competition but also those industry segments and society at large - “the verticals” that will need to use the Smart Networks Services, will be subject to increasing competition by their correspondents in other regions.

As presented above in section 1.2.1, the European current digital ecosystem is not a very strong or favourable position. This threatens the future European technological sovereignty in future smart networks and services as current players will be under threats of rising competition.

This problem is further reinforced by two factors:

The smart networks and services field is a sector with a strong R&D intensity, illustrating a high-risk research and innovation process. This puts European players at further risk as sustaining a leading position requires important investment in research and innovation.

The smart networks and services field is a sector that relies heavily on standardization, and ensuring a strong presence in Standardization requires a coordinated approach at the European level to ensure a critical mass of European contributions.

4.2. A fragile position of European actors in the global digital ecosystem

Europe cannot be considered as the leader for the 5G R&D (no specific advantage in terms of 5G technology), but is still a contender and stands out regarding some specific initiatives around verticals:

Europe has major and very active 5G infrastructure manufacturers (Ericsson & Nokia), but the rest of the EU ecosystem developing the R&D is more limited: no smartphone manufacturer, some test equipment manufacturers (Rohde & Schwarz), software players and minor activities for chipsets (Sequans).

Collaboration has started with various industries (Automotive, ports...) in Europe through R&D projects and represent a significant potential for 5G B2B services provision. The relatively strong position of European industry (as presented in section 1.2.1.2) present an opportunity for future European digital ecosystem.

New form factors for devices (such as IoT) might provide an opportunity for Europe to regain a presence in the device industry.

Although satellite is likely to have a limited impact on 5G and beyond 5G research as well as business wise, it should also be noted that Europe has two of the world major satellite manufacturers.

Companies outside Europe participating to European R&D programs are mainly equipment vendors that have R&D laboratories in Europe. Countries present in past R&D programs mainly come from the USA (Intel, Interdigital, IBM...), China (Huawei), Japan (NEC, Mitsubishi) and South Korea (Samsung).

Stakeholder opinion

A key statement coming up from interviews commonly to all categories deals with the position of Europe lagging behind Asia and US. Indeed almost all interviewees mention the need to keep or regain European leadership in the value chain. Indeed, on network infrastructure, interviewees recognize the leadership of Europe with the presence of two mastodons – Nokia and Ericsson. On the rest of the value chain, Europe has lost its position on devices but for most of interviews there could be an opportunity to gain a leadership position on other fields like IoT devices and other emerging technologies like edge computing considered as critical topic. Europe should have the capacity to both support areas where Europe is good at in the value chain and create European alternatives in the whole supply chain.

Also, interviewees from academia categories draw the attention on the necessity to invest more in research in Europe in order to develop its potential, to remain competitive and to avoid shortage of skills and lack of ventures and start-ups.

4.3. High risk R&D reinforces the risks for European actors

Telecommunication equipment is among the sectors that have the highest research intensity, with an average value around 15% and going up to 30% for some actors. This level of R&D intensity is comparable to other R&D intensive sectors such as Pharmaceuticals and Semiconductors and is the sign of a R&D process that involve significant risks and require huge investments.

The table below both illustrate this high research intensity and show the limited presence of European actors in the field.

Appendix C *R&D Intensity of Telecommunication Equipment providers.*

Company	Country	R&D Expense (in USD billions)	Total Revenue (in USD billions)	R&D Intensity (%)
Huawei	China	12,53	85,54	14,6%
Cisco Systems, Inc.	United States	6,06	48,01	12,6%
Nokia Corporation	Finland	5,90	27,79	21,2%
Telefonaktiebolaget LM Ericsson	Sweden	4,63	24,59	18,8%
ZTE Corporation	China	1,99	16,72	11,9%
ARRIS International plc	United States	0,54	6,61	8,2%
Motorola Solutions, Inc.	United States	0,57	6,38	8,9%
Juniper Networks, Inc.	United States	0,98	5,03	19,5%
Fiberhome Telecommunication Technologies Co., Ltd.	China	0,30	3,24	9,3%
Ciena Corporation	United States	0,48	2,80	17,0%
F5 Networks, Inc.	United States	0,35	2,09	16,8%
Palo Alto Networks, Inc.	United States	0,35	1,76	19,7%
Arista Networks, Inc.	United States	0,35	1,65	21,2%
Viasat, Inc.	United States	0,20	1,56	12,9%
Finisar Corporation	United States	0,24	1,45	16,5%
Fujian Star-net Communication Co., Ltd.	China	0,14	1,18	11,9%
NetScout Systems, Inc.	United States	0,22	1,16	18,5%
Lumentum Holdings Inc.	United States	0,15	0,90	16,4%
Viavi Solutions Inc.	United States	0,14	0,81	16,8%
Infinera Corporation	United States	0,22	0,74	30,3%
Datang Telecom Technology Co., Ltd.	China	0,16	0,67	23,9%
ADTRAN, Inc.	United States	0,13	0,67	19,6%
ADVA Optical Networking SE	Germany	0,12	0,62	19,1%
Calix, Inc.	United States	0,13	0,51	25,0%
Ribbon Communications Inc.	United States	0,12	0,33	36,3%

Source: Strategy& PwC, The 2018 Global Innovation 1000 study, analysis of the 1000 largest corporate R&D spenders.

The consultations of the stakeholders' further support this view of a risk prone R&D in the sector, and more importantly that R&D efforts need to be sustained overtime at all stage of the innovation process:

from long-term R&D with low Technology Readiness Levels (TRL) (which prepare future generations of communication equipment and investigate very long term technological vision),

to mid-term R&D (necessary to investigate how identified technology opportunities can transform into potential products),

to short-term R&D (which investigate deployment issues and the future services enabled by the new infrastructure).

Without long term commitment and sustained R&D efforts at all stages of the innovation process, European industry players would take a significant risk of being, in short or long term relegated to secondary players or even disappear.

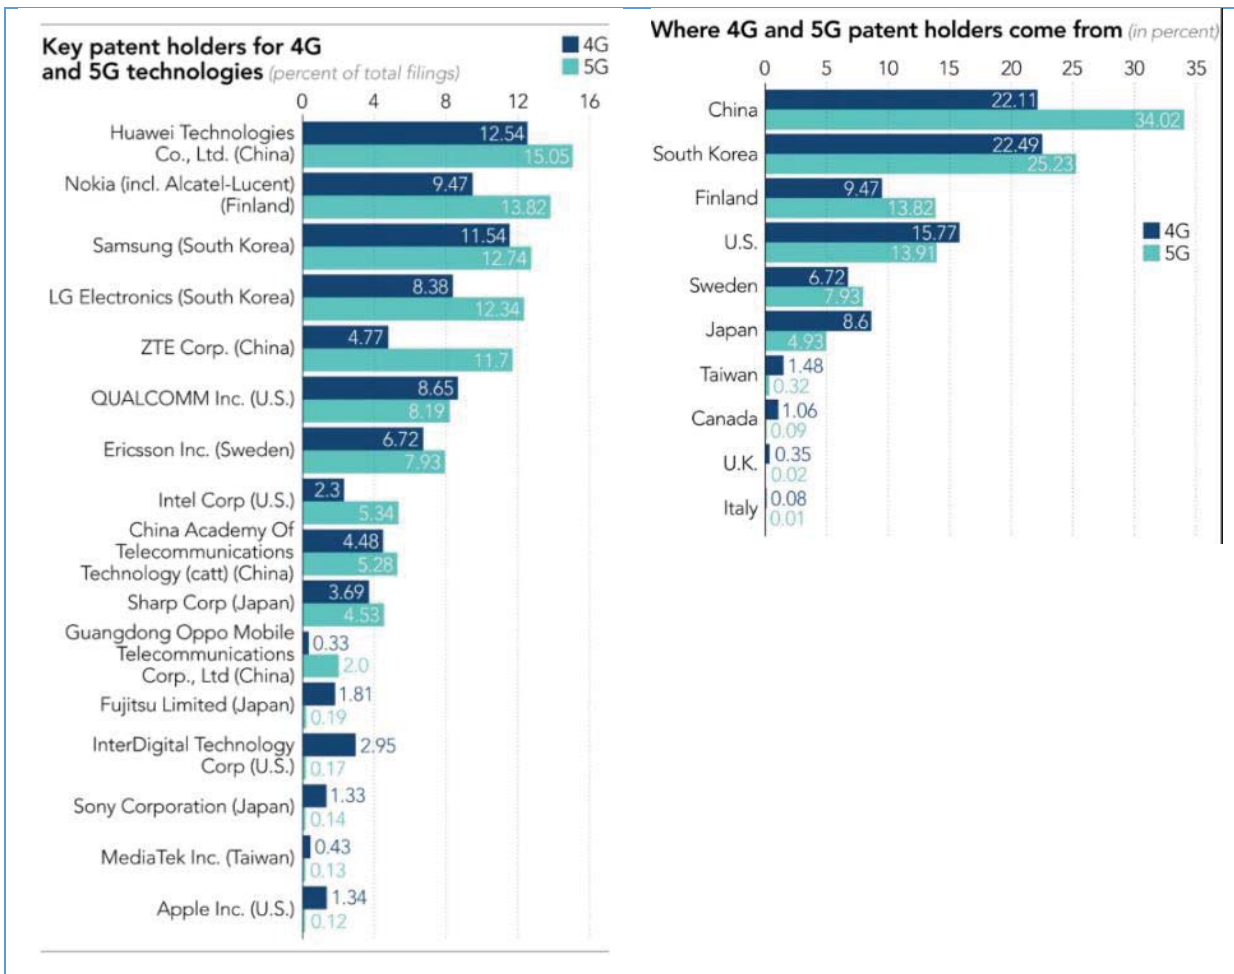

A need for critical mass in standardization

Being in the forefront of standardisation means that those driving standardisation will have a competitive advantage with respect to know how in development but also possibility to file systems and standards blocking (essential) patents and by this being able to position the products and services complying to standards and by this control the market. Generally, those that control the standards arena will have a competitive advantage.

Regarding standardization of 5G: European vendors are at the forefront of contributions to mobile standards. This can be attributed to the dedicated efforts toward standardizations in the 5G-PPP programme. These joint collaborations facilitates submitting standards inputs in a concerted fashion with several partners undersigning and by this creating a European momentum. However, this place remains fragile, and Asia has a strong lead on 5G patents. A lack of future coordinated efforts of European actors in standardization, would lead to lack of the critical mass necessary to sustain the position of Europe.

At the end of March 2019, China had filed for 34% of standard essential patents (SEP) for 5G communication systems, an increase of more than 50% compared with its share of 4G patents, according to IPLytics⁴⁹. South Korea had 25% of key 5G patents, while the share of filings by Japanese and U.S. entities was similar to the one for 4G. As mentioned in Appendix E (analysing KPIs of the 5G-PPP), Europe has around 25% of 5G patents (but more than 50% on RAN), therefore behind China and South Korea.

⁴⁹ IPLytics, *Who is leading the 5G patent race?*, July 2019 available at: https://www.iplytics.com/wp-content/uploads/2019/01/Who-Leads-the-5G-Patent-Race_2019.pdf

Source: Nikkei Asian Review⁵⁰

However, the analysis of essential patents is complicated and an analysis taking into account the number of 3GPP contributions shows that **Nokia and Ericsson rank second and third behind Huawei**. These contributions correspond to work item (WI) or study item (SI) level in the 3GPP standardisation work.

Appendix E *Figure 21: Number of submitted 5G contributions (3GPP) – 2015 to 2018 H1*

⁵⁰ Akito Tanaka, Nikkei Asian Review, *China in pole position for 5G era with a third of key patents*, May 2019, available at: <https://asia.nikkei.com/Spotlight/5G-networks/China-in-pole-position-for-5G-era-with-a-third-of-key-patents>

Source: IHS Markit

In the 3GPP standardisation process between 2015 and the first half of 2018, Nokia and Ericsson had a little bit more than 5000 contributions approved which is more than Chinese vendors Huawei and ZTE.

Appendix F **Figure 22: Number of approved 5G contributions (3GPP) – 2015 to 2018 H1**

Source: IHS Markit

Stakeholder opinion

According to the Open Public Consultation, the potential lack of global standards has been seen as very relevant as a barrier to exploitation according to the majority of stakeholders in the categories of business association, large organization, EU citizen, NGO and public authority.

4.4. Insufficient structural capacity of the EU value chains in responding to requirements set by technological developments for smart networks and services

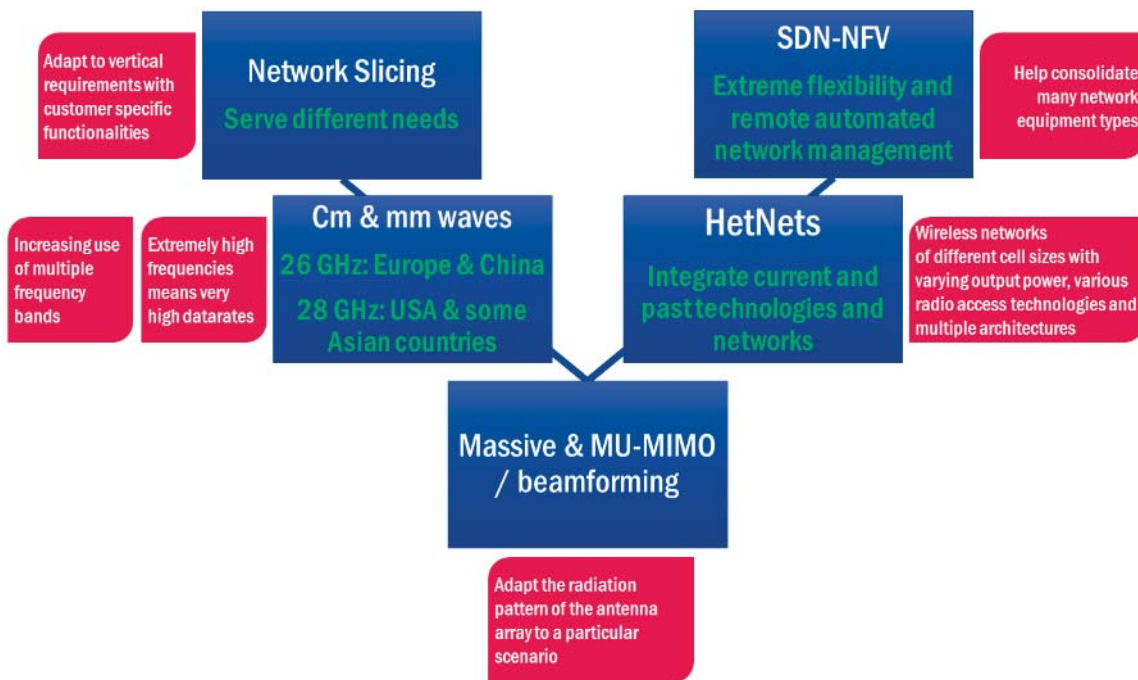

The future smart networks will be an infrastructure relying heavily on advanced digital solutions, that to be developed require the involvement of actors beyond the traditional telecommunication value chain. Furthermore, the services that would be built on top of this infrastructure will have to address the needs of multiple vertical industries (ranging from automotive and manufacturing to transportation, energy, and health). For these industries the future infrastructure and the associated digital services will become critical, which requires their involvement in both defining the requirements and validating its implementation.

