## COMMISSION STAFF WORKING DOCUMENT

### Subsidiarity Grid

#### *Accompanying the document*

#### **DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL**

**amending Directive 2003/87/EC establishing a system for greenhouse gas emission allowance trading within the Union, Decision (EU) 2015/1814 concerning the establishment and operation of a market stability reserve for the Union greenhouse gas emission trading scheme and Regulation (EU) 2015/757**

{COM(2021) 551 final} - {SEC(2021) 551 final} - {SWD(2021) 601 final} -  
{SWD(2021) 602 final}

## Subsidiarity Grid

<b>1. Can the Union act? What is the legal basis and competence of the Unions' intended action?</b>
<b>1.1 Which article(s) of the Treaty are used to support the legislative proposal or policy initiative?</b>
The legal basis for this proposal amending Directive is Article 192 of the Treaty on the Functioning of the European Union (TFEU). In accordance with Article 191 and 192(1) TFEU, the European Union shall contribute to the pursuit, inter alia, of the following objectives: preserving, protecting and improving the quality of the environment; promoting measures at international level to deal with regional or worldwide environmental problems, and in particular combating climate change.
<b>1.2 Is the Union competence represented by this Treaty article exclusive, shared or supporting in nature?</b>
In the case of environment, the Union's competence is shared.
<i>Subsidiarity does not apply for policy areas where the Union has <b>exclusive</b> competence as defined in Article 3 TFEU<sup>1</sup>. It is the specific legal basis which determines whether the proposal falls under the subsidiarity control mechanism. Article 4 TFEU<sup>2</sup> sets out the areas where competence is shared between the Union and the Member States. Article 6 TFEU<sup>3</sup> sets out the areas for which the Unions has competence only to support the actions of the Member States.</i>
<b>2. Subsidiarity Principle: Why should the EU act?</b>
<b>2.1 Does the proposal fulfil the procedural requirements of Protocol No. 2<sup>4</sup>:</b> <ul style="list-style-type: none"><li>- Has there been a wide consultation before proposing the act?</li><li>- Is there a detailed statement with qualitative and, where possible, quantitative indicators allowing an appraisal of whether the action can best be achieved at Union level?</li></ul>
In order to collect evidence and ensure greater transparency, the Commission first invited feedback on an inception impact assessment, outlining the initial considerations and policy options of the revision <sup>5</sup> . The Commission then organised an online public consultation, receiving almost 500 replies <sup>6</sup> . To support the initiative concerning carbon pricing for maritime transport, a targeted stakeholder survey was carried out accompanied by a targeted interview programme <sup>7</sup> .

<sup>1</sup> <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E003&from=EN>

<sup>2</sup> <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12008E004&from=EN>

<sup>3</sup> <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E006:EN:HTML>

<sup>4</sup> <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:12016E/PRO/02&from=EN>

<sup>5</sup> The inception impact assessment was open for feedback from 29 October 2020 to 26 November 2020 and received about 250 contributions. The outcome can be found on the following website:

<https://ec.europa.eu/info/law/better-regulation/have-your-say/initiatives/12660-Updating-the-EU-Emissions-Trading-System>.

<sup>6</sup> This was open for 12 weeks from 13 November 2020 to 5 February 2021. The outcome can be found on the following website: <https://ec.europa.eu/info/law/better-regulation/have-your-say/initiatives/12660-Updating-the-EU-Emissions-Trading-System/public-consultation>.

In addition, the Commission held (virtual) bilateral and multilateral stakeholder meetings, including with industry representatives across different sectors, trade unions, non-governmental organisations and Member States and participated in virtual conferences. Finally, the Commission instructed a contractor to organise two expert workshops<sup>8</sup> on the review of the Market Stability Reserve (MSR). The results of the consultation activities are reported in the impact assessment accompanying this proposal.

Articles 191 to 193 of the TFEU confirm and specify EU competencies in the area of climate change. Climate change is a trans-boundary problem, which cannot be solved by national or local action alone. Coordination of climate action must be taken at European level and, where possible, at global level. EU action is justified on grounds of subsidiarity as set out in Article 5 of the Treaty on European Union. Since 1992, the European Union has worked to develop joint solutions and drive forward global action to tackle climate change. More specifically, action at EU level will provide for cost effective delivery of the 2030 and long-term emission reduction objectives while ensuring fairness and environmental integrity.