4.4.1. A future infrastructure relying heavily on advanced digital solutions

The development of future smart networks and services will require important interactions between the research on future telecommunication networks technologies and other digital technologies. A lack in synergies between these research activities would significantly reduce the potential impact of the initiative.

With 5G, software technologies have taken a critical role in the development of the future generations of telecommunication networks. The development of network slicing and SDN (Software Defined Networks) and NFV (Network Function Virtualization) are key components of the 5G technological stack.

Appendix G **Figure 23: Examples of 5G Technology Enabler**

Source: IDATE DigiWorld, 5G IoT – Market Opportunities in the Vertical Industries, 2018.

This rising importance of software is impacting the research ecosystem of the telecommunication industry. It requires dedicated investment in software technologies, potentially reaching out of the traditional telecom value chain. A primary example of this need to reach beyond traditional research ecosystem is around the question of cybersecurity. A more important role of software in the network architecture increases the importance of research collaborations between cybersecurity players and telecommunication actors.

Furthermore, the development of an infrastructure able to fit the needs of the future “Smart Services” also requires integration and cooperation with other fields of research that reach beyond pure telecom infrastructure research.

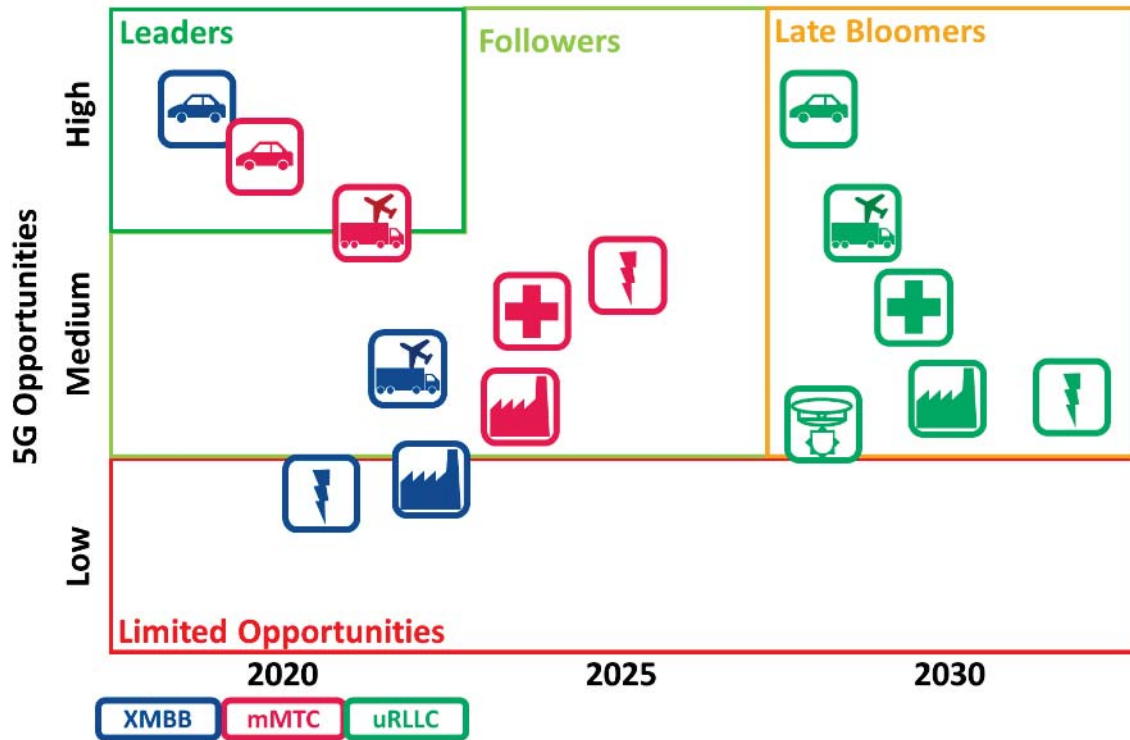

Stakeholder opinion

As such it appears necessary to many stakeholders’ interviewed to ensure that future Smart Networks and Services research is sufficiently connected to research in IoT, but also edge computing, artificial intelligence (especially at the edge of the network), cybersecurity and cloud. These technologies will indeed be essential for the development of the future smart services and will also be directly applied to the network infrastructure themselves.

4.4.2. An infrastructure critical for the adoption of digital solutions in many industries

The future network infrastructure is set to become a critical infrastructure for numerous industries that are transforming themselves by progressively adopting digital technologies. The initial research on 5G (as presented above in section 1) has started to mobilise actors beyond the telecommunication industry and dedicated professional associations (such as the 5G AA and 5G ACIA) have been set-up to facilitate the collaboration between the fields.

Appendix H *Prospects of adoption of 5G in vertical use cases, by sector (Automotive, Transport, Energy, Health, Manufacturing, Public Services) and technologies (eXtended Mobile Broadband, massive Machine Type Communication, ultra-Reliable Low Latency Communications).*

Source: IDATE DigiWorld, 5G IoT – Market Opportunities in the Vertical Industries, 2018.

Future research on 5G, beyond 5G and 6G capabilities will thus have to take into account the requirements from the vertical players. The integration of the players from the vertical industries into Smart Networks and Services research will have to be strengthened. This investment of vertical players is necessary in order to develop both the research on future smart services needed by the various industries to transform themselves and an infrastructure able to meet their requirements.

Stakeholder opinion

The stakeholders interviewed support this vision and insist on the need to have a movement from both the telecommunication industry and the vertical industries to build future smart networks and services and on the necessity of a future programme to encourage such movement. Indeed, vertical industries role is key from the definition of the topics of the research (meeting their requirements) to the evaluation of the technology (applicability) but also in measuring the business approach (value creation) brought by the network technologies.

For the majority of interviewees with no clear distinction of specific category of stakeholders, the involvement of industries is key so that the expansion of the value chain beyond the traditional telecom one is required with notably the integration of vertical players. As a consequence, interviewees insist on the necessity to involve a wide variety of players in the structure of the research program, which is key to understand and to take into account the diversity of verticals' requirements like security, network coverage, energy consumption, ultra-low latency round trip.

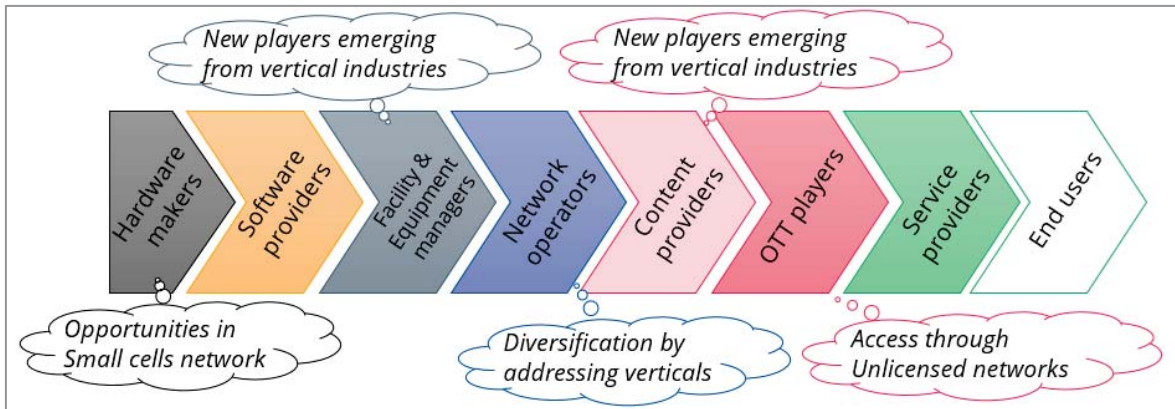

4.4.3. An infrastructure that will require structural changes in various value chains

The telecommunication industry has been characterized by rapid changes triggered by the deregulation of markets, the increased competition and advancing technologies. At the industry level, mobile network operators have traditionally controlled and managed most of the value chain (with the support of OEMs

developing the technologies), but the mobile ecosystem has evolved from a linear relationship into a network of specific companies involved at different stages in the value chain.

The emergence of new modes of communication like 5G is impacting the existing connectivity ecosystem. Indeed, 5G will not only enable new applications and services but also enable more new players to provide connectivity, services and even infrastructure. The virtualisation principle of 5G, for instance, will provide from the end-user perspective a unified network relying on several connectivity providers exploiting various technologies and infrastructures. It can be thus expected that more players will participate in the connectivity value chain.

Appendix I **Opportunities of evolution of the value chain**

Source: IDATE DigiWorld, 5G IoT, November 2018

Current connectivity providers (MNOs, MVNOs) will take the opportunity of these new technologies to try to diversify their offer and address new market segments (in specific verticals, including manufacturing) as a way to compensate declining consumer revenues.

Hardware equipment manufacturers can also see these new technologies as an opportunity to diversify their business modelling bundling equipment with connectivity service provisioning for example in the small cell area.

Some industrial solution providers, and potentially manufacturers, will also play a role in the new communication value chains, not only as content and service providers, but also as connectivity provider, infrastructure providers. The opening of vertical markets will also open up space for existing actors of the wireless industry to target specific roles for vertical industries. The emergence of new possible roles will offer opportunities for both new and existing players within the vertical value chains.

Appendix J **Figure 26: New connectivity business models enabled by 5G**

Source: IDATE DigiWorld, 5G IoT, November 2018

This is reinforced by the integration of direct, proximity communications (such as public safety services or V2V, V2I) in the 5G standards, removing partially or even entirely in some case the need for a mobile operator in the value chain.

These evolutions of the value chain have a potential to disrupt existing businesses, and could threaten established European actors. They could also be seen as opportunities for Europe to reposition its industry and take a larger part in the digital value chain by relying on its strong existing industries. This will require dedicated actions to support the evolution of the European industrial ecosystems and support synergies between industries.

Stakeholder opinion

According to interviewees with no clear distinction of specific category of stakeholders, the value chain needs to evolve with players emerging from vertical industries. It will give the opportunity to provide new business models such as “Anything as a Service” model allowed by new technologies that provide flexible and open infrastructure.

4.5. Too slow and uneven a development of 5G infrastructure

It is important to note that, although deployment issues are clearly beyond the scope of research programme, the investment need for the deployment of future network can strongly impact future research on smart networks and services.

Indeed, an insufficient investment in the deployment of 5G network in Europe would result both in delays in future research on networks by European players (no need to research solutions beyond 5G if 5G is not deploying), and in research on the associated smart services (which require a deployed infrastructure).

Addressing deployment issues, and ensuring synergies between deployment and research activities is thus important to support R&I activities in the field, it is also of critical importance to ensure the development the European digital market.

The current deployment of 5G in Europe suffers from several factors that delay it in comparison to other regions of the world:

- A lack of investment in the deployment of the new infrastructure
- Insufficient synergies between national and European initiatives supporting 5G
- A lack of coordination of spectrum policies

4.5.1. A lack of investment in the deployment of the new infrastructure

The early development of 5G technology shows an increasing competition at the global level on network technologies and deployments of future infrastructure. The current state of play can be seen as a menace for European telecommunication equipment providers.

According to GSMA, a first stage of 5G investments corresponds to early deployments between 2018 and 2020 with \$ 140 billion spent in the USA, South Korea, Japan, and China. It corresponds to two thirds of the global 5G CAPEX. The five largest European countries will contribute for \$30 billion and GCC players will spend roughly \$5 billion.

During the 2021-2023 period, Europe should double its 5G Capex reaching \$ 100 billion as more EU Member States get 5G commercial services. In Asia and in the USA, 5G geographical deployment continue to expand.

After 2024, lagging countries in Latin America, Commonwealth of Independent States Middle East North Africa and other African countries will start to implement 5G infrastructures.

Some mobile operators have already announced their investments in 5G networks for the coming years:

Deutsche Telekom will invest 20 billion EUR in its 5G network for the 2018-2021 period and targets 99% population coverage in 2025.

U.K. operator Three has indicated that it will invest \$2.57 billion in getting ready for 5G.

In South Korea, SKT invested 5 billion USD between 2017 and 2019 to build the first part of its 5G network and KT announced a 5G investment of 20.5 billion USD between 2018 and 2023.

Japanese incumbent, NTT Docomo will spend 8.8 billion USD between 2018 and 2023 on its 5G network. The US mobile operators have awarded multi-year contracts for 5G deployment to Samsung, Ericsson and

Nokia. T-Mobile signed two contracts of \$ 3.5 billion each to Nokia and Ericsson.

It is expected that the Radio Access Network (RAN) will represent 80% of the total CAPEX whereas the core network will amount for 20% of the total.

In China, the share of network equipment awarded to foreign vendors is controlled by the government. Huawei and ZTE are expected to get the lion's share of network equipment for 5G networks in China. Consequently, Nokia and Ericsson are likely to get a lower share of the 5G infrastructure market in China compared to 4G.

China is expected to deploy hundreds of thousands of 5G base stations in the coming years whereas South Korea had already installed more than 90,000 5G base stations in October 2019. Ramp-up is going to be much slower in Europe with only hundreds of 5G base stations installed at the same date. This discrepancy in investment timetables might favour Chinese vendors against European ones.

Appendix K *Mobile capex by region*

Source: GSMA Intelligence

Stakeholder opinion

According to the Open Public Consultation, a very large majority of respondents from the categories of academia, business association, SMEs, large organizations and EU citizen agree on the high relevance to address the innovation gap in the Europe in translating the results of connectivity, cloud and Internet of Things devices research.

This vision is also supported by almost all interviewees in the need from Europe to invest in the development of such technologies but above all to help bringing them to commercialization with trials and development of adapted use cases.

4.5.2. *A lack of synergies between national and European initiatives supporting 5G*

Past activities around 5G have seen the multiplication of initiatives supporting 5G research as well as 5G deployments in Europe at the European, Member States or Local level. These initiatives often miss opportunities for synergies and coordination.

The European 5G Infrastructure Public Private Partnership (5G-PPP) represents a 3.5 Billion investment in 5G with € 700 million of public investment. Public funding for Phase 1 (2014-2016) was €128 million

and it should be noted that overall EU investments from 2007 to 2013 amount to more than €600m in research on future networks, half of which was allocated to wireless technologies contributing to development of 4G and beyond 4G. Phase 2 of the 5G-PPP represented 149 M€ and Phase 3 the remaining budget (423 M€). Work has already started on beyond 5G as 18M€ have been granted by the European Commission for 6 projects.

Many European countries have launched national R&D programmes which are generally restricted to national participants. As an illustration, the table below shows national 5G research & development programs in Finland, Germany, Spain and in the United Kingdom. Even though the share dedicated to 5G cannot be identified exactly, this amount is quite high already in the UK and in Germany.

Appendix L : *National 5G R&D programmes*

Country	National 5G R&D programmes
Finland	Business Finland is a publicly funded expert organisation for financing research, development and innovation in Finland with 467 MEUR of funding in 2016 (including 6 MEUR from EU structural funds) for 3,760 projects. Business Finland pushed the 5thGear program with 200 MEUR funding for 2015-2019.
France	Many R&D projects on 5G financed by the national research agency ANR
Germany	100 MEUR from the “Gigabit Germany Initiative for the Future” 80 MEUR from the “5G Initiative for Germany”
Spain	In March 2019, the Spanish Administration announced it will give €20 million in public funds to two 5G pilot schemes to be carried out by Telefonica and Vodafone
UK	740 MGBP (834 MEUR) to 5G trials and full fibre deployment across the UK by 2020/2021

Source: IDATE DigiWorld

It should be noted that 5G projects financed by national authorities often overlap the research and development thematic covered by European programs.

Even though players involved in national R&D programs and H2020 projects are mainly the same (vendors, universities, operators...), there is a risk of duplication of the financing effort at national and European level. More coordination is needed at European level in order to optimise resources dedicated to 5G research and development.

Stakeholder opinion

According to the Open Public Consultation, the market fragmentation due to lack of industrial policy and implementation strategies is seen as very relevant for R&I efforts at Europe level especially clearly expressed by the majority of SMEs. For the other categories including academics, business association, large organization and EU citizen, the topic remains relevant but at a lesser level.

This vision is in accordance with interviews where they outline the need to make a link between research and deployment, especially requiring a focus on services and supporting use cases very early in the research program. A pragmatic approach is required in order to have the ability to translate innovation in commercialization. Also, many interviewees from different categories of players mentioned how Europe is good at technologies research but should work on business models and value generation. Lastly, interviewees also mention the lack of coordination to target a single market, lack of incentives to take research to commercialization stage and lack of global vision.

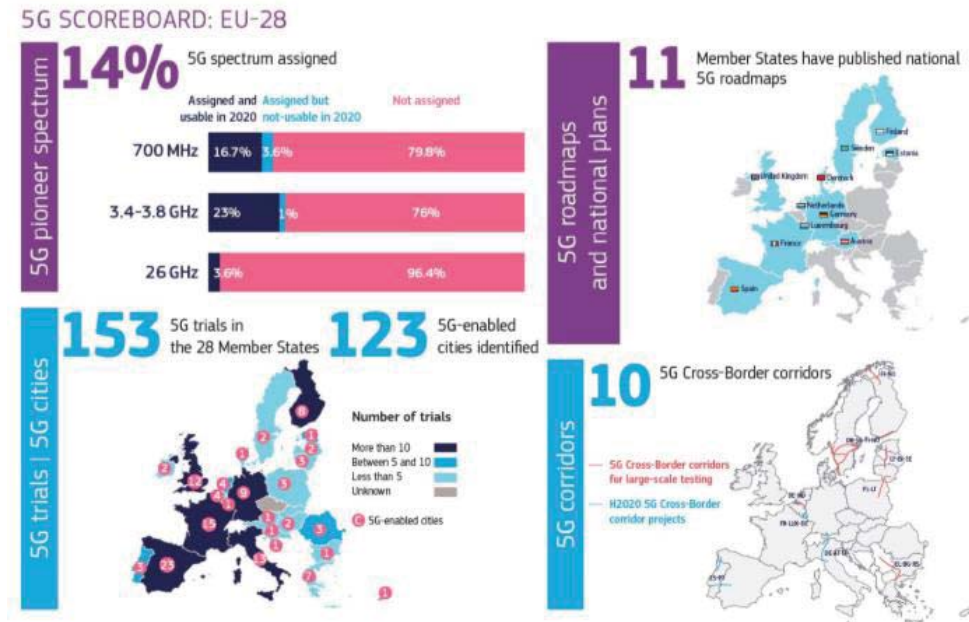

4.5.3. A lack of coordination of spectrum policies

5G pioneer bands identified at EU level are the 700 MHz, the 3.6 GHz (3.4-3.8 GHz) and the 26 GHz (24.25-27.5 GHz) frequencies. Whereas the 700 MHz band has been harmonised through an EC Implementing Decision (EU) 2016(687) of 28 April 2016, a ‘5G-ready’ amendment of the 3.6 GHz

implementing decision has been adopted in January 2019. The European Commission adopted an Implementing Decision to harmonise spectrum in the 26 GHz frequencies in May 2019.

Member States have adopted a common deadline for the effective usability of pioneer spectrum in the European Electronic Communications Code, namely the 3.6 GHz band and at least 1 GHz within the 26 GHz band have to be assigned in all Member States by end of 2020.

Appendix M 5G scoreboard – June 2019

Source: European Commission⁵¹

However, there is no coordination between EU Member States regarding spectrum allocation conditions and at the end of June 2019, only 14.2% of the Pioneer Bands had been assigned in the EU (China is in a similar position). Bands are different in other regions of the world and can therefore not be totally compared. USA has already allocated all its spectrum for low bands, Japan and South Korea have almost allocated all their spectrum for mid and high bands (while Europe is lagging behind).

Lack of coordination of spectrum policies in EU creates uncertainties for the operators. This is already the case for bands as mentioned above. The use of frequency bands above 100 GHz will mean more R&D and more certainty regarding availability timetable for experimentations and future commercial use. A common approach to spectrum allocations is needed in order to limit the risk for the industry, as there is a risk that Member States will use the sales of spectrum as an alternative to general taxation, as has been done in the past.

With combination of verticals, combination of multiple regulatory environments become a challenge, whilst public actors may be called upon to play an increased role considering that many of the targeted verticals (healthcare, automotive/transport..) have a clear public policy dimension, different from broadband which is primarily driven by commercial forces (so regulation is mainly about fair competition, accessibility and consumer protection).

Stakeholder opinion

According to the Open Public Consultation, business associations, SMEs and large organizations find very relevant the regulation in the field of radio spectrum allocation.

⁵¹ European 5G Observatory, 5G Scoreboard, June 2019 <http://5gobservatory.eu/observatory-overview/5g-scoreboards/>

For several interviewees from different categories, a strong coordination in Europe is required for spectrum harmonization involving the implication of Member States very early in the program. Indeed the spectrum fragmentation in cost and allocation is seen as a key issue (very irregular depending on the countries).

4.6. Insufficient capacity of 5G to respond to advanced communication requirements

Future digital use cases such as super-immersive multimedia and super-high definition video, massive scale communications (IoT) for anything and anywhere, use cases requiring super-precision 3D positioning, and XR experience (AR+VR+MR) will have very demanding telecommunication requirements that exceed the foreseen capabilities of 5G, even in its most advanced roadmaps.

These future use cases include:

Super-immersive multimedia and super-high definition video: going from 8K to 64 K video, with the integration of sensing, imaging and highly accurate positioning capabilities with mobility to enable the provision of new applications. The development of Five-dimension (5D) services, integrating all human sense information (sight, hearing, touch, smell and taste) is in early development and should be available in about 10 years from now. It will provide a truly immersive experience and new services such as telepresence.

Holographic telepresence: Within a 10 year's timeframe, new forms of interaction will become possible leading to a true immersion into a distant environment. Holographic communications, using multiple-view cameras, will require data rates in the order of Tbps, which are not supported by 5G.

XR Experience (AR+VR+MR): XR reality encompasses virtual reality (VR), augmented reality (AR) and mixed reality (MR). Future devices will include haptic interfaces, earphones, glasses and wearable displays that will replace smartphones and provide a totally new user experience.

Massive-scale communications (IoT) for anything and anywhere: 6G networks will support extreme massive connectivity, with more than 500 billion connected things are expected worldwide by 2030. 6G will target capacity expansion to offer high throughput and continuous connectivity. Wider coverage is also planned, including bringing connectivity at sea and in the air.

Smart City: The objectives are improvements of life quality, environmental monitoring, traffic control and city management automation. 6G smart city applications will include support for user-centric M2M communication and use low-cost and low-energy consuming sensors that will interact with each other. Autonomous vehicles will combine wireless networks, sensing and distributed AI.

Use cases requiring super-precision 3D positioning: Many use cases will require super-precision 3D positioning such as commercial UAVs, ground-robotics navigation, lane-level navigation, industrial navigation and tracking, and heavy-machine navigation. 6G will foster the Industry 4.0 revolution and will see new semiconductor and integrated circuit innovations.

Based on this long-term perspective, the early requirement of future communication networks are starting to appear. Some of them can be considered as extensions of 5G requirements, but other are clearly disruptive, requiring major evolutions beyond the state of the art.

Appendix N *5G and 6G technology requirements*

KPI	5G	6G
Traffic capacity	10 Mbps/m ²	~1-10 Gbps/m ³
Peak data rate DL	20 Gbps	1 Tbps
Peak data rate UL	10 Gbps	1 Tbps
Uniform user experience	50 Mbps 2D everywhere	10 Gbps 3D everywhere
Latency (radio interface)	1 msec	0.1 msec
Jitter	Not specified	1 micro second
Reliability (frame error rate)	10 ⁻⁵	10 ⁻⁹
Energy/bit	Not specified	1 pJ/bit
Localisation precision	10 cm on 2D	1 cm on 3D

Legend: evolution, disruptive

Source: IDATE DigiWorld based on *6G - The Next Frontier*, 2019, Emilio Calvanese Strinati, et al., *6G: So, what happens in 2030?*, November 2019

Reaching these future requirements, will require new technological paradigms through the use of spectrum in the THz range (frequencies from 300 GHz to 10THz), innovations in semiconductors, optics and new materials, through a new architecture combining computation and communication resources, and relying heavily on artificial intelligence and machine learning. Energy-efficient communication strategies are also expected to become increasingly important, especially in view of a pervasive deployment of the Internet of Things, with myriads of tiny sensors. Energy harvesting mechanisms and advanced wireless-charging technologies will be developed with a focus on laser-charging techniques (potential of delivery of 2W of power up to a distance of about 10 metres).

Stakeholder opinion

According to respondents from both the Open Public Consultation and interviews, and for a high proportion of SMEs, there is an agreement on the necessity to enlarge the technological scope of the research program beyond 5G. Typically, in order to address critical applications, security should be addressed as well as a wide array of technologies including network intelligence, network automation, network softwarisation, network slicing, edge computing, cybersecurity, machine learning, Artificial Intelligence, IoT, robotics, high performance computing...

4.7. Increasing challenges of digital services toward ethics privacy and cybersecurity

The development of digital services in recent years has seen the rise of several challenges for EU citizen regarding their privacy, data protection, cyber security or more generally ethical concerns.

Several fundamental human principles can be challenged by the development of future smart networks and services, such as:

Identity and Reputation: Several innovative smart services challenges the notions of Identity (relation that one bears to oneself) and of Reputation (relation that others bears to oneself). The limitation of digital technologies to define rationally such notions that are, by human nature, multiple, complex and changing raises several challenges. From the right to be forgotten to the right to have complex and evolving identities that cannot rely on a single online or offline identity. As future smart services are likely to more and more store but also increasingly generate automatically (through profiling and

presentation) identities and reputation, serious challenges can be envisioned on the definition of human identity and reputation. The rise in profiling approach and the rising use of digital profile as a basis for real life services and interactions, and technologies such as Artificial Intelligence can be seen as threatening these human fundamental notions.

Relationships: Digital services based relationships also face the same danger as identity: to try to define rationally, in a Boolean approach the complexity and evolving nature of human relationships. The rise of digitally mediated relationships questions the future of human relationships as physical interactions and non-verbal language, key to human interactions, are for now mostly left out of digital relationships. Concerns can be raised both for those who are left out of the online conversation and for those for which the online conversation replace to a large extent real relationships. Questions of how to consider and handle relationships with purely digital avatars will also have to be handled as such relationships, once considered as farfetched science fiction become closer and closer to our reality.