In light of the emission reduction target for 2030, and in the perspective of the climate neutrality objective to be achieved by 2050, stronger EU action is needed.

The explanatory memorandum of the proposal, and the impact assessment under chapter 3, contain sections on the principle of subsidiarity.

**2.2 Does the explanatory memorandum (and any impact assessment) accompanying the Commission's proposal contain an adequate justification regarding the conformity with the principle of subsidiarity?**

Yes, they do. The explanatory memorandum (as well as the accompanying impact assessment) explain that climate change is by its very nature a trans-boundary challenge that cannot be solved by national or local action alone. Coordinated EU action can effectively supplement and reinforce national and local action and enhances climate action.

Although initiatives at the national, regional and local level can create synergies, alone they will not be sufficient. On their own, individual Member States' carbon markets would represent too small a market to achieve the same level of results. Therefore, an EU wide approach is needed to drive industry level changes and to create economies of scale.

**2.3 Based on the answers to the questions below, can the objectives of the proposed action be achieved sufficiently by the Member States acting alone (necessity for EU action)?**

This proposal aims increase the contribution of emissions trading in a manner commensurate with the overall EU emissions reduction target of at least 55% for 2030. This objective cannot be achieved by the Member States alone as it requires cost-efficient emissions reductions across the Union and increased resources that can only be achieved through the EU-level carbon market.

(a) Are there significant/appreciable transnational/cross-border aspects to the problems being tackled? Have these been quantified?

<sup>7</sup> The stakeholder survey run from December 2020 and February 2021, and the targeted interview programme from January 2021 to February 2021.

<sup>8</sup> [https://ec.europa.eu/clima/events/expert-workshop-market-stability-reserve\\_en](https://ec.europa.eu/clima/events/expert-workshop-market-stability-reserve_en),  
[https://ec.europa.eu/clima/events/2nd-expert-workshop-market-stability-reserve\\_en](https://ec.europa.eu/clima/events/2nd-expert-workshop-market-stability-reserve_en).

Climate change is a trans-boundary problem and both international and EU action can effectively complement and reinforce regional, national and local action. The European Climate Law<sup>9</sup>, as agreed by the co-legislators, makes the EU's climate neutrality target legally binding, and raises the 2030 ambition by setting a target of at least 55% net emission reductions by 2030 compared to 1990. The EU Emissions Trading System (ETS) covers 41% of the EU's greenhouse gas emissions. The environmental contribution of the ETS needs to be increased in a manner commensurate with the overall EU target for 2030. If the legislation remains unchanged, sectors currently covered by the ETS would together achieve a 2030 emission reduction of 51% compared to 2005 (see Section 5.1 of the impact assessment). This would be an insufficient contribution to an overall target of -55% compared to 1990. The policy scenarios that achieve around 55% reductions project a cost-effective contribution of the sectors currently covered by the ETS in the range of -62-63% compared to 2005.

(b) Would national action or the absence of the EU level action conflict with core objectives of the Treaty<sup>10</sup> or significantly damage the interests of other Member States?

Urgent economy-wide emission reductions to combat climate change are necessary to fulfil the objectives of Article 192 TFUE, of preserving, protecting and improving the quality of the environment, protecting human health, as well as to promote measures at international level to deal climate change. The absence of EU level action could lead to 'environmental dumping' between the Member States, where Member States compete for the least stringent climate change measures to benefit their own economies, damaging the internal market and weakening climate action. An urgent climate transition requires a high degree of investments. As a result, foregoing the benefits of economies of scale and the possibility of reducing emissions where they are more cost-effective, would result in a slower climate transition due to increased costs and less available funds.

(c) To what extent do Member States have the ability or possibility to enact appropriate measures?

Member States are able to act to reduce greenhouse gas emissions that are under the scope of the EU ETS through other policies than emission limits adopted pursuant to Directive 2010/75/EU. However, they are not able to establish an EU-level carbon market. In particular, national action remains important in the areas of buildings and road transport, for which a separate EU level emissions trading system is proposed as additional economic incentive to achieve cost-effective emission reductions.

(d) How does the problem and its causes (e.g. negative externalities, spill-over effects) vary across the national, regional and local levels of the EU?