Culture: The disappearance of traditional boundaries of time and space enabled by smart networks and services is fuelling the definition of ever multiplying alternative cultures as group cutting across traditional boundaries come to define their own set of symbols and values that are coherent and meaningful in their understanding. At the same time the rapid ubiquitous communication mechanisms offered by new digital services enable the rapid spread of cultural elements. The application of evolutionary principles to cultural elements shows that faced to this increased creativity and competition traditional cultural elements could be put to risk. The human impact of putting cultures at risks, with the risk of violent reaction and protective isolative move is a serious challenge.

Motivation and Attention: The collective data and knowledge production, publication, archiving and research capacity has since long far exceeded the human brain ability to process it. This raises serious challenges to both human attention (capacity to freely focus) and human motivation (capacity to freely choose on which information to process).

Responsibility: The rising complexity of digital systems, often based on networks and sometimes decentralized, combined with the multiple roles of stakeholders result in near to impossible attribution of responsibilities in case of failure, error, or denegation of complex digital services. This will have stronger and stronger consequences as such systems get more complex and more intertwined with Physical devices in the vertical industries. Difficulty to attribute responsibility raises the double risk of either putting too much constraint on smart services providers, and therefore impeding innovation capacity, or to the contrary that the risk entirely reposes on end users.

Fairness: The existing risk of “Digital divide” can in a near future be significantly increased both in scale and impact. The differences in access to future network infrastructure and digital services, is being reinforced in a knowledge divide, which create the risk of a 2 speed society with a strong divide between those who master and understand digital technologies and their impact on society and life and those who don't. Additionally, questions of fairness, linked with responsibility, of automated decisions and algorithms will have to be raised. The intentions, and views of the world of the designer are embedded in every creation, therefore the fairness of the decisions can always be questioned even for supposedly neutral and machine automated choices.

Safety and Privacy: Safety concerns are on the rise as digital technologies are having a stronger and stronger impact on everyday lives not only in online world but also increasingly offline. The rise of privacy concerns is also a well-documented risk as personal data collection; archiving, processing, transfer becomes the norm in many digital scenarios. Although these two notions are for now well covered by regulations, past example shows that these regulations were often put into place after the technology development, and that future development could challenge the status quo.

Stakeholder opinion

The relevance of this topic has been asked among stakeholders through the Open Public Consultation especially regarding the concerns with using Smart Networks and Services platforms for ethical, privacy, security, or EMF reasons. For a majority of respondents in several categories including academia, SMEs, large organizations, EU citizen the topic is evaluated as very relevant. For business association and public authority, the topic is seen as relevant but at a lower degree (which can be taken as a hint that this issue is unlikely to resolve only through market dynamics).

4.8. Lack of energy efficient technological solutions for future network infrastructures

The development and deployment of any infrastructure at a European scale will require significant energy consumption, resulting in increased emissions of greenhouse gases. Beyond this simple fact, the current lack of energy efficient technological solutions for future smart networks and services raise a significant threat in term of future energy consumption throughout the lifespan of the infrastructure.

Current feedbacks on the deployment of early 5G networks points toward an increase in energy consumption of the network. Furthermore, the development of new solutions, such as Edge Computing, that are likely to complement rather than replace cloud-based solutions will result in the deployment of additional computing resources, with increased energy consumption.

Current perspective on the electricity consumption of mobile network generation point to several years of steep growth of the energy consumption of new networks while legacy solution decreases slowly as they are rolled back.

Appendix O *Expected electricity usage of wireless networks*

Source: Symetry/MDPI⁵²

About 80% of the energy consumption in a network is due to base stations. In a recent whitepaper⁵³, Huawei indicates that “According to the measured data of multiple operators, the power consumption of one band 5G equipment (64T64R, 3.5 GHz Massive MIMO, including one BBU and three AAU/RRUs) is 300% to 350% of 4G with the same configuration. A 5G BBU is about 300 W while an AAU is about 900 W at 30% load rate (peak is about 1200 W to 1400 W).”

⁵² <https://www.mdpi.com/2073-8994/11/3/408/pdf>

⁵³ <https://carrier.huawei.com/~media/CNBBG2/download/products/network-energy/5G-Telecom-Energy-Target-Network-White-Paper.pdf>

Appendix P *Power consumption of frequency evolution*

Source: Huawei.

Furthermore, beyond energy issues, the development and deployment of a new infrastructure, as well as the development of new services requiring new devices (including new forms of devices, such as advanced AR/VR solutions or IoT devices) will require the extraction and transformation of primary resources that is very likely to have negative impacts on local environments.

As such and without a specific attention to mitigate these effects, the development of a future smart networks and services is likely to have major environmental impacts, which may not be compatible with other engagements and policies of the European Union and its Member States.

Stakeholder opinion

Based on interviews, this topic is especially seen as primordial for the category of verticals who mention the importance of energy evoking the need to reduce energy consumption as well as the ability to use renewable energies (with the suggestion of new regulation).

This is a cross-referenced vision with the Open Public Consultation in which drastically reducing energy consumption of future smart network and service platforms is seen as very relevant for a couple of categories including academia, SMEs, large organizations, EU citizen and public authority; only the category of business association finds the issue at a lesser level of relevance.

5. ADDITIONAL INFORMATION ON POLICY OPTIONS

Degree of coverage of the different functionalities by policy option

Type and composition of actors (including openness and roles)

Option 0: Horizon Europe calls	Option 2: Co-funded	Option 3: Institutionalised Art 185	Option 1: Co-programmed	Option 3: Institutionalised Art 187
<p>What is possible? Any legal entity in a consortia can apply to Horizon Europe calls in ad hoc combinations</p> <p>Calls are open to participation from across Europe and the world (not all entities from third countries are eligible for funding)</p> <p>What is limited? Systematic/ structured engagement with public authorities, MS, regulators, standard making bodies, foundations and NGOs.</p> <p>What is not possible? To have a joint programme of R&I activities between the EU and committed partners that is implemented based on a common vision.</p>	<p>What is possible? Partners can include any national funding body or governmental research organisation, Possible to include also other type of actors, including foundations.</p> <p>What is limited? Requires substantial national R&I programmes (competitive or institutional) in the field. Usually only legal entities from countries that are part of the consortia can apply to calls launched by the partnership, under national rules.</p> <p>What is not possible? To have industry/ private sector as partners.</p>	<p>What is possible? Partners can include MS and Associated Countries.</p> <p>What is limited? Non-associated third countries can only be included as partners if foreseen in the basic act and subjected to conclusion of dedicated international agreements. Needs good geographical coverage – participation of at least 40% of Member States is required Requires substantial national R&I programmes (competitive or institutional) in the field.</p> <p>While by default the FP rules apply for eligibility for funding/participation, in practice (subject to derogation) often only legal entities from countries that are Participating States can apply to calls launched by the partnership, under national rules.</p> <p>What is not possible? To have industry/ private sector as partners.</p>	<p>What is possible? Suitable for all types of partners: private and/or public partners, including MS, regions, foundations. By default open to AC/ 3rd countries, but subject to policy considerations. Can cover a large and changing community. HE rules apply by default to calls included in the FP Work Programme, so any legal entity can apply to these.</p> <p>What is limited? If MS launch calls under their responsibility, usually only legal entities from countries that are part of the consortia can apply to these, under national rules</p> <p>What is not possible?</p>	<p>What is possible? Suitable for all types of partners: private and/or public partners, including MS, foundations. By default open to legal entities from AC/ 3rd countries, but subject to policy considerations. In case of countries participating: non-associated third countries can only be included as partners if foreseen in the basic act and subjected to conclusion of dedicated international agreements HE rules apply by default, so any legal entity can apply to partnership calls.</p> <p>What is limited? Requires a rather stable set of partners (e.g. if a sector has small number of key companies).</p> <p>Basic act can foresee exceptions for participation in calls / eligibility for funding.</p> <p>What is not possible?</p>

Type and range of activities (including flexibility and level of integration)

Option 0: Horizon Europe calls	Option 2: Co-funded	Option 3: Institutionalised Art 185	Option 1: Co-programmed	Option 3: Institutionalised Art 187
<p>What is possible? Horizon Europe standard actions that allow <i>broad range of individual activities</i> from R&I to TRL 7 or sometimes higher. Calls for proposals published in the Work Programmes of Horizon Europe (adopted via comitology).</p> <p>What is limited? What is not possible? To design and implement in a systemic approach a portfolio of actions. To leverage additional activities and investments beyond the direct scope of the funded actions</p>	<p>What is possible? Activities may range from R&I, pilot, deployment actions to training and mobility, dissemination and exploitation, but according to national programmes and rules. Decision and implementation by “beneficiaries” (partners in the co-fund grant agreement) e.g. through institutional funding programmes, or by “third parties” receiving financial support, following calls for proposals launched by the consortium.</p> <p>What is limited? Scale and scope of the programme the resulting funded R&I actions and depend on the participating programmes, typically smaller in scale than FP projects</p>	<p>What is possible? Horizon Europe standard actions that allow a broad range of coordinated activities from R&I to uptake. In case of implementation based on national rules (subject to derogation) Activities according to national programmes and rules. Allows integrating national funding and Union funding into the joint funding of projects</p>	<p>What is possible? <i>Horizon Europe standard actions</i> that allow a broad range of coordinated activities from R&I to uptake. The association representing private partners allows to continuously build further on the results of previous projects, including activities related to regulations and standardisation and developing synergies with other funds Union contribution is implemented via calls for proposals published in the Work Programmes of Horizon Europe based on the input from partners (adopted via comitology). Open and flexible form that is simple and easy to manage.</p> <p>What is limited? Limited control over precise call definition, resulting projects and outcomes, as they are implemented by EC agencies.</p>	<p>What is possible? <i>HE standard actions</i> that allow to build a portfolio with broad range of activities from research to market uptake. The back-office allows dedicated staff to implement integrated portfolio of projects, allowing to build a “system” (e.g. <i>hydrogen</i>) via pipeline of support to accelerate and scale up the take-up of results of the partnership, including those related to regulations and standardisation and developing synergies with other funds. E.g. setting up biorefinery plants and promoting their replication by additional investments from MS/private sector. Procuring/purchasing jointly used equipment (e.g. HPC) Allows integrating national funding and Union funding into the joint funding of projects</p> <p>What is limited? Limited flexibility because objectives, range of activities and partners are defined in the Regulation, and negotiated in the Council (EP).</p>

Directionality

Option 0: Horizon Europe calls	Option 2: Co-funded	Option 3: Institutionalised Art 185	Option 1: Co-programmed	Option 3: Institutionalised Art 187
<p><i>What is possible?</i></p> <p>Strategic Plan (as implementing act), annual work programmes (via comitology). Possible also to base call topics on existing or to be developed SRIA/roadmap</p> <p><i>What is limited?</i></p> <p>No continuity in support of priorities beyond the coverage of the strategic plan (4 years) and budget (2 years Annual work programme).</p> <p><i>What is not possible?</i></p> <p>Coordinated implementation and funding linked to the concrete objectives/roadmap, since part of overall project portfolio managed by agency</p>	<p><i>What is possible?</i></p> <p>Strategic R&I agenda/roadmap agreed between partners and EC</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Objectives and commitments are set in the Grant Agreement.</p>	<p><i>What is possible?</i></p> <p>Strategic R&I agenda/roadmap agreed between partners and EC</p> <p>Objectives and commitments are set in the legal base.</p> <p>Annual work programme drafted by partners, approved by EC</p> <p>Commitments include obligation for financial contributions (e.g. to administrative costs, from national R&I programmes).</p>	<p><i>What is possible?</i></p> <p>Strategic R&I agenda/roadmap agreed between partners and EC</p> <p>Objectives and commitments are set in the contractual arrangement.</p> <p>Input to FP annual work programme drafted by partners, finalised by EC (comitology)</p> <p>Commitments are political/best effort, but usually fulfilled</p>	<p><i>What is possible?</i></p> <p>Strategic R&I agenda/roadmap agreed between partners and EC</p> <p>Objectives and commitments are set in the legal base.</p> <p>Annual work programme drafted by partners, approved by EC (veto-right in governance)</p> <p>Commitments include obligation for financial contributions (e.g. to administrative costs, from national R&I programmes).</p>

Coherence (internal and external)

Option 0: Horizon Europe calls	Option 2: Co-funded	Option 3: Institutionalised Art 185	Option 1: Co-programmed	Option 3: Institutionalised Art 187
<p>What is possible? Coherence between different parts of the Annual Work programme of the FP ensured by EC</p> <p>What is limited? Synergies with other industrial strategies</p> <p>What is not possible? Synergies with national/regional programmes and activities</p>	<p>What is possible? Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and EC</p> <p>Synergies with national/regional programmes and activities</p> <p>What is limited? Synergies with other programmes or industrial strategies</p> <p>What is not possible? Synergies with national/regional programmes and activities</p>	<p>What is possible? Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and EC</p> <p>Synergies with national/regional programmes and activities</p> <p>Synergies with other programmes</p> <p>What is limited? Synergies with industrial strategies</p> <p>What is not possible? Synergies with industrial strategies</p>	<p>What is possible? Coherence among partnerships and with different parts of the Annual Work programme of the FP can be ensured by partners and EC</p> <p>If MS participate: Synergies with national/regional programmes and activities</p> <p>Synergies with industrial strategies</p> <p>What is limited? Synergies with other programmes</p> <p>What is not possible? Synergies with other programmes</p>	<p>What is possible? Synergies with other programmes</p> <p>What is not possible? Synergies with other programmes</p>

6. ADDITIONAL INFORMATION ON GREEN DEAL ISSUES

This annex provides additional information on the Smart Networks and Services (SNS) initiative in relation to the carbon neutral objectives of Europe, as set out in the Green Deal initiative of the Commission. It suggests the need for an extended stakeholder base to reach these ambitious objectives, in view of the fast growing demand of users and industries for connected ICT services

SNS are expected to directly contribute to two key Sustainable Development Goals directly related to energy efficiency and reduction of carbon footprint: SDG 11 on sustainable cities and communities, and SDG 13 on Climate Actions. The targeted impact of SNS is twofold: i) SNS supports energy efficiency improvements of “vertical industries” using SNS to implement their digital business process; ii) drastic reduction and decarbonisation of the energy used for the operations of SNS platforms;

a) Energy savings enabled by SNS platforms

SNS has the potential to optimise the business processes of multiple industrial sectors through tight integration into their digital processes. It can hence enable energy savings and lowering of carbon footprint in other sectors. Already today, the GSMA and the Carbon Trust calculated that the use of mobile technology enabled a global reduction in emissions of around 2,135 million of tons CO₂e in 2018⁵⁴ (global emission level in the order of 55000 millions of tons). These emissions savings were almost ten times greater than the global carbon footprint of the mobile industry itself.

Figure 1 below shows the ICT and connectivity gains that could apply to a number of sectors as analysed by GeSI⁵⁵. It shows a potential gain of 12,100 millions of tons of CO₂ in 2030, which is the extra emission expected over the period. In that context, SNS would contribute to keep the carbon footprint of these sectors constant, rather than significantly increasing over the period.

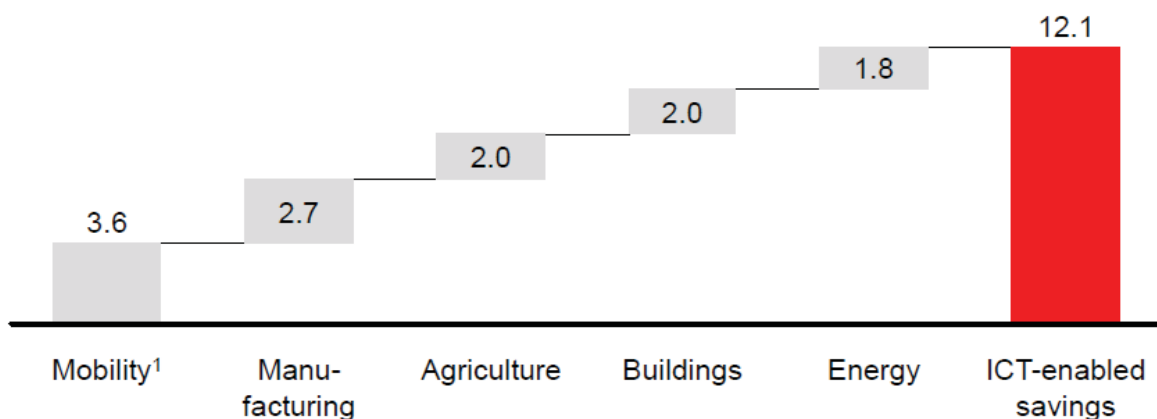

Figure 1, expected CO₂ abatement potential per sector.

⁵⁴ <https://www.gsma.com/newsroom/press-release/mobile-technologies-enabling-huge-carbon-reductions-in-response-to-climate-emergency/>

⁵⁵ Global eSustainability Initiative

Figure 2 shows the abatement potential of ICT for a number of use cases as also analysed by GeSI, with a 2030 timeline. These are based on conservative estimate not taking into account the future advanced capabilities of SNS platforms. For this reason, the SNS initiative has set itself an objective of 20 to 30 % energy reduction in at least two key industrial sectors, automotive and factories being identified at this stage. Reaching these objectives will require a clear involvement of the target industries, and the setup of pan European trials with Member States infrastructures in a number of cases (automotive, energy..)

b) Energy efficiency of SNS platforms

The telecommunications sector accounts for roughly 4% of global electricity consumption⁵⁶. As explained in the core text, energy consumption of network platforms are set to increase over the next decade by a factor of about 10 if no specific action is undertaken. Several factors are contributing to such an increase:

- the continued growth of mobile traffic, with typical yearly growth rate between 50% and 100% as data usages get popular and high performance 4G networks get available;
- the densification of networks. This is a long term trend that will shift power consumption patterns from transmission towards computing. Today, the main source of energy consumption of mobile networks is in the radio access transmission, i.e. transporting information from the user device/smartphone to the access radio Base Station. This represents about 70 to 80% of the total energy consumption. Future networks will deploy much denser radio access points, closer to the users, to optimise capacity and reduce network latency. This

⁵⁶ 5G PPP Metro Haul project White Paper:“Optics Research for Future Smart Networks and Services”, January 2020, developed by British Telecom, ADVA, Lexcens, University Politecnico de Catalunya, Fraunhofer HHI.

has two impacts: i) the device being closer to the radio access point, the needed transmitted power decreases; ii) as the device gets connected to many more access points during a mobile session, the computing power increases. As the need to process information closer to the user increases, computing becomes dominant in the energy consumption pattern of both the network and the device⁵⁷.

This evolution is well understood by the community and considered unsustainable in the longer term, and non-compatible with the objectives of the Paris agreement, to cap temperature increase at 1,5° maximum. In that context, the industry has already taken steps to drastically reduce energy consumption and carbon footprint, as exemplified by the release of the science-based pathway to reduce Greenhouse Gas (GHG) emissions across the telecoms sector⁵⁸. This supports the GSMA's commitment to helping the mobile industry achieve Net Zero carbon emissions by 2050.

The new Science-Based Target (SBT) is the result of a collaboration between the International Telecommunication Union (ITU, the telecom agency of the United Nations), the Global eSustainability Initiative (GeSI), the GSM Association (GSMA), and the Science Based Target initiative⁵⁹ (SBTi) to develop a sector-specific decarbonisation pathway that allows ICT companies to set targets in line with the latest climate science. It includes emissions reductions trajectories for mobile, fixed and data centre operators to meet the Paris Agreement goal of limiting global warming to 1.5°C, designed to substantially reduce the risks and effects of climate change.

The SBT sets emissions trajectory reductions over the decade (2020-2030) for each ICT sub-sector. Mobile network operators adopting the SBT are required to reduce emissions by at least 45 per cent over this period. The initiative is based on an extended use of renewables for SNS platforms that will help to reduce carbon footprint. The SNS initiative is designed to support these industry objectives and to extend them further by a reduction of the energy needs of the infrastructure itself, targeted to 1/10 compared to the planned evolution. This later objective would keep energy needs of SNS platforms comparable to those of 2015, an objective considered as possible by GeSI for other industrial sectors⁶⁰ supported by SNS. Therefore, SNS sets an objective that is in line with that of other industrial sectors.

Reaching this objective requires a full value chain perspective, as energy consumption is diversely spread over terminals/device, network, and computing platform as described above. Therefore, SNS will develop energy consumption models, technologies and architectures enabling to decrease energy footprint of these platforms in line with the above objectives, as part of its R&I and industrial roadmap.

PART 1 - COMMON FOR ALL CANDIDATE INSTITUTIONALISED EUROPEAN PARTNERSHIPS

1. BACKGROUND AND CONTEXT TO EUROPEAN PARTNERSHIPS IN HORIZON EUROPE AND FOCUS OF THE IMPACT ASSESSMENT– WHAT IS DECIDED

[Note that the part dedicated to the Partnership on Transforming Europe’s rail system starts on page 26.]

1.1. Focus and objectives of the impact assessment

This impact assessment accompanies the Commission proposal for Institutionalised European Partnerships to be funded under Horizon Europe, the 2021-2027 Framework Programme for EU Research and Innovation (R&I).¹ It sets out to **help decide in a coordinated manner the right form of implementation for specific candidate initiatives** based on a common approach and methodology to individual assessments². It also provides an **horizontal perspective on the portfolio of candidate European Partnerships** to identify further efficiency and coherence gains for more impact.

European Partnerships are initiatives where the Union, together with private and/or public partners (such as industry, public bodies or foundations) commit to support jointly the development and implementation of an integrated programme of R&I activities. The rationale for establishing such initiatives is to achieve the objectives of Horizon Europe more effectively than what can be attained by other activities of the programme.³

Based on the Horizon Europe Regulation, European Partnerships may be set up using **three different forms**: “Co-funded”, “Co-programmed” and “Institutionalised”. The setting-up of **Institutionalised Partnerships** involves new EU legislation and the establishment of dedicated implementing structures based on Article 185 or 187 of the Treaty on the Functioning of the EU (TFEU). This requires an impact assessment to be performed.

The Horizon Europe Regulation defines **eight priority areas**, scoping the domains in which Institutionalised Partnerships could be proposed⁴. Across these priority areas, **13 initiatives** have been identified **as suitable candidate initiatives** for Institutionalised Partnerships because of their objectives and scope. This impact assessment aims to identify whether 12 of these initiatives⁵ need to be implemented through this form of implementation and would not deliver equally well with traditional calls of Horizon Europe or other lighter forms of European Partnerships under Horizon Europe. This means assessing whether each of these initiatives meets the necessity test set in the **selection criteria** for European Partnerships in the Horizon Europe Regulation, Annex III.

¹ Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

² Based on the European Commission Better Regulation framework (SWD (2017) 350) and supported by an external study coordinated by Technopolis Group (to be published in 2020).

³ For further details on these points, see below Section 1.2.2.

⁴ Set out in the Annex Va of the Horizon Europe Regulation (common understanding), <https://data.consilium.europa.eu/doc/document/ST-7942-2019-INIT/en/pdf>

⁵ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47).

This assessment is done **without any budgetary consideration**, as the overall budget of the Multiannual Financial Framework of the EU – and hence of Horizon Europe – for the next financing period is not known at this stage.⁶

1.2. The political and legal context

1.2.1. Shift in EU priorities and Horizon Europe framework

European priorities have evolved in the last decades, and reflect the social, economic, and environmental challenges for the EU in the face of global developments. In her Political Guidelines for the new European Commission 2019 – 2024⁷, the new Commission President put forward six overarching priorities, which reach well beyond 2024 in scope⁸. Together with the Sustainable Development Goals (SDGs), these priorities will shape future EU policy responses to the challenges Europe faces, and thus also give direction to EU research and innovation.

As part of the Multi-annual Financial Framework (MFF) 2021-27 the new EU Framework Programme for Research and Innovation **Horizon Europe will play a pivotal role for Europe to lead the social, economic, and environmental transitions needed to achieve these European policy priorities**. It will be more impact driven with a strong focus on delivering European added value, but also be more effective and efficient in its implementation.⁹ Horizon Europe finds its rationale in the daunting challenges that the EU is facing, which call for “*a radical new approach to developing and deploying new technologies and innovative solutions for citizens and the planet on a scale and at a speed never achieved before, and to adapting our policy and economic framework to turn global threats into new opportunities for our society and economy, citizens and businesses.*” While Horizon Europe continues the efforts of strengthening the scientific and technological bases of the Union and foster competitiveness, a more strategic and impact-based approach to EU R&I investment is taken. Consequently, the **objectives of Horizon Europe** highlight the need to *deliver on the Union strategic priorities and contribute to the realisation of EU objectives and policies, contribute to tackling global challenges, including the Sustainable Development Goals by following the principles of the Agenda 2030 and the Paris Agreement*.¹⁰

In this context, **at least 35 % of the expenditure from actions under the Horizon Europe Programme will have to contribute to climate action**. Furthermore, a **Strategic Plan** is co-designed with stakeholders to identify **key strategic orientations for R&I support** for 2021-2024 in line with the EU priorities. In the Orientations towards the first Strategic Plan

⁶ EU budget commitments to the European Partnership candidates can only be discussed and decided following the political agreement on the overall Multiannual Financial Framework and Horizon Europe budgetary envelopes. The level of EU contribution for individual partnerships should be determined once there are agreed objectives, and clear commitments from partners. Importantly, there is a ceiling to the partnership budgets in Pillar II of Horizon Europe (the legal proposal specifies that *the majority of the budget in pillar II shall be allocated to actions outside of European Partnerships*).

⁷ https://ec.europa.eu/info/strategy/priorities-2019-2024_en

⁸ 1.A European Green Deal; An economy that works for people; A Europe fit for the Digital Age; Promoting our European way of life; A Stronger Europe in the World; and 6.A New push for European Democracy

⁹ EC (2018) *A Modern Budget for a Union that Protects, Empowers and Defends. The Multiannual Financial Framework for 2021-2027*. Communication from the Commission to the European Parliament, the European Council, the Council, the European Economic and Social Committee and the Committee of the Regions, COM(2018) 321 final

¹⁰ Article 3, Common understanding regarding the proposal for Horizon Europe Framework Programme.

for Horizon Europe, the need to strategically prioritise and “*direct a substantial part of the funds towards the areas where we believe they will matter the most*” is emphasised. The Orientations specify, that actions under Pillar II of Horizon Europe “Global Challenges and European Industrial Competitiveness” will target only selected themes of especially high impact that significantly contribute to delivering on the political priorities of the Union. Most of the candidate European Partnerships fall under this Pillar.

1.2.2. *Key evolutions in the approach to partnerships in Horizon Europe*

Since their start in 1984 the successive set of Framework Programmes uses a variety of instruments and approaches to support R&I activities, address global challenges and industrial competitiveness. Collaborative, competition-based and excellence-driven R&I projects funded through Work Programmes are the most traditional and long-standing approach for implementation. Since 2002, available tools also include **partnerships**, whereby the Union together with private and/or public partners commit to jointly support the development and implementation of a R&I programme. These were introduced as part of creating the European Research Area (ERA) to align national strategies and overcome fragmentation of research effort towards an increased scientific, managerial and financial integration of European research and innovation. Interoperable and integrated national research systems would allow for better flows of knowledge, technology and people. Since then, the core activities of the partnerships consist of building critical mass mainly through collaborative projects, jointly developing visions, and setting strategic agendas.