The effects of raising the contribution of emissions trading towards a higher emissions reduction target will not be felt equally across the EU, as their starting point in terms of the emissions in the sectors covered by the Directive are not the same. Some Member States will be more affected than others. Increasing the contribution of the ETS to achieve the revised target will require investments in the energy systems and the greening of industrial processes in Member States where modernisation needs are already the highest. Regions and local communities in which employment is linked to fossil fuel production are impacted more significantly than others. Furthermore, there are distributional concerns within Member States, as low-income households across the EU will bear a

<sup>9</sup> Regulation (EU) 2021/... of the European Parliament and of the Council of ... establishing the framework for achieving climate neutrality and amending Regulations (EC) No 401/2009 and (EU) 2018/1999 ('European Climate Law') (OJ L ...).

<sup>10</sup> [https://europa.eu/european-union/about-eu/eu-in-brief\\_en](https://europa.eu/european-union/about-eu/eu-in-brief_en)

relatively higher burden notably in terms of heating fuel expenses compared to wealthier households. Hence, there are likely to be different distributional issues that emerge if the EU emissions trading is expanded to new sectors. At the same time, there will be also positive social impacts, like an improvement concerning health issues linked with air pollution. In addition, emissions trading generates auction revenues which can be used by Member States to address these problems, including if there were specific problems at regional or local level.

(e) Is the problem widespread across the EU or limited to a few Member States?

The need to address climate change is widespread across the EU.

(f) Are Member States overstretched in achieving the objectives of the planned measure?

The ETS Directive establishes a carbon market in the EU, without specific targets per Member State. Emission reductions take place where they are most cost-efficient. Nevertheless, the ETS Directive includes measures to mitigate the distributional and social effects of the ETS explained in point 2.3(d) above, reinforced by the proposal. Notably, the ETS Directive includes:

- A solidarity redistribution provision consisting of the redistribution of 10% of the auctioned allowances to 16 low income MS (around 5% of the current overall cap or around 700 million allowances over the 2021-30 period)
- The Modernisation Fund (up to 2025, 2% of the overall cap or around 275 million allowances over the 2021-30 period, from 2026 onwards 4% of the cap).
- 150 million allowances issued under the new emissions trading system for road transport and buildings will be made available to increase the current Innovation Fund of 450 million allowances to stimulate the green transition.
- Article 10c derogation applying to 10 low income Member States that can opt to give free allocation (of up to 40% of their regular auction volume) to investments in power generation for the modernisation of the energy sector (totalling about 630 million allowances over the 2021-30 period).
- [CBAM]

In addition, Decision (EU) 2015/1814 establishes a market stability reserve for the ETS with an intake until 2025 that is only based on the 90% regular auctioning shares, exempting the 10% solidarity shares. The proposed new Regulation on a social facility for climate action addresses the social impacts of carbon pricing in the new emissions trading system for buildings and road transport.

(g) How do the views/preferred courses of action of national, regional and local authorities differ across the EU?

The ETS is widely supported across the Union. The different views or preferred courses of action do not relate to the use of the ETS in itself, but to aspects of its design.

**2.4 Based on the answer to the questions below, can the objectives of the proposed action be better achieved at Union level by reason of scale or effects of that action (EU added value)?**

The objectives of the proposed action be better achieved at Union level by reason of the cost-efficiency of emissions reductions, coherence of EU action, preserved functioning of the internal market and strengthened EU position to foster global action on climate change.

(a) Are there clear benefits from EU level action?

Yes. The benefits from EU level actions relate to the economies of scale and improvement of the EU internal market explained below. In addition, EU action can also inspire and pave the way for the