As analysed in the **interim evaluation of Horizon 2020**¹¹, a considerable repertoire of partnership initiatives have been introduced over time, with 8 forms of implementation¹² and close to 120 partnership initiatives running under Horizon 2020 - without clear exit strategies and concerns about their degree of coherence, openness and transparency. Even if it is recognised that these initiatives allow setting long-term agendas, structuring R&I cooperation between otherwise dispersed actors, and leveraging additional investments, the evaluation points to the complexity generated by the proliferation of instruments and initiatives, and their insufficient contribution to policies at EU and national level.

¹¹ Interim evaluation of Horizon 2020, Commission Staff Working Document, SWD(2017)221 and 222

Interim evaluation of the Joint Undertakings operating under Horizon 2020 (Commission Staff Working Document, SWD(2017) 339); Evaluation of the Participation of the EU in research and development programmes undertaken by several Member States based on Article 185 of the TFEU, Commission Staff Working Document, SWD (2017)340)

¹² E.g. initiatives based on Article 187 (Joint Technology Initiatives), Article 185 TFEU, Contractual Public-Private Partnerships (cPPPs), Knowledge & Innovation Communities of the European Institute of Innovation & Technology (EIT-KICs), ERA-NETs, European Joint Programmes, and Joint Programming Initiatives.

Box 1 Key lessons from the interim evaluation of Horizon 2020 and R&I partnerships

- The **Horizon 2020 Interim Evaluation** concludes that the overall partnership landscape has become overly complex and fragmented. It identifies the need for rationalisation, improve their openness and transparency, and link them with future EU R&I missions and strategic priorities.
- The **Article 185 evaluation** finds that these public-public partnerships have scientific quality, global visibility and networking/structuring effects, but should in the future focus more on the achievement of policy impacts. From a systemic point of view, it found that the EU public-to-public cooperation (P2P) landscape has become crowded, with insufficient coherence.
- The **Article 187 evaluation** points out that Public-Private Partnership (PPP) activities need to be brought more in line with EU, national and regional policies, and calls for a revision of the Key Performance Indicators. As regards the **contractual PPPs (cPPPs)** their reviews identified challenges of coherence among cPPPs and the need to develop collaborations and synergies with other relevant initiatives and programmes at EU, national and regional level.

Over 80% of respondents to the Open Public Consultation (OPC) indicated that a significant contribution by future European Partnerships is 'fully needed' to achieve climate-related goals, to develop and effectively deploy technology, and for EU global competitiveness in specific sectors/domains. Views converged across all categories of respondents, including citizens, industry and academia.

The impact assessment of Horizon Europe identifies therefore the need to **rationalise the EU R&I funding landscape**, in particular with respect to partnerships, as well as to **re-orient partnerships towards more impact** and delivery on EU priorities. To address these concerns and to realise the higher ambition for European investments, Horizon Europe puts forward **a major simplification and reform for the Commission's policy on R&I partnerships**¹³. Reflecting its pronounced systemic nature aimed at contributing to EU-wide 'transformations' towards the sustainability objectives, Horizon Europe indeed intends to make a more effective use of these partnerships with a **more strategic, coherent and impact-driven approach**. Key related changes that apply to all forms of European Partnerships encapsulated in Horizon Regulation are summarised in the Box below.

¹³ Impact assessment of Horizon Europe, Commission Staff Working Document, SWD(2018)307.

Box 2 Key features of the revised policy approach to R&I partnerships under Horizon Europe based on its impact assessment

- ✓ **Simpler architecture & toolbox** by streamlining 8 partnership instruments into 3 implementation forms (Co-Funded, Co-Programmed, Institutionalised), under the umbrella ‘European Partnerships’
- ✓ **More systematic and transparent approach** to selecting, implementing, monitoring, evaluating and phasing out all forms of partnerships (**criteria** for European Partnerships):
 - The selection of Partnerships is embedded in the strategic planning of Horizon Europe, thereby ensuring coherence with the EU priorities. The selection criteria require that partnerships are established with stronger ex-ante commitment and higher ambition.
 - The implementation criteria stipulate that initiatives adopt a systemic approach in achieving impacts, including broad engagement of stakeholders in agenda-setting and synergies with other relevant initiatives to promote the take-up of R&I results.
 - A harmonised monitoring & evaluation system will be implemented, and ensures that progress is analysed in the wider context of achieving Horizon Europe objectives and EU priorities.
 - All partnerships need to develop an exit strategy from Framework Programme funding. This new approach is underpinned by principles of openness, coherence and EU added value.
- ✓ **Reinforced impact orientation:**
 - Partnerships are established only if there is evidence they support achieving EU policy objectives more effectively than other Horizon Europe actions, by demonstrating a clear vision and targets (**directionality**) and corresponding long-term commitments from partners (**additionality**).
 - European Partnerships are expected to provide mechanisms – based on a concrete roadmap - to join up R&I efforts between a broad range of actors towards the development and uptake of innovative solutions in line with EU priorities, serving the economy and society, as well as scientific progress.
 - They are expected to develop close synergies with national and regional initiatives, acting as dynamic change agents, strengthening linkages within their respective ecosystems and along the value chains, as well as pooling resources and efforts towards the common EU objectives.

Under Horizon Europe, a ‘European Partnership’¹⁴ is defined as *“an initiative where the Union, prepared with early involvement of Member States and/or Associated Countries, together with private and/or public partners (such as industry, universities, research organisations, bodies with a public service mission at local, regional, national or international level or civil society organisations including foundations and NGOs), commit to jointly support the development and implementation of a programme of research and innovation activities, including those related to market, regulatory or policy uptake.”*

The Regulation further specifies that European Partnerships shall adhere to the *“principles of Union added value, transparency, openness, impact within and for Europe, strong leverage effect on sufficient scale, long-term commitments of all the involved parties, flexibility in implementation, coherence, coordination and complementarity with Union, local, regional, national and, where relevant, international initiatives or other partnerships and missions.”*

1.3. Why should the EU act

1.3.1. Legal basis

Proposals for Institutionalised European Partnerships are based on:

- 1) Article 185 TFEU which allows the Union to make provision, in agreement with the Member States concerned, for participation in research and development

¹⁴ Article 8 and Annex III of the Horizon Europe Regulation (common understanding)

- programmes undertaken by several Member States, including participation in the structures created for the execution of those programmes; or
- 2) Article 187 TFEU according to which the Union may set up joint undertakings or any other structure necessary for the efficient execution of Union research, technological development and demonstration programmes.¹⁵

1.3.2. *Subsidiarity*

The EU should act only in areas where there is demonstrable advantage that the action at EU level is more effective than action taken at national, regional or local level. Research is a shared competence between the EU and its Member States according to the TFEU. Article 4 (3) specifies that in the areas of research, technological development and space, the EU can carry out specific activities, including defining and implementing programmes, without prejudice to the Member States' freedom to act in the same areas. The candidate initiatives focus on areas where there is a demonstrable value added in acting at the EU level due to the scale, speed and scope of the efforts needed for the EU to meet its long-term Treaty objectives and deliver on its strategic policy priorities and commitments. In addition, the proposed initiatives should be seen as complementary and reinforcing national and sub-national activities in the same area. Overall European Partnerships find their **rationale in addressing a set of systemic failures**¹⁶:

- Their primary function is to create a platform for a strengthened **collaboration** and knowledge exchange between various actors in the European R&I system and an enhanced **coordination** of strategic research agendas and/or R&I funding programmes. They aim to address **transformational failures** to better align agendas and policies of public and private funders, pool available resources, create critical mass, avoid unnecessary duplication of efforts, and leverage sufficiently large investments where needed but hardly achievable by single countries.
- The concentration of efforts and pooling of knowledge on common priorities to solve multi-faceted societal and economic challenges is at the core of these initiatives. Specifically, enhanced cross-disciplinary and cross-sectoral collaboration and an improved integration of value chains and ecosystems are among the key objectives of these instruments. In the light of Horizon Europe, the aim is to **drive system transitions and transformations towards EU priorities**.
- Especially in fast-growing technologies and sectors such as ICT, there is a need to **react to emerging opportunities** and address systemic failures such as shortage in skills or critical mass or cross-sectoral cooperation along the value chains that would hamper attainment of future European leadership and/or strategic autonomy.
- They also aim to address **market failures** predominantly to enhancing industry investments thanks to the sharing of risks.

2. THE CANDIDATE EUROPEAN PARTNERSHIPS – WHAT NEEDS TO BE DECIDED

2.1. Portfolio of candidates for Institutionalised European Partnerships

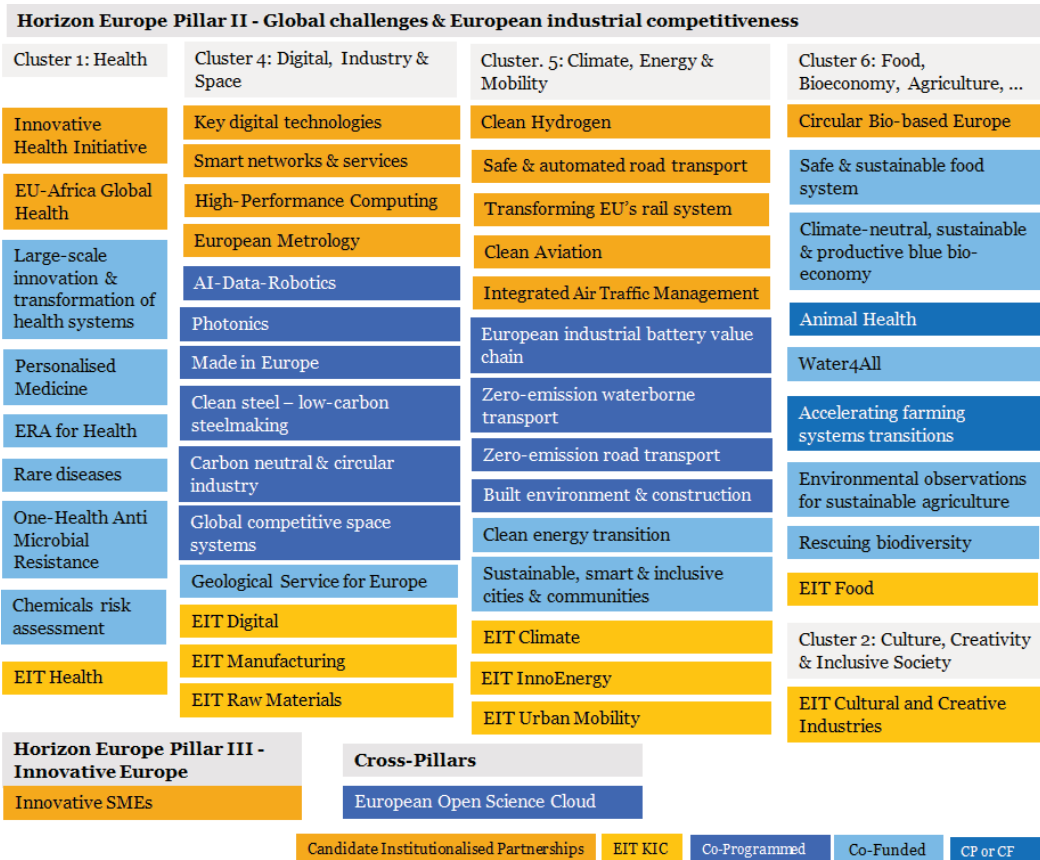

The new approach for more objective-driven and impactful European Partnerships is reflected in the way candidate Partnerships have been identified. It involved a co-design

¹⁵ Both Articles are under Title XIX of the TFEU - Research and Technological Development and Space.

¹⁶ The Interim Evaluation of Horizon 2020 and the impact assessment of Horizon Europe provide qualitative and quantitative evidence on these points. Sections 1 and 2 of each impact assessment on candidate European Partnerships include more detail on the necessity to act at EU level in specific thematic areas.

exercise aiming to better align these initiatives with societal needs and policy priorities, while broadening the range of actors involved. Taking into account the 8 areas for Institutionalised European Partnerships set out in the Horizon Europe Regulation¹⁷, a co-design exercise as part of the Strategic Planning process of Horizon Europe lead to the identification of **49 candidates for Co-funded, Co-programmed or Institutionalised European Partnerships**¹⁸. Out of these, **13 were identified as suitable candidate Institutionalised Partnerships because of their objectives and scope**¹⁹. Whilst the Co-Funded and Co-Programmed Partnerships are linked to the comitology procedure (including the adoption of the Strategic Plan and the Horizon Europe Work Programmes), Institutionalised Partnerships require the adoption of legislation and are subject to an impact assessment. The Figure below gives an overview of all candidate European Partnerships according to their primary relevance to Commission priorities for 2019-2024.

Figure 1 - Overview of the candidates for Co-Funded, Co-Programmed and Institutionalised European Partnerships according to Horizon Europe structure

Source: Technopolis group (2020)

There are only three partnerships for which implementation as an Institutionalised Partnership under Article 185 is an option, i.e. European Metrology, the EU-Africa Global Health partnership, and Innovative SMEs. Ten partnerships are candidates for

¹⁷ Horizon Europe Regulation (common understanding), Annex Va.
¹⁸ Shadow configuration of Strategic Programme Committee for Horizon Europe. The list of candidate European Partnerships is described in “Orientations towards the Strategic Plan of Horizon Europe” - Annex 7
¹⁹ Only 12 are subject to this impact assessment, as one initiative on High Performance Computing has already been subject to an impact assessment in 2017 (SEC(2018) 47)

Institutionalised Partnerships under Article 187. Overall the initiatives can be categorised into ‘horizontal’ partnerships and ‘vertical’ partnerships.