development of market based measures at global level, e.g. as regards the maritime transport within International Maritime Organisation. EU action also allows the EU to have a stronger position internationally to apply a Carbon Border Adjustment Mechanism, which will be based on the ETS to ensure compliance with the World Trade Organisation rules.
(b) Are there economies of scale? Can the objectives be met more efficiently at EU level (larger benefits per unit cost)? Will the functioning of the internal market be improved?
Yes. As a carbon market, the ETS incentivises emission reductions to be made by the most cost-efficient solutions first across the activities it covers, achieving greater efficiency by virtue of its scale. Implementing a similar measure nationally would result in smaller, fragmented carbon markets, risking distortions of competition and likely lead to higher overall abatement costs. The same logic holds for the extension of carbon pricing to new sectors.  Many of the policy elements of the proposal have an important internal market dimension, in particular the options related to the carbon leakage protection and the low-carbon funding mechanisms.
(c) What are the benefits in replacing different national policies and rules with a more homogenous policy approach?
The benefits of a more homogenous approach are highlighted in point 2.4(b) above. Emission reductions take place where they are most cost-effective, thus reducing the overall cost of the climate transition for the EU. Emissions reductions also take place without distorting the internal market, and preventing environmental dumping. As highlighted in point 2.3(c) above, for the new ETS for buildings and road transport, the aim is not to replace but to complement national policies.
(d) Do the benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities (beyond the costs and benefits of acting at national, regional and local levels)?
The benefits of EU-level action outweigh the loss of competence of the Member States and the local and regional authorities, because reducing greenhouse gas emissions is fundamentally a trans-boundary issue that requires urgent effective action at the largest possible scale. The EU, as a supranational organisation is well-placed to establish effective climate policy in the EU. Concretely, the benefits are the cost-efficiency of emissions reductions, coherent EU action, preserved functioning of the internal market and strengthened EU position to foster global action on climate change.
(e) Will there be improved legal clarity for those having to implement the legislation?
Yes. The wording of several provisions is improved (e.g. Article 10a(8) of the ETS Directive on the Innovation Fund).
<b>3. Proportionality: How the EU should act</b>
<b>3.1 Does the explanatory memorandum (and any impact assessment) accompanying the Commission’s proposal contain an adequate justification regarding the proportionality of the proposal and a statement allowing appraisal of the compliance of the proposal with the principle of proportionality?</b>
Yes. The explanatory memorandum (as well as the accompanying impact assessment) explain that this proposal complies with the proportionality principle because it does not go beyond what is

necessary in order to achieve the Union's objectives of reducing greenhouse gas emissions in a cost-effective manner, while ensuring fairness and environmental integrity.

The European Climate Law has endorsed an overall economy-wide and domestic reduction in greenhouse gas emissions of at least 55% below 1990 levels by 2030 and climate neutrality by 2050.

All options analysed for the strengthening of the existing ETS are based on the already existing instrument, the ETS Directive. The initiative is limited to ETS adjustment needs that are triggered by this increased emissions reduction target of at least 55%.

The instrument of emissions trading ensures that additional costs for industry due to the increased level of ambition of the EU's climate policies are expected to be kept to a minimum, given that the ETS incentivises emissions reduction by operators with the lowest abatement costs. Moreover, the use of the existing instruments minimises any additional administrative costs.

**3.2 Based on the answers to the questions below and information available from any impact assessment, the explanatory memorandum or other sources, is the proposed action an appropriate way to achieve the intended objectives?**

The proposal is the appropriate way forward to ensure that the sectors currently under the ETS, and those to which the system is extended, contribute to the reduction of emissions in line with the increased EU emissions reduction target for 2030. It reinforces a carbon pricing mechanism that has proved to be effective for those sectors already covered by the ETS, and extends it to sectors that currently are not reducing their emissions sufficiently, building on the lessons from the successfully established existing ETS.

(a) Is the initiative limited to those aspects that Member States cannot achieve satisfactorily on their own, and where the Union can do better?

Yes, the proposal is limited to a carbon pricing system in those sectors previously under the EU ETS, and those sectors that in the absence of additional measures would not decrease as much as required to be on a path to achieve an economy-wide 55% reduction in emissions (buildings, road transport, and the maritime sectors). These sectors are subject to regulatory measures but generally not subject to a carbon price and may therefore not be sufficiently incentivised to reduce their emissions. Carbon pricing is only one of the policies that will be necessary to achieve the level of emissions reductions required; Member States should make use of additional measures to trigger the reduction of greenhouse gas emissions.

(b) Is the form of Union action (choice of instrument) justified, as simple as possible, and coherent with the satisfactory achievement of, and ensuring compliance with the objectives pursued (e.g. choice between regulation, (framework) directive, recommendation, or alternative regulatory methods such as co-legislation, etc.)?

The objectives of this proposal can be best pursued through a Directive. This is the most appropriate legal instrument to make amendments to the existing ETS Directive.