The ‘**horizontal**’ partnerships have a central position in the overall portfolio, as they are expected to develop methodologies and technologies for application in the other priority areas, ultimately supporting European strategic autonomy in these areas as well as technological sovereignty. These ‘horizontal’ partnerships are typically proposed as Institutionalised or Co-programmed Partnerships, in addition to a number of EIT KICs, they cover mainly the digital field in addition to space, creative industries and manufacturing, but also the initiative related to Innovative SMEs. ‘**Vertical**’ partnerships are focused on the needs and development of specific application areas, and are primarily expected to support enhanced environmental sustainability thereby addressing Green Deal related objectives. They also deliver on policies for more people centred economy, through improved wellbeing of EU citizen and the economy, like health related candidate European Partnerships.

2.2. Assessing the necessity of a European Partnership and possible options for implementation

Horizon Europe Regulation Article 8 stipulates that Institutionalised European Partnerships based on Article 185 and 187 TFEU *shall be implemented only where other parts of the Horizon Europe programme, including other forms of European Partnerships would not achieve the objectives or would not generate the necessary expected impacts, and if justified by a long-term perspective and high degree of integration.* At the core of this impact assessment is therefore the need to demonstrate that the impacts generated through a Partnership approach go beyond what could be achieved with traditional calls under the Framework Programme – the Baseline Option. Secondly, it needs to assess if using the Institutionalised form of a Partnership is justified for addressing the priority.

For all candidate Institutionalised European Partnerships the options considered in this impact assessment are the same, i.e.:

- Option 0 – Baseline option – Traditional calls under the Framework Programme
- Option 1 – Co-programmed European Partnership
- Option 2 – Co-funded European Partnership
- Option 3 – Institutionalised Partnership
 - Sub-option 3a Institutionalised Partnerships based on Art 185 TFEU
 - Sub-option 3b Institutionalised Partnerships based on Art 187 TFEU

2.2.1. Option 0 - Baseline option – Traditional calls

Under this option, strategic programming for R&I in the priority area will be done through the mainstream channels of Horizon Europe. The related priorities will be implemented through **traditional calls** of Horizon Europe covering a range of actions, mainly R&I and/or innovation actions but also coordination and support actions, prizes or procurement. Most actions involve consortia of public and/or private actors in ad hoc combinations, while some actions are single actor (mono-beneficiary). There will be no dedicated implementation structure and no support other than what is foreseen in the related Horizon Europe Work Programme. This means that discontinuation costs/benefits of predecessor initiatives should be factored in for capturing the baseline situation when relevant.

Under this option, strategic planning mechanisms in the Framework Programme will allow for a high level of flexibility in the ability of traditional calls to respond to particular needs over time, building upon additional input in co-creation from stakeholders and programme

committees involving Member States. The Union contribution to addressing the priority covers the full duration of the initiative, during the lifetime of Horizon Europe. Without a formal EU partnership mechanism, it is less likely that the stakeholders will develop a joint Strategic Research Agenda and commit to its implementation or agree on mutual commitments and contributions outside their participation in funded projects.

2.2.2. *European Partnerships*

Under this set of options, three different forms of implementation are assessed: Co-funded, Co-Programmed, Institutionalised European Partnerships. These have **commonalities that cannot serve as a distinguishing factor in the impact assessment process**. They are all based on agreed objectives and expected impacts and underpinned by Strategic Research and Innovation Agendas / roadmaps that are shared and committed to by all partners in the partnership. They all have to follow the same set of criteria along their lifecycle, as defined in the Horizon Europe Regulation (Annex III), including ex ante commitment from partners to mobilise and contribute resources and investments. The Union contribution is defined for the full duration of the initiative for all European Partnerships. The Horizon Europe legal act introduces few additional requirements for Institutionalised Partnerships, e.g. the need for long-term perspective, strong integration of R&I agendas, and financial contributions.

Figure 2 - Key differences in preparation and implementation of European Partnerships

Type	Legal form	Implementation
Co-Programmed	Contractual arrangement / MoU	Division of labour , whereby Union contribution is implemented through Framework programme and partners' contributions under their responsibility.
Co-Funded	Grant Agreement	Union provides co-funding for an integrated programme with distributed implementation by entities managing and/or funding national research and innovation programmes
Institutionalised based on Article 185/187 TFEU	Basic act (Council regulation, Decision by European Parliament and Council)	Integrated programme with centralised implementation

The main differences between the different forms of European Partnerships are in their preparation and in the way they function, as well as in the overall impact they can trigger. The Co-Programmed form is assessed as the simplest, and the Institutionalised the most complex to prepare and implement. The functionalities of the different form of Partnerships – compared to the baseline option – are presented in Figure 3. They relate to the types of actors Partnerships can involve and their degree of openness, the types of activities they can perform and their degree of flexibility, the degree of commitment of partners and the priority setting system, and their ability to work with their external environment (coherence), etc. These key distinguishing factors will be at the basis of the comparison of each option to determine their overall capacity to deliver what is needed at a minimised cost.

Figure 3 Overview of the functionalities provided by each form of European Partnerships, compared to the traditional calls of Horizon Europe (baseline)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
Type and composition of actors (including openness and roles)

Baseline: Horizon Europe calls	Option 1: Co-Programmed	Option 2: Co-Funded	Option 3a: Institutionalised Art 185	Option 3b: Institutionalised Art 187
activities	programmes & activities			programmes & activities

2.2.2.1. Option 1 - Co-programmed European Partnership

This form of European Partnership is **based upon a Memorandum of Understanding or a Contractual Arrangement** signed by the Commission and the private and/or public partners. Private partners are represented by industry associations, which also support the daily management of the partnership. This type of partnership would allow for a large degree of flexibility for the activities, partners and priorities to continuously evolve. The commitments of partners are political efforts described in the contractual arrangement and the contributions from partners are provided in kind more than financially. The priorities for the calls, proposed by the Partnership's members for integration in the Horizon Europe's Work Programmes, are subject to further input from Member States (comitology) and Commission services. The Union contribution is implemented within the executive agency managing Horizon Europe calls for research and innovation projects proposals. The full array of Horizon Europe instruments can be used, ranging from research and innovation (RIA) types of actions to coordination and support actions (CSA) and including grants, prizes, and procurement.

2.2.2.2. Option 2 – Co-funded European Partnership

The Co-funded European Partnership is **based on a Grant Agreement** between the Commission and a consortium of partners, resulting from a specific call in the Horizon Europe Work Programme. This form of implementation only allows to address public partners at its core. Typically these provide co-funding to a common programme of activities established and/or implemented by entities managing and/or funding national R&I programmes. The recipients of the EU co-funding implement the initiative under their responsibility, with national funding/resources pooled to implement the programme with co-funding from the Union. The expectation is that these entities would cover most if not all EU Member States. Calls and evaluations would be organised centrally, beneficiaries in selected projects would be funded at national level, following national funding rules.

2.2.2.3. Option 3 – Institutionalised European Partnership

This type of Partnership is the most complex and high-effort arrangement, and requires meeting additional requirements. Institutionalised European Partnership are **based on a Council Regulation (Article 187 TFEU or a Decision by the European Parliament and Council (Article 185 TFEU)** and are implemented by dedicated structures created for that purpose. These regulatory needs limit the flexibility for a change in the core objectives, partners, and/or commitments as these would require amending legislation.

The basic rationale for this type of partnership is the need for a strong integration of R&I agendas in the private and/or public sectors in the EU in order to address a strategic challenge. It is therefore necessary to demonstrate that other forms of implementation would not achieve the objectives or would not generate the necessary expected impacts, and that a long-term perspective and high degree of integration is needed. For both Article 187 and 185 initiatives, contributions from partners can be in the form of financial and in-kind contributions. Eligibility for participation and funding follows by default the rules of Horizon Europe, unless a derogation is introduced in the basic act.

Option 3a - Institutionalised Partnerships based on Article 185 TFEU

Article 185 of the TFEU allows the Union to participate in programmes jointly undertaken by Member States and limits therefore the scope to **public partners** which are Member States and Associated Third Countries. This type of Institutionalised Partnership aims therefore at reaching the greatest possible impact through the integration of national and EU funding, aligning national strategies in order to optimise the use of public resources and overcome fragmentation of the public research effort. It brings together R&I governance bodies of most if not all EU Member States (legal requirement: at least 40% of Member States) as well as Associated Third Countries that designate a legal entity (Dedicated Implementation Structure) of their choice for the implementation. By default, participation of non-associated Third Countries is not foreseen. Such participation is possible only if it is foreseen in the basic act and subject to conclusion of an international agreement.

Option 3b - Institutionalised Partnerships based on Article 187 TFEU

Article 187 of the TFEU allows the Union to set up joint undertakings or any other structure necessary for the efficient execution of EU research, technological development and demonstration programmes. This type of Institutionalised Partnership brings together a stable set of **public and private partners** with a strong commitment to taking a more integrated approach and requires the set-up of a dedicated legal entity (Union body, Joint Undertaking (JU)) that carries full responsibility for the management of the Partnership and implementation of the calls. Different configurations are possible:

- Partnerships focused on creating strategic industrial partnerships where, most often, the partner organisations are represented by one or more industry associations, or in some cases individual private partners;
- Partnerships coordinating national ministries, public funding agencies, and governmental research organisations in the Member States and Associated Countries;
- Or a combination of the two: the so-called tripartite model.

Participation of non-associated Third Countries is only possible if foreseen in the basic act and subject to conclusion of an international agreement.

2.3. Overview of the methodology adopted for the impact assessment

The methodology for each impact assessment is based on the Commission Better Regulation Guidelines²⁰ to evaluate and compare options with regards to their **efficiency, effectiveness and coherence**. This also integrates **key selection criteria for European Partnerships**.

Box 2 Summary of European Partnerships selection criteria²¹

- **Effectiveness** in achieving the related objectives and impacts of the Programme;
- **Coherence** and synergies of the European Partnership within the EU R&I landscape;
- **Transparency & openness** as regards the identification of priorities and objectives and the involvement of partners & stakeholders from the entire value chain, backgrounds & disciplines;
- Ex-ante demonstration of **additionality** and **directionality**;
- Ex-ante demonstration of the partners' **long term commitment**.

²⁰ European Commission (2017), Better Regulation Guidelines (SWD (2017) 350)

²¹ For a comprehensive overview of the selection criteria for European Partnerships, see Annex 6.

2.3.1. Overview of the methodologies employed

In terms of **methods and evidence used**, the impact assessments draw on an external study covering all candidate Institutionalised European Partnerships in parallel to ensure a high level of coherence and comparability of analysis, in addition to an horizontal analysis.²² For all initiatives, the understanding of the overall context of the candidate institutionalised European Partnerships relied on desk research, including among others the lessons learned from previous partnerships. This was complemented by the analysis of a range of quantitative and qualitative evidence, including evaluations of past and ongoing initiatives; foresight studies; statistical analyses of Framework Programmes application and participation data, and Community Innovation Survey data; analyses of science, technology and innovation indicators; reviews of academic literature; sectoral competitiveness studies and expert hearings. The analyses included a portfolio analysis, a stakeholder and social network analysis in order to profile the actors involved as well as their co-operation patterns, and an assessment of the partnerships' outputs (bibliometrics and patent analysis). A cost modelling exercise was performed in order to feed into the efficiency assessments of the partnership options, as described below. Public consultations (both open and targeted) supported the comparative assessment of the policy options. For each initiative, up to 50 relevant stakeholders were interviewed by the external contractor (policymakers, business including SMEs and business associations, research institutes and universities, and civil organisations, among others). In addition, the analysis was informed by the results of the Open Public Consultation run between September and November 2019, the consultation of Member States through the Strategic Programme Committee and the online feedback received on the Inception Impact Assessments of the set of initiatives.

A more detailed description of the methodology and evidence base that were mobilised, completed by thematic specific methodologies, is provided in Annexes 4 and 6.

2.3.2. Method for identifying the preferred option

The first step of the assessments consisted in scoping the problems that the initiatives are expected to solve given the overall economic, technological, scientific and social context, including the lessons to be learned from past and ongoing partnerships on what worked well and less well. This supported the identification of the objectives of the initiative in the medium and long term with the underlying intervention logic – showing how to get there.

Given the focus of the impact assessment on comparing different forms of implementation, the Better Regulation framework has then been adapted to introduce “**key functionalities needed**” - making the transition between the definition of the objectives and what would be crucial to achieve them *in terms of implementation*. The identification of “key functionalities needed” for each initiative as an additional step in the impact assessment is based on the distinguishing factors between the different options (see Section 2.2.1). In practical terms, each option is assessed on the basis of the degree to which it would allow for the key needed functionalities to be covered, as regards e.g. the type and composition of actors that can be involved (‘openness’), the range of activities that can be performed (including additionality and level of integration), the level of directionality and integration of R&I strategies; the possibilities offered for coherence and synergies with other components of Horizon Europe, including other Partnerships (internal coherence), and the coherence with the wider policy environments, including with the relevant regulatory and standardisation framework

²² Technopolis Group (2020), Impact Assessment Study for Institutionalised European Partnerships under Horizon Europe, Final Report, Study for the European Commission, DG Research & Innovation

(external coherence). This approach guides the identification of discarded options while allowing at the same time a structured comparison of the options not only as regards their effectiveness, efficiency and coherence, but also against a set of other key selection criteria for European Partnerships (openness, transparency, directionality)²³.

In line with the Better Regulation Framework, the assessment of the effectiveness, efficiency and coherence of each option is made compared to the baseline. Therefore, for each of these aspects the performance of using traditional calls under Horizon Europe is first estimated and scored 0 to serve as a reference point. This includes the discontinuation costs/benefits of existing implementation structures when relevant. The policy options are then scored compared to the baseline with a + and – system with a two-point scale, to show a slightly or highly additional/lower performance compared to the baseline. A scoring of 0 of a policy option means that it would deliver as much as the baseline option.