A Directive requires Member States to achieve the objectives and implement the measures into their national substantive and procedural law systems. This approach gives the Member States more freedom when implementing an EU measure than does a Regulation, in that Member States are left the choice of the most appropriate means of implementing the measures in the Directive. This allows Member States to ensure that the amended rules are consistent with their existing substantive and procedural legal framework implementing the EU ETS, in particular regulating permits for installations as well as enforcement measures and penalties.

(c) Does the Union action leave as much scope for national decision as possible while achieving satisfactorily the objectives set? (e.g. is it possible to limit the European action to minimum

standards or use a less stringent policy instrument or approach?)

Yes, as a Directive is used, leaving to Member States the decision on how to achieve the objectives set out in Directive, where uniform conditions of implementation are not needed. For example, the ETS Directive leaves to the Member States the choice of excluding smaller installations under certain conditions, or of unilaterally including additional activities and gases. A less stringent policy instrument would not be adequate to establish an EU carbon market, that requires a common framework applying to all the Union to ensure equivalent application in all Member States. Else, the benefits of cost-efficient emissions reductions and prevention of environmental dumping would not be achieved.

(d) Does the initiative create financial or administrative cost for the Union, national governments, regional or local authorities, economic operators or citizens? Are these costs commensurate with the objective to be achieved?

The EU ETS generates significant revenues. At present most of those auction revenues accrue to Member States. The proposal affects national budgets and administrations primarily because it provides for the transfer of a share of ETS auction revenues to the EU budget. This is in line with the inter-institutional agreement of 16 December 2020<sup>11</sup>, which requires the Commission to propose a limited own resource based on the EU ETS by mid-2021<sup>12</sup>.

Nevertheless, national budgets of Member States will benefit from the extension of the EU ETS scope to maritime transport and from the new emissions trading for road transport and buildings.

The secure operation of the Union registry is funded from the Union budget. Extending the ETS scope to maritime transport and the new ETS for road transport and buildings will require additional resources for the secure operation of the Union registry, as specified in the financial statement accompanying this proposal. These resources will be made available through redeployment in the light of the budgetary and staffing constraints for European Public Administration under the current Multiannual Financial Framework while related operational expenditure will be funded with the LIFE programme envelope. IT development and procurement choices will be subject to pre-approval by the European Commission Information Technology and Cybersecurity Board.

Financial and administrative costs are limited for those sectors already covered by the ETS. The covered entities, have become very familiar with the ETS's annual compliance cycle based on obligations related monitoring, reporting and verification of emissions. Compliance with these rules is almost 100%. This also holds for the national authorities responsible for various implementing tasks, such as the issuing of emission permits, the assessment of monitoring plans and emission data, as well as the allocation of free allowances.

A strengthening of the ETS does not affect these regular activities. However, as ambition increases and free allocation starts to decrease, industrial players may choose to become more active participants on the carbon market, increasing their hedging behaviour to better manage their compliance costs.

The situation is different for the new sectors to which emissions trading may be extended.

With regard to the maritime sector, the regulated entities, i.e. the ship-owners will already be familiar with the dedicated rules on monitoring, reporting and verification of emissions for their sector. These activities will have to be complemented by allowance management to ensure a sufficient number of allowances is acquired and surrendered in time.

The regulated entities in the road transport and buildings sector have no experience with emissions trading or its practical implications. Putting the obligation upstream on the tax warehouses and on

<sup>11</sup> OJ L 433I , 22.12.2020, p. 28–46

<sup>12</sup> Proposal for a Council Decision amending Decision (EU, Euratom) 2020/2053 on the system of own resources of the European Union (COM(2021) xxxx).

fuel suppliers implies however that those entities usually have experience in dealing with fuel taxation and related administrative procedures. Additional administrative tasks will be related to the particularities of an emissions trading system, such as obtaining a GHG emissions permit; opening and maintaining registry account(s), complying with monitoring, reporting and verification rules; and the timely purchasing and surrendering of allowances. No free allocation is envisaged for these sectors, hence the implementation for national authorities is simplified. Member States could decide to establish as the competent authority for the new sectors the same as the one actually responsible for the current EU ETS, reducing the administrative burden and benefitting from synergies.

(e) While respecting the Union law, have special circumstances applying in individual Member States been taken into account?

Yes, see point 2.2.(f).