On the basis of the evidence collected, the intervention logic of each initiative and the key functionalities needed, the impact assessments first evaluate the **effectiveness** of the various policy options to deliver on their objectives. To be in line with the Horizon Europe impact framework, the fulfilment of the specific objectives of the initiative is translated into ‘expected impacts’ - how success would look like -, differentiating between scientific, economic/ technological, and societal (including environmental) impacts. Each impact assessment considers to which extent the different policy options provides the ‘key functionalities needed’ to achieve the intended objectives. The effectiveness assessment does not use a compound score but shows how the options would deliver on the different types of expected impacts. This is done to increase transparency and accuracy in the assessment of options²⁴.

A similar approach is followed to evaluate the coherence of options with the overarching objectives of the EU’s R&I policy, and distinguishes between **internal** and **external coherence**. Specifically, internal coherence covers the consistency of the activities that could be implemented with the rest of Horizon Europe, including European Partnerships (any type). External coherence refers to the potential for synergies and/or complementarities (including risks of overlaps/gaps) of the initiative with its external environment, including with other programmes under the MFF 2021-27, but also the framework conditions at European, national or regional level (incl. regulatory aspects, standardisation).

To compare the expected costs and benefits of each option (**efficiency**), the thematic impact assessments broadly follow a cost-effectiveness approach²⁵ to establish to which extent the intended objectives can be achieved for a given cost. A preliminary step in this process is to obtain a measure of the expected costs of the policy options, to be used in the thematic assessments. As the options correspond to different implementation modes, relevant cost categories generally include the costs of setting-up and running an initiative. For instance, set-up costs includes items such as the preparation of a European Partnership proposal and the preparation of an implementation structure. The running costs include the annual work programme preparation costs. Where a Partnership already exists, discontinuation costs and

²³ The criterion on the ex-ante demonstration of partners’ long term commitment depends on a series of factors that are unknown at this stage, and thus fall outside the scope of the analysis.

²⁴ In the thematic impact assessments, scores are justified in a detailed manner to avoid arbitrariness and spurious accuracy. A qualitative or even quantitative explanation is provided of why certain scores were given to specific impacts, and why one option scores better or worse than others.

²⁵ For further details, see Better Regulation Toolbox # 57.

cost-savings are also taken into account²⁶. The table below provides an overview of the cost categories used in the impact assessment and a qualitative scoring of their intensity when compared to the baseline option (traditional calls). Providing a monetised value for these average static costs would have been misleading, because of the different features and needs of each candidate initiative.²⁷ The table shows the overall administrative, operational and coordination costs of the various options. These costs are then put into context in the impact assessments to reflect the expected co-financing rates and the total budget available for each of the policy options, assuming a common Union contribution (cost-efficiency):

- The costs related to the baseline scenario (traditional calls under Horizon Europe) are pre-dominantly the costs of implementing the respective Union contribution via calls and project, managed by the executive agencies (around 4%, efficiency of 96% for the overall investment).
- For a Co-Programmed partnership the costs of preparation and implementation increase only marginally compared to the baseline (<1%), but lead to an additional R&I investment of at least the same amount than the Union contribution²⁸ (efficiency of 98% for the overall investment).
- For a Co-Funded partnership the additional R&I investment by Member States accounts for 2,3 times the Union contribution²⁹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the national programmes, can be estimated at 6% of the Union contribution (efficiency of 98% related to the overall investment).
- For an Article 185 initiative the additional R&I investment by Member States is equal to the Union contribution³⁰. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 7% of the Union contribution (efficiency of 96% related to the overall investment).
- For an Article 187 initiative the additional R&I investment by partners is equal to the Union contribution³¹. The additional costs compared to the baseline of preparing and implementing the partnership, including the management of the Union contribution implemented by the dedicated implementation structure, can be estimated at 9% of the Union contribution (efficiency of 94% related to the overall investment).

²⁶ These costs are not monetised. While monetised cost figures are available for existing European Partnerships, they widely differ between each case, thus limiting meaningful comparability. Moreover, they are not readily applicable for new candidate initiatives. Instead, the analysis uses a static, common model of average real costs as a means to show the order of magnitude of efforts and reveal the principal differences between the options. Discontinuation costs will bear winding down and social discontinuation costs and vary depending on e.g. the number of full-time-equivalent (FTEs) staff concerned, the type of contract (staff category and duration) and applicable rules on termination (e.g. contracts under Belgian law or other). If buildings are being rented, the cost of rental termination also apply. As rental contracts are normally tied to the expected duration of the current initiatives, these termination costs are likely to be very limited. In parallel, there would also be financial cost-savings related to the closing of the structure, related to operations, staff and coordination costs in particular. This is developed further in the individual efficiency assessments.

²⁷ A complete presentation of the methodology developed to assess costs as well as the sources used is described in the external study supporting this impact assessment (Technopolis Group, 2020).

²⁸ Minimum contributions from partners equal to the Union contribution

²⁹ Based on the default funding rate for programme co-fund actions of 30%, partners contribute with 70% of the total investment.

³⁰ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

³¹ Based on the minimum requirement in the legal basis that partners contribute at least 50% of the budget.

Figure 4 - Intensity of additional costs compared with Horizon Europe Calls (for Partners, stakeholders, public and EU)

Cost items	Baseline: traditional calls	Option 1: Co-programmed	Option 2 Co-funded	Option 3a - Art. 185	Option 3b -Art. 187
Preparation and set-up costs					
Preparation of a partnership proposal (partners and EC)	0		↑↑		
Set-up of a dedicated implementation structure		0		Existing: ↑ New: ↑↑	Existing: ↑↑ New: ↑↑↑
Preparation of the SRIA / roadmap	0		↑↑		
Ex-ante Impact Assessment for partnership		0		↑↑↑	
Preparation of EC proposal and negotiation		0		↑↑↑	
Running costs (Annual cycle of implementation)					
Annual Work Programme preparation	0		↑		
Call and project implementation	0	0 In case of MS contributions: ↑	↑	↑	↑
Cost to applicants	Comparable, unless there are strong arguments of major differences in oversubscription				
Partners costs not covered by the above	0	↑	0	↑	↑
Additional EC costs (e.g. supervision)	0	↑	↑	↑	↑↑
Winding down costs					
EC		0			↑↑↑
Partners	0	↑	0	↑	↑

Notes: 0: no additional costs, as compared with the baseline; ↑: minor additional costs, as compared with the baseline; ↑↑: medium additional costs, as compared with the baseline; ↑↑↑: higher costs, as compared with the baseline.

The cost categories estimated for the common model are then used to develop a scorecard analysis and further refine the assessment of options for each of the 12 candidate Institutionalised Partnerships. Specifically, the scores related to the set-up and implementation costs are used in the thematic impact assessments to consider the scale of the expected benefits and thereby allow a simple “value for money” analysis (**cost-effectiveness**)³². In carrying out the scoring of options, the results of fieldwork, desk research and stakeholder consultation undertaken and taken into account.

For the **identification of the preferred option**, the scorecard analysis builds a hierarchy of the options by individual criterion and overall in order to identify a single preferred policy option or in case of an inconclusive comparison of options, a number of ‘retained’ options or hybrid. This exercise supports the systematic appraisal of alternative options across multiple types of monetary, non-monetary and qualitative dimensions. It also allows for easy visualisation of the pros and cons of each option. Each option is attributed a score of the adjudged performance against each criterion with the three broad appraisal dimensions of effectiveness, efficiency and coherence.

As a last step, the alignment of the preferred option with key criteria for the selection of European Partnerships is described, reflecting the outcomes of the ‘**necessity test**’.³³ The

³² More details on the methodology can be found in Annex 24.

³³ Certain aspects of the selection criteria will be further addressed/ developed at later stages, notably in the context of preparing basic acts (e.g. Openness and Transparency; Coherence and Synergies), in the Strategic Research and Innovation Agendas (e.g. Directionality and Additionality), and by collecting formal commitments (Ex-ante demonstration of partners’ long-term commitment).

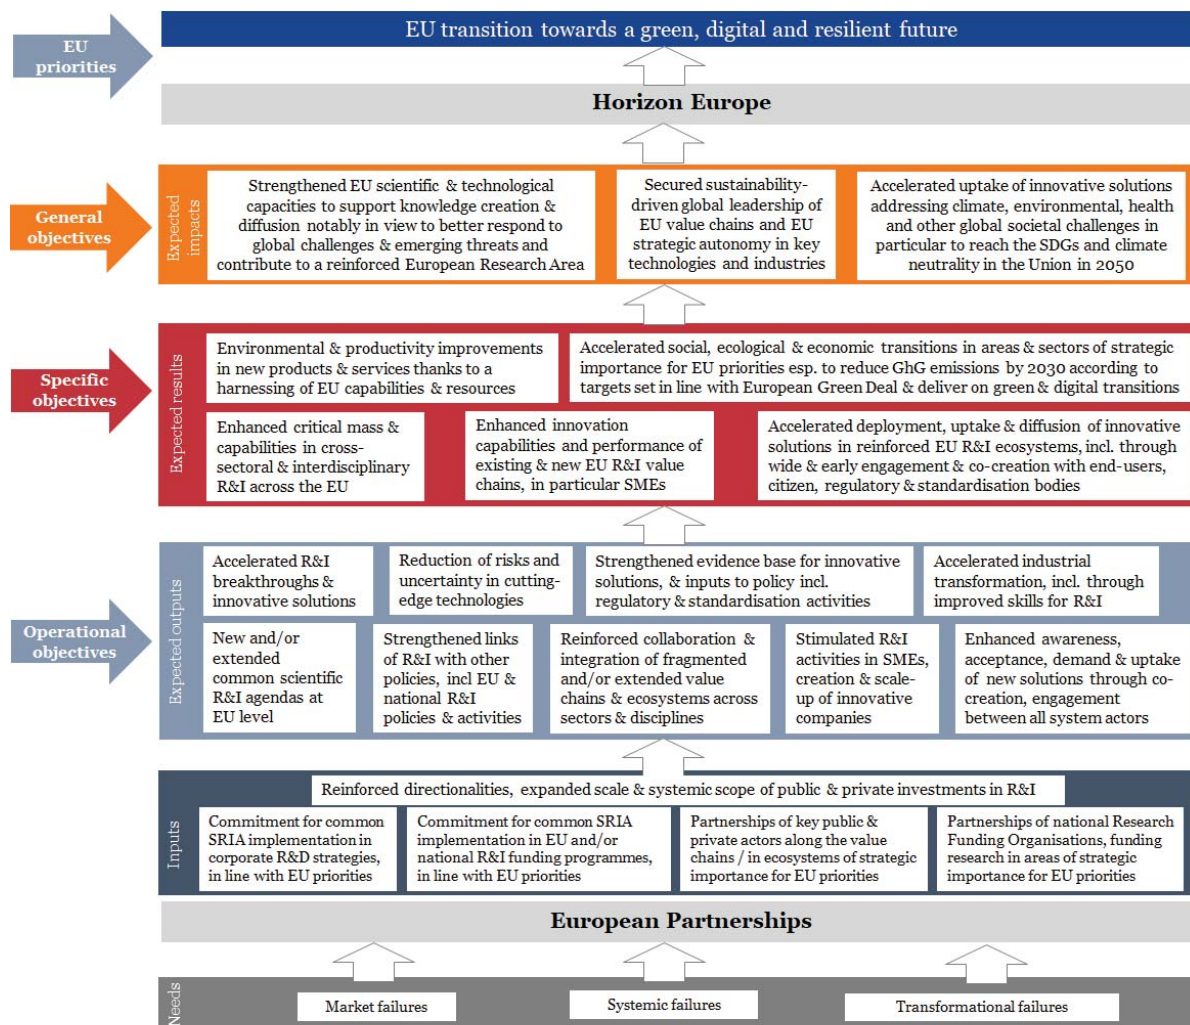

monitoring and evaluation arrangements are concluding the assessment, with an identification of the key indicators to track progress towards the objectives over time.

2.4. Horizontal perspective on candidate Institutionalised European Partnerships

2.4.1. Overall impact orientation, coherence and efficiency needs

The consolidated **intervention logic** for the set of candidate Institutionalised European Partnerships in the Figure below builds upon the objectives as reported in the individual impact assessments.

Figure 5 – Overall intervention logic of the European Partnerships under Horizon Europe

Source: European Commission, DG Research & Innovation, Unit A2 Programme Analysis and Regulatory Reform, adapted from Technopolis Group (2020)

When analysed as a package the 12 candidate Institutionalised European Partnerships are expected to support the achievement of the European policy priorities targeted by Horizon Europe by pursuing the following joint general objectives:

- Strengthening and integrating EU scientific and technological capacities to support knowledge creation and diffusion notably in view to better respond to global challenges and emerging threats and contribute to a reinforced European Research Area;
- Securing sustainability-driven global leadership of EU value chains and EU strategic autonomy in key technologies and industries; and

- c) Accelerate the uptake of innovative solutions addressing climate, environmental, health and other global societal challenges contributing to Union strategic priorities, in particular to reach the Sustainable Development Goals and climate neutrality in the Union in 2050.

In terms of specific objectives, they jointly aim to:

- a) Enhance the critical mass and scientific capabilities in cross-sectoral and interdisciplinary research and innovation across the Union;
- b) Accelerate the social, ecological and economic transitions in areas and sectors of strategic importance for Union priorities, in particular to reduce greenhouse gas emissions by 2030 according to the targets set in line with the European Green Deal, and deliver on the green and digital transition;
- c) Enhance the innovation capabilities and performance of existing and new European research and innovation value chains, in particular SMEs;
- d) Accelerate the deployment, uptake and diffusion of innovative solutions in reinforced European R&I ecosystems, including through wide and early engagement and co-creation with end-users, citizen and regulatory and standardisation bodies;
- e) Deliver environmental and productivity improvements in new products and services thanks to a harnessing of EU capabilities and resources.

In terms of their operations, taking a horizontal perspective on all initiatives allows for the identification of further possible collective efficiency and coherence gains for more impact:
